The University College Buildings, Nottingham, have been erected from the designs and under the superintendence of Messrs. W. & R. Mawson, of Bradford, architects, and were opened, as our readers will recollect, in June last, by Prince Leopold, when we gave particulars of the foundation.* The buildings occupy an excellent position in a central part of the town of Nottingham, and the site is enclosed by wide open streets, viz., South Sherwood-street, Bilbie-street, and Shakspeare-street.

The principal front of the building is towards Shakspeare-street, and is 260 ft. in length and 60 ft. in height. The style of the building is Gothic, and all the parts, both in the exterior, interior, and the fittings throughout, are designed in harmony with each other.

The general outline of the front is composed of the principal entrance gable in the centre, projecting considerably from the general line, and of which we give a view, and terminated at each end by gables, also projecting. These three gables have massive pinnacles at their angles rising from the ground-line. The façade between the centre and the two end gables is divided into two-light windows, with shafts in the jambs, and with shafted mullions.

The upper floor is formed with a continuous arcade of single-light windows, with piers between, formed of double coupled columns. The ranges of windows on the ground and first floors are broken in the centre by handsome projecting bay-windows of different treatment, with square heads at the top filled in with tracery. These bay-windows are carried the whole height of the building, and their lofty roofs are carried into the main roof. Between the bays and the wings are placed four richly-treated dormer windows.

The central entrance gable is the principal feature in the front, and is divided on the ground-floor into three pointed open archways, with clustered columns and well-carved capitals. On the first-floor level, over the three archways, are three windows which light the main entrance-hall, filled with geometrical tracery, with shafts to the jambs and mullions. The upper part of the central gable is covered with diaper work, and divided by a broad band of sculpture, representing a school of students of the arts and sciences; there are also three large medallions, in high relief, of music, sculpture, and painting. In each of the three gables of the principal front are placed two statues, 7 ft. 6 in. high, on pedestals with canopies over: Shakspeare, Milton, Bacon, Newton, Watt, and Cuvier. These statues, which are very creditably modelled, and executed in the same stone as the building, add very greatly to the character of the front, and are the work of Messrs. Farmer & Brindley, of Westminster.

In the centre, at the junction of the principal gable and the side roofs, is placed a *flèche* of wood, covered with lead, rising to a height of 120 ft.

The façades towards Bilbie-street and South Sherwood-street are treated in a similar manner to the principal front, and designed to group with it, and to form a picturesque outline.

The building throughout is executed in Ancaster stone of a bright, warm colour. The heads of the windows generally, and the whole of the larger windows in the principal gables, and opening into the staircases, are filled with stained glass. The roofs are lofty, covered with Westmoreland slates in bands, and terminated with a handsome ridge cresting in wrought iron. The principal fronts, between the gables, are finished with a pierced parapet in stone. The chimneys are in cut stonework, with projecting and recessed sides, with moulded bosses and cornices.

The large open space all round the buildings, laid with grass and planted with trees, allows the varied outline of the principal fronts to be well seen.

The interior of the building is very simple in its arrangement, but very convenient; each division of the building is separated, and yet communicates with the other. We publish plans of the principal floors. Generally, the front towards Shakspeare-street is devoted to the main entrance and staircases, with class-rooms on each side, and corridors lighted by two open quadrangles. Behind the principal entrance are placed three theatres for chemical, physical, and general lectures, the two former having laboratories, workrooms, and professors' rooms attached. These rooms are all arranged and fitted with the best and newest improvements, and no study has been spared to render them as complete, in every respect, as those most experienced in the working of them could suggest.

On the left of the principal front, facing South Sherwood-street, are the rooms of the Public Free Library; on the ground-floor is the entrance vestibule and staircase opening into the news-room and central reading-room, 90 ft. in length, with an average width of 45 ft. On the first-floor are the reading-room and reference library, the same size, lighted from the roof, and also from the sides, with a reading-room for ladies. A committee-room and students' reading-room are provided on the ground-floor.

On the right of the principal front, facing Bilbie-street, are placed the Vertebrate and Invertebrate Museums, with separate entrance, vestibule, and staircase,—the former on the ground-floor and the latter on the first floor, lighted from the roof, and each 90 ft. in length and 45 ft. in average width, with large projecting bays in the centre, which give variety to these fine rooms, and add to their convenience. The rooms in the basement are devoted to the unpacking of books and arrangement of them, under the free library wing, and to workrooms for the preparation of specimens under the museums, communicating with lifts with the rooms above.

All the fittings and furniture throughout the building are in American walnut.

The entire cost of the whole works, including furniture, fittings, and decoration, is about 70,000*l.*

The workmanship throughout has been carried out under the careful supervision of Mr. Richard Bates, the clerk of the works.

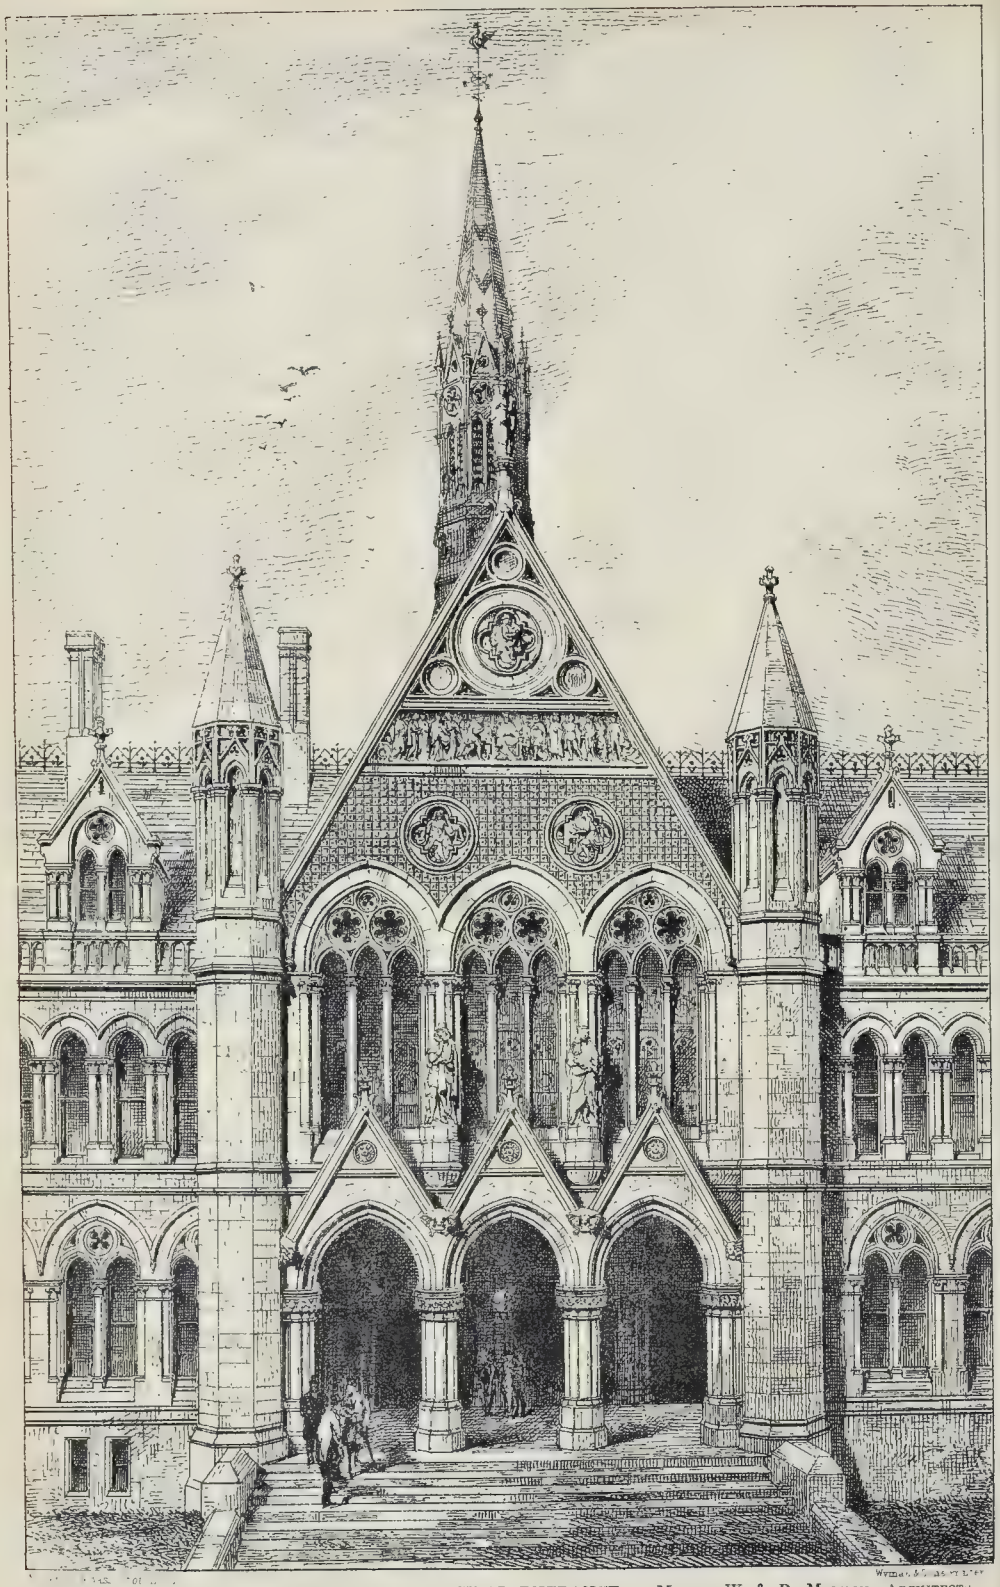
* Vol. xl., p. 786.

NEW OFFICES, WEST GEORGE-STREET, GLASGOW.

We give a view of some handsome office buildings, recently completed in Glasgow, for Mr. James Aiken, from the designs of Mr. John McLeod, of that city, architect. They are situated at the corner of West George-street and Wellington-street, having a frontage to the former street of 39 ft. and of 111 ft. to the latter. There is a considerable slope in Wellington-street, allowing shops with cellars to be introduced at the lower end. Mr. Aiken's firm (Burns, Aiken, & Co.) occupy the whole of the principal floor, entering from West George-street. Their accommodation consists of a general office 40 ft. by 28 ft., three large private rooms for the partners, one smaller room, safes, &c. They have also a large strong room on the basement, 40 ft. by 34 ft., fitted up with iron racks for deed-chests.

From West George-street access is obtained to the upper floors, which are all occupied as offices,—the whole of the first and part of the upper floor by the British India Steam Navigation Company and Messrs. McKinnon & Company. The offices are all provided with safes, lavatories, &c.

The basement and principal floors are fire-proof, being formed with rolled iron joists and concrete.



The lobbies and landings are laid with imitation marble tiles, and the walls of staircase, safes, and lavatories are lined with white glazed tiles.

The building is of white freestone from Overwood Quarries.

The principal contractors were,—for mason's work, Messrs. George Barlas & Co.; wright's work, Mr. James Connell; and for marbles and tiles, Messrs. Galbraith & Winton.

The work has cost about 11,000*l.*, exclusive of site.

Conflagrations.—"R. T." writes:—In early youth I remember, on asking a blacksmith why he threw water on his fire, he informed me it was to make it burn up strong. Our fire-extinguishers still do it, leaving off when the building is gutted out; they are prejudiced against chemicals. I wonder if they would try a block of soda submerged near the intake-pipe. This gradually dissolving the water would be strongly impregnated with tungstate that kills fire. Our friends east of Temple Bar are just now very warm on the subject; innovations do upset vested interests; perhaps, even they may take kindly to the above suggestion.

PAINTING AND SCULPTURE AS AIDS TO RELIGION.

At the Church Congress in Newcastle, on the 6th inst., Mr. T. Gambier Parry read the following paper:—Like many other things, Fine Art is a power for good and evil; and its attractiveness makes that power great. For evil, we find it in works of vanity and vice; for good, we see it in the fire which shines from beneath the surface of good men's works. Will and genius are the sources of its power, and thus a work of marble or of colours becomes a thing of purpose and of life; yes, and a more true and clear exponent than language of men's nature and men's thoughts, for language may hide and pervert truth, but Art would convict itself in the lie it would try to tell. The impulse of art comes the artist knows not whence. An irresistible and untraceable ideal haunts him; its imagery falls on him like a reflection from another state of being; the mystery of it engages him; the beauty of it fascinates him; its power increases in his search to realise it; heart and mind are oppressed at the sense of it; and the poetry of art alone affords the means of its expression. A work of art comes forth because it must. Its purpose is its own relief. All fine arts have a common origin, and are necessary to each other. The arts of the painter and the sculptor belong to the architect, and enhance the beauty of his work; but music does so even more perfectly; for, with all that sculpture may adorn it or painting enrich it, architecture is never so grandly beautiful as when the divine strains of music are echoing from its forms. Music translates these forms into a perfect eloquence, and clothes them with the colours of her own beauty. How easy, then, to understand the endearment of art to mankind! Thoughts pure and beautiful flash across him, and are the next instant gone, like a sunray in the sky or a fragrance from the earth. The thoughts had left but a vague shadow of their image, but art rescued it and made it a reality. That first rude sculptor may well have started back who first saw the embodiment of the soul's conception, Whence that conception? An invisible, inscrutable breath had impinged upon his thought, as the light air wafts across his forehead; whence it came and whither it went he knew not. There it stands before him a reality —terrible in its reality; an embodied shadow; an emanation from his own life; a film of thought that had flashed out from the unknown, and was the next moment lost; gone like the gloss upon the dew, but caught up, recovered, reproduced by his rude skill. How inevitable was idolatry! Whence was the birth of that rude image? Was it an agony of grief, or the dread of death, or of conscience that had struck upon his imagination? He looked blindly into infinity, conscious of a light he could not see. The terror of the unseen had forced upon him the idea of deity. He felt the divine element in things, and called them gods. As with that rude sculptor, so in all time, art is both the creature and the producer of emotion; and most natural, therefore, is the result that the subject which produces the deepest emotions produces also the greatest art. Its moral and religious influence is indubitable; but unlike the effects of eloquence in literature and speech, art is most powerful by its indirect appeals. I doubt the moral value of its direct representations of pain or shame or evil. Its influence for good and noble action is by the fascination of its works which make those actions beautiful. Its illustrations of agony and vice are themselves as repulsive as the evil they wish to cure. I doubt therefore Hogarth's pictures of the Rake's Progress having ever stopped the course of a rake, or Morland's illustrations of the fall and ruin of Letitia having ever stayed the folly of a frivolous girl. But there can be no doubt of the power of art to clench a conviction already received, or to add force equally to superstition and to truth. The arts of all time have illustrated this, from the idol of the savage (the embodiment of the demon of his dread), to all that the arts of Assyria and Egypt, Greece and Rome, have done, or the lavished ornament of the temple of the Jews, the paintings of the catacombs, the frescoes of the Middle Ages: all testify to this use and power. The embodiment of the religious ideal,—and deeper far than that, the impersonation of that ideal,—has been a longing desire of mankind approaching to a necessity. The irresistible conviction of spiritual existence, the idea of the power and beauty of invisible beings, has so possessed the minds and imaginations of men that the whole material universe has been peopled with them, from the gods who reigned in the starry heavens to those bright and graceful beings with which mythology has filled the woods and fountains, the rocks, the ocean, and the very air itself. Impersonation was the ideal on which the Pagan arts had been perfected. They swayed the emotions of men. But yet with all their beauty, and with all their power, an impenetrable shadow hung over them. Satisfaction was incomplete. The impersonation was inanimate. The life of it, indeed, was in the artist's mind, and its beauty was in the eyes of those who looked on it. Human sense had grasped at what the human spirit had yearned to see. The material of an inanimate symbol was given to it. Intellect and sense alone were satisfied. The heart, the mainspring of humanity, was not touched. A great ideal in philosophy, in literature, and in art had for ages occupied the mind and imagination of mankind. But whence its power, if it were but a thing of fancy or a dream? The whole fabric of it had long since perished but for the conviction of its own inward truth. That conviction was the forecast of a great reality. All art had strained its eyes towards it; the loftiest music of all poetry had raised its voice to it; and, far beyond the reach of all these, suffering humanity had lifted its blind eyes, and stretched out its hands to it; and it was this,—the hearts of all nations had yearned for the impersonation of life. At length, and in the fulness of time, that life was manifested, and that life was the light of men, and the human heart was satisfied. The Christian artist is like "the sower that went forth to sow." Art is truly a divine seed, whose fruit is for the sweetness of man's life. But human infirmity mars it, and human failing blights it; till, well watered by human tears, men reap in joy. Art is sent with a divine message to the world, and that message is the evidence of the universe to the perfection of its Creator as exhibited in the mystery of beauty. This is the commission that the artist bears,—to translate to the world the symbols of God's universal love. The divine attributes of power and infinity might overwhelm the world with fear, but the attribute of love reassures it. Beauty is the symbol of that love. Reason cannot define nor imagination fathom it; and he that bears the commission of that message can do no more than, by the simple eloquence of truth, to win the sympathies of men, and to train them as he has trained himself to see in the lineaments of beauty not the mere fancy of a fascinated sense, but a power overlying, underlying, pervading all things,—the mystery of beauty; not a mere quality of material, but an element of life; not a mere accident in physical nature, but a designed purpose of its existence. But here we are met by the Word of Wisdom which must be true, that "No man by searching can find out God." To answer or to explain this impediment we need but little of our own unaided wisdom to reply that "The philosopher cannot be found out by searching among the atoms of his body, nor the life and instinct of an animal by the keenest anatomy." An unwise man does not well consider this, and a fool will not understand it. But the Word of Wisdom is perfect, and has dispelled all difficulty and discouragement by answering thus:—"The spirit searches the deep things of God;" and it further adds, "We have received the spirit which is of God that we might know the things that are freely given to us of God, because they are spiritually discerned." Great powers of insight have been given to us, but they fail to reach that spiritual ideal, except on fixed conditions. The senses, reason, imagination, conscience, are the main elements of human perception; but each one is subject to those conditions. No one function of that great machinery can arrogate its own sufficiency when its gaze is turned to things divine. Imagination is indeed that faculty by which the soul ascends to the contemplation of the Divine nature, but for its health it needs the balance of the rest. So sense and reason alone must fail to reach it. They may suffice to treat of the phenomena of mind and matter; but they make a sorry and a crippled machine to trust the course and conduct of human life. The cold and narrow creed that some schools of thought and philosophy would thrust upon the world exacts a far more difficult acceptance than the wide and simple Gospel of God. The immortal soul is self-conscious. It is conscious, too, of universal life, and of its own place in it. It has been offered that Gospel of Death, and has refused it. It is satisfied with the knowledge of the fact of mystery, as that without which eternity would be an idle void. It listens to the echoes of a distant past. It has never let go the hand of God. It sees and hears His guiding spirit in the trial-sphere of human life. It knows His footsteps; it traces His light. All nature is His parable. But nature is the universe, a wide subject, and a large word to use. Nature has many meanings to men's minds. Nature is God's home and ours. How lovely is she! And yet men wrangle over her. Pride and faith would fight over her; but, thank God, how near does the love of her bring together the philosopher, the Christian, and the poet, heal all the wounds of prejudice and mistrust, turn all their enmity and contempt to brotherhood, and blend their rivalry in her adoring admiration! All subjects take their colour from men's minds. Things present themselves, and men's minds represent them. But then those things have passed through a great machine, through the sieve of an instant, analysing sense,—through stream and counter-stream of reason and imagination,—and they come out, like the hope of the human soul, unchanged, indeed, in individuality, but transformed, transfigured. So the influence of fine art upon thought and life depends greatly upon the tenor of the individual disposition, for some minds turn all poetry to prose, and some invest the simplest things with the halo of their own brightness. *Nihil ictigit quod non ornavit.* The spirit of universal life in nature points to immortality. Fine art embodies it, and translates its lovely parables to the world. She is the bearer of the lamp of that life to all who have eyes to see the divine beauty in her imagery and ears to hear the divine wisdom in her voice. But some are cold, some deaf and blind; and she casts her pearls before them in vain, for no art can draw music from the chord that Nature has not already tuned. If science and morality have their sermons in stones, religion has hers in forms of beauty. But, alas! it is not unreasonable to fear that the influence of fine art with the multitude goes no deeper than the eyes, and their value of it is rather for its furniture than its poetry. Regard plainly for one moment the effect of a great picture and sculpture gallery upon the multitude. What do they find? A vast array of pictures and statues; portraits and landscapes of all nationalities; here and there a scenic representation of a religious subject from one school, or an academic composition from another; then, more rarely, indeed, a gem of devotional expression; the rest are boats or battles, or domestic scenes most picturesque, or vice and revelry most offensive; and the sightseers disperse, delighted with their entertainment, exhilarated by its brightness, and confounded by its multiplicity. But pause one moment more. There were some who went lingering away; for there were those among that multitude, and possibly among the poorest and the meanest in the world's esteem,—men, women, and perhaps children too, on whom some lovely ray of thought had struck; and the aspirations of devotional expression, still breathing from the surface of some old canvas, as the poor artist had left them, with his last sigh, a legacy for the world, had found their kindred spirit and had struck home at last. These were they who possessed the chord that nature had already tuned. The music was in the lyre, and mute only till the musician's touch awakened it. But you have asked a serious question: "How can religious life and thought be affected by art?" I can only venture to reply thus:—Fine art is profoundly more a thing of spirit than of sense. To a soul penetrated with the love of God all things minister. To such a one, whether practically an artist or not, but at least contemplatively one, whose powers of natural insight have been cultivated and refined by all that it is art's sacred mission to teach,—to such a one nature has opened wide her great treasury of Divine life. She has spread before the eyes of his responsive spirit, in a vista of infinity, the mystery of Divine beauty. Unsolved, unsolvable! He gazes with adoration. The highest faculties of his nature,—of body, soul, and spirit,—in silence bow before it. Sense perceives, imagination portrays, reason accepts, conscience assures, with all the power of their blended testimony, that that inscrutable mystery of beauty is the mode in which it has pleased the blessed God to communicate to His creatures the perfection of His wisdom and His love. The sublime vision is beyond the range of mortal sight. The moral sense, the voice of the soul

within, has answered "Yes"; and the heart turns to its course in human life, the sphere of a short pilgrimage, fortified and content. The convictions which thought, study, and the experience of life had heaped together, stored, sorted, and purified in the great laboratory of memory, have been illuminated by a ray from the throne of immortality. Fear vanishes. Difficulties which tempt, infirmities which impede, are but the discipline of an existence conscious of its own infancy. The way of life lies out before. The light of Divine beauty has been shed upon it; and thus along the pathway of this mortal life, whether it be earthward or heavenward, the footsteps of the travellers are made light, and their hearts rejoiced with the blessings of assurance and of peace.

ART ABROAD.

Viscount Powerscourt, K.P., commenced his address, as President of the Art Section of the Dublin Congress, by some observations upon the Dutch school, and reviewed in succession the works of other of the principal Continental schools. He remarked that there were great and distinct schools of art in the capitals of the various states which now form the German Empire, and the many fine collections of works of the old masters in the cities of Germany exercised an influence on art-education all over the country which, with different local characteristics, made the race one of the most remarkable for the cultivation of artistic genius. Few people who visited the principal capitals were aware that there were in the Cassel Gallery something like thirty works of Rembrandt, including several landscapes by that great master, which were so very rare. He did not suppose that in all the collections of England altogether more than half a dozen landscapes by Rembrandt could be found. His lordship remarked, with regard to the subject of picture-cleaning, that it was a practice more honoured in the breach than in the observance, and when done required the greatest care and judgment. Very few understood it, and more pictures were destroyed by the practice than could be told. He had often been horrified by the irreparable damage done to pictures, because all the fine and delicate glazings put on by the artist were removed in the process of cleaning, and although the picture often looked wonderfully renovated, for a short time afterwards, by bright new varnish, the experienced eye would see at once a hardness and crudity in the colour denoting that the more delicate parts of the work had for ever disappeared. With reference to the French school, Lord Powerscourt pointed out that in France, under whatever rule happened to be in existence, art was systematically nursed and fostered, and made familiar to the people in a way which he did not think obtained, at least to the same extent anywhere else. In France there was, as part of the Government, the Ministry of Fine Arts, and although no doubt we had in England also our Science and Art Department, as a branch of Government, there were certain ways in which art was more directly encouraged in France than in any other country, including our own. There was a certainty, under conditions of merit, that a French artist must have proper recognition of his talents, and that not depending, as in this country, upon individual appreciation of any particular style or branch, but in the widest sense on a system of substantial reward by the State of the highest merit in painting and sculpture, of whatever kind, method, or even material it might consist. That was, in sculpture,—whether it were a figure or group in marble, bronze, terra cotta, or anything else,—if it only came up to the required standard; and, in the same way, in painting,—let it be an historical work, a study of the nude figure, or of animals, or still life,—the Government dealt with it, and gave the greatest spur to the efforts of the artist which could be, by not only distributing prizes, but by purchasing the finest works that were exhibited, and adding them to the national collections. This was, no doubt, done in England too, but it was mainly confined to the works of deceased artists, which there might, perhaps, be good reasons for, although they did not on this plan receive the stamp of national approval in their lifetimes in the way they did on the other side of the Channel. In France, whether there was a monarchy, an empire, or a republic, there was the Ministry of the Arts, and the united wisdom of the Council chose, independently of any consideration except merit, the works to which they awarded the palm in the annual exhibition. The prizes were always awarded, and if there was not sufficiently conspicuous merit, it did not at all follow that any picture must be purchased for the nation, so that the proceedings of the jury were kept pure, which would not be the case if they were always to purchase. In France, the effect of art upon the social life of the people is, continued Lord Powerscourt, much more apparent than in England. In this country you hardly ever hear among the artisan classes any remark bearing in any way upon their appreciation of anything of the kind; but in Paris it is quite remarkable how many of them there seem to be who know and feel a good deal about it. This is due to a great extent to the much greater freedom of access to public collections which there is there, as well as in other Continental countries, than here, and especially to the fact of the national museums as well as the *Salon* being freely open to the humblest on holidays, and especially on Sundays. It is really most interesting to see the Louvre or the Palace of Versailles on such occasions, crowded with *ouvriers* with their wives and families, examining with attention and intelligent interest the grand works of the old masters, or the contemporary paintings in the *Salon* or the Luxembourg. These days are certainly rather to be avoided by those who have leisure at other times, for the galleries are generally so full that it is impossible to obtain more than a glimpse of the pictures over the people's shoulders. All that access to the great works and examples of art must, and it is evident does, have a civilising and refining effect, which I hope we shall see carried out in a somewhat more liberal spirit soon in England. I have the strongest opinion that it must be better to make it possible for those who must perforce spend their whole week in some close warehouse or factory, perhaps amid the whirr of machinery or the monotonous employments to which so many must necessarily be condemned, to go into the spacious galleries such as exist in London and elsewhere, on these the only days when it is impossible for them to do so, and feast their eyes on the glowing canvases which are there displayed. There is the idea that it would entail a certain amount of extra Sunday work upon the officials and *employés* in the museums; but on the Continent they are generally not opened till after the hour of Divine service, and the officials have their Monday for rest, when the galleries are generally closed. We have tried this plan here in Dublin at the National Gallery, and the arrangement is found to work well. With regard to English art, his lordship said the work of the best British artists stands as high as any in the world, and in domesticity, and in touching and noble sentiment, it is probably unsurpassed; but there is very little, if any, of the system of the best painters having schools and pupils of their own, which was the case in Italy, Spain, Holland, or other countries in the great days, and is still the practice in France, Belgium, and elsewhere at the present time.

"WHAT IS THE INFLUENCE OF THE ANNUAL EXHIBITIONS OF CONTEMPORARY PICTURES AND SCULPTURE ON ART AND PUBLIC TASTE?"

In the Art Department of the Social Science Congress, Dublin,

Sir Thomas A. Jones, President of the Royal Hibernian Academy, read a paper on this subject, in which he said,—The field opened up by this inquiry is one of vast extent, and presents no small difficulties to an unprejudiced investigator. Until our civilisation is sufficiently advanced to admit art in the adornment of our churches, and our national and municipal buildings, we cannot hope to find a fitting field for the exercise of those higher powers of conception and execution which assuredly exist among us, and only require encouragement for their full development. The Corporation of Manchester is setting a noble example in this respect, which, it is hoped, other public bodies will imitate, but the success of which it would be premature to discuss. And here the utility of our annual exhibitions of contemporary art becomes apparent, as they afford the only means by which our artists can come as it were face to face with their public, and influence with that public might be possible if, regardless of past failures, they dared to oppose their insular prejudices, and by working for art, and art only, they aimed at turning the tide of our national tendencies. Did they even adopt a lower standard and, like the French artists of the day, struggle through years of labour and privation in the pursuit of fame, content to deny themselves the luxuries and even comforts of life if the laurels of the *Salon* eventually crown their brows, then, indeed, British art might occupy a nobler position among the nations. Unfortunately, our artists, with few exceptions, seem neither actuated by love of art nor desire for fame. Their object is to gain as much money as they can in the shortest time possible. Consequently they will not afford themselves time to thoroughly master the technique of any art in their eagerness to "make it pay," and having no higher aim they manufacture art such as it is, and that modern creation, the dealer, goes the round of their studios, and, like the buyers for commercial houses, selects the wares best suited to the taste of his customers. Brilliant exceptions there doubtless are, and some great artists among us labour to interest, and, at the same time elevate, the public taste; but the manufacturer carries the day, and even were the forms of ancient Greece linked with the colour of Veronese presented to our public, they would waken little sympathy among the masses who throng our exhibition galleries. So it comes that our figure-painters and sculptors are driven to the representation of familiar subjects, and it must be confessed their compositions, though sometimes puerile and conceited, are unstained by the grossness and vulgarity of the Dutch school of Teniers and Ostade, and often they invest them with pathos and intellectual interest. If, however, they stoop to adapt their creations to the public standard, there can be no doubt they have their reward, for in the annals of art, past or present, the enormous sums received by living British artists are unparalleled, and the present day may well be styled the golden age of art in England. Annual exhibitions, however, if they fail to influence the taste of the day, undoubtedly tend to increase it. Could the statistics of the last ten years be procured, and we could compare the number of exhibitions, the numbers attending them, and the amount of sales effected, there exists little doubt that 1881 would be found far in advance of 1871, and on such data it might reasonably be presumed that there must be a great increase in the number of individuals taking an interest in art, and necessarily possessing what we call taste. Instead of being confined to the capitals and a few leading cities, annual art exhibitions are now instituted in many provincial towns, and even in Dublin, within the last few years, two societies, the Irish Fine Art and the Dublin Amateurs, give annual exhibitions in addition to that of the Royal Hibernian Academy, and we are promised another Art Association, a distinctive feature in whose programme will be an annual loan collection of works of high artistic standard. Any attempt to disparage the talents of our living artists is here most emphatically disclaimed. Had they the support of either the State or that of public bodies and corporations, they would doubtless be able to meet, and fit themselves for, the requirements of the more exalted styles of art. Failing this support they must only adapt themselves to the prevailing taste of their public, and as landscape-painting comes within the range of its intellectual capacity, the landscape-painting of the present day is, consequently, far in advance of all previous efforts in both refinement of feeling and truth, and, it is presumed, will form the distinctive characteristic of nineteenth-century art in the estimation of the critics of future civilisations. On our public taste lies the blame of any shortcomings in our art; for, though with lavish hand it patronises what affords it satisfaction, no Minister would be allowed to hold office who proposed to allocate a portion of the funds for the decoration of our public buildings. South Kensington, no doubt, is amply supported by the State, but it must be borne in mind that its object is the improvement of our art-manufactures. It justifies that support, and, in the opinion of competent judges, has mainly contributed to the marvellous advance in art-manufacture and decorative taste within the last thirty years, and the hope may be expressed that, in time, its influence may re-act upon the higher branches, and bad art will seem incongruous amid surroundings marked by perfect taste and harmonious colouring. The question before us, it will be remembered, is,—"What is

the influence exercised by our annual exhibitions of art and public taste?" And it has been attempted to show their influence is little, if any, on art, and that, on the contrary, they are controlled by public taste. But public taste, in this instance, means the taste of the upper and middle classes, who can afford to pay for admission and purchase catalogues. The masses of the people to whom these exhibitions might prove a boon, and a powerful civilising agent, are as completely excluded as if their existence was ignored. We are amazed at the refined feeling shown in the manufactures of France and other Continental states; but we forget that in these countries all art-galleries and exhibitions are free to the artisan, the mechanic, and the labourer, on the only day of the week on which they can enjoy and profit by them.

With us the same puritanism that banishes art from our churches hermetically seals all places of rational amusement to the lower orders, while with glaring inconsistency it leaves the gin-palaces and public-houses open for their delectation. How much misery, how much crime, might be prevented were our picture galleries, our exhibitions, our museums, and our botanic gardens opened free to the public on Sundays between the hours of three and six in the afternoon! And in what way could this privilege interfere with the religious services of the day? The inconsistency of the hackneyed answer, that this would deprive the custodians of public galleries of their day of rest is apparent, when we never hesitate to employ our own servants, our cab-drivers, and our railway *employés* on that day. In this city, remote as it is from the great art centres, we are fortunate in being among the first to recognise this great want. The Royal Hibernian Academy has for years back opened its annual exhibitions, for six weeks in each season, at the nominal sum of one penny, between the hours of eight and ten in the evening. The council at the same time supply a cheap edition of the catalogue, and what are the results? Within the last ten years 241,668 persons of the humbler classes have availed themselves of this advantage, and the numbers attending show a steady increase from 18,776 in 1871 to 30,739 in the last year. The galleries can only accommodate 900 at a time, yet the arrangements never permit of overcrowding, thus answering the objection frequently urged against free admission. It is worthy of remark that during these ten years not the slightest injury has occurred to either pictures or frames; and another notable fact, and one of great significance is, that the workmen who pay one penny for admission buy catalogues far exceeding in relative proportion the number purchased by the day visitors at 1s.

Mr. Mark H. Judge read a paper by Mr. W. Cave Thomas, which contained the following passages:—

Mr. Cave Thomas thinks that the prevailing notions on the relation of the fine arts to society are so erroneous that we should derive instruction by glancing at that relation in the historic past. The supporters of the vulgar notion that art civilises could hardly maintain that any but the highest, the best, could effect this end; yet we know that civilisation advanced along a highway disfigured by hideous, crude, and imperfect art. To elevate the masses, to show how powerless even the best art was to civilise, he pointed out that the vast legacy of art-treasures which the Italian people had ever present to them, from the "decadence" until now, were utterly unable to arrest the intellectual, political, and social decline of Italy, much less to resuscitate her, or even to revive painting and sculpture. When it is asked, what is the influence of our annual art exhibitions? Mr. Thomas emphatically replies, to make English art more and more representative,—representative of the *bizarre* tastes of the many. English artists, whatever their original aspirations may have been, are obliged to bow to public taste. However much we may be disposed to rail at the Royal Academy, it is totally unable to change by its exhibitions the tastes of the people; there is a power outside of and stronger than the Academy,—the mighty public's will and pleasure, and of these its exhibitions are consequently and perforce the exponents. It is this will and pleasure, if we desire to elevate art, that we must endeavour to alter and to right. And this, it would appear to him, is only to be accomplished by one or other of the two following ways:—Either by making the public think more deeply and consistently, or by a highly-educated class or caste setting the right fashion in art. For right leading, a demand for the higher forms of art is more potential for good than all the precepts and art talk in the world. Painters themselves cannot be expected to paint high-class but unsaleable pictures; nevertheless, there are artists who would be but too pleased to respond to a State art policy, which should demand the illustration of historic incident, of religious and poetic themes. A policy of this kind is that of all others the best calculated to hasten a grand national art development. And yet such a policy is persistently opposed by men who cannot distinguish between an oil-painting and a fresco. The power of art to instruct is little, but the power of art to please and to entertain is great. Art exhibitions, therefore, afford innocent entertainment and recreation for the mind, as long as the art exhibited observes moral limitations. And it is upon these grounds that the Sunday Society wisely and justly demand the opening of our galleries and our museums on Sundays. It will, indeed, be a great day for England and for English art when its chief exhibitions shall be in its public buildings and its highways, for then art will have escaped from the trammels of capricious patronage, to devote its energies to a national purpose. Who shall initiate the movement to this end, the State or the aristocracy?

Sir Robert Stewart, who at this stage was called upon to take the chair, said, as far as he could make out, the views of all the essayists were much in harmony, except that Sir Thomas Jones's remarks had a more local application, he having looked at art from a home point of view, while the other gentlemen spoke of it from experience gained on the other side of the water.

AT HASTINGS AND ST. LEONARDS.

Visitors to Hastings and St. Leonards during the season which has just closed will have noticed how rapidly these favourite watering-places are expanding, and the building activity which is discernible in the locality at almost every point northwards of the parade, both on the east and west sides. A noticeable feature amongst the several buildings in course of erection is that many of them are of a public and institutional character. These include the

Gaiety Theatre and Opera House, in the Queen's-road, immediately opposite the recently-opened new Town-hall. On a portion of the site on which the theatre is being erected, the river "Bourne" is said formerly to have flowed. Including the Gaiety Restaurant, which forms a portion of the block, and which was opened for business about a month since, the building will have a handsome frontage to Queen's-road 74 ft. in length, and upwards of 60 ft. in height, being faced with red Fareham brick, and Portland cement windows and dressings. The elevation will contain three stories above the ground-floor, with fluted pilasters on the upper floors, the frontage being surmounted by a balustraded parapet, with a central pediment inclosing windows, which will light the gallery saloon of the theatre. The principal entrance to the theatre, in the centre of the Queen's-road frontage, will be 10 ft. in width, having on each side massive piers, and surmounted by a projecting archway and balustrade, the doorway being flanked on each side with polished granite columns and carved capitals. The ground-floor portion of the Queen's-road frontage of the buildings is intended to be let for shops and other business purposes, and the upper floors for offices, to which there will be a separate entrance, immediately on the south side of the entrance to the theatre. The building is carried to a depth of 122 ft. eastward from the Queen's-road, having a frontage on the north side, where will be the entrances to the pit and gallery, and also to the stage, scene dock, and dressing-rooms connected with the theatre. The main entrance in Queen's-road leads to the stalls, dress-circle, and also to the upper circle, by a concrete staircase. There will be three rows of stalls having accommodation for an audience of sixty. The dress-circle and six private boxes will seat 200 persons; the upper circle 250; four rows of pit stalls, 120; and the pit itself, 350. The two front rows in the gallery will form the amphitheatre, having accommodation for an audience of 120; whilst the gallery itself will hold 400 persons, the capacity of the theatre being thus equal to an audience of 1,500. There will be a spacious promenade behind the dress-circle, with ladies' retiring-rooms, and also refreshment saloons in connexion with every part of the theatre. In addition to the ordinary approaches to the upper circle and gallery, there will also be relief staircases for use when required. All the floors and the several staircases will be connected with each other, thus affording facility for entrance and exit. The box and gallery frontage will be of the horse-shoe form. The width of the proscenium will be 25 ft., its height 36 ft., and the depth of the stage 32 ft. Under the stage there will be a mezzanine floor 7 ft. 6 in. in depth, with a well beneath it also 7 ft. deep. The theatre will be illuminated chiefly by a sun-light in the ceiling, which will also serve for ventilation purposes. The architects are Messrs. Cross & Wells, of Havelock-road, Hastings; Mr. Phipps, of Mecklenburg-square, London, acting as consulting architect; and Mr. Bodda, of Western-road, St. Leonards, is the builder. The estimated cost of the theatre, which is expected to be ready for opening by Christmas, is 12,000*l*.

The Albert Temperance Hall and Coffee Palace.—Immediately on the north side of the theatre, with one of its frontages in Queen's-road, and another deep frontage running parallel with the side frontage of the theatre, a large and commanding new building, called the Albert Temperance Hotel, has just been erected by the Hastings and St. Leonards Coffee Palace and Hotel Company, Limited. The foundation-stone was laid by Canon Basil Wilberforce in July, 1880, as indicated by the inscription on the memorial-stone, and within the last week or two the building has been completed, and is now being finished preparatory to its opening for business in a few days. The hotel from its height forms a prominent architectural feature in the locality of Queen's-road, but the width of the frontage to that thoroughfare is limited to 20 ft., the principal elevation being the return-frontage, in the narrow thoroughfare leading to Wellington-square, which is 82 ft. long. The two frontages are each 60 ft. in height to the parapet, with a Mansard roof, rising to a height of 75 ft., and two towers at the east and west end respectively, 85 ft. high from the ground-line, and which are surmounted by an ornamental iron cresting. The building is faced with Portland cement, which now seems to be a favourite material in building at Hastings, in preference to stone, on which the saline atmosphere of the locality is said to have an injurious effect. The hotel contains five lofty rooms, in addition to the basement, in which is the kitchen, and other apartments in connexion with the culinary department. The principal entrance at the corner of Queen's-road leads into a first-class restaurant, whilst another entrance leads into a spacious *café*, on the coffee-palace principle. The manager's offices are also on the ground-floor. The first floor contains the general coffee-room,—an apartment of large dimensions,—together with a ladies' coffee-room, and several private sitting-rooms. The second floor also contains a number of private sitting-rooms, whilst the floors above are all devoted to bed-rooms. Messrs. Cross & Wells are also the architects of the hotel, and Mr. Alfred Womersley, of Hastings, is the builder.

The Approaches to the Baths on the Parade.—The tepid salt-water swimming-baths on the parade at Hastings, said to be the largest baths of the kind in the world, have been illustrated in the *Builder*. The spacious and ornamental approaches to these baths, which were in an unfinished state when the baths themselves were opened, have recently been completed, and now form one of the most striking structural features on the parade. The materials of which the approaches are formed consist chiefly of terra-cotta of varied colours and designs, supplied by Messrs. Doulton & Sons, of the Lambeth Potteries. There are two distinct and separate approaches, one to the ladies' and the other to the gentlemen's baths. The floor-level of the entrance to the baths is about 20 ft. below the level of the parade, the baths' floor being reached by flights of steps 12 ft. in width. On each side of the approach-steps at the parade-level are ornamental piers surmounted by vases, all in terra cotta, and similar piers and vases at the foot of the stairs. The floor-level below is laid with encaustic tiles, and the open space around the floor leading to the baths is arcaded in terra cotta, and ornamented with several medallion figure-heads. The approaches at the parade-level are inclosed by dwarf walls in terra cotta, surmounted by iron railing.

A New Hospital for Poor Children.—The locality of Hastings and St. Leonards appears

to be regarded as a favourite one for the erection of convalescent homes and other institutions of that character for the recruiting of health. Only a few months ago the Princess Louise formally opened a Convalescent Home for Hertfordshire, which has been erected at West Marina, St. Leonard's, from the designs of Mr. T. Chatfeild Clarke, and another building of a kindred character, close adjoining, is now almost finished and ready for occupation. This institution, which is designated a "Hospital for Poor Children," is a large and handsome building, which has been erected on a lofty eminence to the westward of St. Leonard's, close to the West Marina Station of the London, Brighton, and South-Coast Company. It commands an extensive view of the east and west coast, and the surrounding county, with Beachy Head and Eastbourne in the distance. The lower portion of the building is faced with red brick, whilst the upper parts are tile-faced and in diaper work. The architecture partakes of the Queen Anne style, the several elevations being surmounted by gables, and a high-pitched roof in red tiles. A peculiar feature of the building consists of a vaulted playground immediately under the superstructure, and from which there is a full view of the sea. The building stands within its own spacious grounds, which are now being ornamentally laid out prior to the opening of the institution, which will shortly take place.

Proposed Extension of the St. Leonard's Parade.—Within the last year or two works of a very substantial character have been carried out at St. Leonards in the construction of a strong sea wall, and the extension of the parade westward, the entire length of the parade from the east end at Hastings being now about two miles and a half. We understand that the extension of the parade still further westward in the direction of the locality known as Bopeep and Bexhill, is contemplated by the local authorities, building in the immediate neighbourhood being at present going forward in the erection of residences of a good character.

Enlargement of the Hastings New Park.—The new park, a short distance to the north-west of the parade at Hastings, is at the present time being considerably extended and ornamentally laid out in the direction of the suburban localities known as Bohemia, Silverhill, and Hollington, and Hastings is more especially extending towards these three several districts by the erection of large numbers of mansions and residences, the effect of which is practically to change the suburban character of the localities named, and to absorb them into Hastings itself.

DESTRUCTION OF AN ANCIENT HOUSE.

The well-known dealers in rare books, the Messrs. Jefferies, of Bristol, included in their premises the chief rooms of the ancient building formerly occupied by William Canynge, who found the money to build part of Redcliff Church in that city. Few antiquaries who visited Bristol to inspect the relics of the past which it contains failed to look in at Canynge Buildings. On Friday in last week, we regret to say, the premises occupied by Messrs. Jefferies, including these ancient remains, and the very valuable stock of books and MSS. belonging to the firm, were for the most part destroyed by fire. The loss is estimated at 25,000*l.*; but, in truth, no amount of money will represent it.

OBITUARY.

Mr. A. M. Rymer-Jones, C.E.—The death is announced of Mr. Alexander Manson Rymer-Jones, Assoc.-Memb. Inst. C.E., second son of the late Professor Rymer-Jones, F.R.S. He died on the 5th inst. at Valencia del Ventoso, Spain, of fever. He was thirty-six years of age. He invented the "Temnograph," an instrument for levelling automatically, which is fully described in the "Minutes of Proceedings," of the Institution of Civil Engineers, vol. lxi., p. 268 (1879-80, part 3).

"Proceedings at the Clerkenwell Vestry."—A statement under this heading, in a recent issue, was not quite correct. The gentleman elected as assistant in the Surveyor's office (Mr. P. J. Killick) *was* one of the six candidates chosen by the committee, but the committee's decision was reversed to the extent that in their list the successful candidate stood fourth or fifth in order.

PATENT RECORD.*

APPLICATIONS FOR LETTERS PATENT.

4,101. Baron de Liebhaber, Avallon, France. Cleaning, polishing, &c., buildings, and articles of marble, stone, &c. Sept. 23, 1881.

4,102. A. Bedborough, Westminster. Window sashes and frames. Sept. 23, 1881.

4,103. J. Hardinge, Westminster. Combined cramp, nail-driver, punch, and gauge for working flooring, &c. Sept. 23, 1881.

4,109. M. F. Rush, Alderagate. Curtain rollers. Sept. 23, 1881.

4,115. F. Dyer, Camden-town. Flood valves for drains. Sept. 23, 1881.

4 119. A. M. Ross, Edinburgh. Laths for Venetian blinds. Sept. 24, 1881.

4,136. W. Truswell, Sheffield. Heating by steam. Sept. 26, 1881.

4,151. W. P. Thompson, Holborn. Fireplaces and grates. (Com. by J. M. Cook, Cincinnati, U.S.A.) Sept. 27, 1881.

4,152. W. R. Lake, Southampton-buildings. Apparatus for heating dwelling-houses, &c. (Com. by B. R. Hawley, Chicago, U.S.A.) Sept. 27, 1881.

4,157. F. Hamilton and F. A. Hamilton, Leadenhall-street. Reflectors. Sept. 27, 1881.

4,177. G. E. Wolff, Hamburg. Smoke-consuming firegrates. Sept. 28, 1881.

4,185. F. H. F. Engel, Hamburg. Treating calcareous bricks. (Com. by J. A. A. Reuck, Wickendorf, Germany.) Sept. 28, 1881.

4,187. G. W. Wigner and R. H. Harland, Great Tower-street. Apparatus for heating water by gas for baths, &c. Sept. 29, 1881.

4,188. G. Hatton, Southport. Outside Spanish sun-blinds. Sept. 29, 1881.

4,191. G. J. Cox, Maidstone. Gas cooking and heating stoves, &c. Sept. 29, 1881.

4,204. H. Parson, Dulwich. Securing casements and doors when partially or entirely closed. Sept. 29, 1881.

4,212. P. Spence, Manchester. Purifying sewage. Sept. 29, 1881.

NOTICES TO PROCEED

have been given by the following applicants, on the dates named.

September 27, 1881.

2,342. F. Firth, J. Firth, and E. Firth, Dewsbury. Brickmaking machines. May 27, 1881.

2,422. W. R. Lake, Southampton-buildings. Fluid meter. (Com. by L. J. E. Jacqued, Paris.) June 1, 1881.

3,582. C. Winn, Birmingham. Water-waste preventers, &c. Aug. 17, 1881.

3 985. H. H. Lake, Southampton-buildings. Door knobs or handles. (Com. by C. C. Harrington, Newton, U.S.A.) Sept. 15, 1881.

September 30, 1881.

2,292. D. Nichols, Leeds. Laying gas, water, and other pipes, &c. May 25, 1881.

2,605. W. T. Sugg, Westminster. Sun-lights. June 15, 1881.

2,624. W. T. Sugg, Westminster. Gas cooking-stoves. June 16, 1881.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending October 1, 1881.

4,008. G. Jennings, Stangate. Steam apparatus for warming and ventilating houses, &c.

An apparatus similar to a tubular steam boiler is set on end, so that the tubes stand vertically. The lower ends of the tubes pass through the shell and open into an air-chamber which is supplied with the open air. The upper ends are above the top end plate, which forms a pan in which is water. This is heated by the hot air passing through the tubes and the steam thereby produced moistens the heated air. Steam is supplied to the interior of the shell which heats the tubes. Oct. 2, 1880. Price 6d.

475. P. Jensen, Chancery-lane. Apparatus for cleaning and rolling up carpets.

The carpet is fastened to a jointed endless belt which is passed round a series of rolls. Above the first roll is placed a brush. The carpet then passes under the beaters which are vibrating, and consist of elastic sticks or loops. These are raised by revolving cams and brought down again by springs. The dust falls into a drawer extending the whole length of the machine. The carpet then passes over a roller of a corrugated shape to open the back of the carpet, the dust from which is blown out by a centrifugal blower. Rotary brushes are used to clean the back of the upper web and the nap or outside of the carpet. After the cleaning, one end of the carpet is jammed into a slit in a spindle on the carriage and wound up thereon. (Com. by MM. Mayer, Langfildes, and Hammerschlag, Vienna.) Feb. 4, 1881. Price 6d.

644. G. E. Pritchett, Bishop's Stortford. Apparatus for heating, lighting, cooling, and ventilating.

This is a modification and improvement on Patent No. 1,613, of 1880, in doubling the plates formed of suitable shapes and also doubling the tubes. These may, however, be actuated and heated singly, and may be made portable if required. Feb. 16, 1881. Price 6d.

653. W. A. G. Schönheyder, Stoke Newington. Stoves for heating, lighting, and ventilating.

This relates to stoves for gas, oil, &c., and consists of a variety of improvements in details of construction, &c., which are described in fourteen pages of specification, and illustrated by sixteen figures in the drawings, but which are not capable of being condensed. Feb. 15, 1881. Price 1s. 2d.

700. H. B. Scott and H. V. R. Read, Westminster. Trough or multiple water-closets.

The trough under a number of closet-seats has one of its ends formed as a sloping weir, beyond which is the trap to the drain. The trough when in use is filled with water up to the level of the weir. At suitable times a volume of water is thrown into the trough from the end farthest from the weir. This flushing can conveniently be done by a syphon. Feb. 17, 1881. Price 4d.

702. G. Butler, Chiswick. Floor-cramps.

To the main strap is pivoted a fork from one end only, so that the fork partakes of an eccentric motion from the pivot when any back action of the main strap commences. The main strap is provided with slots, within which a ratchet, forming a cramping-bar, is free to move in one direction, under the action of a hand-lever and push-pawl, a stop-pawl being provided to hold the cramping-bar while the hand lever-pawl is moving back. The stop-pawl is furnished with a foot-plate that by a depression compels the stop-pawl to be released when the cramping has been effected, thereby releasing the fork from the joists. Feb. 18, 1881. Price 6d.

744. H. Skerrett, Sparkbrook. Door-chains or door-fastenings.

Instead of having a slotted cate fixed to the door for the necked stud of the free end of the chain to slide in, a stud is fitted on the door, and on the free end of the chain is a long link, slotted longitudinally, with a circular opening at the chain end of the link, for the passage of the head of the stud on the door. Feb. 21, 1881. Price 6d.

765. F. S. Willoughby, Stockport. Galleries or holders for gas and lamp globes and shades.

A spring bolt is used to secure the globe, &c., in the galleries, which slides in a hole or socket, and is pressed by a spring against the globe. (*Pro. Pro.*) Feb. 23, 1881. Price 2d.

769. H. Lecornu, Caen, France. Apparatus for cooking and heating.

Insulating boxes or hoods are made, and when the stove is properly heated, it is placed under one of these, and no more heat can escape, and the cooking goes on by itself. Feb. 23, 1881. Price 6d.

784. W. J. C. Joughin, Walthamstow. Automatic measuring cocks.

A turbine is fitted in the waterway beyond the cock, which shows the amount of water passing through. (*Pro. Pro.*) Feb. 24, 1881. Price 2d.

823. R. C. Cross, Dewsbury. Construction and glazing of windows and sashes.

The sash-bars are made in two parts, the outer part being a fixture, and the inner part being movable. The inside face of the outer part is rebated, and the glass being placed in position in the rebate, the inner part is secured over it by thumb-screws. The glass is, therefore, secured without the use of putty, &c. (*Pro. Pro.*) Feb. 26, 1881. Price 2d.

832. G. F. Phillips, Newgate-street. Fire-stove screen-frames.

On the feet are erected the upright pillars, which are hollow to receive bars, which can be moved up and down to fix the screens, secured to them at the desired heights. The base pillars have a transverse rod, to which also screws may be attached. (*Pro. Pro.*) Feb. 26, 1881. Price 2d.

849. J. H. Johnson, Lincoln's-inn-Fields. Bituminous cements and compositions for paving.

Coal-tar products being subject to oxidation by atmospheric air, the object of this invention is to oxidise them before they are laid for paving, &c., so that no deterioration afterwards may take place. The coal-tar products are subjected to a heat of say 300° Fahrenheit for twenty-four hours, during which all volatile oils are evaporated, and to effect more completely this oxidation, a small quantity of permanganic acid is also introduced. The heavy oils of petroleum may be treated in the same way, and brought to the condition of oxygenated bitumen. (Com. by E. J. De Smedt and W. J. Twining, Washington, U.S.A.). Feb. 28, 1881. Price 4d.

St. Pancras Industrial Exhibition.—The St. Pancras Industrial Exhibition was inaugurated at Tolmers-square Institute by the Lord Mayor, as president, on Saturday, the 8th inst. Messrs. H. M. Meech and M. A. Sweet, the honorary secretaries, explained the circumstances under which the Exhibition had originated, and the latter more especially pointed out the drawbacks which were experienced in obtaining new inventions from the industrious classes on account of want of proper protection by the operation of the existing patent laws. Mr. Sweet, with the consent of the Lord Mayor, moved the adoption of a petition to Parliament, which was carried unanimously, praying an amendment of the patent laws, by which the real inventor would have his invention protected at a small cost at the outset and an increasing fee year by year, which would improve the development of improvements in inventions consistent with justice to the inventor.

* Compiled by Hart & Co., patent agents, 28, New Bridge-street, E.C.

THE SCULPTURE FOR BLACKFRIARS BRIDGE.

Sculptors who submitted designs for the groups proposed to be placed on Blackfriars Bridge by the Corporation in reply to advertisement are beginning to inquire discontentedly what has become of their models. This is not to be wondered at, seeing that it must be nearly a year since the advertisements appeared.

M. Deputy Rudkin is reported to have stated, at the Court of Common Council, that Sir Frederick Leighton, "after a considerable delay," had said it would not be desirable for him to give his opinion upon the designs by himself; and that the committee had decided to ask Messrs. Woolner, Marshall, and Armitage to act.

Sir F. Leighton was mentioned in the conditions under which this competition was instituted, as having agreed to assist with his advice; and it is rather late in the day for him now to decline that responsibility. It is, moreover, scarcely courteous to the competing artists to have kept them waiting so long before discovering this. Doubtless, however, Sir Frederick could explain.

This competition is for the purpose of selecting the *design*; the selection of the *sculptors* after the general design is arranged, is to follow.

The question is really an architectural one, and we are disposed to think that an architect would be more likely to select the best design, and be less liable to be impressed by modelling, than a sculptor, who might consider technical excellence more than architectural fitness and suitability to position. If the design should fall into the hands of the ordinary sculptor, and "pretty groups" be placed upon the piers regardless of architectural effect, another fine opportunity will be thrown away. Verily, they do manage these things better in France, where there is a proper co-relation between the architect and the sculptor, with a resulting monumental effect, for which we here look in vain.

There should have been a public exhibition of the designs during all this time, and the consensus of criticism might have brought about a good selection.

THE ROYAL COMEDY THEATRE.

The new theatre which has been erected from the designs of Mr. Verity, architect, at the corner of Panton-street and Oxenden-street, Haymarket, is advertised to be opened to the public on this (Saturday) evening. So many changes, however, have been made already in respect of this undertaking that we will not speak positively. We gave a view of the exterior of the building in our last volume, together with some particulars,* but it was then called "The Alexandra Theatre," and must be looked for under that heading. At that time, too, it was proposed, as we stated, to illuminate the auditory by the electric light, but, in consequence of difficulties which made themselves obvious at the recent exhibition in France, the intention has been abandoned for the present.

The general contractors for the building are Messrs. Kirk & Randall, of Woolwich. Mr. Little-johns has fitted the stage with all the newest appliances. Messrs. Jackson & Sons have executed the carton-pierre enrichments. The fireproof floors are of Dennett & Ingle's patent construction. The upholstering and seating have been done by Messrs. Shoolbred, who have also decorated the saloon on the right of the entrance vestibule. The general decorations have been carried out by Mr. E. Bradwell, and the act-drop is by Messrs. Howell & James. Mr. H. N. Taylor was the architect's clerk of works.

St. Vedast's, Foster-lane.—A correspondent writes:—"Can any one tell how much longer this fine, substantial, and sacred edifice is to remain closed? It is now several months since the church has had any divine service performed in it. Perhaps the parochial authorities of the united parishes can inform your readers and Churchmen the reason why, and say when this church is again likely to be re-opened for service. If they cannot, the fault lies with the higher authorities. If the Bishop of London is waiting until the quaint little Church of St. Matthew, Friday-street, is taken down before the former is opened, he may find such a scheme break down, and I sincerely hope and trust it may."

* Vol. xl., pp. 762 and 773.

"A VICTORY OVER SEWER GAS."

Sir,—I have no intention of entering into any discussion on the subject of my letter, published on October 1, describing a "Victory over Sewer Gas," which must stand upon its own merits; and I have no intention to examine "disconnecting ventilating traps," or any kind of traps, which, I hold, give unreliable and uncertain protection against gas generated in sewers or soil-pipes. Such gas is heavier than the air, and should be expelled with certainty. And these are the last words I shall trouble you with on the subject, at least for the present.

Mr. Mineard is the proper person to defend his invention, and is prepared to do so. I merely wished to give my personal testimony, which goes for what it is worth.

Henry Cole.

Sir,—I am pleased to see the scheme of house-drainage fully illustrated and described by Sir Henry Cole, and more so as the general arrangement is, in its main features (less the heating chamber) similar to the double-check system introduced by myself many years since, and described in "An Architect's Letter," published by Messrs. Spon, a copy of which is in the library of the Royal Institute of British Architects, and also read in the Society of Arts rooms at the Sanitary Conference in May, 1879.

The double-check system consists of a drain under or round the dwelling-house, a pipe at the back of the house and a pipe at the front of the house, large, and both extending above the roof, having curved terminals, one pointing one way and one the other, and between the drain and the main sewer is fixed a double trap, having two separate water-seals, and a vent-pipe between them.

The system has been in operation in Bristol, Clifton, and neighbourhood many years, and there has not been one failure; and although I have often tested houses fitted upon this system, I always found a current of air passing through the drains and pipes; and, with my experience, I am decidedly of opinion that the heating-chamber is a mistake, for although, under the care of Sir Henry Cole, the gas would probably be kept burning and the burner in proper condition, with ninety-nine persons out of one hundred no care would be taken in the matter, the general public feeling no interest, the light would be put out, and the 50s. per year cost saved; or the light might accidentally go out, then what would be the result? Why, the double-check system would be in operation to an extent, air would pass down one pipe and up the other, and constantly reversing, a good deal depending upon the temperature of the back or front of the house; or when the closets were emptied, or storms on, to form plugs or pistons of water in the vertical pipes, air would then be forced toward the front of the house, and drawn into the pipes from the back; but in the case of a reverse action (or the air passing down one back pipe and up another), drain-air would pass up the back vertical pipes, under the gutters, and if the roofs were tiled, or laid with zinc, would pass under the eaves and into the roofs, through the ceilings and into the sleeping and other rooms, the single trap would absorb the sewer-gas and give it off the house-side, and make matters worse.

In my experience of more than thirty years in the profession I have found that when things about buildings require attention, they are seldom for any length of time attended to, and, therefore, every fitting should be self-acting. No lighting, no oiling, and no attention. There are other minor defects in the details of the described scheme, such as liability of syphonage, double-pipe inlet, single outlet, &c., which your readers will no doubt detect; but the facility given for sweeping the horizontal drain is a good feature.

I cannot agree that the scheme is a sure victory over sewer-gas. Henry Masters.

Sir,—As the person responsible both for plan of house-drains and also for the way in which the work has been carried out at 106, Philbeach-gardens, Sir Henry Cole has called my attention to Mr. Buchan's criticism in this week's *Builder*, as he thinks I am the party (if any) who should reply to same.

1. Mr. Buchan seems to have fallen into his own trap, as his note savours too much of shop and to be merely recommending his own trap; and as the particular trap used by me is no essential feature in the system, I am at liberty and should use the trap that is, in my opinion, best suited to my own requirements.

2. The quibble as to sewer-gas is unworthy of serious reply. I understand sewer-gas to be the gas generated by the decomposition of sewage matter, whether it occurs in the main drains or merely from the residue unavoidably left in traps, soil-pipes, and house-drains; and I have never heard of any sane builder, much less sanitary expert, who questioned the necessity of shutting off by a *good* trap the sewer-gas from main drains. While admitting that even the best traps could not, under all circumstances, be relied on, yet it is undoubtedly principally with the gases generated in the house system that we have to deal. I claim that in my plan not only are the gases generated in house system effectually removed, but that, in the event of leakage through trap from main drains, the gases passing the trap would rush with the warm current up the upcast-shaft instead of passing under or into the house.

3. Mr. Buchan says that if joints are defective, &c., the upcast shaft will draw its supply from the inlets nearest the heating-chamber. Of course it will; therefore we make it draw its *ordinary* supply down the soil-pipe from the top of the house; and as any water-closet, with valve opened after use, provides a nearer inlet, it accounts for the *down*-draught through the apparatus of water-closets.

As for the defective joints, &c., any defect from work scamped has nothing to do with my particular principle, but applies equally to all methods employed; but where (as in this case) it is open to every householder or member of a family to try for himself whether the system is in good working order or not, without sending for sanitarian or plumber, surely the risk from defective work is reduced to a minimum.

4. Mr. Buchan speaks of the enormous forces employed. It needs a Scot, excruciating on his political economy, to speak of "twa bawbees'" worth of gas used in twelve hours as *enormous*.

5. With respect to the plans. The plans inserted were plans of Sir Henry Cole's first house, and merely showed the application of my method to a house built on the same plan as the vast majority of London houses. In addition to that, the plans were not carefully got out for purposes of illustration, but merely an old office set that I had to clean up at the last moment, owing to the fact that a set of plans I had specially ordered did not reach me in time to send a more complete one.

6. I am most particular to trap all my wastes, baths, lavatories, housemaids' sinks, and butlers' pantries, using Beard & Dent's P traps, with brass screwed caps, and Antill's trap for scullery waste; so there I confess my draughtsman inaccurate.

7. The portion of drain from servants' w.c., about 12 ft., needs a ¾ inlet, which would give a slightly less current down the soil-pipe, or what would be preferable, treatment like the best w.c.'s, namely removal of trap and substitution of good valve-closet. Unfortunately we cannot always afford the very best appliances for servants' apartments.

8. Mr. Buchan says that putting in an apparatus for blowing off stinking air continuously is not a plan to be recommended: to which I reply,—that inasmuch as the whole of the air in soil-pipes, house-drains, and upcast is changed two or three times every minute, and any sewer-gas passing is brought in contact with the flames in the heating-chamber, which consumes anything of an offensive character, the air passing from our upcast is rendered considerably purer than it is by any other process.

As, Mr. Editor, I find (from the number of visitors calling to see the system working, as well as from letters I have received) there is a considerable amount of interest in the public mind on the subject, if you will grant me space in your valuable paper, I will prepare a short statement showing what I consider the defects in other systems, and what are the merits of my own. G. E. Mineard.

Competition: Hospital for Sick Children, Bristol.—Designs for the above were invited by advertisement in the local papers, and a number of architects responded. After consideration of the designs by the committee and medical staff, those prepared by Mr. Robert Curwin, of London and Liverpool, were adopted. The hospital is intended to accommodate seventy-seven patients.

THE WORD "NATURE" IN REFERENCE TO ART.

SIR,—It would seem desirable that some simple definition of the word "nature" should precede a discussion upon art-matters.

Two principal meanings have been very concisely expressed by John Stuart Mill:—"In one sense it means all the powers existing in either the outer or the inner world, and everything which takes place by means of those powers. In another sense it means not everything which happens, but only what takes place without the agency, or without the voluntary and intentional agency, of man. This distinction," he writes, "is far from exhausting the ambiguities of the word; but it is the key to most of those on which important consequences depend."

It is plainly evident that Mr. Colling, in his comparisons, regards nature in the latter sense, and, having explored one little corner of a boundless repository of natural forms or "physical facts," he simply and plainly states the fact that of all the forms known to him which are applicable to decorative art, those which are founded upon geometrical bases are the most pleasing and satisfactory.

The somewhat confused sentence to which you rightly take exception, and at the same time as clearly explain, would seem to be intended to emphasise the prevalence of geometrical forms in those "physical facts" which have been examined by him, and to suggest that further research would have an analogous result.

JAMES SMITH.

THE DAWSON MEMORIAL STATUE.

SIR,—Dissatisfaction continues to be expressed in Birmingham with the new Dawson statue, lately unveiled. The figure is the work of Mr. Woolner, R.A., for which he has been paid 1,200*l*. It is of marble, and represents the man in the act of addressing an audience, with his body resting on his left leg, and the right advanced, the fingers of the right hand placed in the palm of the left hand, which is open, and has the fingers bent backward very much,—unnaturally so. This particular position of the hands is one which George Dawson never assumed.

The drapery consists of a Tooa coat and trousers, both of which are very much too large for the figure, and are in consequence full of creases. The coat lies close over the vest unbuttoned. The head is very disappointing, his most intimate friends fail to recognise the lineaments.

A meeting of the subscribers is called for an early date next week, when it will be proposed to replace the present statue by another, and remove this to some less prominent position in a niche of the new Art Gallery or other suitable place, or to deal in some other manner with it.

The canopy covering the statue is as yet unfinished. It is so overladen with carving that what it lacks in dignity is made up for by crockets. OBSERVER.

BREEDING FEVER: MARYLEBONE.

At the Marylebone Police-court last week, the owner of Nos. 2 and 4 Charles-street, Lisson-grove, was summoned by the Marylebone Vestry for allowing nuisances to exist on those premises to the danger of health. Mr. W. E. Greenwell, solicitor to the Marylebone Vestry, prosecuted, and stated that fourteen cases of typhus fever had already occurred in the street named. The houses were constantly under the notice of the Vestry, and proceedings were being taken under Torrens's Act. The surveyor had examined No. 4, and found under the flooring of one of the rooms in the basement sewage matter to the depth of 6 in., and under the floor of the basement of No. 2 liquid sewage matter to the extent of 2 ft., due to defective sewerage. Though the two houses were reported by the medical officer of health to be unfit for habitation, they had several families in them, and persons were even living in the room adjoining that under which the sewage was found. Evidence having been given, Mr. Cooke made an order that the two houses be cleared of the occupants at once, and that the offensive matter be removed within a week.

A QUERY.

SIR,—I beg to direct the attention of our profession in England to the disinterested offer of Messrs. Deane & Sons of "their gratuitous professional services" to the Committee of the Exhibition of Irish Manufactures, as is reported in Saturday's Dublin papers, of which I enclose a cutting.

It may be that I am very ignorant of what is conducive to the dignity of the profession, and I would, therefore, feel obliged if some of your readers would enlighten me by answering the following queries:—1. Is it usual for English architects to offer unsolicited "their gratuitous professional services"? 2. Are any members of the above-mentioned firm Fellows or Associates of the R.I.B.A.?

AN IRISH ARCHITECT.

Smoke Abatement Exhibition.—In regard to the exhibition at South Kensington we are informed that it will be opened next month. A large number of exhibits are coming forward, not only from the chief London manufacturers of heating apparatus, but from Sheffield, Birmingham, Manchester, Liverpool, &c., a variety of improved heating and smoke-preventing appliances and smokeless fuels are offered for exhibition and practical testing by the Smoke Abatement Committee. There will be exhibits from foreign countries also.

Miscellanea.

The Telephone and the Stage.—At the Royal Dublin Society's *conversazione*, given in honour of the Social Science Association, a stream of visitors flowed towards the room where it was announced that they would hear by telephone Mr. Irving's and Miss Terry's performance of "The Cup" and "The Belle's Stratagem" in the Gaiety Theatre. Two wires had been laid from the theatre, in the interior of which some eighteen or twenty receivers had been placed. The auditorium at the Dublin Society House was furnished with eighteen pairs of ear-pieces. The strictest silence was enjoined and was observed as far as possible, although a slight rustling from the entrance and exit of the visitors could not be prevented. The effect obtained is extraordinary, and not easily described. According to *Freeman's Journal*, the ear perceived a miniature sound-picture of the voice of Irving, in which every inflection was as distinctly marked as the lights and shades in a photograph. It was not, however, possible to follow the words distinctly. Every now and then a word could be recognised, and no doubt a person who was familiar with the play,—or with any other play transmitted in like manner,—would be able to follow the words very much better than those not possessed of that advantage. The widely different tones of Miss Terry were also reproduced with singular distinctness. The sounds of the music were much more audible. Still, all was miniature. It was very much as if the speaking and the music were heard through a thick wooden partition. It must be borne in mind, however, that the arrangements requisite for the display subjected the telephone to a very severe test. The lapping of the wires by such a number of ear-pieces in the listening-chamber reduced the sound of each, and a further diminution of effect was caused by the subdued noise of the crowd in the house. The apparatus was supplied by Messrs. Prescott, and the telephones were lent by Mr. Arthur Porte, of the United Telephone Company.

The "Art and Mystery" of Sweeping Streets.—At a meeting of the City Commission of Sewers, on Tuesday, Mr. W. Braham, on behalf of the Streets Committee, asked for authority to appoint an assistant-superintendent of cleansing, &c., at a salary of 250*l*. a year. Mr. J. Cox thought any gentleman appointed at a salary of 250*l*. a year should receive his appointment from the Court. Mr. Deputy Rudkin said it was unsafe to delay this question, as the winter was approaching. They wanted some one in case the Superintendent should fail through ill-health. They proposed to give 250*l*. because they required a really capable man. If the selection was left with the Commission they would be inundated with candidates, and they would in all probability appoint the wrong man, because they would have no knowledge of his qualifications. Mr. Deputy Hora was in favour of the committee selecting three candidates. Mr. Innes thought the Commission might trust the committee in a matter of that kind. Mr. Gover supported this view. Mr. J. Cox was not aware that the art and mystery of sweeping streets required so much consideration. That argument would apply all round. They might want an assistant engineer, an assistant solicitor, or an assistant medical officer. This was a fresh appointment, and he moved as an amendment that several names should be submitted to the Commission for final decision. The amendment was put and lost, and the original motion, with the words added, "reporting the appointment for confirmation by this Court," was adopted.

Mount Stuart, Rothesay.—The heating and ventilation of Mount Stuart, now being erected for the Marquis of Bute, under the superintendence of Messrs. Anderson & Browne, architects, Edinburgh, has been entrusted to Mr. Wilson W. Phipson, engineer, London. The system selected for this important building is the forced introduction of fresh air previously warmed in distinct chambers, by an improved plan of hot water and steam combined.

The Turners' Company.—The works submitted in competition for prizes offered by the Worshipful Company of Turners, and now in the ball-room at the Mansion House, are superior, as a whole, to any previous collection sent in reply to the company's advertisements. The judges have been at work the last two days making their awards, and the prizes will be delivered by the Lord Mayor on this, Saturday morning, the 15th inst.

Unhealthy Property in Bishopsgate.—At the last meeting of the City Commission of Sewers, the clerk read a letter from the vestry clerk of St. Botolph, Bishopsgate, with resolution of vestry, calling attention to the present filthy condition of several houses in Windsor-street and Widegate-street. Mr. Clark (the inspector), in reply to questions, said the whole of the houses in Windsor-street and Widegate-street had been served with notices for the houses to be thoroughly cleaned and white-washed, and the drains had been attended to as recently as June. The inhabitants were a filthy lot of people. Mr. Boor asked if the medical officer had inspected the property within the last six months? The medical officer said he had seen it three times within the last six months, and the allegation of its being overcrowded was incorrect. There were fifty-five rooms and 164 inhabitants, 2·09 per cent. per room, which was not crowding in any sense of the word. These properties were generally washed over with hot lime, and the moment it dried he would defy any one to say whether it had been lime-whited or not. The behaviour of the inhabitants was simply that of savages. They did not seem to be at all bound by the common decencies of life, and he did not know that he was not libelling the savages to compare them with these people. Nothing could be more inhumanising than the atrocious habits of the inhabitants of Windsor-street and Widegate-street. The only thing was to clear the houses of the present tenants and make them decent habitations. The letter was referred to the Sanitary Committee.

Proposed New Fish Market at Liverpool.—Liverpool, like London, has its fish-market question. A special meeting of the Markets Committee of the Corporation was held on Tuesday last to consider the question of the site of the proposed new fish market. The committee had a long discussion on the resolution of the corporation instructing them to report as to the best site, the probable cost, and the probable returns obtainable from the new market. The acquisition of some premises in Great Charlotte-street and the extension of the present market there was advocated by one member of the committee, but the site known as Lucas's site was more favourably received. Both Mr. Vaughan and Mr. Miles expressed themselves strongly in favour of the Nash-grove site, which, it was said, would secure a concentration of the wholesale markets, and avoid a large outlay for the acquisition of a site. Considerable discussion took place in reference to these different sites, and it was eventually resolved, "That, having regard to the approaching close of the municipal year, it is recommended that the consideration of the subject of providing an extension of the wholesale fish market be deferred until the appointment of the new committee."

The Drainage of the Lower Thames Valley.—At a meeting of the Lower Thames Valley Main Sewerage Board, presided over by Sir T. J. Nelson, a letter was read from the Local Government Board acknowledging the receipt of a copy of a resolution passed by the Joint Board with regard to the terms upon which the West Kent Main Sewerage Board were willing to arrange for the discharge into their sewers of sewage from the Lower Thames Valley district, and stating that the Board much regretted to learn that the last proposals of the West Kent Board were such that the Joint Board had felt themselves unable to agree to them. It was stated by the Chairman that the time was very shortly coming when they would have sat there four years, and the only result they had to show for it was an unfortunate expenditure of a very large sum of money, which had absolutely resulted in nothing. Where does the blame rest?

The Macleod Gate Latch.—A gate-latch seems a small matter, but the result, on particular occasions, as between one that will act efficiently and one that will not, may be important. The Macleod latch is simple, durable, and can be opened easily on either side of the gate. One chief claim in its favour is that being fixed, not, as in the usual way, on the gate, but on the gate-post, whilst on the gate itself is the bolt, which is simply a straight iron rod, should the gate and post vary ever so much in their positions, as they constantly do by sinking or otherwise, the variation may at once be compensated, without cost or trouble, by raising or lowering this iron rod. Mr. William Kirkpatrick, of Walsall, has undertaken the manufacture.

What Worms Do.—The main purpose of Mr. Darwin's new book is to show that what is generally called "vegetable" mould is almost solely the work of worms, and is, therefore, more animal than vegetable. The *Times*, in an appreciatory review of the work, says,—They are constantly swallowing earth and tiny stones, and passing them through their bodies to the surface in a finely triturated and fertilised condition; in fact, they may be said to manure the earth inside their own bodies. By means of this process the entire earthy surface of a country is constantly in a state of change. The whole earth underneath our feet all over the world is swarming with worms; probably all over there are in every acre of land from 35,000 to 50,000 worms. Every one is familiar with the casts of worms, which themselves look like worms of earth. With so many worms at work, then, it is not difficult to imagine what will be the effect of a constant accumulation of such casts. In some cases, if spread over the ground, they would measure ¼ in. in depth per year, equal to 1 in. of earth brought up from below, passed through the bodies of worms, and deposited on the surface in five years. In one instance given by Mr. Darwin, 12 oz. of castings were thrown up in a year on a square foot, or 6·75 lb. on the square yard, equal to 14½ tons of so-called fertile "vegetable" mould over an acre in one year. Leaves, and stones, and lime, and other substance spread over a field, and left untouched, have been found in a very few years several inches below the surface, in a uniform layer. This, there can be no doubt, from the multitude of data supplied by Mr. Darwin, is all the work of worms. The millions of leaves and other vegetable matter dragged by the persevering creatures underneath the soil, whether passed through their bodies or not, form a splendid natural manure.

The Photographic Society's Exhibition.—The collection of works now on view in the Water-Colour Gallery, Pall Mall East, 582 in number, suggests at first sight to the ordinary visitor little advance over preceding exhibitions. Examination, however, shows that it has a special characteristic, that is, a collection of works instantaneously produced and never before equalled. The extreme sensitiveness of gelatine plates is now utilised completely by the adoption of instantaneous shutters, and we are told that a negative may actually be obtained in the 200th part of a second. In the gallery there is a frame of subjects by Mr. Henry Dixon, representing a number of athletes in various positions, running, jumping, and leaping, each figure being perfect in detail, and the outline as sharp and clean cut as an engraving. The outline of the falling athlete is not slurred in the least, but is absolutely clear, and every detail of costume and physiognomy is accurately delineated. Mr. J. T. Dixon has a frame of studies of animals by the same process, and these are enlarged without being retouched, coming out very clearly, and the lifelikeness of the animal is consequently assured. The small views, *carte de visite* size, would scarcely attract attention, but being enlarged every detail comes out in the perfect manner, and the result is little less than a marvel. Mr. William Bedford, Mr. Joseph Gale, Mr. T. G. Whaite, Mr. H. F. Robinson, and others have received medals for works of different kinds which they exhibit here. We advise a visit.

Enlargement of the Mint.—During the discussion before a Parliamentary committee last session the capabilities of the Mint to meet the additional requirements were strongly urged as a reason against the proposed removal to the Thames Embankment, provided an enlargement of the present premises were carried out, and additional machinery provided; and the Embankment site was decided against. In accordance with that decision the Government have purchased some surrounding property, and the extension of the establishment is to be proceeded with.—*City Press.*

Birmingham.—Messrs. Camm Brothers, of Smethwick, near Birmingham, have recently set up five stained glass windows in the church of St. Silas, Aston, near Birmingham. The subjects are: "The Charity of Dorcas," "The Good Samaritan," "St. John the Baptist," "Christ Feeding the Multitude," and "St. James."

Devonshire Hospital, Buxton.—The new extension buildings of the Devonshire Hospital and Buxton Bath Charity were opened on Tuesday last, by his Grace the Duke of Devonshire. We shall have more to say about them in a future number.

Unprotected Churches in East Anglia. Taking as his text our inquiry whether the Church of South Wootton, Norfolk,—recently seriously injured by lightning,—was provided with a conductor, Mr. E. P. Loftus Brock, in a letter to the *Times*, says that, as far as his experience goes, lightning conductors are all but conspicuous by their absence in East Anglia. He writes,—"During the Great Yarmouth Congress of the British Archæological Association, in 1879, I had occasion again and again to call attention, on visiting some of the beautiful churches included in our programme, to the fact that they were not provided with these ordinary means of safety. The money value of the buildings inspected and thus undefended I may moderately estimate at 200,000*l.*, while their antiquarian and historical interest could not, of course, be replaced by any monetary consideration." He urges that archdeacons or other ecclesiastical authorities might address themselves to the protection of these churches with good results.

R.C. Church of St. Joseph, Guildford.—The new R.C. Church of St. Joseph, Chertsey-street, Guildford, is to be opened on the 19th inst. by Cardinal Manning. The completed portion of the design will seat 200 adults. A side aisle and lady-chapel remain to be added hereafter. Messrs. Mitchell, Bros., of Stratford, near Guildford, have carried out the works, and the architect is Mr. E. Ingress Bell.

Lincoln Surveyorship.—At the meeting of the Lincoln Court of Sewers, last week, Mr. Thropp was unanimously elected surveyor to the court, in the room of the late Mr. J. S. Padley, whose death was recently announced in our columns. Mr. Thropp, as partner and deputy of the late surveyor, has done the work of the office for many years.

TENDERS

For additions and alterations to the Joint Counties Asylum, Abergavenny. Messrs. Giles & Gough, architects. Quantities by Mr C. H. Goode:—

Sanders, Southampton	£55,785	0	0
Trevena, Plymouth	54,950	0	0
Thomas, Watkins, & Jenkins, Swansea	50,600	0	0
Church, Bristol	49,849	0	0
Welsh, Hereford	49,301	0	0
Bowers, Hereford	49,000	0	0
Burton, Cardiff	48,980	0	0
Pattinson, Sleaford	47,600	0	0
Ashbee & Son, Gloucester	47,100	0	0
Everal, Malvern	47,000	0	0
Crowe, Hereford	46,500	0	0
Lovatt, Wolverhampton	45,541	0	0
Barnsley & Sons, Birmingham	44,400	0	0
Davies Cousins, Cardiff	44,000	0	0
Garlick, Birmingham	42,981	0	0
Horsman & Co., Wolverhampton (accepted)	42,000	0	0

For alterations, &c., to 118, 120, and 122, High-street, Clapham. Mr. Johnson, architect. Quantities by Messrs. Northcroft, Son, & Neighbour:—

Patman & Fotheringham	£2,059	0	0
Lawrie, Bros.	1,980	0	0
Hall	1,928	0	0
Earl & Son	1,833	0	0
Hobson	1,873	0	0
McLachlan & Sons	1,814	0	0
Maxwell	1,749	0	0
Mills	1,700	0	0
Sawyer	1,677	0	0
Lane & Son	1,634	0	0
Thorpe	1,549	0	0

For lodge and stables at Start's Hill, Orpington. Mr. G. St. Pierre Harris, architect. Quantities by Mr. C. Stanger:—

Haisman (accepted)	£391	0	0

For altering and converting nine private houses into shops, at Vicarage-lane, Stratford, for Mr. J. Wilton. Mr. W. P. Taylor, architect:—

E. Northwood (accepted)	£212	0	0

For the erection of foreman's house and offices adjoining, in Carpenter's-road, Stratford, for Messrs. J. Wilton & Sons. Mr. W. P. Taylor, architect:—

Norton & Son	£515	0	0
G. Hooking	497	0	0
North, Bros.	430	0	0
E. Northwood (accepted)	304	18	0

For the erection of a residence and stabling at Nutley, Sussex. Mr. R. Wheeler, architect:—
Candler (accepted).

For proposed villa to be erected in Lordship-lane, Dulwich, for Mr. J. Henderson. Mr. E. Peters, architect:—

B. Downs	£1,430	0	0
Ennor, Julian, & Co.	1,405	0	0
Pierse & Banyard	1,390	0	0
Gillett	1,385	0	0
Watson (accepted)	1,325	0	0

For alterations to Highbury House, South Norwood, for Mr. A. T. Grantham. Mr. E. Peters, architect:—
Hollidge (accepted).

For the repairs of sea-wall and construction of groynes and new outfall for the Commissioners of the Level of Teadring, Essex. Mr. W. Berrell, engineer. Quantities supplied by Messrs. R. L. Curtis & Sons:—

Hill & Co.	£9,632	0	0
Botterill	8,169	0	0
Chamberlain	7,473	0	0
Barnes	6,924	0	0
Harrison	6,850	0	0
Tyler	5,893	0	0
Saunders	5,840	0	0
James	5,801	0	0
Hunter	5,678	0	0
Maran	5,648	0	0
Walker (accepted)	5,132	0	0

For alterations and additions at No 39, Middle street, Brighton, for Mr. C. Catt. Mr. S. Denman, architect:—

Cheesman	£860	0	0
Parsons	802	10	0
Newnham	802	0	0
Patching	790	0	0
Dean	770	0	0
Garrett	755	0	0
Wright (accepted)	694	0	0

For three shops adjoining the Greyhound, Lea Bridge-road. Mr. Cotton, architect:—

Handley	£2,489	0	0
Hewlett	2,378	0	0
Tomms	2,245	0	0
Shurmur	2,187	0	0
Hayworth	2,049	0	0
Jackson & Todd	1,849	0	0
Edwards	1,480	0	0
W. Young	1,193	0	0

For the enlargement of the Penrose-street School, Walworth, by 700 places, for the School Board for London. Mr. E. R. Robson, architect:—

J. Marsland	£7,667	0	0
J. D. Hobson	7,455	0	0
E. Lawrance	7,400	0	0
B. E. Nightingale	7,393	0	0
Higgs & Hill	7,334	0	0
Stimpson & Co.	7,289	0	0
Kirk & Randall	7,189	0	0
W. Shepherd	6,959	0	0
S. J. Jerrard	6,925	0	0
C. Wall	6,920	0	0
W. Tongue*	6,877	0	0

* Recommended for acceptance.

For the enlargement of the school in Wood's-road, Peckham, by 600 places, for the School Board for London. Mr. E. R. Robson, architect:—

Kirk & Randall*	£4,513	0	0

* Recommended for acceptance. Based on the contract schedule of prices, this firm having erected the school.

For the erection of a school to provide accommodation for 800 children, in Melvin-road, Penge, for the School Board for London. Mr. E. R. Robson, architect:—

Higgs & Hill	£9,394	0	0
Atherton & Latta	9,284	0	0
W. Tongue	9,273	0	0
J. T. Chappell	9,256	0	0
J. Grover	9,185	0	0
Kirk & Randall	9,169	0	0
S. J. Jerrard*	9,143	0	0

* Recommended for acceptance.

For the erection of a school to provide accommodation for 800 children in Nynehead-street, Clifton-road, for the School Board for London. Mr. E. R. Robson, architect:—

Higgs & Hill	£9,890	0	0
Atherton & Latta	9,450	0	0

We are compelled to decline pointing out books and giving addresses.

Notice.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under ..... 4s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

Terms for series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under ..... 2s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

REPLIES TO ADVERTISEMENTS,
Addressed Box —, Office of "The Builder,"
Cannot be forwarded, but *must* in all cases be *called for*, and the Office Receipt produced.

THE CHARGE FOR A BOX IS AS UNDER :—
For "Situations Wanted" Advertisements ..... 3d. per Week.
For all other Advertisements ..... 6d. per Week

PREPAYMENT IS ABSOLUTELY NECESSARY.

**** Stamps *must* not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, King-street, Covent-garden, W.C. to
DOUGLAS FOURDRINIER, Publisher,
Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied *direct* from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum, *prepaid*. Remittances payable to DOUGLAS FOURDRINIER, Publisher, 46, Catherine-street, W.C.

Best Bath Stone.
WESTWOOD GROUND,
Box Ground, Combe Down,
Corsham Down,
And Farleigh Down.
RANDELL, SAUNDERS, & CO., Limited,
Corsham, Wilts. [Advt.

Box Ground Stone
Is the best for use in all exposed positions, being a well-known and tried weather stone.
50,000 feet cube in stock.
PICTOR & SONS,
Box, Wilts. [Advt.

Doulting Freestone and Ham Hill Stone of best quality, in blocks, or prepared ready for fixing. An inspection of the Doulting Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK, Norton-sub-Hamdon, Ilminster, Somerset. — Agent, Mr. E. WILLIAMS, 73, Charlotte-street, Portland-place, W. [Advt.

Doulting Stone and Ham Hill Stone, of best quality. Prices and Estimates, including delivery to any Station, on application to Staple & Hann, Quarrymen, Stoke-sub-Hamden, Ilminster. Agent, Mr. E. CRICKMAY, Langbourn-chambers, 17, Fenchurch-street, E.C. [Advt.

Asphalte.
Seyssel, Patent Metallic Lava, and White Asphaltes.
M. STODART & CO.
Office :
No. 90, Cannon-street, E.C. [Advt.

Asphalte.—The Seyssel and Metallic Lava Asphalte Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms, granaries, tun-rooms, and terraces. [Advt.

*Yriarte's "Florence."**

LORENTINE architecture presents a singular blending of different elements and of different kinds of interest. Most of the principal architectural monuments of Florence seem to form more or less examples of the fusion, or of the employment simultaneously, of elements belonging to both Classic and Gothic architecture. But this dual character is exhibited in the city at large, to some extent, as well as in individual buildings. If we compare the Palazzo Vecchio and the Campanile, for example, which are two of the most typical, as well as most important, structures in the city, they seem like architecture from two different quarters of the earth. No one on the mere inspection of drawings of the two buildings, would imagine that they were separated only by somewhere about 300 yards in space, and by about thirty years or so in time. Indeed, there is even a very close artistic connexion with them, since the Palazzo is attributed to Arnolfo di Lapo, the architect of the Duomo, which latter gave at least the key for the style of the Campanile. The two buildings are a kind of contradiction to the position maintained by so many of the Gothic revival architects in this country, that there could not be one style of architecture for one thing and another style for another thing; a Gothic which should be a church style, and not a domestic style. The architect of the Palazzo and the Duomo, at any rate, had two distinct styles, and worked both of them with a considerable measure of success, though the designer of the Campanile cut him out in the more ornate cathedral style, and threw the cathedral into the shade. But the Palazzo Vecchio is a grim memorial of the state of turmoil from which the Florence of the Medici and of the great Florentine period of art emerged. It is a building, externally at least, for grim use, for defence and retreat; its lower story is nearly solid, pierced only with small grated windows; its upper story overhangs portentously over huge machicolations, and even sterner effect is produced by the tower rising from the line of the machicolated story, and overhanging the lower part of the building. Hardly any building could be named which is more historically significant than the Palazzo Vecchio. Standing in the midst of the city which is the Athens of the modern epoch of the world, and which is full of artistic beauties of every kind, and was the headquarters of the refined and cultured dilettantism of the Renaissance, this stern pile of building seems like an ominous record of the fiercer times which preceded the development of Florentine art. The internal architecture of the palace has much refinement and beauty, such as might well go with the same age which created the Duomo and its Campanile; but externally it is a building emphatically denying all sympathy with culture or with the train of associations for ever interwoven with the name of Florence.

The contrast between this stone fortress and the architecture of the Campanile is the most marked that there could be. The fortress represents that quality of Gothic architecture which has been regarded by some Gothic revivalists as representing the essential characteristics of Gothic architecture,—that which almost ignores all decoration except such as arises out of the construction. It has much of that character which Ruskin has happily designated "wolfish," and which some architects, following in the steps of his teaching, have endeavoured to realise in the erection of buildings for modern purposes with the aspect of feudal castles. The Campanile is the frank reverse of all this. It must be classed as Gothic, but it wants nearly all the elements most essentially characteristic of true Gothic architecture. There are no massive buttresses, no bold display of construction; the one feature that is in unison with true Gothic feeling in it is the bold machicolation of the cornice,—bold in scale and proportion, though treated with very delicate ornament in detail. For the rest, the Campanile is almost like goldsmiths' Gothic, as one might say. It wants one of the most necessary elements in architectural design which nearly all Italian towers want, that spreading at the base which is so essential to give the appearance of monumental stability. It is, moreover, entirely an architectural facing, not a real piece of building; a recollection which must always be an annoyance in our contemplation of it. But yet there is no question that the Campanile fascinates, and has fascinated, all who have looked at it. Even those who condemn it on stern grounds of architectural truthfulness do so lovingly, and as if they could not escape the charm of it. And the secret of this is, that in spite of the objection we naturally feel to a merely veneered architecture, there is in the Campanile the display of a highly-refined artistic taste and organisation. It is not in a perfectly pure and homogeneous style, it does not represent the best and most solid manner of building; but it is a design in which every portion is accurately balanced and proportioned to the whole, and in which we see the application of classical refinement and finish applied to what in the main are Gothic details. The lesson of the Campanile in this respect is a very important one. It shows that, in spite of the inherent architectural weaknesses of style and construction which it exhibits, this carefully-considered refinement and proportion of parts will have a lasting effect in compelling admiration for the total result,—that the aim after the forcibly picturesque, in an unsystematically designed building, may be often a delusion, leading the designer away from the qualities in architecture which will most strongly assert their pre-eminence in the long run. In short, the Campanile is a *design*, not a mere *pile*; and architecture, as pursued by men of cultivated tastes, should have that quality. Among recent modern Gothic architects in this country there is a taste for piling, and it is singular that those who will express high admiration for the refined and studied design of the Florence Campanile will themselves illustrate a totally opposite theory in their own buildings by putting up towers and other masses of building in a way that suggests no study except how to avoid the appearance of study. Such buildings will please as long as the forced taste for irregular piling lasts; but when it passes off, as every forced taste of the kind is sure to do sooner or later, there will be little left to command the admiration of future generations. The defects of the Campanile design, in addition to that inherent defect of want of solid construction, are that the tracery is rather clumsily treated in detail (but this is only apparent on a very close examination), that the twisted columns springing from projecting brackets are not truly architectural in their relation to the whole, and look rather too much as if affixed for the purpose of ornament, and that the tower has never received its completion. Of this latter fact few of those who admire it are aware; though we have found a rather general consensus of opinion among amateurs that it "looks unfinished." Considering how almost universal is the completion of the straight-lined Italian Campanile with a lantern and spirelet, it is astonishing how blind even architects seem to be to this incomplete state of the Campanile, even supposing that they are unacquainted with its history. M. Yriarte alludes to the fact, mentioning that Giotto had intended to terminate the square by a pyramid, as in the Campanile of St. Mark, at Venice, but that his successor Taddeo Gaddi had suppressed that addition. It may be observed that there is a certain doubtfulness as to the actual authorship of the design, some of the most learned Italian students of architectural or of Florentine history regarding Giotto's connexion with it as a myth; but they none of them express any doubt as to the fact that it was not intended to have its present abrupt termination. In fact, the carrying over of heavy machicolation with nothing further is a device proper rather to military towers than to such a piece of purely decorative architecture as this. It

* Florence. L'Histoire—Les Médicis—Les Humanistes—Les Lettres—Les Arts. Orné de 500 Gravures et Planches. Deuxième Edition. Par Charles Yriarte. Paris: J. Rothschild, 13, Rue des Saints-Pères. 1881.—See p. 475, *ante*.

may be doubted, however, whether a heavy pyramidal roof like that at Venice would not rather overweight the delicate design of the substructure, so different from the nearly solid mass of the Venetian tower.

The Duomo itself does not stand nearly so well, as an architectural design, as the Campanile. In the portion of the church which was designed by Arnolfo di Lapo, previously to the Campanile, the faults of the style, its flatness and constructive weakness of effect, are much more apparent, both proportionately to the mass and absolutely; for the Campanile shows considerably more relief of surface than the immense mass of the cathedral walls. The Campanile is the work of a man of superior genius (whether it were Giotto or not), improving upon the details of the church. The illustration we give from the exterior of the church* is one given by our author more for sculptural than for architectural reasons, to illustrate the sculpture in the tympanum, "La Madonna della Cintola," which M. Yriarte ascribes to the hand of Jacopo della Quercia; resting, as far as we gather, entirely on the evidence of the style of the work itself, in the absence, as he says, of any document affirming other authorship. It has been traditionally assigned to Nanni di Banco. We may be allowed to feel sceptical as to conclusions based in such a case on merely internal evidence, and it would hardly be worth while either to concede or to contest the point. The illustration serves, however, to draw attention to some of the points in the architectural detail; the rich treatment of the archivolt of the doorway, which in its succession of well-marked and bold mouldings is in curious contrast with the exceedingly flat and even tame treatment of other portions of the detail; the very Classic character of most of the foliage decoration, especially the running scroll-work in one of the broader members of the archivolt, so different from anything that is found in Gothic buildings anywhere but in Italy; and the bad and rather trumpery taste of some of the inlaid ornaments, especially the absurd ornament of the wide band running round the sculpture panel in the tympanum: this, fortunately, is too subordinate to injure the total effect, but it is an example of the lapses of taste which are found in the detail of the Duomo, and in a lesser degree in some of that of the Campanile. For the dome, M. Yriarte expresses a greater degree of admiration than we are able to allow. He says of it, "*Elle dépasse en audace et en harmonie tous les monuments de l'art moderne.*" The great claim of Brunelleschi to admiration is in his thoroughly workmanlike way of building; he alone of those who wished to construct it knew what he was about; it is an eminently well-built dome, and has additional interest in the fact that it is an almost solitary instance of the application of the dome on a large scale to what may, on the whole, be regarded as a Gothic building. But as a piece of design it cannot be so highly praised; the base of the dome is weakly treated, and the lantern is a poor design in itself, and is clumsily joined on to the apex of the dome. The shade of Brunelleschi must rest content with engineering rather than architectural honours.

In commenting on San Miniato, M. Yriarte observes that the constant use of an inlay of coloured marbles, so prevalent in Florence, arose naturally out of the usual tendency of the builders of whatever neighbourhood to make use of the materials readily available in that neighbourhood. The environs of Florence were rich in coloured marbles of different kinds, and hence the temptation, when prosperous times and days of high culture set in, to make use of such materials largely in order to produce a rich and sumptuous effect. It would perhaps be unreasonable to complain of an exaggerated use of a special material when it has resulted in the creation of almost a special class of architectural design peculiar to the Florentine district; otherwise we might say that the Florentine architects would have produced a more monumental and more strictly architectural effect if they had restricted their use of these marble inlays to the less constructively important portions of their buildings, marking the construction by plainer and more massive materials. The front of San Miniato is, of course, entirely altered from its original form by this addition of incrustations in a later day; the old basilica, in fact, underwent successive changes in the course of generations as one artist after another brought his contribution to it. As M. Yriarte says, happily this was in the great age of Florentine art, and the basilica could hardly but benefit by any additions made to it in such an age; but it may be questioned for all that whether the variegated panelling of the façade does not rather clash with the simple outlines of the old building. In Santa Croce, another of the works of Arnolfo di Lapo, and in style a simpler edition of the style of the Duomo, the treatment of the front is remarkably satisfactory and harmonious, but there is all the difference between a building designed from the first in this style, and a building of an older date and simpler style, to which the polychromatic decoration has been added. Byron has familiarised every reader with a portion of the peculiar claims to interest possessed by this church,—

> "In Santa Croce's holy precincts lie
> Ashes which make it holier";

those namely of Michelangelo, Galileo, Machiavelli, and Alfieri; the tomb of the latter was the work of Canova. When Byron wrote, Dante had no monument in "ungrateful Florence," a fact which inspired the poet with two of the best stanzas of "Childe Harold," but his monument is now among those of Santa Croce, by the sculptor Étienne Ricci. M. Yriarte remarks in a melancholy tone on the inferiority of these two modern monuments to the older ones. "Comparing them to the monuments of the fifteenth century and those of the Renaissance, of which Florence possesses such prodigious examples, these tombs are of an inferiority so marked that '*on fait un retour sur soi-même*,' in asking how it is that the source of genius can have been thus drained so as to dry up so green and verdant a tree as that which had flourished in the Tuscan soil. It is not only at Florence that one experiences this feeling; at Venice already, in the marvellous church of Santa Maria Gloriosa dei Frari, when we see, by the side of the tombs of the Doges and Condottieri of the fifteenth century, the miserable monument on which the great name of Titian is inscribed on a singular pyramid of marble, we cannot refrain from some sad reflections. There is evidently a fatal law to which humanity has to submit; genius is born, grows, develops itself, and covers the whole earth with its shadow; then, little by little, the sap recedes from the growing trunk; the tree produces fruits less savoury, flowers less beautiful, the branches finally wither and the tree is dead." A remark which falls in curiously with one at the close of a paper on art, printed in our last number. M. Yriarte might have added that it is useless to devise mechanical means for propping up the tree when it is dead.

Another phase of Florentine architecture is illustrated in what is in some respects one of the most remarkable bits of architecture in the city, the Loggia dei Lanzi, the design of which is ascribed to Orgagna. The peculiar interest of this arcaded space (apart from the works of art which are placed under its shelter), lies in its singular combination of Gothic and Classic feeling. The grouping of the pilasters which combine to form each pier is a feature essentially Gothic; the treatment of the arches in receding faces is also Gothic, but the arches are circular, and the general effect of the arcade is certainly Classic rather than Gothic. It combines in a rare degree lightness and grace with sufficient massiveness. Then the cornice terminates in an open balustrade distinctly and completely Gothic in character, and carried on trefoil Gothic arches, but these trefoil arches spring from a row of Classic cantilevers. The combination is one of the most peculiar in architecture, the more so from the double form in which it occurs; in the lower portion a fusion of Gothic and Classic elements is seen, Classic forms being used in a Gothic manner; in the upper portion pure Classic and pure Gothic details are used in juxtaposition. This finish certainly clashes with the lower portion, and looks as if designed by a different hand.

We remarked on the extraordinary contrast between the style of the Palazzo Vecchio and that of the Campanile, and the reminiscence of the turbulent times of Florence which survived in the stern walls of the former. But this contrast in Florentine architecture reappears when we come to the rise, in the Renaissance period, of that style of palatial architecture which is so marked an element in Florence, and which has exercised so strong an influence on modern architecture of the same class in other countries. If we take such a building as the Riccardi Palace, we find here an architectural style quite different in expression from the stern and grim style of the Old Palace, but also as completely opposed as possible to the delicate but superficially constructed architecture of which the Campanile is the finest type. Here there is no veneering, but the most solid and massive construction; very little ornament, the effect being chiefly produced by the disposition and the simple decorative treatment of the windows, by the use of a stronger rustication in the lower story of the masonry, and by a powerfully proportioned horizontal cornice which dominates the whole. In this particular example, the Riccardi, there does seem to be a certain degree of the same influence which gave expression to the architecture of the Old Palace; for the basement story of the Riccardi retains some of that fortress-like aspect which naturally arises in habitations built in turbulent times. The lower story seems adapted for defence, the upper stories for habitation. This distinctive treatment of the lower story becomes less marked in others of these Florentine palaces; in the Rucellai and Guadagni palaces the plain and massive treatment of the lower story is retained, with small and insignificant windows, but with a much less fortress-like aspect than in the Riccardi; in the Pitti Palace this distinction of the lower story is not observed at all, and the general character is the same throughout. The larger of these palatial structures are notable examples of the effect that may be produced in architecture by exceedingly simple and broadly treated masses of building, well proportioned, and, to a certain extent, varied in their different stories, and built in the most massive and monumental manner. It is in this latter fact that great part of their effect resides. There is nothing little or scamped about them; they are built as if to last for centuries. In this respect they afford as marked a lesson in one way as the Campanile affords in another way. The latter shows what can be done by great delicacy and profusion of detail, carried out with great finish and refinement. The palaces are examples of the effect to be obtained by solid, massive, honest building, reticent in regard to decoration, and designed in a manner perfectly dignified and unpretentious, and precisely in accordance with the object for which they were built, to provide city dwelling-houses on a grand scale.

We cannot, however, pursue the subject farther in detail. In reference to the second of the two illustrations we are enabled to give this week,* we may observe that it also, like the other, is taken from the portion of M. Yriarte's book which is devoted to Florentine sculpture, representing, as it does, a feature which is decorated with one of the best and most characteristic designs of Donatello, the sculptured groups of children in the panels. These groups are given in an enlarged form on another page of the book. The interest of the illustration showing the whole design is, however, rather architectural than sculptural, as it is an exceedingly good example of a class of objects common in Italian churches. This particular example is included in M. Yriarte's work as among specimens of sculpture by Florentine artists; it is not in Florence, but is built out of the south-west angle of the cathedral of the small town of Prato, about eleven miles from Florence. It was built for the periodical exhibition of a celebrated relic, the sacred girdle of the Virgin, and hence it was considered a worthy object for the exercise of the great Florentine sculptor's genius in supplying the carved panels. On the picturesque design of the pulpit as a whole it is unnecessary to dilate. We may observe that here again is the admixture of Gothic with Classic feeling so peculiarly characteristic of Florence and its neighbourhood; the thick angle column carrying the umbrella-like canopy is decidedly a Gothic feature; but the lower portion is decorated with miniature pilasters, and carried by Classic cantilevers.

In addition to the numerous engravings of buildings, pictures, statues, and portraits, the book is farther beautified by the reproduction, in fac-simile, of a number of Florentine book ornaments, which surround the titles of the various chapters, and are exceedingly characteristic and beautiful specimens of Florentine taste in these minor forms of adornment. The illustrative department of the book is throughout excellent, and carried out on a most liberal scale, the whole making a beautiful and sump-

tuous volume on one of the greatest and most fascinating periods of artistic history, and such as will be a valuable, and indeed almost essential, addition to every good library.*

EFFECTS OF LIGHT ON STAINED WINDOWS AND ON SCULPTURE.

Sir,—Happening to be in London on the 8th inst., when, as you may remember, an extraordinary darkness occurred in the morning, which spread over many miles of country, and which in some places,—the neighbourhood of Sydenham, for instance,—required the lamps to be lighted, one or two effects of light occurred to my observation, which, perhaps, you may think worthy of putting on record.

The first of these was at Westminster Abbey. Finding, in spite of a thirty miles' run to town, that I was too early for a person I wished to see at Westminster, I economised the time by a visit to the Abbey. The morning service was going on, the candles in the choir being lighted, as at evensong in winter. When a glorious burst of music from the organ had signalised the close of the service, and the departure of the clergy from the choir, I walked round the familiar and venerated aisles. But I was in a new region, or rather was transported back in time by five or six centuries. It was not at first apparent to what this effect was due,—and you will allow that the explanation is not only interesting, but comforting. I am not sure how far you agree with those *laudatores temporis acti*, who have been heard to express a wish to fill their pockets with pebbles, and discharge the contents at the rose-windows of the transept. I confess to having entertained a wish so to do myself. But no such wish crossed the mind on that gloomy day. The effect of the low atmospheric illumination on the windows was like that effected by age. So much less light than usual was transmitted, that what actually reached the eye had that "dim religious" tone in which many of us think that these windows are deficient. The north transept window, especially, looked like rich antique glass, and the small lights below it looked like the very earliest window jewelry. The memorial windows to our three great engineers,—Stephenson, Brunel, and Lock,—were remarkably rich in their effect, casting a sort of glow-worm lustre, so that they appeared rather as something visible by their own light than as sources of evident illumination for the interior. The effect of the whole was wonderfully fine. Not only so, it leads to the hope that when the London atmosphere shall have anticipated the chemical action of centuries in roughening and dirtying the external surface of the glass, the windows of the Abbey will have lost any approach to what may be called either tawdriness or glare, and the glass-workers of 1880 will be promoted to a higher place among the fathers of the art than criticism has yet accorded to them.

The other experience was at South Kensington. How far it may be due to the darkness of the day, and how far to the vertical lighting of the lofty hall to which "David" and other large pieces of sculpture have been removed from the north court, I cannot say; but I confess that I was startled by a legacy of recently departed genius. You know, sir, that if I have a passion for anything, it is for noble sculpture; that I have sculptor's blood in my veins, and that the chisel is not unfamiliar to my hand. And my study and criticisms of the art have not led me to put John of Bologna or Benvenuto Cellini on the same level as Pyrgoteles, or Polycletus as high in the scale as Phidias. But when in that light, not very bright, but skilfully cast down, I looked on two groups by Alfred Stevens which I had *not* altogether admired at St. Paul's, a kind of awe came upon me. "The mantle of the Florentine," I said half aloud, "has been cast on the shoulders of Stevens." There is a little of the rich delicate grace of John of Bologna, there is a trace of the elaborate elegance of the "Eloquence" of the Argyle monument; but there is the breath of Michelangelo in these groups. They were two,—casts of the original models,—for the tomb of the Duke of Wellington: "Courage and Cowardice," and "Truth and Falsehood." I had never quite understood how it was that I had not admired them more in St. Paul's. The modelling is undeniably fine, the design masterly, the action energetic, but not overstrained. I had also, I think in your pages, made complaint of the villainous lighting of the whole composition, as crammed into a sort of cell in which there was no room for the artist to turn himself round. But I had not before put two and two together, nor duly realised how the noble genius of Stevens had been stifled and smothered,—at least as to the effect produced by its children,—by the usual foe and victor of the sculptor, bad illumination. I went a step further. I thought, what will the editor of the *Builder* say if I express the opinion that these figures of Stevens, if lighted in the same way, need not blush to find themselves side by side with the creations of Michelangelo? And lo! as I pondered, stood before me the awful forms that watch over the Medicean tombs. In the corner of the large hall were two packing-cases, the front or lid of each of which had been removed, and the figures within,—casts of the two chief figures on the tombs,—with a back-ground of straw and packing, received a light even more restricted in its direct incidence than that which fell on the groups of the English sculptor. The shadowy awe, of which Byron has so well spoken, that broods beneath the helmet of the pensive seated figure, seemed as if spirit dwelt within the form. It was impossible for these two masterpieces of Michelangelo to be seen under a more impressive and well-adapted light than that which thus casually fell upon them. I gazed at them with reverence. But I did not retract my opinion as to the kinship of the genius of Alfred Stevens.

Let me ask you, and ask all those who love art for the sake of art, and who seek to master her hidden secrets, not for the sake of criticism, but for that of instruction, to give more careful heed to this question of illumination. The sculptor is a fellow-worker with the sun. Take away the light, and where is the form? Concentrate the light in as small a pencil as possible; direct it from above, and treat it by shadowy projections,—the wings of Medusa, the cap of Hermes, the helmet of Mars,—and you have a closer approach to life than painting can render. Ay, and to an imaginative, spiritual life, nobler than that of the busy world around. Put the same figure in an open square, or in a room with ordinary windows, and you have—a piece of stone-cutting. Who cares to look at the Shakspeare of Roubiliac, executed for Mrs. Garrick, and for which Garrick himself stood as a model, in the corner of the British Museum in which it is stowed away? Some little time ago I was at Oxford, where I was shown, I think in the ante-chapel of New College, a beautiful relief in memory, if I am not deceived, of Sir W. Jones. But the relief was so lighted as to look poor, thin, and mean. It was between two cross-lights, and placed without any reference to the proper illumination of the sculpture. I said to the authority who showed me the place, "I think that is a fine piece of work; but I am sure you have never seen it." Whether I was thought a little mad or no I cannot say; but I was allowed to open a door so as to cut off one set of rays of light, and have the relief illuminated from a single direction alone. "Now," I said, "did you ever see it before?" "No, sir, I certainly never did," said the verger. It had been seen before as lighted by the mason. It was then seen as it had been lighted by the sculptor.

I must ever regret missing the opportunity of seeing the Wellington figures in the studio of Stevens. You, sir, no doubt did see them, and you can, perhaps, say how they were illuminated there. I do not say that it is impossible to illuminate sculpture better than with what I may call its native light. Torch-light, for instance, makes some sculpture look far finer than day-light. If I had time for the work of the studio, I should try the effect of a figure wrought and to be seen only by torch-light. The story of the candle, that Michelangelo fixed in his cap, serves to hint at something of the same kind. I hold that it is absolutely certain that to produce anything in sculpture that deserves the name of the grand, the light might be restricted to a certain incidence during the whole time of execution, and the figure must be seen by the same, or by some equally restricted, light. The difference between a figure at Madame Tussaud's, and the Newton, in Trinity College Chapel, Cambridge, is palpable. But it is quite possible so to illuminate an inferior work of art, even a wax mask, and so to disfigure a noble sculpture by a flood of incongruous light, as to confuse the very primer of excellence. "Let there be light" is the fiat of art. "Let there be the true light" is the main secret of the sculptor. C.

* We willingly go a little out of our way to mention that the French publisher has appointed as his agent for England Mr. Charles Davis, 47, Pall-mall.

A PLEA FOR THE INDIAN PUBLIC WORKS DEPARTMENT.

The members of the Indian Public Works Department are now so widely spread that a few notes on two papers referring to them, recently made public, will, doubtless, be of interest to many of our subscribers. The first is an elaborate and carefully thought-out minute by Sir Andrew Clarke, R.E., K.C.M.G., late Minister for Public Works in India, and previously well known in this country in connexion with the Portsmouth Dockyard and other works, and from his being on the council of the Institution of Civil Engineers. He reviews the past history of the Department, and though he knows the discontent to have been long standing, and appears to consider the members of the Department to have good grounds for their dissatisfaction, he states he has observed "no disloyalty to Government" on their part in pressing their claims on his attention. He reviews the difference betwen their pay and pension rules and those of the Civil Service and the military officers employed, and instances one or two in which the present rules press very heavily on the civil officers, and, in fact, says, "the whole tenor of this section of the pension code shows that it was never intended to be applied to an establishment like that of the civil engineers of the P.W.D." It was a necessity of a service now quite obsolete, and when framed no one considered that it would be eventually applied to the class it now includes.

Sir A. Clarke points out the present prospects of the Department, and the work it will be called upon to perform, and concludes that at least 100 engineers would have to be retired on suitable pensions, which should be a special grant to meet the unprecedented case. He suggests that those retired should go voluntarily, especially so as regards the class known as "Stanley Engineers," as they could not be retired compulsorily, but that to all cases the permanent benefit to the Department as regards efficiency should be considered rather than "the desire to save in one item of the civil estimates." It appears from one of his statements that, whereas the Royal Engineers, with between twenty and thirty-two years' service, can get pensions ranging from between 166*l.* and 416*l.* per annum, which they can claim voluntarily, and have in addition the prospective benefits of a possible 1,125*l.* per annum, after thirty-eight years' service, the civilian can only get between 166*l.* to 416*l.* in the same time, and then only on the production of a medical certificate stating his incapacity to serve any longer, should his service be under thirty years.

Since the minute was written, and since he left India, over 300 engineers have been dismissed the service, the retirement of fully four-fifths of this number being anything but voluntary, whereas all that has been done with the Royal Engineers branch of the Department is to allow two years' holiday on farlough pay to those who wished it, a boon which, had it been offered to the civil branch, would have been eagerly accepted by many.

Sir Andrew Clarke concludes his minute with a reference to the Roorkee and Cooper's Hill Colleges, and to the Stanley Engineers, the latter of whom, he says "stand first in the order of utility," whereas of the Cooper's Hill men he states that for some time after joining they "are very little use indeed." Why is this?

The second document referred to is "A Return made to the House of Lords on the motion of Lord Belper, of annual expenditure and receipts of Cooper's Hill College, &c., dated 25th July, 1881." From this it appears that out of 450 students in ten years, 299 have gone to the Public Works Department, and that the cost of their education, &c., has been in round numbers 198,000*l.*, to which a sum of 47,000*l.* odd must be added on account of ten years' simple interest at 4 per cent. on 119,076*l.*, the original cost of Cooper's Hill College Buildings, making a total of 245,000*l.* The college has received fees, &c., to the amount of 149,000*l.* odd. The ultimate burden on the Indian estimates being for ten years 96,000*l.* odd, or at the rate of a little over 320*l.* per assistant. These figures appear large

and it is questionable if the result is commensurate with the expenditure. Sir Andrew Clarke in the minute above referred to states that he could not find that the opinion of the Government of India was ever asked for in the matter, and the time now appears to have arrived when it should be decided if the already modified College system should or should not be continued.

Some of the suggestions made by him have been carried out; for instance, the Military Works Department is now officered entirely from the Royal Engineers, but nothing whatever has been done to fill the Civil branches entirely with civilians, or by a proper proportion of civilians to military. We think that in these departments the higher grades should be filled by promotions in proportion to the total number of civil or military engineers respectively.

We also have been led to think that some such rules should be laid down as are said to exist in the Swedish service, where civilians and military men are all paid alike, one consolidated rate, and that as regards retirement and pension rules they should be the same as for all other covenanted civil servants of the Government of India.

Both minute and blue book will repay careful perusal by all who are interested in the matter.

THE SAFETY OF THE CHURCHES OF EAST ANGLIA.

The Honorary Secretary to the British Archæological Association, referring to the inquiries made, without eliciting reply, by the *Builder* as to the existence or otherwise of a lightning conductor to the church of South Wootton, Norfolk, recently much damaged by lightning, reiterates his former warnings as to the danger to which the churches of East Anglia are exposed by the neglect of this necessary precaution. Norfolk and Suffolk, as Mr. Loftus Brock justly remarks, and as all familiar with those counties are aware, are distinguished for the number, beauty, and lofty and conspicuous sites, of their church towers. "They answer, so to speak, one another from hill to hill, and fulfil in many respects the *beau idéal* of a church in relation to its prominent position in a landscape." The churches inspected in 1879 during the Congress of the British Archæological Association at Great Yarmouth are estimated by Mr. Brock at the money value of 200,000*l.*; which is a mere trifle in comparison to their historic and architectural value.

The livings being usually poor, and the country agricultural, the aid that is usually now so freely forthcoming on any appeal in support of the fabric or the service of our churches is more scanty in East Anglia than in richer parts of England. But the occurrence of damage from storm is thus all the more to be deprecated. On the simplest principles of ecclesiastical economy we hold that those concerned for the welfare of the Church will do well to listen to the warning, and not to listen alone, but to give the remonstrance the solid echo of their subscriptions. For ourselves, we put the matter on a higher ground than that of cost. No money can replace a grand old monument. The new churches, we are happy to hear, are so far secured in that respect that the application of a lightning conductor is made a *sine quâ non* for the granting of any aid from the Church Building Societies. But better be damaged half a dozen new churches than one old one. Not that the former mischief is not to be deprecated,—but it is at all events reparable. The other may be irreparable. In our review, some time back (vol. xxxviii., p. 20), of Mr. Richard Anderson's excellent work on lightning conductors, we cited the long list, which occupies eleven pages of royal octavo in that book, of the damage done to churches and other public buildings by lightning in the last and in the present centuries. Many of the instances are taken from our own columns. At the same time there can be no doubt that this long list very imperfectly represents the number of lightning strokes that actually occurred. There has been a lull in the destructive activity of the lightning, of late,—due, we think, probably, to meteoric causes, rather than to the effect of protective conductors. If so, we may at any time find we are entering on a cycle of thunderstorms. The escape of any building, or any set of buildings, unprotected by conductors, for a number of years from damage by lightning, affords no pledge for their continued security. Cromer Church, in Norfolk, which had the pinnacle slightly damaged by lightning in August, 1879, is the last case cited by Mr. Anderson. Will the British Archæological Association accept the advice that by calling on their members to supply all the information attainable by each of them as to the injury of public buildings by lightning, in their several localities, and by issuing an enlarged edition of the list commenced by Mr. Anderson, they may do good service to the cause they have at heart, and call the attention of all those who love old English churches to the need of protecting them from the thunderbolt? We shall willingly print any such list.

BUILDING SOCIETY RETURNS.

In pursuance of an order of the House of Commons of 25th February last, the Registrar has issued an abstract of the accounts furnished by incorporated building societies, which is the sixth return presented since the passing of the Act. It contains the names of all societies, now existing, that were incorporated prior to the 1st of January, 1881. The societies in the list number 1,321, of which 1,163 have made returns. Of the 115 which have not made returns, 94 are either in course of winding up, or have not yet completed a year's financial arrangements, so that only 22 are defaulters. The receipts of the companies are:—

	No.	Receipts.
England and Wales	1,115	£18,694,555
Scotland	48	625,225
Total	1,163	£19,329,780

These totals show increased receipts of 2,277,333*l.* for England and Wales, and of 11,012*l.* for Scotland, since the last return. Out of the gross total, nearly 11,700,000*l.* stand to the credit of 63 societies, leaving the balance of 7,600,000*l.* to be shared between the remaining 1,100. There are 35 societies of which the receipts exceed 100,000*l.* each, rising from that sum to 923,277*l.*; 28 societies exceed 50,000*l.*, and are under 100,000*l.* The liabilities are,—

Ordinary shares	£21,493,814
Preferential	1,554,159
Depositors	14,183,678
Total	£37,231,651

The assets are,—

Mortgage securities	£36,011,383
Other securities and cash	2,213,978
Total	£38,215,361

It is well that all the security which official inspection can supply should be afforded to these useful associations. The advantage which an association possesses over an individual, in the way of amassing money, is chiefly derived from the facilities possessed by the former of investing their income the moment it comes to hand, so that, in fact, they come very close to the receipt of compound interest, as that extraordinary offspring of civilisation lives and grows upon paper. And the working man who puts his weekly shillings into a sound building society is actually ensuring the benefit of this wonder-working compound interest. Then we must remember the vast difference made by enlisting human nature on the side of economy and prudence. Loose cash wears out the pockets. It is well said to burn holes in them. It is so easy to change it for beer at the public-house, and the worst of the change is, that while the cash preserves its individuality wherever it goes, and does its duty as a medium of exchange whenever it is called on,—the beer does not. It disappears,—no more to reappear. Sometimes in disappearing, like coal that is burned under a boiler, it does good work. As often, we fear,—if not more often,—it does more harm than good. If the magic wand of some great master of fiction were to represent to the English workman how many a cottage could be built, in how short a time, out of the pots of beer which he did *not* drink,—we think it would give an impulse to building societies. Here is a little calculation which we made the other day *apropos* of the plan then proposed, which has since fallen through, in Germany as to a State insurance of the life of the working man. It would be far better for him to insure for himself. The difficulty has been how he could do so. The building society supplies the method. And let it be remembered that what we now say of a penny a day will have to be trebled if we substitute the words pot of beer for the word penny.

A penny a day is 1*l.* 10*s.* 5*d.* a year. Neglecting the odd pence, if an individual were to lay by a penny a day from the age of twenty to that of seventy, allowing the hoard to accumulate in an old stocking, or buried in a hole in the earth, the sum would amount to 75*l.* at the end of the fifty years; and if the depositor died during the time, the deposit would be in exact proportion to the number of days during which the deposit had been carried on.

If a similar accumulation had been allowed to take place with pounds, or larger sums, instead of pence, it is obvious that the depositors might have made a much better use of their savings than to bury them. Invested in houses, in land, or in trade, the capital would have been living instead of dead, and would have earned an annual return. If this return had been at the rate of three per cent., the 75*l.* would have increased to 112*l.*; if it had been at the rate of five per cent., it would have amounted to 209*l.*

LABOURERS' DWELLINGS IN DUBLIN.

At a recent meeting of the Dublin Corporation, Mr. E. Dwyer Gray, M.P., moved the adoption of the report of the Public Health Committee *in re* the adoption of the Labouring Classes' Lodging-houses and Dwellings Act (Ireland) 1866, 29 and 30 Vic., cap. 44. The Committee reported:—

"1. That the Labouring Classes' Lodging-houses and Dwellings Act, 1866, is applicable to Dublin, and that it is highly desirable that it should be put in operation.

2. That the Oxmantown Estate, and possibly portion of the property which may be purchased by the Corporation for the purpose of the new street to the Swivel Bridge, afford convenient sites and occasions for a commencement.

3. That there are very many vacant spaces in Dublin, especially those reported on in the annual report of Dr. Cameron for 1880, which might be purchased on reasonable terms, and upon which dwellings might be erected with great advantage.

There are many hundreds of houses in Dublin in an utterly unsanitary condition, as your committee have frequently reported, and which your committee would take more stringent steps to close if they did not, as they have also reported, fear that the consequent overcrowding other dwellings might result in greater evils than those now existing."

Mr. Gray said it was now proposed merely to pass a preliminary resolution notifying to the ratepayers that the Corporation intended taking the matter into consideration on a particular day, and he would suggest Monday, the 7th day of November. There was no reason why this undertaking should not be attended with success. They had the example of the Artisans and Labourers' Dwellings Company in Dublin before them, and that undertaking paid four per cent., dividend. He saw no reason why this other undertaking should not also pay close on four per cent., so that by spending 100,000*l.* or 200,000*l.* on it, it would not mean that the interest would be saddled on the ratepayers, but that the undertaking might be made self-supporting. He confessed he was of opinion that the Corporation should not become extensive landlords, and it would be only as a last resort that he would recommend them to engage in any extensive building speculation, because he did not think that the Corporation or any public body could be good landlords, and their experience of their Baldoyle tenants had been that building was not very remunerative. However, the work was one which should not be shelved. In connexion with this undertaking they contemplated providing rooms for single women of the poorer classes at low rates; for he believed that no class required the protection of the public authorities more than these poor, industrious, struggling women. He moved a resolution to the effect that public notice be given of the intention of the Council to take into consideration the propriety of adopting the Labourers Act for Dublin, and that the Council would take it into consideration at a meeting of the Council on Monday, the 7th of November, at one o'clock.

The motion was adopted.

This subject was also discussed in the Health Department of the Dublin meeting of the Social Science Congress, where

The Recorder of Dublin read a paper, in the course of which he stated that the supremacy of the death-rate in Dublin lately compelled the speeding of a Royal Commission, and the very able report of the commissioners, Messrs. Rawlinson, C.E., and MacCabe, of the English and Irish Local Government Boards, unhesitatingly attributed this evil state of things to the condition of the houses of the poor. Previously to this report the Recorder had addressed the Lord Mayor on the supremacy of the city crime rate, attributing

this also to the social condition of the poorer classes within their homes and in the streets outside. The author urged the reparation and reconstruction of the various statutory powers already existing under general Acts, rather than seeking to deal with this ancient and diversified city upon any single or special plan. These statutory powers came under the heads of,—1. Provisions relating to cleaning of entire civic areas; 2. Those relating to the reparation of individual houses; 3. Those relating to the provision, by civic authority, of houses for the working classes. The work of improvement has a tendency to raise rents, and therefore to create a residuum of the very persons who are most difficult to deal with, and yet most need remedial measures. In the work of reparative reform the duties of corporations, owners, occupiers, and magistracy, are correlative and reciprocal, and each without the other vain. The author expresses his conviction that the urban grievances which now call for redress are more urgent than those rural claims which have monopolised public attention.

Dr. Charles A. Cameron, M.D., S.Sc.C., Cambridge, Fellow and Professor of Hygiene, R.C.S.I., Medical Officer of Health for Dublin, read a paper on the question, in the course of which he referred to what had been done in the way of erecting dwellings for the labouring classes in a number of towns in England and Scotland. He stated that the loans advanced under the Artisans' and Labouring Classes' Dwellings Improvement Act up to March 31, 1880, were:—for England, 1,419,970*l.*; for Scotland, 115,000*l.*; and for Ireland, 30,500*l.* Under the provisions of the Labouring Classes' Dwellings Act the loans raised in England and Scotland amounted to 394,741*l.*, and in Ireland to 66,634*l.* The Corporation of Dublin have put in force the provisions of the Artisans' Dwellings Act. They have completely cleared away a collection of dwellings situated under unhealthy conditions, at a cost of 22,000*l.*, and they have let the cleared site to the Dublin Artisans' Dwellings Company at a rent of 1,200*l.* a year. Another unhealthy collection of dwellings is being cleared away at a cost of 150,00*l.* A report, in which I have advocated the erection of dwellings for the lowest and most dependent classes of the population by the Corporation of Dublin, has just been unanimously adopted by the Public Health Committee; and, having been approved by the chairman of the committee, Mr. E. Dwyer Gray, M.P., I have little doubt but that his powerful influence, exerted as it is in the cause of sanitary reform, will induce the Corporation to expend a large sum in the erection of dwellings under the Labouring Classes' Dwellings Act. Roughly speaking, from 100,000*l.* to 200,000*l.* might be advantageously and remuneratively expended in this work. One of the most urgently required measures for the improvement of the sanitary condition of Dublin is the erection of a large number of dwellings for the lowest classes of the industrial population. The buildings which have been erected by the Dublin Artisans' Dwellings Company and the Industrial Tenements Company afford excellent accommodation for a large number of persons. The former have now 270 tenements, containing 1,243 inhabitants. But there are probably at least 10,000 married men—labourers, porters, and messengers,—whose weekly earnings do not exceed 15*s.*; there are some thousands of poor widows, with or without families, old worn-out men and single women, earning a precarious living, and residing in wretched dwellings. To all these classes of persons the tenements of the Artisans' Dwellings Company are as inaccessible as are the houses in Fitzwilliam-square to ordinary mechanics. It is more especially the dwellings of these classes that urgently require amelioration. The weekly rents paid by several thousands of the very poorest classes vary from 8*d.* to 2*s.* In the tenements which I have just described circulates no inconsiderable proportion of the poisons of the zymotic diseases, and more especially those of small-pox (when epidemic) and typhus fever. There are three acts relative to the erection of dwellings for the labouring classes, namely,—The Labouring Classes' Lodging Houses and Dwellings Act (Ireland), 1866, 29 & 30 Vict., cap. 44; the Labouring Classes' Dwelling-houses Act, 1867, 30 Vict., cap. 28; the Artisans' and Labourers' Dwellings Act, 1868, 31 & 32 Vict., cap. 130. I shall now enter into a brief description of the kind of dwellings which, in my opinion, should be erected. Each should consist of a two-storied house containing four rooms; the dimensions of two of these should be 12 ft. in length, 12 ft. in breadth, and 12 ft. in height, a capacity of 1,728 cubic feet, and two rooms 10 ft. by 10 ft. by 10 ft., 1,200 cubic feet. The house need only be of the plainest kind, but the stairs, doors, and window-frames should be strong, so as to resist rough usage; the cost of such a house would not be more than 125*l.*, and of the site, say 35*l.* If each house cost 150*l.*, then 666 could be erected for the sum of 100,000*l.* The average number of individuals per family is about 4·5, therefore the 666 tenements would provide for (at the rate of two families per house) 6,000 persons. For each tenement of two rooms the rent should be 2*s.* per week. This is somewhat more than many labourers pay; but I am sure there would be no difficulty in getting tenants for two good rooms at so low a rent. The existence of such 1,332 tenements would stimulate the owners or renters of the ordinary low-class tenemental dwellings to a healthy competition, which would be the means of causing a general improvement in the condition of the homes of the people. Would the erection of 666 tenement houses such as I have described entail a permanent burthen on the city? I do not think it would. Let at 10*l.* 8*s.* per annum per house, the revenue would be 6,364*l.*; 4,000*l.* a year interest (which would gradually extinguish the debt) on the loan required to build the houses would be paid out of the rent. Supposing that even a considerable number of tenants were defaulters, 1,000*l.* per annum would be more than sufficient to keep the houses in repair. It is regrettable that the humbler classes do not form themselves into building clubs for the purpose of purchasing or building dwellings for their own use. There are only two or three such associations in Dublin, but their capital is very small. The excellent building society which was established thirty years ago at Carlisle is one which I would gladly see copied in this city. The members of this society can borrow 100*l.* for the purchase of a dwelling, and repay the money in weekly instalments of 3*s.* 4*d.* during a period of 16¾ years. The income of the society in 1879 was 145,767*l.*, and the expenses of management only amounted to 468*l.* 11*s.* 4*d.*, the fees paid to the committee being the modest sum of 15*l.* The capital of the society amounts to 427,198*l.*, and its members receive good dividends.

Mr. Edward Spencer, secretary of the Dublin Artisans' Dwellings Company, also read a paper on the subject, in which he gave an account of the operations of that company, who are spending 66,980*l.* in providing accommodation for 531 families, and then considered the best means of surmounting the difficulties by which the task of providing accommodation for the working classes of Dublin is at present surrounded.

After some discussion, on the motion of Mr. H. H. Collins, secretary of the Health Section, the following resolution was passed, with one dissentient:—

"That it is the opinion of this section that it is desirable that the Corporation of Dublin should seriously consider the propriety of providing dwellings for the labouring classes under the provisions of the various Acts of Parliament relating thereto, and that the Council be requested to submit to the Corporation this expression of its opinion."

BURGLARS AND BUILDERS.

Dark nights and visions of making a fortune at one stroke are sufficient attractions for Bill Sykes and his fraternity to cause them to leave their domestic firesides and seek the residences of those whose households offer facilities for satisfying their desires. The tramp seeks more frequently than not but food and shelter for a night. The professional housebreaker seeks other spoils of a more valuable nature. The former individual is often a harmless, miserable, half-starved creature, driven by the pangs of hunger to desperation; enfeebled, perhaps, by disease, or emaciated through want of bodily necessities. When disturbed in his nocturnal rambles he is ofttimes supplicating in manner, seeking alms, or asylum from the weather, working on one's compassion rather than anything else. But the latter personage, the *crême de la crême* of the profession, does not rely on such feminine modes of satisfying his desires. He is powerful in brute strength, and aided by the implements of his craft,—the "jemmy," crowbar, revolver, or knife,—is sufficiently strong in himself as to experience no pangs of fear at being disturbed in the midst of his labours. Who knows but what the burglar feels sensations of pleasurable delight when encountering an unarmed and defenceless being at dead of night and alone? The sense of superiority that reigns within his soul, and the sensibility of the utter powerlessness of his antagonist, may, no doubt, create a gratifying sensation in the intruder's mind, armed thus *cap-à-pie*. Recent events rather seem to point to this, at all events. Shooting blindly at policemen with revolvers is undoubtedly the outcome of such ideas. Considering how open many houses are at the present time for such attacks, and what opportunities they present for attaining easy access to their interiors, it is rather a surprise that more care is not bestowed on such portions as offer peculiar facilities for accomplishing this. It is a question whether the subject of household defence rests more especially with the architect or builder. The former is distinctly responsible for the arrangement of such openings as windows, doors, &c.; and the last-named, the execution and final adjustment of locks, bolts, bars, window-catches, and similar means of defence. It is a fact, however, that too often the security of a dwelling is but a secondary consideration, the exterior beauty and form of the edifice being of pecuniary importance in the eyes of the builder as more likely to gain the object he has in view,—the speedy sale or letting of the mansion. "An Englishman's house is his castle," and as such should be treated in a manner befitting a structure of this nature, respecting the dangers to which it will be subject, and the uses to which it will eventually be put.

Iron bars intended to guard basement windows are, as a rule, easy of removal by mere strength of arm; window-panes may be cut through without an expenditure of much labour; catches are wrenched off with equal facility; locks are picked without difficulty, doors are prised open, and panels drilled through without employing much force or taking up any considerable time. It must, however, be owned, that burglaries frequently occur through the carelessness of domestics or those intrusted with the supervision of defensive fastenings. But still there is a wide margin on the other side, and one that admits of considerable improvement by the building trade.

Some time back there appeared in the pages of a comic weekly a series of cartoons descriptive of the shortcomings peculiar to the modern "builder." Amongst the illustrations were two which touched directly on the subject under consideration. The first of these represented a gentleman at an ironmongery emporium purchasing sundry bolts of massive construction. The second picture depicted one of the "Trade" doing the same, but in this instance the article purchased is of a more slender make, and is described there as giving "*fifty* to the ounce." "It is the custom of the trade," might be advanced as a suitable solution of the question, and an explanation of the difference that exists between the articles designed for the builder's use and those intended for that of the private individual. In many modern houses there is a tendency to place windows too near the ground, and to omit to protect some by suitable metal bars strongly fixed in the brickwork. Even this protection is in reality not wholly sufficient. Such windows should be provided with internal shutters of stout construction, for even if a bar were filed or bent away sufficiently to allow the burglar to cut a hole in the glass, move the catch, and open the window, it would be a difficult job, if not quite impossible, to break or remove a strong shutter fastened internally. Front windows, when on a level with balconies or broad cornices, should be secured by thick shutters inside, and this care should more especially be observed in the case of those abutting but a foot or so from the ground.

It is a curious fact that although so much attention is usually bestowed on hall-doors, the windows adjoining the same have escaped attention. We find, as a rule, such doors provided with a couple of heavy bolts, a strong lock, and a massive chain. Now it stands to reason that a burglar desiring to enter a house quietly and unobserved would certainly not choose a large and massive door facing the roadway to effect his purpose. In fact, one might say, without much fear of falling into error, that not one burglary in a hundred has ever been accomplished by this means. To abstract a pane of glass and open a window

is the work of a moment with a skilful thief, and a much easier task than drilling the panels of a strong and thick wooden door for the purpose of destroying the bolts or locks.

There is another source of danger, too, that lies in the *roofs* of many houses. The traps communicating with the leads are usually destitute of any fastenings whatever, and the same may be said of the trap-door which opens from the loft to the landing. These last always open inwards, so the task of removing them is not a very arduous one. Has the possibility never suggested itself to the householder that it would be a matter of no great difficulty to enter an empty house, climb to the roof, walk along the roofs of adjoining buildings, and then drop through, by means of a rope, to any desired habitation? This simple fact seems to have been quite forgotten; for we doubt if there exists one house that is adequately provided with suitable means for preventing this mode of entering its interior. A fruitful source of danger lies in these traps, and their security should be a matter of consideration amongst all whose dwellings are provided with such.

Then there is the question of coal and cellar flaps, conveniently placed for thievishly-inclined persons to get down into the basements of houses, and rarely, if ever, properly secured against removal.

The above points, necessarily briefly enumerated, all more or less concern the builder, and it should be a matter of importance with him to see them properly attended to.

It would be folly to say the building trade wanted "waking-up," but still a "hint in time" may, perhaps, like the proverbial "good stitch," prove of some use as a means of pointing out some flaws in the trade of an obvious nature, and, therefore, causing remedial measures to be taken in the future. A. J. D.

PARIS.

The Rue de l'Abbé de l'Épée, near the Luxembourg, has been extended to the eastward for a length of about 330 ft., as far as the Rue Gay-Lussac. The western end of this street, between the Boulevard St. Michel and the Rue St. Jacques, is proposed to be widened, but this improvement cannot at present be carried out, as the widening would necessitate interference with the garden of the Deaf and Dumb Institution, which abuts upon the south side of the street. The Abbé de l'Épée (born in 1712, died in 1789), whose name is preserved by the street, was the founder of the Deaf and Dumb Institution in the Rue St. Jacques, and there is a statue to him in the court-yard, as well as a bust in the school-room.

On the site of the ancient prison of the Abbaye, which was finally destroyed by the construction of the Boulevard St. Germain, an open space or "square," as the French now prefer to call it, will be formed adjoining the ancient church of St. Germain-des-Prés, which will be called the Square de l'Abbaye. In the centre of this square it is proposed to place a statue of Bernard Palissy, the potter, whose name is also preserved in a small street in the neighbourhood.

The trees on the Boulevards of Paris are gradually disappearing, attacked by a disease which, up to the present time, has baffled investigation. It appears that the tree that best resists the effects of the atmosphere of Paris is the tree called by the French the *Vernis de Japon*, which was first introduced into France in the year 1871. Another tree which equally withstands the depressing influence of the metropolis is that called the *arbre du Judée*, distinguished by its red flowers and ample foliage. There are several examples of this tree in the squares of Paris. The *trianchonthos*, a thorny shrub, which frequently attains a height of 40 ft., appears also to flourish in the climate of Paris.

An exchange has been recently effected between the City of Paris and the French Government, by which the former has ceded to the latter a considerable space of ground situate on the west side of the city, called L'Île des Cygnes, in return for the site of the park of the permanent exhibition established in the Champ de Mars. This Île des Cygnes, like our own Isle of Dogs, although originally detached, now forms part of the City, and comprehends the Quai d'Orsay, the Government tobacco-manufactory, the esplanade of the Invalides, the suburb of Gros-Caillou, and a portion of the Champ de Mars. In the middle of the eighteenth century there existed *en aval du Pont de Concorde* a large island, containing about 250 acres (100 hectares). This island was then called the Île de Malequerelles, on account, as it is said, of the frequent disturbances which took place there between the students of the University and the inhabitants of the villages of Auteuil, Grenelle, and Chaillot. A celebrated resort of pleasure-seekers in the vicinity, known as the Moulin de Javelle, and numerous drinking-shops, attracted a large number of Parisians here during the summer months. On this island a large number of the bodies of the victims of the Massacre of St. Bartholomew were buried. According to a contemporary account, wagonfuls of corpses of both sexes and all ages were thrown into the river. These corpses were carried by the tide as far as the Île du Louvre and the Île de Malequerelles, where they were removed from the water, and interred to prevent danger from infection. The same document informs us that the number of bodies interred in the neighbourhood of St. Cloud and Auteuil was about twelve hundred.

In the reign of Louis XIV. the Île de Malequerelles acquired the more harmonious name of the Île des Cygnes. In later times the ground was gradually built upon, and recently a portion has been devoted to the service of the Garde Mobile and the Government Marble Dépôt.

A small island in the middle of the Seine, between the Pont de Grenelle and the Pont de Jena is still called the Île des Cygnes, and is a favourite resort of anglers.

A CIRCLE RAILWAY FOR VIENNA.

After a long period of stagnation, greater activity is beginning to prevail again in the matter of providing better intercommunication than at present exists between the various parts of the Austrian capital. The local railway project, which has been allowed to slumber since 1873, has once more become one of the burning questions of the day, various plans having been submitted to the public, the project of Mr. Fogerty, an English engineer, of a circle railway being especially much talked about. The data which follow have been taken from the *Bautechniker*. The railway as planned would for its greater part (5½ miles out of a total length of little over 9 miles) be a high-level one, and run on an iron viaduct. Its object is to connect a central station, to be erected, with the existing termini and the other parts of Vienna and its suburbs. The central railway station is to be located at the Donau-canal, in the Franz-Josephs-Quai Park. Thence the line would run on an iron viaduct along the canal to the Aspern Brücke, and the slope of the left, or, according to the latest modification, the right, Wien-Ufer as far as the Schlachthaus-Brücke, in the sixth district, in which course all the bridges of the Donaucanal and the Wienfluss intersected are to be crossed by raised viaducts. At the Schlachthaus-Brücke the tracing turns into the Gürtelstrasse, which it follows as far as the Währingerlinie, and across which the line would run, according to the configuration of the ground, partly on viaducts, partly in cuttings or tunnels. The tracing then turns to the right through the Linienwall, passes through the ninth district, along the Alsbachstrasse to the Brigittabrücke, whence, along the Donaucanal, the junction with the central station is once more effected. From this closed circle a branch leads to the Franz-Josephs-Bahn, where locomotive and other sheds are to be erected. The maximum rise of the line will be 16·7 in 100, the minimum radius 533 ft. The permanent way is to have the normal gauge, and two lines of rails. Nineteen stations are projected, and a junction with the Westbahn and a branch to Schönbrunn and Hietzing are planned. The railway is to be completed in three years. The speed of the trains is to be only 18·6 miles per hour.

London Sanitary Protection Association. The first general meeting of this Association will be held at the Society of Arts, John-street, Adelphi, on Tuesday, the 25th inst., at eight p.m., Professor Huxley, F.R.S., President of the Association, in the chair. Professor Fleeming Jenkin, F.R.S., will give an account of the progress and success of the Association from its establishment up to the present time.

LONDON REVISITED.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

At the recent meeting of the British Archæological Association at Malvern, it was proposed to repeat the experiment made last autumn,—and with much success, notwithstanding unfavourable weather,—by arranging for a few days in London for the special behoof of the country members of the Association. After a good deal of consideration, it was decided that the excursion should commence on the 14th and end on the 18th of this month, and with Mr. G. R. Wright, F.S.A., and Mr. George Patrick as hon. secretaries, and Mr. John Reynolds as treasurer, a very successful programme was arranged and entered on, the weather having been, on the whole, very favourable. We append some brief notes of the four days' visits.

St. Paul's Cathedral

was selected for the first visit, and accordingly, at about eleven o'clock on the morning of Friday, the 14th inst., a party of about sixty ladies and gentlemen assembled at the western entrance of the cathedral, where they were met by the Rev. W. Sparrow Simpson, D.D., F.S.A., one of the minor canons, and by him conducted over the building, beginning with the crypt, where some fragments of Old St. Paul's were pointed out. The tombs of Wren and other men distinguished in art were pointed out in the well-known "Artists' Corner," while the other "lions" of the crypt, foremost amongst which are the Nelson and Wellington sarcophagi and the Wellington funeral car, were regarded with much interest by the visitors. Ascending to the floor of the cathedral, the visitors were conducted into the choir and aisles, where the carving by Grinling Gibbons and the ironwork by Huntington Shaw, as well as the principal monuments, were pointed out. Upstairs in the Library of the cathedral, some rare books were brought out for the delectation of the visitors. All the pre-Reformation books belonging to the Library were burnt in the Great Fire in 1666. An inquiry by Mr. Lambert as to the cathedral plate elicited the reply that it was stolen in 1810. In the Trophy Room Mr. Edmund Ferrey's drawings of Old St. Paul's attracted a great deal of attention. Most of the party ascended to the Whispering Gallery, and tested for themselves the peculiar acoustical property of that part of the building. They did not go any higher, however, owing to the violence of the gale that was blowing at the time. Thanks having been accorded to Dr. Sparrow Simpson (who, it should be stated, recounted the interesting discoveries made during the last few years by Mr. Penrose, the surveyor to the fabric, on the sites of the old Chapter-house and Paul's Cross), the party proceeded to Anderton's Hotel, Fleet-street, for luncheon; and afterwards to the

Church of St. Bartholomew the Great, Smithfield.

Here Mr. Loftus Brock described the principal monuments in the church, including that of Rahere, the founder. This very well-preserved tomb is of much later date than the time of Rahere himself, having been restored by Prior Bolton, whose oriel window, having carved on it the punning rebus, a bolt or arrow driven through a tun or cask, is seen above one of the arches on the opposite side of the choir of the church. The monument in the south aisle to Sir Walter Mildmay, the founder of Emmanuel College, affords, as Mr. Brock observed, a good instance of the complete way in which the Classic styles had superseded Gothic at the close of Queen Elizabeth's reign. The date of this monument is 1589, and it is a pure example of columnar architecture. The monument contains some very beautiful detail, and is mainly of alabaster, inlaid with various coloured marbles.

Professor T. Hayter Lewis, in the course of a brief paper on the church, observed that so much had been said of late years as to the damage caused by the over-restoration of ancient buildings, that he would first point out that the parts of the ancient stonework which had been replaced were the two columns in the choir [those nearest the pulpit and reading-desk respectively], which were crushed and dangerous; the two centre columns of the semicircular apse [which had been destroyed altogether], a few parts of some other columns and piers which had been cut away for tombs, piers, &c.; and the tracery of the clearstory and north aisle

windows, which were noted in 1791 as being then destroyed. With these exceptions, the whole of the work is old. The history of the church was briefly this:—It was founded *temp.* Henry I. (1100-1135), by Prior Rahere, the founder, also, of the hospital, which was originally an infirmary for lying-in women and for children under seven years of age. Rahere was a prior of the order of Augustine or Austin (Black) canons. These canons had enormous influence, Mr. Parker noting that they possessed 127 houses in England,—amongst them being St. Mary Overie, Southwark, Stewkley, and Iffley. Rahere began the priory church of St. Bartholomew, it is stated, in 1103. The choir is said to have been consecrated in 1123, and the "rest of the work" ten years later, *i.e.*, in 1133. It was thus about co-eval with the naves of Durham (1099-1128), and of Norwich (1121-1145), and with the choir and eastern aisles of the transepts of Peterborough (1118-1155). The choir of Norwich (1096) was somewhat earlier, but only by a few years. The east ends of the choir of Norwich and of the choir at Peterborough were apsidal. St. Bartholomew's was apparently from the first a completely Norman building, having an eastern apse with a processional aisle round it. It also had at least three towers, as was shown by a seal attached to a charter dated 1133 ("Archæologia," xiv., p. 49; Dugdale, ii., p. 380). This seal was supposed to represent the south side of the church and of the Lady Chapel. The church seems to have been completed in 1133, when Archbishop Boniface, of Savoy, made his celebrated visitation. He (Prof. Lewis) had not been able to find out anything about the nave, if one existed at that time, but he had thought that by looking up some of the old writers who mentioned the scene that took place on the occasion of the archbishop's visitation, he might be able to throw some light on the subject. It would be remembered that great scandal was caused in the church from the fact that in the course of a scuffle in which the archbishop took part, he was found to be wearing a suit of armour beneath his ecclesiastical robes. He had turned to Matthew Paris, and he had met with a rather curious passage, which he did not think had been noticed elsewhere. Matthew Paris said (according to Mr. Giles's translation) that the monks received the archbishop in the middle of the church, that is, the choir ("*In medio ecclesiæ, videlicet, in choro*"). The nave, anyhow, was rebuilt somewhere in the thirteenth century, in, of course, the Early English style. Considerable alterations were made in the church by Prior Bolton (1526-32). In 1544, Henry VIII. sold the priory house, with dormitory, chapter-house, cloisters, refectory, &c., ordering that the church should be a parish church, as it is now. The ground, 87 ft. long, rendered vacant by the destruction of the nave (which was then pulled down) was reserved for a burial-ground. The piers to the south aisle of the nave were standing until 1856, when they were pulled down to widen the path. The bases were left underground, but are now to be seen, as the ground has been lowered. The ugly brick tower at the present west end of the church is said to have been built in 1622-28 in place of the steeple which was then pulled down to its foundation. The whole church was doomed to destruction at the beginning of the present century, on the plea that it was dangerous, and it was only saved by the energetic efforts of an architect, Mr. Hardwick, an ancestor of the present architect of that name. At the east end of the choir, behind the apse, are considerable remains of a large building, which was evidently entered from the church by an opening about 20 ft. wide, the piers of which remain, and are of Perpendicular masonry, and have Perpendicular capitals. Probably two detached columns came between these, and it was very likely that the whole was erected at about the same time as the eastern straight wall cutting off the apse. An oratory was mentioned here as dedicated to the Blessed Virgin (Cottonian MSS.), but it was not likely to have been built in Norman times, as the external buttresses, as well as the piers just described, are of late date, and a Lady Chapel beyond the apse was not common in Norman work. There is one at Norwich, but it was added in the thirteenth century. Beyond the church were the buildings of a complete monastery, inasmuch as the Austin Canons, though not monks, nor, of necessity, priests, lived much as monks did, and with the same kind of monastic buildings. Of these, an excellent notice exists in the *Gentleman's Magazine*, vol. 79 (pp. 226-7), describing their state in 1791. The east cloister only then remained. It was used as a stable. It is now all gone, having fallen down in 1833. There is a perspective drawing of it in Stow's "London." On the east side of the cloister was the chapter-house, of oblong form and of Henry III.'s time (1216-72). The walls in 1791 remained 3 ft. or 4 ft. high, the space enclosed by them being used as a wood-store. The walls are now destroyed and the space built over. Directly against the south aisle was a small chapel, described as "magnificent," having a grand entrance from the south transept and another from the church. Of this, except the latter doorway, no trace remains. The north transept was quite destroyed, and the site was then, as it still is, occupied by a smith's shop. The south transept remained, but it was unroofed, walled-out from the church, and used for burials. This, too, is now destroyed. A good drawing of it is given in Wilkinson's "Londinia Illustrata," 1819. The nave is stated to have been pulled down in Henry VIII.'s time. The series of vaults abutting south of the chapter-house were of great extent, upwards of 130 ft. long and 30 ft. wide, groined from the walls on each side on to a central row of pillars (round and octagonal alternately), and formed, no doubt, the ground-story of the dormitory which existed here, as at Westminster, Battle, &c., with a passage over the chapter-house as a ready access for the monks to the church. The whole of this has been removed quite recently. In 1868 the restoration of the present church (*i.e.*, the choir of the old church) was taken in hand by the late Mr. Slater and Mr. Lewis, under the direction of a committee, whose chief members were the present Rector, the Rev. J. Abbiss, the late Mr. J. Boord, Mr. Foster White, and the late Sir William Tite. The condition of the church was then briefly this:—It was filled to a depth of between 2 ft. and 3 ft. with earth, which had been filled in, owing, no doubt, to defective drainage at the old level. The two columns already alluded to were crushed and in a dangerous state, owing to a defective foundation. The apse was cut off by a straight wall, the upper part of which still remains, supported on an iron girder; and the space behind it over the eastern aisle, and the large building behind it, supposed to have been the Lady Chapel, were occupied as a fringe manufactory. This wall was built in Perpendicular times, as is shown by the portions of window-jambs which still remain. The wall of the north aisle had been forced out, and the arches were very unsafe. The north triforium was used (as it still is) as a school, and the south triforium was destroyed. There was a huge gallery at the west end, and the space on the ground level, under the south transept aisle, was enclosed as an access to the Vestry, which was, and still is, over the transept-aisle. What was done in the restoration was this: The earth was cleared out, the exact level of the old paving ascertained, and the whole site drained. An exact plan was taken of all the gravestones, which were carefully marked and replaced precisely under their original positions. The two columns referred to, and those required to complete the apse, were rebuilt with large stones, so as to show the precise amount of new work. The wall of the north aisle was raised by levers to an upright position, as had been done before at Hereford, and since (on a much grander scale) at St. Alban's. A new foundation was prepared, and the wall and arches raised without injury to a single stone. The most important part of the work, however, viz., that to the apse, remained to be done. Possession could not be obtained of the factory at the back of the wall, and, after earnest consultation with the Architectural Committee of the Incorporated Church Building Society, the architects for the restoration advised that the original plan of the lower part of the apse should be restored, though the upper part could not be, and the lower part of the wall was therefore cut away and supported as now seen. In removing it, it was found to be largely built of fragments of Norman and Early-English work, the greater part of which has been preserved at the east end of the south aisle. There also, against the wall, is preserved all that could be found of the old paving tiles. The stonework throughout was thickly coated with numerous coats of white-wash and colour, but as the architects feared to have the stone injured, it was merely scraped with wooden scrapers, and where these were insufficient, or where the stone was merely dirty, the old surface was left untouched otherwise than by washing. The effect was, no doubt, to leave the church in a not very clean state; but, on the other hand, the old work was uninjured, and in many places the fine diagonal tooling of the Norman masonry can be seen as it was left some 750 years ago. At the west end, beyond the central tower, are clear indications, both in the aisle and above, of the Early English work of the nave. The transept arches of the crux are pointed, whereas those of the east and west are round. Now these pointed arches could scarcely have been of earlier date than 1175 or 1180, and it is an open question as to whether they were delayed in building until that date, or whether they were afterwards re-set, as in the well-known case of the aisle-arches at York next the central tower. Professor Lewis said he had examined them carefully from a ladder, but could see no evidence of this, and his opinion as to their being really of later date than the east and west arches was strengthened by the fact that the arch-mouldings were also somewhat different. But some very curious alterations had taken place in this part of the church. The Norman corbels to the west arch had been re-carved as Perpendicular. Some of the Norman stonework at the base of the north-east pier has been replaced by Perpendicular, and the capitals of the columns of this and the opposite (western) pier have been altered to Perpendicular. The clearstory windows to the Norman clearstory wall were filled in with Perpendicular tracery, and the east end of the choir had been continued square, above part of the circular apsidal wall, up to the east wall which, in Perpendicular times, had cut off the apse. All this work has been left untouched, except as before described, so that an architect going over the old church now could read its history, so far as the dates and the changes are concerned, almost as well as though the writing were in a book instead of being placed indelibly on the stones. Professor Lewis concluded by detailing the differences in the tooling and other characteristics of masonry of various periods, and told an amusing story of a learned archæologist who had conceived a theory that the church had been built to a large extent under the influence of Byzantine architects, because he had discovered that the groining of the south aisle was domical. Unfortunately for his theory the groining was of lath and plaster, put up in the year of our Lord 1830 by Johnny Bligh, district surveyor.

Mr. Loftus Brock, in some supplementary observations, said it was impossible to look at the church without coming to the conclusion that a nave had existed at some early period of the history of the fabric. He cordially endorsed all that had been said by Professor Hayter Lewis as to the arches which supported the central tower. On behalf of the visitors, he expressed thanks to the rector, Mr. Abbiss, who was present, for kindly permitting the examination of the church, and to Professor Hayter Lewis for his interesting discourse. After a few remarks to the same effect from Mr. Wright, the visitors proceeded to

St. Bartholomew's Hospital,

where Professor Hayter Lewis, who is one of the Governors, introduced them to the Clerk of the Hospital, Mr. Cross. In the large Hall of the Hospital, approached by the grand staircase (painted gratuitously in 1736 by Hogarth,—the subjects being "The Good Samaritan" and "The Pool of Bethesda"), the visitors were shown by Mr. Cross an interesting series of documents and seals,—all, with the exception of the charter granted by Henry VIII., of pre-Reformation date. One of these documents bears the seal of Rahere. Several of the seals are perfectly preserved. It was stated by Mr. Cross that many of these documents had never been carefully examined in modern times, though possibly the perusal of some of them would amply compensate for the time and trouble needed for the work. Thanks having been given to Mr. Cross for his courtesy, a large number of the party proceeded through the City to see the

Roman Remains beneath the Coal Exchange.

These consist of portions of a hypocaust evidently belonging to baths, although, said Mr. Thomas Morgan, there seemed to be some difficulty in ascertaining whether the hypocaust formed part of public baths or of baths belonging to a private dwelling. It was most probable,

considering their smallness, that they belonged to a private dwelling or villa. When the remains were first discovered, in 1848, they were described in the *Journal* of the Association. They are enclosed on one side by a semicircular apse, and are protected by a large cage of ironwork. It was mainly through the efforts of the Association, in conjunction with the late Mr. Banning, architect, that these remains were preserved *in situ*. Eleven years later, *i.e.*, in 1859, further excavations made to the eastward of these remains brought to light a corresponding apse opposite to the one already mentioned. Mr. Morgan gave an account of Roman baths and bathing, and was thanked by the visitors for his discourse. In answer to a question whether, seeing that the level of the floor of the villa must have been at least 10 ft. or 12 ft. below the present level of Thames-street, the water of the Thames in Roman times was kept back by any sort of dyke or embankment on the Middlesex side, or whether the Thames did not then rise to anything like its present height, Mr. Brock said he thought there was good evidence for supposing that in Roman times the northern bank of the river was embanked eastward from London Bridge for some considerable distance, for a few years ago a Roman jar was discovered in the bank or dyke near North Woolwich, — an ancient defence which prevents thousands of acres of land from being flooded by the river.

The proceedings of the first day were wound up with a dinner at the "Criterion." On Saturday, the first place visited was

Barber-Surgeons' Hall Monkwell-street.

Here the visitors were received by the Worshipful Master, Mr. Woolley, and by Mr. Past-Master C. J. Shoppee. The last-named gentleman described the very interesting and large collection of plate belonging to the Company, and also said a few words about the Court-room and the pictures which it contains. The hall was built by Inigo Jones, and partially destroyed in the Great Fire. The present Court-room, however, is supposed still to retain the ceiling given to it by Inigo. In 1863 Mr. Shoppee acted as architect to the Company in designing and superintending the erection of the warehouses and offices which now occupy a large portion of the site of the ancient buildings of the Company. At that date the quaint old wooden doorway (dated 1671) which, until then, formed part of the Monkwell-street frontage, and which was illustrated in an early volume of the *Builder*, was removed to the interior of the small courtyard which now gives access to the Court-room, and utilised as an entrance. Of the pictures at present in the hall, the centre of attraction was, of course, the celebrated one by Holbein, representing the presentation of a charter to the Company by Henry VIII.; but there are several other interesting canvases here, including a portrait of Inigo Jones by Vandyck. Mr. Lambert read a very entertaining paper on the history of the Company, tracing the origin of the connexion between barbers and surgeons, and detailing the causes that led to the separation of the two callings in comparatively recent times. Thanks having been given to Mr. Woolley, Mr. Shoppee, and Mr. Lambert, the party made its way to the neighbouring

Church of St Giles, Cripplegate.

Here Mr. Brock described the architecture which is late in date. It is a very good example of a town church, and, in common with that of St. Andrew Undershaft and two or three other specimens of City churches, is in all probability a counterpart of many of those which were destroyed by the Fire. A peculiarity noticeable on the north side of the arcade, which is continuous throughout the whole length of the church, is that a narrow strip of space is left between the detached shafts of the pier. This peculiarity did not occur on the south side of the arcade, although it is in a line, carried transversely, with the recess for the staircase to the roodloft, the position of which staircase is still clearly to be seen on the exterior of the south wall. The more ancient church which formerly existed here had been rebuilt in Perpendicular times very much as it now existed. The roof is entirely new, but no doubt the original roof of the present building was like it. The restoration was carried out a year or two ago by Mr. Woodthorpe. The church is, however, interesting on other than architectural grounds. John Speed, the antiquary, was interred here, and there is a small monument to his memory on the south side of the church. Foxe, the martyrologist, was buried here, and there is a plain tablet to his memory at the west end of the church. John Milton was also buried in the church. The registers, which seem to be well taken care of, contain some interesting entries, including that of the marriage of Oliver Cromwell and Elizabeth Bourchier. Mr. Lambert remarked upon the fact that here, at the cripples' gate of a walled city, there existed a church dedicated to St. Giles, while in the walled cities of Germany, such, for instance, as Ratisbon and Nuremberg, it was invariably the case that there was a church dedicated to St. Gideon (another way of spelling Giles) near the cripples' gate. Proceeding outside the church, the visitors inspected

The Bastion of Old London Wall,

in the churchyard adjoining this church. This bastion is now within reach of sight by anybody, owing to the improvement recently made in carrying a public footpath through the churchyard from Jewin-street to Monkwell-street. South of this bastion is another which is concealed from view by buildings in Castle-street, Falcon-square.

The Church of St. Mary-le-Bow,

in Cheapside, was next visited. The church is now undergoing internal renovation. Wren's work was much admired by many of the visitors, but the chief point of interest for the party was the Norman crypt. Mr. Gwilt, who repaired the church early in the present century, described the crypt to the Society of Antiquaries in 1829. As he then pointed out, it affords the earliest Norman work known to exist in the City. The stones are all small in size, the joints are wide, and the details of the caps indicate the early character of the work. In one of the arches, now blocked up, Roman tiles are used as voussoirs. The two pillars now seen by visitors on entering the crypt are two out of six which divided the area into three divisions,—a centre and two aisles, so to say. Wren, in the "Parentalia," says that when the steeple of the present church was in progress he found the remains of a Roman temple, but Gwilt was of opinion that Sir Christopher must have mistaken this crypt, containing as it does Roman *material*, for Roman *work*. The church was formerly known as St. Mary de Arcubus, and St. Mary of the Arches, and, as Mr. Patrick reminded the visitors, the ecclesiastical tribunal known as the Court of Arches derived its name from having held its sittings in this church. At the

Chapel of St. Etheldreda, Ely-place, Holborn,

which was next visited, the party was received by the Rev. Father Lockhart, who described the history of the building, which was probably the last place in London in which the old rites were used, for in the time of Elizabeth and James I. it was let to the Spanish Ambassador, who used it as a chapel. In the time of Charles I. it was used for the Anglican worship. About a century ago the property was bought by a builder, who pulled down the other remaining parts of the palace of the bishops of Ely, and built the street now known as Ely-place upon the site, but he retained the chapel, and let it as a proprietary chapel to a minister of the Church of England. It was subsequently used by a congregation of Welsh Episcopalians, and, a few years ago, the property having got into Chancery, was sold by order of the Lord Chancellor. In all its essential features, particularly as to the two magnificent end windows, it remains intact. The roof, with the exception of the tie-beams, is the original one. There are one or two interesting features in the crypt or undercroft, which, at one time used for the storage of beer by Messrs. Reid, the brewers, was, at another period, and concurrently with the use of the chapel for religious purposes, occupied as a tavern,—drunken brawls below frequently disturbing the congregation above. The visitors having thanked Father Lockhart, next partook of luncheon at the Holborn Restaurant, and subsequently went to

Sir John Soane's Museum, Lincoln's Inn Fields,

where they were received by Mr. James Wild, the curator, and some of the trustees. They spent some considerable time in inspecting the large and varied and but too-little visited collection of objects of art and antiquity. The space in certain portions of the museum is so limited, and the visitors were so numerous, that they could not be conducted *en masse* over the premises. They therefore divided themselves into small parties, visiting the different apartments, under the guidance of Mr. Wild, Mr. Lambert, Mr. Thomas Blashill, and other gentlemen. Thorpe's book, and the collection of drawings by Adam, were examined with interest.

Staple Inn, Holborn,

was the last building on the programme for Saturday, and thither a considerable number of the visitors wended their way. The inn, which is known to most Londoners by the picturesque old overhanging houses which form the Holborn front, is, as was explained by Mr. Burrell, one of the Inns of Chancery (not Inns of Court), and the hall is probably the best of those which remain in connexion with the Inns of Chancery. Originally each of the Inns of Chancery was attached to one of the Inns of Court, and the Inn of Court to which Staple Inn was attached is Gray's Inn. The Inns of Chancery were, indeed, originally overflow hostelries for receiving the students who could not be accommodated by the Inns of Court. Mr. Brock, in describing the hall, commented on its similarity to those of the Middle Temple and Lambeth Palace,—the former being the earliest and the latter the latest of the three. It was very gratifying, he said, to see it maintained in such good preservation, and it was to be hoped that the Principal, Antients, and Members of the Society of Staple Inn would continue to take care of the interesting buildings which vested in them. Before the visitors left the hall, they thanked Mr. Burrell for the interesting particulars given by him concerning the inn.

York House Water Gate.

On Monday morning the visitors mustered on the Victoria Embankment, opposite Cleopatra's Needle, and after a few remarks about the obelisk by Mr. Lambert, they crossed the road and entered the gardens, in order to proceed to the front of the water-gate attributed to Inigo Jones, and which is now, as we have often pointed out, half-buried in a hole at the foot of Buckingham-street. It was formerly the river-entrance to York House, of which it is the only remnant. Mr. Wright recounted the efforts which were made a few years ago by the British Archæological Association to induce the Metropolitan Board of Works to allow the gateway to be raised *in situ*, and utilised as an entrance from Buckingham-street to the Embankment-gardens, but the result of those efforts was unsatisfactory, the Villiers family or their representatives interposing some objection. Taking train by the District line from Charing-cross to Sloane-square, the visitors soon arrived at

The Royal Hospital, Chelsea,

which, as recorded in the Latin inscription over the colonnade, was founded by Charles II., and completed in the succeeding reigns of James II. and William and Mary, for the purpose of affording a home to soldiers disabled by wounds or age. The visitors were received and conducted over the buildings by the Governor (Sir Patrick Grant), the Major and Lieut.-Governor (Colonel Wadeson), and the Chaplain (the Rev. S. Clark). The foundation-stone of the hospital was laid in 1682, and the main building was completed and opened in 1692. The architect, Sir Christopher Wren, became a Commissioner of the Hospital in 1691. Besides the hall and chapel, the main building contains berths or bunks for 538 men, all separately enclosed, besides library, kitchen, and other apartments. The most important addition made to the buildings since Wren's time is the Infirmary building, a detached structure on the west side, adapted in the year 1809 from a house in which Sir Robert Walpole had resided. Sir Robert Walpole's drawing-room, now used as one of the wards, was inspected by some of the visitors. It has a very good enriched ceiling. The excellent woodwork in oak in the chapel and the great hall (formerly used as a dining-hall, but now as a general day-room) was much admired by the visitors, who also evinced much interest in the numerous tattered flags, trophies of war, suspended from the walls of those apartments. In the state-room of the Governor's House, some valuable pictures were shown, including a large canvas by Vandyck representing Charles I. and Queen Henrietta Maria and children. This room also contains a very fine carved mantelpiece, by Grinling Gibbons. Having thanked Sir Patrick Grant and the other officials of the

Hospital for their courtesy, the party proceeded along the Chelsea Embankment to

Chelsea Old Church,

where Mr. Loftus Brock pointed out some fragments of early work in the Lawrence chapel, on the north side, but none of the work to be seen was earlier than the middle of the fourteenth century. Two singular capitals, on the south side of the chancel, were known to be of Sir Thomas More's time, for they were dated 1528. Sir Thomas More's connexion with the church was briefly dwelt upon, and it was observed that the monuments were the chief feature of interest in this curious old building. Pointing to the monument containing a figure by Bernini, of a lady of the Cheyne family, Mr. Brock observed that it was a beautiful piece of workmanship, and was worthy of being kept in a better state of repair than it apparently is. Passing round at the west end of the church, the visitors saw the chained books,—a survival from Mediæval times. Perhaps the finest monument in the church is that of Lord and Lady Dacre, in which the recumbent effigies are of alabaster, the remainder of the monument being of very rare marbles. It dates from the latter part of the sixteenth century. The monument of Lady Jane Guildford, who died in 1555, is one of the most ancient in the church. That of Sir Robert Stanley, dated 1632, though very costly, is more curious than beautiful. After thanking the clergy for permitting them to see the church, the visitors partook of luncheon at the Pier Hotel, Cheyne-walk, and afterwards proceeded in carriages to

Holland House.

Through the principal rooms of this "stately home,"—which, besides being abundantly rich in historical and literary associations, is a storehouse of objects of art and antiquity,—the party was conducted by Mr. Lane, the house steward. After the visitors had spent more than an hour in feasting their eyes with the treasures they beheld, Mr. Wright gave a brief historical sketch of the history of the owners and occupants of the house, quoting from the Princess Lichtenstein's book and from Leigh Hunt's charming work "The Old Court Suburb." Mr. George Lambert then read a brief paper on Inigo Jones, detailing the leading incidents in his career, and pointing out how, on his work at Holland House, he had left the impress of his studies in Italy. Mr. Loftus Brock, in some supplementary observations, remarked that in the celebrated book of plans by John Thorpe, in the Soane Museum, seen by some of the visitors to the Soane Museum, there was a plan inscribed "A House at Kensington for Sir Walter Cope, by me, J. T." That plan showed the exact amount of the work done by Thorpe at Holland House. He thought, however, that without reference to that plan it would be possible to tell which was Inigo Jones's work by the stone used. Wherever Portland stone was used, there it might be safely concluded that the work was by Jones. Before leaving the house, Mr. Wright moved, and Mr. Patrick seconded, a vote of thanks to Lady Holland for permitting them to visit the mansion, and to Mr. Lane for conducting the visitors through the apartments. All who have been privileged to go over Holland House will reciprocate the sentiment of the lines (seen by many of the visitors on Monday), written in 1811 with a diamond by the Right Hon. Jno. Hookham Frere on the glass of a dressing-room window in the east turret,—

> "May neither fire destroy nor waste impair,
> Nor Time consume thee till the twentieth heir.
> May Taste respect thee and may Fashion spare!"

Tuesday was the fourth and last day of this London outing of country members. Assembling at the Charing-cross Station of the District Railway, at ten a.m., they proceeded by train to the Fulham Bridge Station, whence they walked to

Fulham Palace.

Here the Right Rev. Dr. Jackson, Bishop of London, received the visitors, and conducted them over the older parts of the palace buildings. The oldest part of the existing buildings is what is known as the Bonner quadrangle, although it was built by Bishop Fitzjames, in the reign of Henry VII. Over the fireplace of the hall is the following inscription:—

"This hall, with the adjoining quadrangle, was erected by Bishop Fitzjames, in the reign of Henry VII., on the site of buildings of the old palace as ancient as the Conquest. It was used as a hall by Bishop Bonner and Bishop Ridley during the struggles of the Reformation, and retained its origina proportions till it was altered by Bishop Sherlock, in the reign of George II. Bishop Howley, in the reign of George IV., changed it into a private unconsecrated chapel. It is now restored to its original purpose on the erection, by Bishop Tait, of a new chapel of more suitable proportions. A.D. 1866."

Some of the rooms upstairs in the old portion of the palace, now used as domestic offices, were seen by the visitors, and found to contain some good linen-pattern panelling in oak. A question was raised whether the existing bargeboards on the gables facing the river were the originals. The oak of which they are made is certainly very much weatherworn. The new chapel, mentioned in the foregoing inscription, and erected from the designs of Mr. Butterfield, was next visited, and subsequently the library and other rooms in the palace were inspected, chiefly for the sake of the interesting and unbroken series of portraits of bishops of London, beginning with Ridley. In the grounds of the Palace the Bishop pointed out the sad havoc made by the storm of the 14th inst. No fewer than thirty-seven fine trees, many of them of great interest (including the celebrated black walnut-tree), fell before the gale. Similar disasters were met with in Holland Park, in Bushey Park, in the grounds of Hampton Court Palace,—and, indeed, almost everywhere.

Having thanked the Bishop of London for his kindness, the party left the Palace, expecting, on the faith of the programme, to find carriages awaiting to take them on to Kingston. The fortunate few who had their own private carriages were enabled to drive on to Kingston, *viâ* Wimbledon, but the great majority of the excursionists were doomed to suffer a provoking delay, for no carriages were at hand. After a time, it was discovered that, by some inexplicable blunder on the part of somebody or other, the carriages had been sent, not to the Bishop of London's Palace at Fulham, but to the Archbishop of Canterbury's Palace at Lambeth! However, the party ultimately arrived at Kingston, and the majority of them were fortunate enough to get their luncheon at the "Griffin." Just two hours late they arrived at Hampton Court Palace. It was now nearly five o'clock, and getting dusk, and as the greater portion of the Palace was closed at four o'clock, it goes without saying that the belated visitors saw very little of the building and its contents. Mr. Chart, the courteous clerk of the works at the Palace, conducted the party into the great hall, but beyond this, little could be done, and so terminated, somewhat ingloriously, what has been, on the whole, a very successful and interesting series of visits.

INTERNATIONAL COLONIAL EXHIBITION IN AMSTERDAM.

The Dutch Government is already beginning to make preparations for the holding of an International Colonial Exhibition in Amsterdam from May to October, 1883. This project is quite unique in its kind. The Dutch Government has submitted to the various powers possessing colonies the programme of the proposed exhibition. This is accompanied by remarks on the advantages of diffusing information respecting regions of the globe which are only waiting for the application of capital and technical skill to yield almost incalculable wealth. It is intended in the coming international display to illustrate by a certain class of the exhibits the growth of colonies; in short, to show what they were and what they are. The exhibition will be divided into five sections. In one of these raw materials and colonial produce generally will be illustrated. The public works and means of communication, the military and naval resources, as well as the *fauna* and *flora* of the various colonial regions, will be all well represented. Another section of the exhibition will deal with the export trade of the colonies, and here the extent to which European manufactures depend on the raw products of the colonies will be fully illustrated. The third section will illustrate the progress of art amongst colonial races, and will show the influence of civilisation upon their condition. In the fourth section will be given an exhibition of articles produced in the Netherlands which are adapted for colonial use. The fifth and last section will be an entire novelty. This division of the exhibition is intended to illustrate by a series of lectures and addresses from gentlemen of experience and authority, the best methods of developing the enormous resources of the colonies. They will also deal with the subjects of science and art, education, sanitary matters, acclimatation, and international law in reference to colonial dependencies. The economical effects of the relations existing between colonies and the mother country will likewise be the topic of special discussion.

In order to achieve the success contemplated by the Dutch Government in starting this exhibition, the co-operation of all the powers possessing colonies will be necessary. It is hoped, therefore, that Great Britain, France, Spain, Portugal, Russia, Denmark, and Sweden, —these being, in addition to Holland, the only States possessing colonies,—will cordially accept the invitation of the Dutch Government, and cause their various dependencies to be appropriately represented.

THE OLDEST GERMAN TOWN-HALL.

The oldest town-hall or "Rathhaus" of Germany appears to have been discovered at Gelnhausen, in Hessen. Not far from the Romanesque church restored for Protestant worship by Dombaumeister Schmidt, of Vienna, —of whom we speak in another article in connexion with the erection of the most recent town-hall in that city,—an undoubtedly Romanesque building has lately been disclosed. It is still disfigured and quite hidden by a flat building of framework with lean-to roof, and looks, in its present state, like a large dilapidated barn, which is partly used for stacking hay and corn, partly left to ruin. We hear that it is intended to free the building from its encumbrances, and restore it as far as possible. There is still in existence a basement with vaults of fir, a large hall over it, as well as another hall in the first story, reached by a small winding staircase. The large hall on the ground-floor is approached by a portal, still preserved, in the centre of the principal front, the left corner pillar of which stands clear, while only so much of the right-hand pillar is uncovered as enables the Romanesque capital, as richly ornamented, but differently formed, to be seen. The archivolt, half of which is disclosed, shows simply a plain thick bead in a rectangular band. The large hall, which is 43 ft. long and 29 ft. wide, and on the longest side of which is the entrance, has a ceiling of timbers resting upon wooden bearers. The latter are supported by two square and bevelled stays of oak resting upon carved brackets, the hall being thus divided into three equal portions. Traces of window railings appear to be still existing at the left gable, but at present examination is difficult.

The hall in the first story corresponds to the lower one in size, as well as regards the construction of the ceiling and the wooden bearers and stays; but here three well-preserved windows of three round-arched openings each may be noticed in the façade. As usual in buildings of that period, there are no rebates. Each window shows right and left plain rectangular soffits; the round arches are also entirely without decoration, although each is turned very regularly, and consists of three very correctly-worked arch-stones. The intermediate supports of the different windows are formed in the case of the two to the left each by two round, in that of the one to the left by two octagon chamfered pillars. The latter are very slender, a symmetrical stone corbel jutting out on both sides, forming the connexion with the rather thick walls. The profile of the corbels consists, over the Romanesque foliage capitals, variously worked, of a hollow, small perpendicular slab, and round bead with slab over it. The thickness of the wall is flush with the latter. The capitals of the columns and octagon pillars end below in angular fillets; the bases show the attic profile, with plinth underneath. On the wall opposite to the window-front may be seen also plain sandstone slabs let in, which were probably intended as a support for a fireplace, not completed.

Great hopes are entertained that, after completely uncovering the building, more discoveries of architectural interest will be made. The ground-plan, as well as the position of the building in the centre of the old free-town of Gelnhausen, close to the church and the market-place, and the style itself, are said to justify the supposition that we have to deal here with the principal remains of its former town-hall, which would, in that case, probably form the oldest municipal building still in existence in Germany. The Romanesque forms of the building point to the conclusion that it was erected at about the same time as the celebrated

palace of the Emperor Frederick Barbarossa. The latter edifice, on an island in the Kinzig, near Gelnhausen, must have been completed about the year 1146.

The romantic ruins of the palace, surrounded by pretty gardens, and overgrown by luxurious ivy, are not esteemed and visited by archæologists and tourists as they deserve. Perhaps the recently discovered interesting remains of the building which form the subject of this note will draw renewed attention to the venerable town of Gelnhausen, once the scene of much imperial splendour.

NEW ENGINEERING WORKS, BELVEDERE ROAD.

Large new buildings are at present in course of erection in Belvedere-road, Lambeth, for Mr. Brotherhood, ironfounder and engineer, whose present works are in Compton-street, Goswell-road. The site of the new buildings adjoins the premises of Messrs. Lucas Bros., and was until recently occupied by Messrs. Holland & Hannen, who have removed their works to Nine Elms-lane. The buildings, and several workshops in connexion with them, will cover an area of about 20,000 superficial feet, having a frontage to Belvedere-road upwards of 80 ft. in length, with a depth to the river, including a spacious wharf, of 260 ft. The block facing Belvedere-road consists of a building, two stories in height, in stock brick and red-brick-arched window-heads and dressings. Above an arched gateway, 10 ft. in width, in the centre of the elevation, is a handsome projecting oriel window in Portland stone. Each side of the gateway entrance to the interior of the premises is faced with white and blue enamelled brick. This block will contain the drawing-room, pattern-room, and the several offices.

From the gateway entrance to the extreme boundary of the wharf on the margin of the river an iron floor and tramways are laid down along the centre of the enclosed area within, the several fitting and other works, with machinery, being on each side of the central tramways, and having wooden floors laid on a deep bed of concrete. Above these there are also galleries on each side containing similar workshops to those on the ground-floor. The floor of the upper workshops is composed of fireproof arches, resting on ranges of strong iron columns, 18 ft. in height, with lattice ironwork in front for protection. This portion of the building is 45 ft. in height, and is covered in with a glass and slate roof supported on iron trough-girders. The foundry portion is at the west end of the premises, in immediate connexion with the wharfage space. The engine and boiler house will be at the north-west angle, with two lofty chimney-shafts overlooking the river. The foundry will be 60 ft. in height, and covered in with a roof similar to that over the fitting-shops.

The architects of the buildings are Messrs. Hunt & Stewart, of Victoria-street, Westminster, and the contractors Messrs. Smith & Co., of South-street, Grosvenor-square. Mr. G. Crane is clerk of the works.

SCHOOL AT LATHOM.

The accompanying drawings represent a school in course of erection at Lathom, near Ormskirk, for, and at the sole cost of, the Right Hon. the Earl of Lathom, the children of whose tenants and workmen will receive a free education therein. It is being erected on the site of the old school (recently demolished), which, with its thatched roof and dormer lights, was of a very quaint and picturesque character, so much so that we consider the accompanying sketch may be of interest to some of our readers, reminding them of days gone by when the children instructed within its walls were taught to form their letters in sand, kept in a box in each desk for that purpose. Some of these desks (minus the sand) were in use up to the time of its demolition, a few weeks ago. The date of its erection cannot be ascertained, but no doubt exists as to its having been in use considerably over 120 years.

The site is immediately outside, and on the west side, of Lathom Park, and with all its surroundings is beautifully situate within half a mile of Lathom House, his lordship's seat, whilst on the north side, about 100 yards away, is the vicarage, erected by Lord Lathom about four years ago. Between the site and Lathom House, within the park, stand the private chapel, alms-houses, girls' school, and mistress's house, of which the following description is given by Mr. James Dixon, of Ormskirk, in his "Historical and Descriptive Sketch of Lathom Chapel," &c. He says, "The chapel at Lathom is ancient-looking and very pretty, standing at one angle of the quadrangular group formed by the chapel, almshouses, and girls' school, with mistress's school-house, all beautifully over-shadowed by chestnut and oak trees of centuries' growth. The interior of the chapel is very neat, nicely fitted up with benches, and having a very elegant pulpit, made a few years ago, from wood saved from the now demolished Burscough Priory. An eagle, in carved wood, was also replaced in the chapel, whence it is supposed formerly to have been taken, and is now again very properly used as a lectern. The windows in the chapel are of stained glass, the production of the Hon. Mary C. Bootle Wilbraham (now deceased), eldest daughter of the first Lord Skelmersdale, executed many years ago; the subjects are floral devices and armorial bearings of the Skelmersdale family and their alliances."

The plan to the left shows the arrangement of the new building; the schoolroom is 50 ft. by 20 ft., and the class-room 20 ft. by 18 ft., the floor of which, being raised 15 in. above the level of the school floor, and extending into the school about 3 ft., forms a platform for the master's desk, &c. There are two hat and cloak rooms, each 13 ft. by 8 ft. entered from separate open porches, and each having a door opening into the school and class rooms. The materials used in the erection are, externally, red bricks (made on the estate) with a very free use of hard Longridge stone for dressings; the roofs being covered with Welsh green slates. Internally the exposed woodwork is executed in pitch pine varnished; the ceiling of the school is divided into four bays, and that of the class-room into two bays, by carved wrought and moulded principals, exposed, and springing from moulded stone corbels; means for thorough ventilation are provided in the roof. The floors throughout will consist of pitch-pine blocks, in pattern, on a bed of concrete, 6 in. thick. There will be round the school and class rooms an ornamental dado of glazed tiles, 4 ft. 3 in. high. The hat and cloak room will have a pitch-pine dado, 5 ft. 3 in. high, with hat-pegs. All the walls above the dado will be plastered. The windows throughout will be glazed with Hartley's quarry-marked glass. The class-room will be divided from the school by means of Clark's pitch-pine patent revolving shutters. The accommodation is for upwards of 200 children. The work is being executed by the contractor, Mr. Thomas Riding, of Ormskirk, from the plans (approved by the Education Department), and under the superintendence of, the architect, Mr. Thomas Kissack, of Ormskirk and Southport.

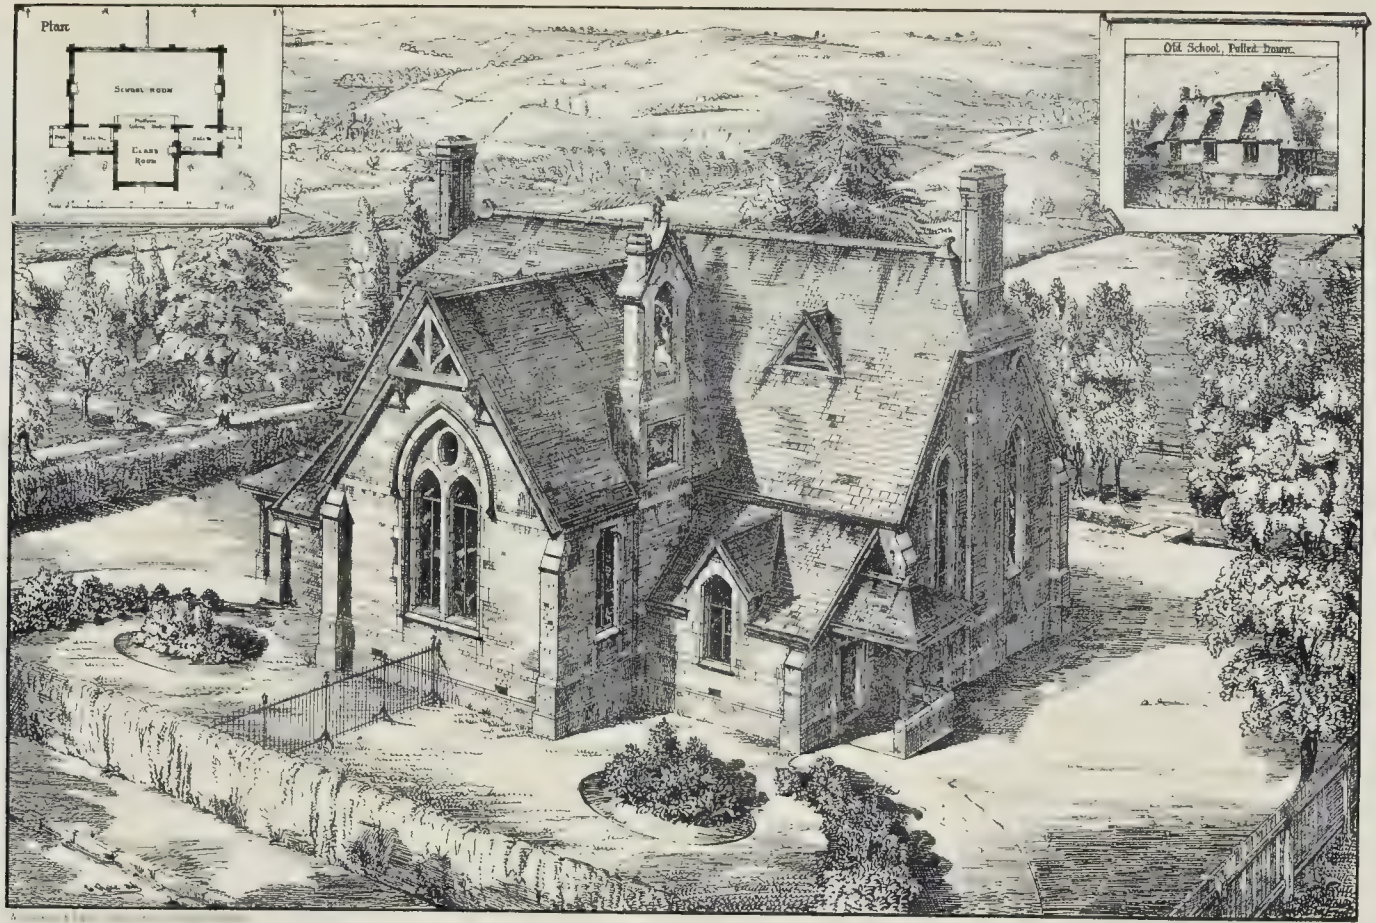
THE NEW TOWN-HALL, VIENNA.

Our readers have been kept well informed as to the large architectural works now in progress in Vienna. Foremost amongst them is the Town-hall, now making rapid progress, of which we have on various occasions spoken, illustrating a portion of it a few years ago. We now give a view of the whole, with sketches of the Banqueting Hall (on the left side), and the chapel. To prevent the necessity for reference, we repeat some of the particulars. The architect, Herr Friedrich Schmidt, now deservedly eminent in Germany, was selected in competition in 1868. His works, we may say, are very numerous. Besides the restoration of St. Stephen's (including the partial rebuilding of the tower), which he brought to its completion, he is the architect of most of the new churches of Vienna. The plans for restoring the castles of Vajda Hunyad in Transylvania, and Karlstein in Bohemia, are also by him.

The Vienna Rathhaus, which was commenced in 1872, forms a parallelogram 505 ft. long and 407 ft. broad, and occupies an area of 205,535 square feet (nearly five acres). The space inclosed by the four façades is divided by two larger and four smaller blocks into seven courts, of which the inner one extends to a length of 260 ft., and a breadth of 115 ft. throughout the entire depth of the interior space, while both to the right and left are placed three courts of various sizes. The style of the building is Gothic, with a leaning towards that development which Gothic architecture presents in Upper Italy. All the blocks have five stories; in the principal façade the two ground-stories are combined into one by an arcade. The lower stories are appropriated to the various offices most used by the public, while the principal floor contains the banqueting and other public halls, with refreshment-rooms, as well as the meeting-halls of the Town Council and the executive. The upper story is occupied by the museum of arms of the city, the archives, &c. The principal staircases are in the centre blocks.

The centre of the building projects from the front by a second row of arcades, and is raised upon a flight of fourteen steps. The tower, 351 ft. high, juts out further from the middle part. Passing through the arcades, a vaulted hall of 112 ft. long and 36 ft. wide is entered. Remarkable for their size are also the banqueting-hall, of an area of 11,645 square feet, and 44 ft. high, with an open loggia along its whole length, and a smaller room in the tower; and the great meeting-hall of the Town Council, of an area of 3,714 square feet, extending through two stories, with galleries on three sides.

All the outside façades are erected in free-stone; those of the courts, from the entresol upwards, in brick with terra-cotta ornaments. All the roofs and ceilings, with the exception of those of the halls and corridors, which are spanned by groined vaulting, are of iron.



In accordance with the views and resolutions of a commission of experts specially appointed for the purpose, the interior decoration of the town-hall is to be carried out in an historical sense. Allegory is to be avoided as much as possible. The decoration has been confided to old and young artists alike, with whose work no special fault can be found. Hans Makart is to paint three frescoes for the ceiling of the banqueting-hall (Reconstruction of Vienna; Science and Arts; Commerce, Traffic, and Trades). At the window-piers will be placed statues of historical personages renowned in the annals of Vienna (for instance, Starhenberg, Solm, &c.), and over them mosaics (portraits of Beethoven, Mozart, van Swieten, Raffaelle, Donner, Grillparzer, &c.). The statues will be the works of the sculptors Weyer, Tilgner, Wagner, and others; the mosaic portraits will be executed after cartoons by Trenkwald, Julius Schmidt, and other artists. The space above the orchestra will be filled with medallion portraits of Raimund, Schubert, Strauss, &c. The ceiling of the hall of representatives will contain a picture of the siege of Vienna by the Turks, by the battle-painter, S. L'Allemand. The council-chamber of the municipality will have a frieze-like decoration in the form of a series of pictures representative of the history of Viennese life (for example, the opening of the Prater at the time of Maria Theresia) by K. Karga and Jul. Berger. The refreshment-room receives a frieze by Professors Laufberger and E. F. Steinle. A life-size portrait of the emperor, by H. v. Angeli, will be placed in the hall of representatives.

CRICKET PAVILION, PETERSFIELD.

This pavilion, recently completed, has been erected by public subscription in the picturesque locality of Petersfield Heath, for the Petersfield Cricket Club. The building is constructed with split fir-poles, the bark being left on. The whole is carried upon a brick and concrete foundation. A continuous oak sill rests upon the wall at the ground level, into which the uprights forming the superstructure are securely framed. The interior is lined with 1½-in. framing, the panels being filled in with 1-in. beaded boarding. The roofs are covered with "withy chips" about 1 in. wide, ½ in. thick, and 1 ft. 6 in. long, fixed in the same manner as ordinary thatch; the ridges being capped with straw.

The building was erected by Mr. J. Maxwell, under the superintendence of the architect, Mr. John Luker, of London and Petersfield, at a total cost of 190*l*.

Crystal Palace School of Gardening.—Mr. F. A. Fawkes (author of a work on Horticultural Buildings, lately mentioned in our pages), is to give a course of three lectures to the students and the public at the Crystal Palace on November 16th, 23rd, and 30th, at five p.m. The lectures will treat of horticultural buildings, their details of construction, fittings, heating, and so forth.

BUILDING NOTES FROM THE WEST OF ENGLAND.

The building trade in the West of England is, if anything, rather better than it has been. The improvement is nothing remarkable, but prospects look healthier than formerly. Amongst various matters which have been engaging attention may be mentioned the following:—

The foundation-stone of St. Saviour's, Woolcott Park, Bristol, was laid a few days ago. For several years an iron building has been in use, and the one which is to supersede this is in the Early Pointed style. The exterior walls are of Pennant stone, with Bath stone dressings. At the west end and springing from the gable will be a bell-turret, rising 80 ft. from the ground; it will have at its apex a canopied niche, containing a figure of Christ the Good Shepherd. There will be little attempt at ornamentation. The interior will consist of nave, north and south aisles, chancel, organ-chamber, vestries on the north, and a transept on the south side. The width of the nave from wall to wall will be 54 ft., and from the chancel to the western extremity the length will be 93 ft. The height to the apex of roof will be 58 ft. The chancel is to be 38 ft. long by 25 ft. wide, and 52 ft. high. The chancel arch will be 20 ft. wide, and 38 ft. high to its keystone. Dividing the nave from the aisles on each side, six arches, with carved capitals and of bold design, will be erected. The total cost of the work is estimated at 4,839*l.*, and the new church will provide seats for 834 persons. Mr. John Beaven is the architect, and the contract has been taken by Mr. Cowlin.

The council of Bristol some time ago decided to erect a new bridge crossing the Avon from Bedminster, a parish of about 30,000 inhabitants. Mr. Ashmead, the city engineer, has just completed his plans for the new structure. His designs are for a bridge with bow-string or lattice girders, one on each side of the bridge, the roadway being supported by cross girders. The rise of the present bridge would be reduced 1 ft., and the width and strength would be considerably greater. The Corporation have approved of the plans and fixed the width at 40 ft. for the carriage-way, and 7 ft. for the pavements.

On October 13th, an addition to the many fine churches in Bristol was opened—St. Mary's, Tyndall's Park. The building has been carried out in instalments, the foundation stone having been laid as long ago as November, 1870. The church is now complete, with the exception of the tower. It is in the Decorated style of the middle of the fourteenth century, and is built of local sandstone. The chancel is 39 ft. long, 24 ft. wide, and 58 ft. high to the apex of the roof. The east window, of tracery work, measures 25 ft. by 15 ft., and contains five lights. The transepts, which are 21ft. 6in. long and 18ft. wide, project from the chancel, into which they open by arches springing from clustered shafts of serpentine, bearing carved caps. The chancel arch is 22 ft. wide and 35 ft. high, the jambs being shafted with polished red Dartmoor granite. There are also western arches from the transepts to the nave aisles, each 11 ft. wide and 14 ft. in height. The full length of the nave is 84 ft., and it is 26 ft. wide, with four bold arches on each side 22 ft. high and 20 ft. wide, springing from circular shafts with moulded bases and carved caps. The arcades support the clearstory, with a three-light window over the apex of each arch. To the apex of the roof the height of the nave is 64 ft. On each side of the nave are lean-to aisles, 12 ft. in width. The north window is of stained glass by Messrs. Burlison & Grylls, of Newman-street, London, the subject being Our Lord in his Subjection to his Parents. Some of the internal carvings, by Mr. E. Sheppard (Bristol) from his own designs, are very effective. The cost of the third instalment of the work has been 3,700*l.*, and about 2,000*l.* are required for the tower. The cost of the two first instalments was large, and 1,000*l.* were paid for the site. Mr. J. Piers St. Aubyn was the architect for the work, and Messrs. Stephens & Bastow were the contractors for the concluding portion.

Rather a novel claim, interesting to builders, has occupied the attention of the Gloucester county magistrates. The Gloucester Highway Board charged Mr. Albert Estcourt, builder and contractor, 41*l.* 13*s.* for extraordinary traffic on the roads. The builder was carrying out a contract of 10,000*l.* for the erection of additional buildings at the Barnwood House Asylum, and it was alleged that the extra wear of the roads had resulted from the hauling of his building materials. Other builders had also caused extra wear, and it was understood they would, if the Board gained their point in this case, have claims sent to them. It was stated that 313 extra tons of stone had to be used in road repairs in consequence of the extra traffic. It was contended that Mr. Estcourt's traffic was not such as was intended by the Legislature to be termed "extraordinary," and the magistrates dismissed the claim of the Highway Board.

A new Jews' synagogue has been opened at Uplands, Stroud.

The engineers of the Great Western Railway have been examining the ground for a new line from the Quaker's-yard Junction, on the western side of the Taff Valley, up to Merthyr. The chief object is said to be to get access to some extensive collieries.

A new coffee hotel, erected at a cost of 3,300*l.*, has been opened by the Bishop of Bath and Wells, at Taunton. The building is for the Taunton Coffee Tavern Company, Limited. Mr. C. H. Samson was the architect, and Mr. Templeman the builder.

As stated in the *Builder* a month ago, efforts are being made to provide a new pier for Weston-super-Mare. Two plans have been obtained since then, and each proposes a pier a mile and a quarter in length, this great length being necessary to obtain a depth of 7 ft. of water at low tides. The plan of Messrs. P. Munro & Son, Bristol, proposes an octagonal head and 129 spans of 59 ft. each, measuring from centre to centre of the columns. All the girders in the elevation of the pier would be continuously connected, and would be furnished at each end with a pair of vertical angle-irons, and bolted together with six bolts, a piece of felt soaked in tar being inserted in the joint. The abutments and wing-walls would be of local stone, set in cement. The pier-head would be supported on piles. The cost Messrs. Munro put at 40,000*l.*, exclusive of expenses of promotion. Mr. Scoones (Bristol), who supplied the second plan, estimated the cost of a pier built in the ordinary way at 60,000*l.* or 70,000*l.*, but the special method of construction he advocated he estimated at 38,225*l.*; this amount including the pier, tramway along it, landing-stage, refreshment-room, bazaar, and band-stand. The engineer does not propose one continuous structure, but says additional safety would be obtained by dividing the length into eight spans, each of which would be stronger than the rest of the pier. The materials would be wrought iron, and the structure on the trussed principle successfully adopted in America. The matter has been referred to a committee to see if there are any legal difficulties in the way of a new pier.

A new church institute has been opened in Weston-super-mare, the total cost of which, with site and furnishing, was 2,300*l.*

The Masonic Hall is another new building just completed in the same town. Messrs. Hans, Price, & Wooler were the architects, and Mr. S. T. Harvey was the builder.

A Methodist Free Church schoolroom has been commenced at St. George's, Gloucestershire. It is of Pennant stone, with freestone dressings. It matches the chapel it adjoins, and the cost will be about 1,000*l.*

The foundation-stone of a mission-room in the Dings, Bristol, has been laid. The cost will be 650*l.*

NEW HIGH SCHOOL FOR BOYS AT OXFORD.

The New High School for Boys, situate in New Inn Hall-street and George-street, Oxford, was formally opened on the 15th ult. (as already briefly mentioned by us). We quote from the *Oxford Journal* some particulars of the building. The site, buildings, and other property of the school are vested in the Corporation of the city, in trust for the purposes of the school; but if the school should ever cease to be used as such, then the buildings and site revert to the Corporation, to be held by them for municipal purposes. The school is to be open,—without regard to social position or religious opinion,—to all boys residing in Oxford and the neighbourhood who shall have attained the age of eight years, are of good character, able to read simple narrative, and write text hand, and show some knowledge of the first four rules of arithmetic. There are reserved fifty Free Scholarships, which are tenable for three years, and are to be filled up as the funds at the disposal of the Governors allow. Thirty of these Free Scholarships are to be held by boys under twelve years coming from the elementary schools of the city. The remaining twenty are to be held by boys already in the school, of ages set forth in the scheme. The Scholarships are to be competed for on examinations, for which due provisions are made in the scheme. The site, which was provided by the Corporation free of charge, lies between New Inn Hall-street, George-street, and Bulwark's-alley, and is bounded on the south by the old city wall and bastion. The chief access for the boys is from New Inn Hall-street, whence they at once reach the playground. The chief face of the building fronts George-street. The Governing Body, before determining on an architect, invited three gentlemen to send in designs, and eventually entrusted the designing of the buildings to Mr. T. G. Jackson, M.A., of Wadham College, Oxford. Keeping in view the limited funds at present at their disposal, the Governing Body resolved to build at first only the principal school-room and four class-rooms; and as soon as the specifications and quantities for this portion of the proposed buildings were complete, they invited tenders from thirteen builders in Oxford and elsewhere, and accepted that of Mr. C. Claridge, of Banbury, amounting to 7,480*l.*, which was the lowest. The building has a frontage to George-street of about 120 ft., and is recessed to form a forecourt, behind which is the principal block, occupying the whole width of the frontage, and containing four class-rooms, below which is a hall about 84 ft. by 28 ft., and a projecting building in front, containing the principal staircase and entrance porch, with a Decorated gable and lanterns above. There is a second staircase at the west end of the hall, with an entrance from the south. For the present this building will not be carried beyond this point, but according to the plan, a long wing containing class-rooms and corridors will ultimately extend westwards, behind, and parallel to the houses in George-street. By this arrangement of the building, a large extent of ground will be left available for a playground between the school buildings and the old city wall, with an entrance from New Inn Hall-street and another from Bulwark's-alley. The plan, when completed, will include a house for the head master, and possibly new Science and Art Schools may be built on a part of the site, for the use both of the High School and of the townspeople generally. The great hall is panelled with wood to a considerable height, and the doorcases are surmounted by the city arms. A large fireplace and chimneypiece form the principal feature of one end, designed more for the appearance of comfort that an open fire gives than for actual necessity, for the whole building is fitted with hot-water pipes, and artificially ventilated. The city arms also appear sculptured on the George-street front, with the mottoes of the town and the University, "*Fortis et Veritas*" and "*Dominus Illuminatio Mea.*" In the gable above is a large enamelled clock-face, and the whole is surmounted by a lantern containing the clock-weights and the bell.

Messrs. Farmer & Brindley have executed the carving; Messrs. Haden, of Trowbridge, supplied the heating and ventilating apparatus; and Mr. Rowell, of Oxford, the clock.

PROPOSED TREATMENT OF LONDON SEWAGE.

At the meeting of the Metropolitan Board of Works, on the 14th inst., the Works and General Purposes Committee presented a report as to a letter from Mr. C. Deavin, regarding some suggestions made by him for dealing with the sewage of the metropolis, so as to minimise as far as possible the pollution of the Thames. Mr. Deavin proposes that in the neighbourhood of the main drainage outfalls a series of reservoirs should be constructed, sufficiently large to receive, say, a daily discharge of the sewage. On the banks of the reservoirs should be placed at certain intervals lime-kilns for burning a sufficient quantity of lime to disinfect the sewage. When the reservoirs were fully charged with sewage the lime should be shot into them, and "by some mechanical contrivance propelled by steam," the lime and the sewage could be mixed together, and when the mixture had settled, the watery portion could be passed into the Thames, while the sediment or sludge at the bottom of the reservoirs might be lifted by machinery into

tanks constructed of iron placed on the top of the kilns, the fire beneath being utilised for drying the sludge, which would then be reduced to a portable state and utilised for fertilising purposes.

The Works Committee recommended that Mr. Deavin be informed that the Board do not consider that past experience would justify the adoption of the process which Mr. Deavin suggests.

The report was adopted, after some discussion, in the course of which Mr. Richardson said that, sooner or later, the Board would have to do something in regard to this question. He should have liked to have Mr. Deavin's proposal referred to the chemist for consideration.

The Works Committee, we believe, acted on the advice of the Engineer of the Board, Sir Joseph Bazalgette, who pointed out that the lime process of precipitation was no new thing, having been in operation, with more or less success, for the last thirty or forty years, but that in every instance it had been attended with great cost, and the residue was not of the value supposed by Mr. Deavin.

NEW SCHOOL BUILDINGS AND MISSION ROOM IN KENNINGTON.

Two large blocks of new buildings are at present in course of erection in Camberwell New-road and James-street, Kennington, in connexion with the Church of St. John the Divine, Vassall-road, to which there are already attached middle-class and parochial schools, together with a spacious mission chapel, all of which have, from time to time, been erected at a considerable outlay, in addition to the handsome church itself (from designs by Mr. G. E. Street), which, although the tower and spire have not yet been built, has already cost about 20,000*l*. The new buildings in question consist of an enlargement of the existing schools in Camberwell New-road to about double their present dimensions, by the erection of a block containing two additional school-rooms, 40 ft. by 25 ft. each. The other block, having its main frontage to James-street, and in immediate contiguity to the school buildings just referred to, consists of an entirely new and distinct building, containing an infants' school and class-rooms on the ground-floor, and a spacious mission-room on the floor above, the building likewise including a convenient residence for the caretaker in charge of the several schools. The building, which is faced with stock brick and red brick dressings, has an elevation to James-street upwards of 70 ft. in length, and is in the Gothic style of architecture, surmounted by three lofty gables, two of which are 45 ft. in height, the gable at the south end of the block, which contains the caretaker's residence, rising to a height of 55 ft. It has a high-pitched roof, in which there are three dormers. The mission room is 25 ft. in height, and is lighted by two three-light windows in the James-street frontage, and a large four-light window at the north end, the lower portion of the three dormers above-named also contributing to light the room, whilst the upper portion serves ventilating purposes.

Mr. F. W. Hunt, of Upper Baker-street, is the architect; and Mr. Tyerman, of Walworth-road, the contractor. Mr. A. Cox is clerk of the works, and Mr. G. S. Double the foreman. The cost of the buildings will be about 6,000*l*., which it is stated will be defrayed by the Rev. C. E. Brooke, the vicar of St. John's, at whose expense, mainly, the church and other buildings in connexion with it have been erected.

BIRMINGHAM.

One of the most recent additions to the architectural features of this town, the new Central Arcade, extending from Corporation-street to Cannon-street, is now completed. It has been erected for the proprietor under the superintendence of Mr. W. H. Ward, architect, the style adopted being a free treatment of the Renaissance. The whole of the interior is faced with stone, with the introduction between the shops of granite pillars; and springing from these at the top of the Arcade are some light iron principals, carrying a roof, which is filled with stained glass. There is a liberal decoration in gold and colour on the flatings and frieze. The shops are convenient, and the offices above have easy access from the street. Underneath the shops, with entrances both from Corporation-street and Cannon-street, is the new Central Restaurant and Grill-room, which is lighted by means of a glass and iron roof, which forms the floor of the Arcade. There is a double row of gas-pendants on each side of the avenue, and each pendant is furnished with an opal lamp. In addition to the ordinary lights in the Arcade, there are clusters of lights at each entrance.

The contract for the erection of the building has been carried out by Mr. J. Garlick. The whole of the glasswork was erected by Messrs. J. & O. C. Hawkes, of Bromsgrove-street; and the ornamental wrought-iron gates were manufactured by Mr. T. Brawn, of Clement-street.

SLATE QUARRYING.

At the last meeting of the Liverpool Engineering Society, at the Royal Institution, Colquitt-street, a paper on "Slate Quarrying" was read by Mr. C. H. Darbishire, Assoc.-M. Inst. C.E. It dealt chiefly with slate quarrying as carried on in the Nantle Valley, and the several beds or veins of slate that are worked therein. The author commenced by alluding to the rock as having been formed of great deposits of mud in water, composed chiefly of silica and alumina, which have been subjected to immense pressure and volcanic convulsion. The split of the slate is attributed in a great measure to the effects of the great pressure. The paper further described the several means of opening quarries whether on the hill sides or on the flat, and alluded to the different lifting apparatuses in common use, advocating inclines instead of the old-fashioned guide-ropes and hauling-chain. Attention was called to the system of bargains, under which practically all roofing slates are made, as well as the duties undertaken by the rock-men and quarry-men respectively, and their tools. The ordinary sawing machinery was described, as well as the dressing-machines in vogue, preference being given to the one invented by the late Mr. Greaves. The explosives mentioned were powder, nitro-glycerine, dynamite, and gun-cotton, all being more or less employed, with the exception of nitro-glycerine, the use of which has now been almost entirely abandoned. In pure slate the common black powder only is burned. The author concluded by pointing out that a quarry venture is not necessarily a success because there happens to be some good splitting slate found therein, but thought that if sufficient good rock is found few ventures are so safe or so lasting.

THE EAST-END BRIDGE PROJECT.

Some of the ward associations interested in the East End are taking steps with the view of again bringing the subject of a new bridge east of London Bridge before the public authorities, and last week a deputation from the Aldgate Ward Association discussed the matter at a meeting of the Portsoken Ward Association. It was urged that, as the Inner Circle Railway was now in a fair way of being completed, it was time that the East End of London should be benefited by the erection of an eastern bridge. Mr. Lefevre, C.E., who formed one of the deputation, said he appeared there as a member of his association, and not as an engineer. In supporting the project, however, he made some remarks of an engineering character, expressing himself in favour of a low-level bridge, which he asserted could be swung round by means of electricity in about half a minute. In the discussion which followed, the necessity for the construction of the bridge was strongly urged, and a resolution was adopted to the effect that it was desirable that a bridge should be erected as quickly as possible east of London Bridge.

The Meetings of the Institution of Civil Engineers will be resumed on the 8th day of November. There will be twenty-six meetings during the ensuing session, and these will be held weekly until the end of May. The Institution is now in telephonic communication with the Exchange System of the United Telephone Company, and its registered telegraphic address is "Institution, London." There has lately been forwarded to the members of all classes the sixty-sixth volume of the "Minutes of Proceedings," being the fourth, and concluding, part for the present year, as well as a Subject-matter Index to the whole of the publications of the Institution, from 1837 to the end of the session 1878-79.

THE PROSPECTIVE UTILISATION OF GAS.

In view of the introduction of the electric light for illuminating purposes there appear strong reasons for believing that gas will at no distant day be utilised for several other purposes besides that of lighting, which, however, it may be expected long to retain. At the half-yearly meeting of the London Gas Company, held last week, the Chairman observed that in spite of the electric light the company had, in the half-year under review, had an increase at the rate of 3 per cent., whilst, in the quarter just expired the increase had been 4¼ per cent., which seemed to show that the electric light was greatly beneficial. The directors, he remarked, found that the use of gas for engines and cooking purposes was greatly increasing. Up to Lady Day, 1880, they were supplying twenty-five engines, but at the present time the number was between fifty and sixty. At the date named they had also forty cooking-stoves heated by their gas, whilst the number was now fully 2,000. Altogether they had some 3,000 machines of different sorts running in their district, independent of lighting, and the number was increasing almost daily. He added that they had received that day an application from one of the electric light companies for the supply of an eighty-light meter. He did not know what they were going to do with it, but this fact demonstrated that even the electric light companies could not do without the use of gas.

THE ST. GEORGE THE MARTYR BATHS AND WASHHOUSES.

There appears to be a probability of the remaining wing of old St. Thomas's Hospital being converted into baths and washhouses for the parish of St. George the Martyr, Southwark. Several years ago the Baths and Washhouses Act was adopted by the parish, and commissioners under the Act were appointed, but hitherto they have not been able to acquire a site, although several have from time to time been named, including a portion of the sites of the old Queen's Bench and Horsemonger-lane Gaol respectively. It is new, however, stated that the owners of the old hospital buildings still standing are willing to dispose of them with the view of their undergoing reconstruction for bath and washhouse purposes, and that negotiations are now going forward between the Commissioners and the owners of the disused hospital, which are likely to result in the purchase of the buildings by the Vestry, and their immediate conversion into public baths.

OBITUARY.

Sig. Raphael Monti, the Sculptor, died in London on Sunday last, aged sixty-three. A native of Milan, he studied sculpture under his father, Gaetano Monti, and at an early age won the Gold Medal of the Imperial Academy in that city by a group of "Alexander Taming Bucephalus." His next considerable work, "Ajax defending the body of Patroclus," was exhibited before he was grown up. Between 1838 and 1842 he resided at Vienna, and between 1842 and 1847 was occupied with several groups designed to add to the attractions of Milan. In the last-mentioned year he came to England, where his "veiled statue," executed at the instance of the Duke of Devonshire, elicited high praise. Returning soon afterwards to Milan, he gave in his adherence to the popular party, and in 1848, as one of the chiefs of the National Guard, was sent on a mission to the camp of Charles Albert. The war over, he again came to England, and from that time devoted himself to his art. His decease is much lamented by his friends and pupils.

St. Leonard's-on-Sea.—With reference to the building here mentioned last week (p. 497, *ante*) as "A New Hospital for Poor Children," we are informed by the architects, Messrs. Fowler & Hill, that its right designation is the Convalescent Home for Poor Children. The institution is not a new one, having been in existence some years, and was established to afford good air and nourishment to convalescent children from London and other large towns, who have been suffering from non-infectious maladies.

PROJECT FOR A SECOND THAMES TUNNEL.

At the meeting of the Metropolitan Board of Works on the 14th inst., a letter was read from the Limehouse District Board of Works submitting for the consideration of the Board a plan (suggested by the Surveyor of the Limehouse District) of a proposed subway communication between the north and south sides of the river eastward of London Bridge. The proposed subway would form a communication between the Commercial-road East and Lower-road, Rotherhithe. The subway is proposed to be constructed as a double tunnel, each passage sufficient to accommodate one line of vehicles, with frequent communication between the passages, which, it is suggested, should be lined with white glazed bricks, and lighted by the electric light. There would be two shafts near the river, one on each side, for the ascent and descent of foot-passengers. On account of the difference of level on the north side, it is proposed to approach the tunnel "by two elliptic spirals of a diameter of 550 ft. and 480 ft. respectively." The length of the proposed subway on the south side of the river would be 1,317 yards; under the river, 392 yards; and on the north side, 1,802 yards,—making a total of nearly two miles. The gradients of the subway would vary from 1 in 90 to 1 in 50.

The letter was referred to the Works Committee for consideration and report.

THE ANGLO-AMERICAN ELECTRIC LIGHT COMPANY'S OFFICES.

Within the last few days the Anglo-American Electric Light Company have opened the new office buildings which have just been erected for them on the east side of Belvedere-road, immediately in front of the company's works, and close to where the Charing-cross section of the South-Eastern Railway crosses over that thoroughfare. The building has a prominent frontage to Belvedere-road containing three floors and a basement, and is about 80 ft. in length. The materials of the building are white and red brick, with Portland cement dressings, and in that material, between the second and third floors, is the following inscription:—"The Anglo-American Brush Electric Light Corporation, Limited, Victoria Works." The general offices of the company are on the ground-floor, the manager's and engineer's offices being on the floor immediately above. The board-room is also on this floor, and is the principal apartment in the building. Its dimensions are 30 ft. by 18 ft., and it is the only room in the building which will be heated by the ordinary fire-stove, all the other apartments being intended to be heated by hot-air pipes. The offices will be illuminated throughout by the electric light.

Mr. J. Tillott, of Basinghall-street, is the architect of the building, and Mr. W. Brass, of Old-street, is the contractor, Mr. Weston being clerk of the works.

ASPHALTE AS A DAMP PREVENTER.

An interesting example of the application of Claridge's Asphalte to keep down damp is to be seen in South Audley-street, near Chesterfield-gardens, where the erection of a large house, from the designs of Messrs. Crickmay & Sons, has just now been commenced by Messrs. McLachlan & Sons. The soil in the immediate neighbourhood is affected by land springs, and in this particular case, moreover, the basement is taken down much lower than adjoining basements, so that the water-course was cut and made itself evident in various parts. Extra precautions were, therefore, necessary to secure dryness, and these have been taken. The whole site of the mansion is covered with Pyrimont Seyssel asphalte, of fine quality, ½ in. in thickness, carefully laid by the company's workmen on a bed of cement concrete. The foundation walls are built on the asphalte. The footings of the walls are covered on the outside, and the outside face of walls is covered up to ground level. The building may be said, as to foundations and road level, to be built in a huge cistern of brickwork, having a ½ in. floor of asphalte all over it, and under footings, carried up the two sides and two ends externally with a like thickness of asphalte; in all to the extent of about 7,500 ft. super. Later on the building will have a flat roof of tile arches, covered with asphalte.

Mr. Farrell, on the part of the company, has just now issued a little book, entitled "On the Uses and Fireproof Properties of Claridge's Patent Asphalte," which gives a list of the purposes to which it may be advantageously applied, and describes, with diagrams, the modes of application. We find quoted in it favourable opinions of the material expressed by ourselves more than a dozen years ago, and more recent experience has in no degree changed these opinions. Care should, of course, be taken to ensure the use of the right material.

DEMOLITION OF ILLEGALLY-BUILT HOUSES.

For some time past a dispute has been going on between the Camberwell Vestry and Mr. Nunn, the Vestry's complaint being that Mr. Nunn was contravening the provisions of the Metropolitan Building Act by erecting a number of houses in Choumert-road, Peckham, beyond the authorised building line. Mr. Nunn was summoned by the surveyor before Mr. Ellison, at the Lambeth police-court, when, on the case being heard, the magistrate ordered the terms of the Building Act to be complied with, and in the event of the order not being obeyed, he authorised the Vestry to demolish the houses. Mr. Nunn not having conformed to the magistrate's decision, the Vestry have taken the matter into their own hands, and at last week's meeting the General Purposes Committee reported that the surveyor had carried out the order of Mr. Ellison by having the houses demolished. Mr. Sugden observed that they were all pleased at the fact that the surveyor had vindicated the law, and that determination had been shown that Mr. Nunn should not set them at defiance; but he thought that the Vestry should show sympathy with one of the tenants on the estate, who had greatly suffered in consequence of the course which the Vestry had been compelled to take. Mr. Middlemass, in reply, said the tenant's action was against Mr. Nunn and not against the Vestry.

PATENT RECORD.*

APPLICATIONS FOR LETTERS PATENT.

4,219. J. Hill, London. Securing knobs to spindles for door-locks, latches, &c. Sept. 30, 1881.

4,226. C. Hook, Bridgwater. Window-sashes and frames. Sept. 30, 1881.

4,257. J. Wadsworth, Manchester. Gas-heating stoves, &c. Oct. 1, 1881.

4,270. E. A. Brydges, Berlin. Pneumatic method of constructing foundations for the piers of bridges and other structures. (Com. by G. Gregersen, Buda-Pest, Hungary.) Oct. 1, 1881.

4,297. B. D. Healey, Brighouse. Asphalte apparatus. (Com. Spec.) Oct. 4, 1881.

4,335. W. R. Kinipple, Westminster. Construction of harbours, breakwaters, docks, &c. Oct. 5, 1881.

4,342. T. Fletcher, Warrington. Gas stoves for heating purposes. Oct. 6, 1881.

NOTICES TO PROCEED

have been given by the following applicants, on the dates named.

Oct. 4, 1881.

2,351. T. A. Brocklebank, London. Putting together steps or stairs, flooring, &c. May 28, 1881.

2,453. J. Herd, Birmingham. Roadways, pavements, &c. June 3, 1881.

3,863. G. Jobson, Derby. Ornamental tiles, &c. Sept. 6, 1881.

Oct. 7, 1881.

2,628. W. W. Beaumont, Camberwell, and J. Wellman, Poole. Apparatus for dressing and cutting stone, &c. June 16, 1881.

3,629. C. Drake, Battersea. Baths. Aug. 20, 1881.

3,911. J. Wetter, New Wandsworth. Reflectors (Com. by W. Wheeler, Massachussets, U.S.A.) Sept. 9, 1881.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending October 8, 1881.

529. B. C. D. Greenhill, Puriton. Machinery for pressing with perforations bricks, tiles, &c.

A cube of clay is pressed into a die by a lever or wheel which acts upon an eccentric, and the same motion simultaneously brings down a series of plungers which perforate the brick. The reverse motion liberates the perforated brick. Feb. 8, 1881. Price 4d.

778. E. O. Mundy, Stratford. Valves or apparatus for preventing waste of water.

A hollow ball of indiarubber works in a guide covered with perforated metal. The lower valve is kept in position by a guide tube working in a bridge piece in the seating. The hollow piston-rod above the ball carries two metal hemispheres, the upper one being fixed and the lower one loose to press into the ball and make it of a cup shape. There is a small hole into the hollow piston-rod between the two hemispheres, and when the rod is raised, water flows through the hole in the ball and fills it. When the rod is depressed, the hole is closed and the water flows out of the ball through the lower guide tube. Feb. 24, 1881. Price 6d.

822. B. C. Cross, Dewsbury. Socket-pipes for sewers and drains.

To keep the lower edge of the pipes for sewers and drains in one and the same straight line when laid, the under side of the pipe is equal in thickness to the combined thicknesses of the other side and the socket. Feb. 28. 1881. Price 4d.

861. W. Morgan-Brown, London. Devices for hanging doors and blinds.

To allow sliding doors which are hung on pivoted levers to remain in the position in which they are placed, without a tendency to return to the position in which the levers are in equilibrium, the truss-formed levers are attached together centrally, and one is connected to the door-post and attached to a guide on the door, while the other is connected to the door and guided on the post. A kind of parallel-motion device is also applied to guide the latter lever in its movement. (Com. by E. Prescott, Rockingham, U.S.A.) March 1, 1881. Price 6d.

875. H. Faija, Westminster. Treatment of concrete and cement for building, &c.

After the concrete or cement is mixed or gauged in the required form, to enable it to be speedily used, it is placed in a chamber into which steam is admitted. It is then subjected to the action of a warm bath of sea-water, or a warm silicate of soda or potash bath. In order to accelerate the induration, concrete or cement may be mixed with alkali or silica or salt in solution. March 1, 1881. Price 4d.

906. G. L. Sutherland, Manchester. Stoves and fireplaces.

The sides and back of the stove have air-warming chambers, which are provided with horizontal partitions, to cause the air to take a circuitous course when flowing through. The two side-chambers are divided into compartments, and these compartments and the back chamber are connected together by arched pipes, round which the heated gases from the fire flow. These gases are caused to flow through a chamber containing water, to deposit the soot therein. March 3, 1881. Price 6d.

912. R. Adam, Southwark. Window-sashes fan-lights, &c.

To make vertically-sliding windows revolve on centres to facilitate cleaning and repairing, the beads between which the sashes slide are movable, and the sashes are hung on pivots which bear in supports which slide between the beads. March 3, 1881. Price 6d.

926. G. Maw and A. Maw, Broseley. Decorating bricks, tiles, pottery, &c.

A mould is made by casting in plaster, metal, &c., of the decoration to be used, and with this mould is pressed the surface of the article either with plastic clay or by the dry or dust process (Prosser's system). The article is then fired and decorated by coloured glazes or enamel. "Mosaic tiles" are produced by moulds, into the depressions of which clays of various colours in the dust state are introduced, backed up with the necessary thickness of dust and submitted to pressure, which consolidates the separate tesserm with the backing, and forms the tile, which is then fired. March 4, 1881. Price 2d.

928. E. E. Lucas, London. Ball-valves.

This valve consists of a circular recessed chamber with a seat at the bottom, in which is a mushroom-valve. The ball lever is jointed at the bottom of the valve and the end turned over so as to resemble a cam. As the water in the cistern is lowered this cam raises the valve. (*Prov. Pro.*) March 4, 1881. Price 2d.

THE BEER MAUSOLEUM.

With reference to the correspondence in our issue of October 8th,* we have received another letter from M. Bouwens, of Paris, in which he objects to Mr. J. O. Scott's assertion that the monument is a joint work, and desires to submit the question to a jury of distinguished artists. We must, however, decline interfering farther in the matter.

Ladies' Sanitary Association.—A second series of nine lectures on "Domestic Sanitation" will be delivered by Dr. Richardson, F.R.S., in the lower hall, Exeter Hall, Strand, during October, November, and December. In this course of lectures the structure and functions of the nervous system of man will be presented. The physical and mental training of the young will be considered in this division. The lectures will be illustrated by the oxy-hydrogen lantern. The first lecture will be delivered on Saturday, October 22nd, at five p.m., and will be continued on the following Saturdays until December 17th. Six prizes will be awarded to the most proficient students.

* See p. 466, *ante*.

DALWOOD CHURCH.

The parish church, a building of the fifteenth century, consisting of west tower, nave, north aisle, chancel, and north chantry chapel, has just been reopened. The gallery under the tower has been removed and the tower arch opened out. The north arcade wall of the nave has been rebuilt, and all the old stones re-used; new roofs covered with Portmadoc slates (the ridges of red tiles) have been put to the nave and chancel, with deal wagon-headed ceilings, the chancel ceiling being the richest. Moulded ribs divide them into panels, with carved oak bosses at intersections of the ribs. A few of the old bosses have been re-used in the nave. The north aisle, roof, and ceiling have been repaired. The modern pews have been abolished, and the body of the church fitted with stained deal open benches. It will now accommodate 200 persons. To the chancel English oak stalls have been put. The Jacobean oak pulpit has been cleaned of paint and re-set on a new base of Ham Hill stone. The new altar-rail is of oak, in wrought-iron metal standards. The chancel pavement is of Godwin's encaustic tiles, specially made for the architect. The chancel arch, which had been cut away, has now been replaced by a new arch of Beer stone (the material employed in the old part of the church). The walls have been re-plastered and cleaned, and all the doors and windows repaired. The glazing is of cathedral rolled glass in various tints, and clear white glass in ornamental lead quarries. To heat the building Porritt's Underground Stove has been employed. About 1,000*l.* have been expended on the works described, which have been carried out in two contracts, by Messrs. Hutchings & Berry, and by Mr. Berry, of Honiton. The plans were originally prepared by the late Mr. Ferrey, F.S.A., and Mr. B. Edmund Ferrey, the work having been superintended by the latter.

STAINED GLASS IN GERMANY.

The *Gartenlaube* has given prominence to the belief that English stained glass has acquired its present position by the following as nearly as possible of the technicalities of the art as practised by its original founders, thus producing the full colour and peculiar general effect of Mediæval work. The attention of the artistic world has, during the last few years, been given, in a somewhat important degree, to the question of stained glass generally, much information having been brought to light by the researches connected with the celebration, in 1879, at Tegernsee in Bavaria, of the nine-hundredth anniversary of the stained-glass factory at that place, the establishment of which is attributed to Count Arnold of Vohburg, and Gonzbert, Abbot of Tegernsee. From this spot the knowledge of the art is said to have diffused itself throughout Europe, and having penetrated into the regions of domestic architecture, its decadence was caused by a combination of influences reflecting the prejudices of centuries less alive to the beauty of the art than our own age, which has witnessed its revival.

The modern art of staining glass is founded, it is remarked, on its re-discovery at the commencement of the present century. An Englishman who was bargaining for some pieces of old stained glass at a glazier's in Nuremberg, happened to meet there a cabinet varnisher named Siegmund Frank, to whom he casually remarked that any one who could revive the once prosperous art of staining glass could make a fortune out of it. Frank took up the suggestion, and produced a heraldic representation as the first sample of this new development of the art. The Government took up the matter later on, and a suitable place for operations was granted to Frank. In 1845 an institution was opened at Munich, under the direction of Herr Ainmüller, who had been associated with Frank in the earlier period of this revival. The English efforts in this direction have been less an imitation of what has been done in Germany than a close following of the Mediæval work which has come down to the present day. The preference shown for it is exemplified by the fact that English stained glass has gained a footing in such a stronghold of German art as Munich. Considering that Bavaria witnessed the original starting of the stained-glass industry, as well as the re-discovery to which allusion has been made, it is evident that the production of English artists must be of a high order of merit to compete so fully in that country with German work.

A peculiarity of stained-glass manufacture, which forms one of the principal difficulties, is in its connexion with the effect of colours upon each other, and the apparent contraction of the size of objects represented when certain combinations are employed. On this subject some details of interest are given, from which it appears that blue exercises a marked influence upon the surrounding colours, making red appear violet, and white seem of a bluish tint. Dark objects on a light ground are less striking than light ones on a dark ground; and in accordance with this principle, an inscription in black upon white is legible at a distance of 11 yards, while a white inscription upon black can be read at a distance of 16 yards. On the same plan it is stated that a black figure on a yellow ground requires to be one-tenth larger than the same figure in yellow upon a black ground for both to appear the same size. Considerations of a similar nature have obliged artists in stained glass to adopt, in certain cases, proportions for objects in their representations, which although not true to nature, are necessary for producing that harmony of general effect at a short distance which is the most important requirement in artistic work of the class referred to.

THE "VICTORY OVER SEWER-GAS."

Sir,—I take it for granted that all who are intelligently interested in sanitary matters are agreed:—

1. As to the necessity of cutting off all direct connexions with the main drainage system by means of a good trap between the house and main sewer.

2. Of trapping all wastes, and delivering them over trapped gulleys in the open air.

3. That the Old system or No system of merely trapping the house-drain and carrying the soil-pipe up to the roof is (theoretically, at least) extinct, and needs no further consideration. Here I would state, as a mark of respect to those who have been for years endeavouring to improve our sanitary system, that each of the new plans, or modifications of the same plan, which I am about to criticise, is immeasurably superior to the old plan to which I have referred.* . . . . . .

It has been apparent to me for years that all or nearly all of the efforts that were being made, were in the wrong direction, viz.,—by ventilating up the soil-pipes. (It is both amusing and confusing to read the different opinions expressed at the Conference on May 3rd and 4th, 1877, as to whether the current in a soil-pipe is up or down, some contending that it is always up, others that it is always down. I think Mr. Ernest Turner was nearest the mark when he said that it was sometimes up and sometimes down; and I see that at the same time Gen. Cotton advocated ventilating down soil-pipe and up a separate shaft.) Also, by the retention of traps under the closet. Believing, as I do, that traps of all kinds are at best but necessary (if necessary) evils, I wanted some plan by which I could dispense with all I possibly could of them. I know that on the question of traps doctors differ, but I am content to adopt the description of Professor Corfield in page 108, "Laws of Health," pub. 1880, where he says, "Water-traps are not to be relied on; they moreover form receptacles in which solid matters lodge, and they always necessarily contain foul water; decomposition goes on in them continually, and foul gases are produced, so that they become, in fact, manufactories of foul air." Again, on page 20 of "Report of Conference," May 4th, 1877, Mr. Rogers Field dwelt upon the fact that sewage-gas passed through the water in ordinary traps imperceptibly, being absorbed on one side of the trapping water and given off on the other, as he had proved to be the case both at Uppingham and elsewhere. On page 65 of the same report he says, "D-traps are small cesspools."

I found by actual experiments again and again with the first and second systems, that although sometimes (when the atmosphere was clear, and a fair amount of wind blowing, especially if it were blowing against the front of the house, against the inlet) we got a very good up-current, even then the current was always checked, and generally reversed whenever the w.c.'s were used, and the better the flush of water, the more complete was the reversal of the current. It was more marked with the open pipe than with the valve inlet. This set me thinking, and I soon saw that there were three forces at work. The air-current, whether induced by cowl or open pipe (query) tending upwards, but always checked by the sewer gas generated in the soil-pipe, which, being heavier, was trying to go down. The fortunes of the struggle varied according to the conditions of the atmosphere; but directly the sewer-gas was reinforced by sewage and water from the w.c.'s, also wanting to go down, the result was an ignoble defeat for fresh air, which found itself driven out at a great rate, by the very way which it was supposed to use only as an entrance. I then set to work to try and yoke these three forces together into one team, by erecting an upcast ventilator of 3 in. wrought-iron barrel (that being the size of my inlet), carrying it up as high as possible, in order to utilise the wind-pressure. This arrangement of itself I found to answer very well, and consider it better than either of the other systems referred to, simply because fresh air and sewer-gas were both being helped along the right road by the greater power of sewage and water from the w.c.'s, and the oftener the w.c.'s were used the more fresh air was drawn down the soil-pipe and through the house-drains, and as there was no force acting against it the current was never reversed. This I found so good, that where poverty makes the cost of heating an objection, or where, in small houses, several parties occupy the same premises, or where there is no gas laid on, I should recommend the adoption of this plan, combined with good valve-closets, with ventilated P-traps, and good syphon or vacuum water-waste preventers, to ensure a good flush of water at each use of w.c.

This measure of success pleased but did not satisfy me, as I wanted not simply a good thing, but the best possible of attainment by me.

In August, 1880, when on a visit to the north, I saw enough of colliery-ventilation to feel convinced I could apply the same principle to aid me in the solution of the drainage problem. It was not till January of the present year that I saw clearly how I could apply it. I set to work and prepared some plans, and in February got my heating-chamber made and fixed to Sir Henry Cole's first house, and the results from the first surprised me. We used a great deal more gas than was necessary, and obtained results far in excess of our requirements. Not only so, but the results were so surprising that the heat alone would not account for them. On further consideration, I account for it by the fact that heat being generated by the consumption of gas within our up-cast, consumes such an amount of oxygen (Professor Corfield states that one gas-burner consumes as much as five men, or more, on page 31, "Laws of Health," 1880; and the *Daily Telegraph* of October 10th, 1881, states in an article on "Stage Lighting," that one gas-burner consumes as much as several men) for its own requirements, which, with its proportion of nitrogen, it has first to draw down the soil-pipe, and through the house-drains as fresh air, thus causing a tremendous current. The heat being generated in this way also provides a ready means for destroying any germs of disease in the sewer-gas, by passing it through the flames in the heating-chamber (it is thus invaluable for application to hospitals, barracks, schools, or large establishments of any kind), and out at the top up-cast above the levels of house-tops, in a state of greater purity than is attainable by any other means. I am now trying the value or reverse of cowls on top of up-cast, and, if I find their use advantageous, shall certainly use them, as I believe we are in duty bound to use all the forces at our disposal.

A word or two in reply to objections. First, to the "supposers." You may suppose anything with respect either to gas, wind, or water. Suppose it is calm, and you get no wind, or a gale, and your cowls are blown away; or suppose there is a very dry season and you get no water, or a very cold season and it is all frozen; or suppose the coal-mines are exhausted, and we can get no more gas, or that we have the gas, but it will not burn through corrosion of the burners or stoppage in the pipes. Well, in all such cases,

* We are obliged to omit our correspondent's criticisms of other plans; they would bring upon us an amount of correspondence to which we could not give space. The subject is a very important one, but some of our readers think they have already had enough of it.

unless you see that your machinery is put in working order again, and kept so, you will fail to produce the desired result. But I contend that, even without any heating-power being applied, the mode I adopt of always ventilating down the soil-pipe and up an upcast between the front of the house and the main drain, with both inlet and outlet above the level of all the windows, and actuated jointly by the water and sewage from the w.c. and the mobility of the atmosphere, is better than any plan that has come under my notice (although in that case I would retain ventilated P-traps, as before stated).

Secondly, as to the cost. It may or may not be enormous. I have tried it for weeks together without applying any heat, and have found it work well. I have used about 1 ft. of gas per hour (costing about 6d. weekly), and found it better. I am now using about 2 ft. per hour, and find it best; the results are so good that I am practically content. I have not attempted to find out the cheapest way to fit up a house with regard to sanitary matters, but the best,—and I at least prove my faith by my works, as I am applying it to all my new houses,—while the extra cost of valve-closets, disconnecting-shaft, and upcast ventilator will be 20*l.* or 25*l.* As, however, there are lots of shoddy merchants already in the market, whose aim is cheapness, I have no intention to endeavour to compete with them. G. E. Mineard.

POLITICS AND TRADE UNIONS.

Sir,—I entirely dissent from the writer of the letter headed "Politics and the Trade-Unions Congress." * If the trade unions would but look after the vote protected by the ballot, and get the knowledge how to use it, they would do more good than by trusting to the system of striking to get wages up. There is a great deal of fallacy about their getting wages higher. It is true, in some instances, mechanics and labourers get a larger amount of wage in the building trade; but it is neutralised by the advance in house-rent, butcher's meat, shoes, clothing, &c. And that is not all; there is a more rapid way adopted of doing work, and machinery is displacing many *employés* in the building trade; but more of that anon. My object in putting pen to paper is to show an "Old Hand" that the great fault of the working class is that they are not political enough. Why, the coloured people of the United States are better posted up in what concerns the welfare of the country than what many of the English working class are here. I have passed two years in Kansas, in the far West, and I should recommend an "Old Hand" to take a trip to America, and then he would see that there are plenty that are in their "teens that go early to the loom, the forge, and the plough," become Presidents of the United States, like Lincoln and Garfield, or become eminent, like Elihu Burritt, the learned blacksmith; and, more than that, he will see no dilapidated husbandry there. (See the current numbers of the *Daily News*.) We are living in a transitional age. The increase of population and the spread of education are opening the people's eyes, but we are bound and tied by our great-grandfathers' notions.

It is because we are content to let others think for us, that we are divided into Liberals and Conservatives. That nonsense is all played out, and it is time we took a new departure; and if we are hewers of wood and drawers of water, are we to be content while we have plenty of wood to hew and water to draw? No, no, Mr. Old Hand; such counsels are dangerous both to employers and employed. Politics is as necessary to the life of the nation as the air we breathe or the water we drink. It is toleration we want; civil and religious liberty. It is because the English mechanic is not political enough that he is led into the disastrous strikes of late years. Because a few well-meaning men meet together (and I give them credit for good intentions) they forget the surplus outside, and how it is created, and think they can carry all before them. I know what it is. I have had some years' experience, and hope to have more yet. I am no strike-jobber; and let me give a word of advice to the men in the building trades, first to move all places of meeting as far as possible from the public-house, and to remember that a grave responsibility rests on those that wield the striking instrument: too often, like a boomerang, it recoils on the heads of those that use it, as well as on the innocent and inoffensive. At the same time, it is at best a wretched palliative. Like a civil war, it breaks up the happiness of many a home, and after a few years you find yourself in the same position as when you started. W. A. S., Plasterer.

* See p. 433, *ante*.

GUIDES IN THE BRITISH MUSEUM.

Sir,—Your interesting and instructive articles upon the Egyptian exhibits at the British Museum have been the means of recalling to my mind the still-existing necessity of something in the way of a lucid and comprehensive explanation of our art and archæologic treasures.

Of what use is it to boast of the value and rarity of our collections, if we do not seek to instruct the people so that they may understand and so appreciate them? The majority of the visitors to the British Museum wander about aimlessly, attracted by this and that, with no settled purpose, and in the end understanding nothing. Many a scoff I have heard passed upon a collection of old nails or bronze vessels; while another class simulate admiration for anything and everything they see: the fact of the object being old is to them a sufficient reason for its being so carefully guarded. Each are equally ignorant, and yet the amusement derived from such ignorance by those who do know comes as badly as the foolish observations themselves; for there is actually little or no opportunity for the visitors to gain the information they would gladly avail themselves of if it were procurable. For that the masses do wish to understand is not to be denied, and is proved by the rapidity with which a crowd of interested listeners will congregate around any one who may be explaining or commenting upon the exhibits, and their murmurs of discontent, when dispersed by the officials, in obedience to the rules of the institution, which forbid explanations to be given or crowds to collect.

We shall probably find from the statistics that the number of visitors will have considerably fallen off now the natural history collection has been removed to South Kensington; for it was chiefly in these galleries that the majority seemed to find most enjoyment. Nor is this at all surprising or the reason far to seek. Was it not because they could see there that which they could to a certain extent understand?

What is wanted, and wanted sadly, is a short guide to each room explaining the exhibits and their influence upon art and civilisation, published at a price within the reach of all,—something after the manner of the guides published by the Crystal Palace Company to their various courts,—and if such a series were produced by some competent men under the supervision of Government, it would not only enhance the value of our rare possessions, but lay the foundation of a sound artistic knowledge for the art-student as well as instructing the many of the passing curious. W. C. Haite.

*** We have printed this note as a reason for mentioning what ought to be fully known, but certainly is not, that there are guide-books to all the various rooms obtainable for a few pence; and these will be altered to suit the new arrangement of rooms in due course.

PROTECTION AGAINST FIRE.

Sir,—Your paragraph in last week's *Builder* concerning the destruction of an ancient house at Bristol, where the loss is estimated in money value at 25,000*l.*, but with your significant addition of the few words, "but in truth no amount of money will represent it," owing to the destruction of the world-renowned premises themselves, together with a very valuable stock of books and MSS., calls for a reminder that cannot be made too widely known. It is simply this,—There are many fire-offices standing A 1 that make an allowance on the insurance premium of 10 to 15 per cent., provided the premises are fitted with suitable fire-extinguishing appliances. I may mention that my insurance rates amount to 280*l.* per annum. I keep a fire-engine on the works, and have hydrants connected to the water companies' main. I have also a few hand-pumps of the London Brigade pattern, and three or four dozen buckets *always full of water*. The value of my fire plant is about 400*l.*, and for this outlay I have an allowance from my premium of 15 per cent., or 42*l.* per year. Surely this is an excellent investment, and mine is only a business of a moderate size. A Manufacturer.

Architectural Education at University College.—Pressure of matter compels us to postpone the remainder of Professor Roger Smith's lecture, the first half of which we published last week.

COMPETITIONS.

Fever Hospital, Bolton.—The Sanitary Committee of the Bolton Corporation have selected the plans for the new hospital for infectious diseases, to be erected in Hulton Causeway, Rumworth. The competition was restricted to local architects, and of the eleven sets of designs sent in, the first premium of 25*l.* has been awarded to Mr. Marshall Robinson, of Acresfield, who sent in plans bearing the motto "Desideratum," while the second premium of 15*l.* was awarded to Mr. Thomas Heselden, of Bowker's-row, whose plans were distinguished by the device of the borough arms.

Proposed Baths and Wash-houses for the Parish of Battersea.—We understand that the six sets of designs sent in competition for this building in the month of May last have been submitted to Mr. J. Ebenezer Saunders, architect, who will advise the Commissioners as to their relative merits.

KEEPING DOWN THE WATER.

Sir,—With reference to your correspondent's letter, signed "Greenhorn," in your issue of the 8th inst., I give the following information, which may assist him out of his dilemma:—

Many years ago I had occasion to form an underground tank, 20 ft. by 12 ft., by 9 ft. deep, for the reception of rain-water, and in making the excavation the contractor struck a vein of sand, about the level of the bottom of the tank, from which water rose, and stopped proceedings. I directed a hole to be sunk in the centre, and 2 ft. lower than the bottom of the tank, in which a pump was placed, and by keeping the water down by pumping, the walls were carried up, and the floor of the tank, which was formed of two courses of bricks on flat, in cement, formed, except where the pump stood which, could not be completed owing to the head of water rising in the hole. After thinking over the matter, I had a small well sunk *outside* the tank, 2 ft. deeper than the hole *inside*, and as we struck the same vein of sand and water we placed the pump in it, and by keeping the water down for twenty-four hours, by relays at the pump, we made good the hole *inside* the tank, and gave the cement time to set.

If the subsoil in your correspondent's case is not porous, I would recommend the formation of a small trench drain between the pump-hole inside and the temporary well outside.

Wm. J. Walsh, Surveyor,
Royal Engineer Department.

CHURCH HEATING *VERSUS* CHURCH VENTILATION.

Sir,—For the sake of the attenders this subject might be ventilated a little, because, as it seems to me, the heat is often got up at the expense of the ventilation, and so the comfort (and sometimes even the health) of the sitters and officials is impaired.

To obviate this, the following plan might be useful, viz., heat up the church the necessary time before the services are to begin, so that the walls and seats, &c., may be warm, keeping the ventilators shut altogether or nearly so. Then so many minutes as necessary before the congregation assemble, open all the outlet ventilators, and also the inlet ones and the doors, for a short time, so as to send out the warm confined air quickly by letting in fresh air. The air coming in so will not have time to cool the walls and furniture, and so, although the fresh air may be cool, heat being radiated from the walls, &c., the sitters will feel comfortable, as the doors will be shut before they enter. The remembrance of some disagreeable experiences last winter induces me at the beginning of this to make the foregoing remarks.

W. P. B.

STEAM-PROOF CEMENT.

Sir,—Will any of your readers kindly tell me, through the medium of your paper, which is the best cement to use (and if something should be mixed with it) for jointing flags used for making a floor to dry bricks on? The cement I have used allows the steam to work its way through, and so, instead of being perfectly dry, as the flags are, it is wet, and spoils the bricks which happen to lie on the joints. B. H.

The Steamship "Great Eastern" was put up for sale in London on Wednesday, the highest offer made being 30,000*l.* Of course the vessel was not sold at this price.

THE FISH-MARKET QUESTION.

Sir,—Referring to the remarks in your impression of the 8th inst., on my proposal for establishing a fish-market at Bankside, kindly allow me to state that in the report of Sir J. Bazalgette (engineer), and Mr. G. Vulliamy (Superintending Architect to the Metropolitan Board of Works), which has been partly published by the daily papers, these gentlemen state that their instructions appeared to limit their selection of sites to the neighbourhood of the principal railway termini north of the Thames, and after suggesting that the Board should place no restrictions which would interfere with their recommendations, they propose a site on the south side of Blackfriars Bridge, which, as they state, possesses advantages superior to any other that has been proposed.

It is situated between Southwark street, York-street, and Bear lane, with frontage on Blackfriars-road; and is proposed as a market for railway-borne fish. At the same time they suggest that should it hereafter be considered desirable to unite the water-borne fish-market with it, the same could be easily done by forming a wharf on the banks of the river, and so running the fish in trucks to the market.

Sir H. Walpole states that a riverside is a *sine quâ non* for a fish-market, and I maintain that it is most desirable to have one market for the sale of both rail and water borne fish, and it is absolutely essential that it should be by the riverside; therefore, you will readily see the site I propose,—situated between Blackfriars and Southwark bridges, possessing river accommodation which even eclipses that offered by Billingsgate Market, having direct communication with the principal railways which bring fish to London, and comprising very inexpensive property, with facilities for further extension if required,—is far preferable to the site in Blackfriars-road, which site it would very shortly be found absolutely necessary to connect with the river, and which would, to a great extent, interfere with the tramway and ordinary traffic of Blackfriars-road, which is ever increasing; respectable people would be upset, and the site would be far more expensive than that proposed by me at Bankside, which comprises property in a most wretched and dilapidated condition, and which, of course, could be acquired very cheaply. It is exactly opposite St. Paul's Cathedral, on the other side of the river, and the establishment of a fish-market there would certainly be an improvement to the metropolis.

H. J. Leeuw.

EXPERIMENTS ON TRAPS.

Sir,—I trust the importance necessarily attached to all sanitary matters will be a sufficient excuse for my requesting the favour of an insertion of this letter in your paper. Your readers are aware that with a view to making as many improvements as possible in the sanitary arrangements of buildings, there has lately been delivered a series of lectures at the Society of Arts' Rooms. These lectures referred in particular to that which is known in the trade as "trapping"; and if they have had no other good effect, they have at least aroused energies in the trade that will undoubtedly result in enabling architects, sanitary engineers, builders, plumbers, &c., to decide which is the really best system of closet-trap to adopt, with a view to effectually excluding the poisonous gases from the houses. The first result of this agitation is, that a series of experiments has been tried with closet-traps made to the full size. Within the last two months a scaffold has been erected some 60 ft. high, having attached to it a length of soil-pipe 45 ft. high. To this has been connected six branches for fitting any sized trap desired, and each is fitted with closet-basins. This arrangement has enabled the experimentalists to discover the true action of the ℘, "Eclipse," and ℧ traps.

The action of the ℘ trap is that on lifting the plug at the bottom of the basin (which had been previously filled with water), the water in the basin, as also that in the trap, rushed forward and left the trap unsealed, consequently leaving passage for any sewer gas that might be generated. This action is commonly called siphonage, but is in reality the momentum of the water itself, which, owing to the slope of the trap, though it clears everything before it, at the same time leaves the trap without water, at once proving that the ℘ trap is not a trap at all.

The action of the "Eclipse" trap is the same as that of the ℘.

The ℧ trap, made according to the new method, was also tested, and proved (as I always contended it would) to answer every requirement, *i.e.*, it is perfectly self-cleansing, it does not sbb out, nor does the force of the water, however great, destroy the water seal.

Architects, engineers, and responsible members of the building trade may see the various traps in operation and test them for themselves by applying to Mr. J. Pullen, 73, Penton-place, Kennington Park-road, S.E.

P. J. Davies, A.S.P.

CHURCH-BUILDING NEWS.

Sancreed.—The parish church of Sancreed, Cornwall, which has been restored under the superintendence of Mr. J. D. Sedding, architect, at a cost of 2,150*l.*, was re-opened on the 3rd ult. The restoration fund at present amounts to about 1,750*l.* Before the works were commenced, the church was a pitiable sight, with its defective roofs and walls, and wooden windows.

Stapenhill.—The new Church of St. Peter, at Stapenhill, near Burton-on-Trent, has been consecrated. It occupies the site of an older and smaller building. The new church, which is Late Decorated in style, consists of north and south aisles, 60 ft. long by 17 ft. wide; nave, 60 ft. long by 32 ft. wide; chancel, 30 ft. long by 32 ft. wide; and north and south transepts, 24 ft. long by 21 ft. wide. The aisles and nave have separate roofs, the nave being lighted by means of clearstory windows,—eight double lights on the south side and ten on the north. The light for the aisles is obtained by means of three-light windows,—three on the south side and five on the north. The transepts have each handsome traceried double windows, and a corresponding window is also seen at the west end of the church, while a larger one, of exquisite design, provides light for the chancel at the east end. The whole of the windows are filled in with plain cathedral glass. At the west end of the church is the choir gallery, with circular balustrade front, and the old organ has been re-cased, and placed therein. The aisles are divided from the nave by five bays on either side, supported by Bath stone columns. From these bays the roofs spring, and further support is given to the nave roof by the introduction of gilded steps thrown across. Internally, the nave roof is of varnished Memel deal, but the whole of the other woodwork is of varnished pitch-pine. The aisle floors are paved with ordinary quarries, while the chancel is laid with Minton tiles, and wooden blocks are used in the seats. Each seat is furnished with a rug and hassock. These have been supplied by Messrs. Jones & Willis, of Birmingham. The ventilation of the church is stated to be on a new principle, and has been provided for by Messrs. Foster & Pearson, of Beeston. The internal walls are of brick coated with plaster, with Bath stone dressings. Externally the walls are of Derbyshire stone, with dressings of Bath and Ancaster stone, and the upper part of the tower will also be of the latter material. The tower will reach about 100 ft. in height, or 55 ft. above the windows. A pinnacle, 21 ft. above the coping of the battlement, will surmount the tower at each corner, and smaller pinnacles will be placed at the summit of each side. The church, which will be warmed by hot water in pipes fixed along the walls and floors, contains sittings for about 900 persons, many of which will be free. Messrs. Lowe & Sons had the building contract, while the executors of the late Mr. H. Mason have done the woodwork; Messrs. Pickering Bros. the plumbing, glazing, &c.; Mr. Rhodes (Nottingham) supplied the gasfittings; and Mr. Humphreys (Nottingham) fixed the hot-water apparatus. Mr. Corser acted as clerk of works at first, and he was succeeded by Mr. Dent. The work has been carried out under the superintendence of the architects, Messrs. Evans & Kelly, of Nottingham. The total cost is about 10,500*l.*

Lower Tranmere.—The new church of St. Luke, Lower Tranmere, was consecrated on the 18th inst. by Bishop Kelly, late of Newfoundland, acting for the Bishop of Chester. The building was commenced last year, and takes the place of a temporary church erected in 1874. It consists of nave and chancel (the same height), and side aisles, with somewhat lofty clearstory. It is designed in the late Gothic or Perpendicular style, simply treated. Advantage has been taken of the great fall of the land by placing the vestries underneath the east end, the choir vestry being large enough to seat over 100 persons. The church will accommodate 720 persons. There are four entrances, that at the south-west corner having a commodious porch. The organ is placed at the east end of the north aisle. At the west end of the nave is erected a substantial half-timbered bell-cote. The whole of the exterior is of local stone, and a portion of the interior is faced with Runcorn stone. The benches are of pitch pine, also the altar-rail and table, the pulpit and font being of stone. The builder's work has been carried out by Mr. A. Bleakley, of Birkenhead; the heating by hot-water by Messrs. Hinson; and the lighting by Mr. Hamilton, also of Birkenhead. The whole has been designed and carried out under the superintendence of Mr. G. E. Grayson, architect, Liverpool. The total cost of the building will be about 5,500*l.*

Miscellanea.

Manchester Architectural Association.—The annual *conversazione* of this Association was held on Wednesday evening in the Memorial Hall, Albert-square. The society at present numbers about seventy members. The proceedings included an address by the president, Mr. J. Murgatroyd, and an exhibition of models, drawings, sketches, and other works of art contributed by members and friends of the Association.

New Schools are about to be erected in the Bearwood-road, Smethwick, from the designs of Messrs. J. F. Sharp & Co., Birmingham, architects to the Harborne School Board.

The Turners' Company.—This company have again awarded prizes for works submitted. In wood there were twenty-six exhibits, including vases, candlesticks, inkstands, columns, oval frames, plates, waiters, table legs and columns, cigar-holders, paper-racks, ring-stands, and other articles. The judges (Mr. A. P. Bower, Mr. S. Jacques, Mr. J. Jones, and Mr. Winser) certified improvement in these examples over those shown at former exhibitions. They awarded the first prize to Mr. J. S. Coulson, of Kirkgate, Thirsk, for four vases and card-dishes; the second prize to Mr. Nickolay, of 43, Rupert-street; and the third prize to Mr. J. M'Donald, of 4, Chapel-house-street, Millwall. The same judges also spoke in high praise of the work of the students in the Middle-class School in Cowper-street, Finsbury. They awarded the prize to W. V. Weldon. In the amateur class they gave the prize to Mr. H. Balsham, of Altrincham. In pottery, the judges were Mr. George Wallis, F.S.A., of South Kensington Museum; Mr. Horace Jones, the City Architect; Mr. C. T. Newton, C.B., of the British Museum; and Mr. J. J. Holtzapffel. The first prize was awarded to Mr. Alfred Dupuis, of 129, Princes-road, Lambeth, for some beautiful vases and pillars; the second to Mr. Thomas Ellis, of 69, Vauxhall-road; and the third to Mr. William Bolton, of 57, Dashwood-road, Battersea. In the metal classes the judges were Sir Henry Bessemer, F.R.S., Mr. C. Hutten-Gregory, C.M.G., Colonel Haywood (engineer to the Corporation), and Mr. R. Price Williams. The first award was made to Mr. A. E. Nelson, of 31, Halton-street, Canonbury, for some hard-flatting rolls. The second prize was given to Mr. H. A. Alexander, of 166, Camberwell-road, for a ball-and-socket joint; and the third to Mr. C. J. Barber, of 74, Cleveland-street, Fitzroy-square, for a Grecian vase. The Lord Mayor has since presented the prizes.

"Owen Jones" Prizes, 1881.—This competition was instituted in 1878 by the Council of the Society of Arts, as trustees of the sum of 400*l.*, presented to them by the Owen Jones Memorial Committee, being the balance of the subscriptions to that fund, upon trust to expend the interest thereof in prizes to "Students of the Schools of Art who, in annual competition, produce the best designs for household furniture, carpets, wall-papers and hangings, damask, chintzes, &c., regulated by the principles laid down by Owen Jones." The prizes are awarded on the results of the annual competition of the Science and Art Department. Six prizes were offered for competition in the present year, each prize consisting of a bound copy of Owen Jones's "Principles of Design," and a Bronze Medal. The following is a list of the successful candidates:—

1. Gideon Fidler, School of Art, Salisbury.—Design for carpet.
2. John Lamb, School of Art, Kidderminster.—Design for carpet.
3. Thomas Dutton, School of Art, Nottingham.—Design for lace.
4. Rose Phillips, School of Art, Northampton.—Design for wall paper.
5. Robert Harris, School of Art, Salisbury.—Design for chintz.
6. W. J. Clulow, School of Art, Macclesfield.

Dealing with Dangerous Structures.—At the meeting of the Metropolitan Board of Works, last week, the Finance Committee presented a report, stating that it appears desirable that further Parliamentary power should be obtained by the Board in connexion with the recovery of the expenses of dangerous structures, and recommending that the subject be referred to a committee for consideration, with a view to obtain an amendment of the law by a clause in a Various Powers Bill, or as soon as a fitting opportunity presents itself. This recommendation was agreed to.

The Gale of Friday, the 14th inst.—The daily papers have informed readers of the very great damage done all over the country by the storm of Friday in last week. Many lives were lost, and several marvellous escapes are recorded. Buildings were unroofed and strong walls blown down. These facts ought to receive the careful attention of all who are engaged in construction. In connexion with this subject, we note that a communication has been addressed to the principal fire-offices suggesting the expediency of establishing a distinct branch of business for insuring houses against damage by wind.

New Dock at Swansea.—Their Royal Highnesses the Prince and Princess of Wales were present on Tuesday at the opening of a new dock at Swansea. The dock, which has been constructed at a cost of nearly 200,000*l.*, was christened the Prince of Wales Dock.

The Wind and the Thames.—*Apropos* of the storm of Friday, the 14th of October of this present year, when for several hours the waters of the Thames were so low that the bed of the river was in many places exposed, and the stream so far withdrawn from the bank on either side that an opportunity was afforded for picking up several curiosities, several of considerable interest and value, it may be interesting to give the following extracts not made use of in any history of Old London:—"March 2nd, 1761.—The flow of the tide was so little that the starlings [the wooden piles driven in outside the foundations of the piers] were not covered at high water,—a thing not known in the memory of man." "July 4th, 1768.—The water of the river Thames was so much driven [by the wind] out of its usual channel above bridge, as is not remembered by the oldest man living; one-half of the bed of the river remaining uncovered with water during two tides." "August 11th, 1772.—The water of the Thames was so remarkably low in the afternoon, that people might have waded across from Pepper-alley-stairs to the opposite side without danger of drowning." A storm of wind was raging at the time. Pepper-alley-stairs will now be sought for in vain. They were above bridge, near Paul's Chain, facing Pepper-alley, on the Borough side.

The Board Room in Spring Gardens.—At the meeting of the Metropolitan Board of Works on the 14th inst., it was resolved, on the motion of Mr. Selway, to refer the question of the warming and ventilation of the Board-room to the Building Act Committee. There is good reason for such a reference, the room, although a large one, being generally very close and "stuffy." If any structural or internal alterations are made in the apartment, the esteemed Superintending Architect of the Board will earn the gratitude of the reporters by bringing forward the front of their gallery by at least a foot. Any reporter who wishes to pass to or from a seat at the end of the gallery nearest from the door cannot do so without disturbing the whole of the fifteen or sixteen other occupants. The gallery is just wide enough for its long row of chairs, but the provision of adequate gangway-room behind the chairs seems to have been forgotten.

Leggott's Patent Window Lift and Fastener.—In this arrangement the window is wound up, or down, by simply turning a handle, which acts on a short endless screw, and in the model we have seen it certainly seems to act very satisfactorily. The apparatus provides an easy and inexpensive method (always at command and under ready control) for ventilating any apartment by the opening of a window, either at top or bottom, or both, by one operation. It affords at the same time security against thieves, as the sashes, whether closed or opened, are perfectly locked. It dispenses with all sash-cords, sash-weights, sash-fasteners, and the consequent annoyance and expense of repairs which always attend the antiquated system of window-hanging hitherto retained. We understand that two of the lifts have been made by order of Mr. John Whichcord, architect, for the new Houses of Parliament, Cape Town.

Alexandra Palace Industrial Exhibition.—The young men of Holloway and neighbourhood are well represented by the exhibits of F. J. Bancroft (a junior in the Highways Department of the Islington Vestry), who, under the head of "Studies in Building Construction," shows a collection of upwards of sixty specimens of woods, as used in carpenter's, joiner's, and cabinet-maker's work, as well as a very fair show of architectural drawings, and specimens of wrought-iron bars twisted and bent in various ways, to show the quality of the metal; also a collection of specimens of granite used in paving roads.

City and Guilds of London Institute.—This Institute for the Advancement of Technical Education has just now issued its Programme of Technological Examinations for 1881-82 (Gresham College, London). It gives a syllabus of subjects of examination, and includes copies of the papers set in the last examination for 1881.

Builders' Benevolent Institution.—An old friend of this important institution, desiring to aid its current funds, has offered to contribute one hundred guineas if twenty other gentlemen will give ten guineas each. A letter on the subject from Mr. Geo. Burt, the President, will be found in our advertising columns.

The Manchester Infirmary.—The Earl of Derby took the chair at a meeting held in the Manchester Town-hall, on Tuesday, in aid of the funds of the Manchester Infirmary, of which institution he is the President. He explained the financial position of the infirmary as follows. It had been found necessary since 1877 to make alterations and improvements in the hospital costing 23,000*l.*, while the hospitals at Cheadle and at Monsall had cost 11,000*l.* more. It was absolutely necessary to put up a building for the use of the nursing staff, and that would involve an additional outlay of 5,000*l.* It is calculated that the cost at which the infirmary could be maintained on its present footing was 27,000*l.* to 28,000*l.* yearly. Unluckily, Lord Derby said, in all cases, more especially in the case of hospitals, and above all in hospitals situated in large towns, nothing was more costly than effective sanitary work. The very first condition of sanitary improvement was fresh air and plenty of it, and fresh air in hospitals meant increased space, and increased space meant a larger outlay in building, and not only that, but a larger outlay to keep up the buildings.

Communication with Lighthouses and Lightships.—A meeting was held at the Mansion House on Tuesday, convened by the Lord Mayor on a requisition signed by 1,200 citizens, for the purpose of representing to her Majesty's Government the urgent necessity of establishing telegraphic communication between lighthouses and lightships and the shore, so as to prevent great loss of life round the coast in vessels shipwrecked or in distress. The Lord Mayor, who presided, observed that most of the vessels in distress and the wrecks happened to be at least ten or twelve miles distant from the mainland; that rockets and guns were now the only available means of communication; and that these entirely failed in fogs, snowstorms, and often atmospheric disturbances. He could hardly imagine any more desirable end to attain than the placing of the lighthouses and the surrounding lightships in instant communication with the shore, by which means a vast amount of property and great numbers of lives might be saved. The lighthouses were admirably managed by the Trinity House, and the lifeboats on shore were ever ready for duty, but lives were lost and goods sacrificed by the absence of communication, and the loss of time that now elapsed in observing the signals of distress. Resolutions urging the Government to carry into effect the desired communication were adopted.

Topographical Society of London.—We understand that Wyngaerde's large view of London, which has been lent on bond to the Society by the Trustees of the Bodleian Library, is now being copied by the Typographic Etching Company's photo-intaglio process. It is hoped sheets of a considerable portion of the view may be delivered to the members with but little further delay. The extracts from the calendars of State papers, &c., are being collected, as announced in the prospectus, and it is expected that the first report of the Society will contain several illustrations of houses of interest which have lately been pulled down.

Exhibition of Paintings on China, Birmingham.—The third annual exhibition of paintings on china was opened on Tuesday at Mr. R. W. Thrupp's Fine Art Gallery in New-street. The majority of the exhibitors are ladies. The exhibition is a thoroughly representative one, for whilst Birmingham figures well with 120 exhibitors out of 467, the others include works of artists from all parts of the country. In consequence of the increase on the number of exhibitors,—from 252 to 467,—it has been necessary to limit each to three exhibits.

Norwood.—A new Baptist chapel is being erected in Gipsy-road, Norwood. A contract has been entered into with Messrs. J. Smith & Sons, builders, of South Norwood, to build the new chapel at the cost of 3,936*l.*, from the designs of Mr. Hampden W. Pratt, of Furnival's-inn, who was the successful architect in the competition which took place in May of this year. The building is intended to seat between 700 and 800 persons.

The Church at Carlton-in-Cleveland, near Stokesby, was entirely destroyed by fire on Wednesday morning. The church was only rebuilt about three years ago, at a cost of 2,000*l.* The whole of the parish registers were consumed. It is supposed that the fire was the work of an incendiary.

TENDERS

For proposed new Parsonage House, at St. Peter's, London Docks, for the Rev. R. A. J. Suckling. Mr. Bowes A. Paice, architect. Quantities by Mr. C. Poland:—

For Foundations and pulling down old buildings.

Dawson	£1,490	0	0
Laing & Son	1,407	0	0
Higgs & Hill	1,140	0	0
Colls	1,075	0	0
Dove Bros.	990	0	0
Brown	945	0	0
Cooper	878	0	0
Manley	790	0	0
Palmer & Son	725	0	0

For Superstructure.

Dawson	£5,900	0	0
Colls	5,873	0	0
Laing & Son	5,229	0	0
Higgs & Hill	5,180	0	0
Dove Bros.	4,925	0	0
Brown	4,900	0	0
Palmer & Son	4,675	0	0
Cooper	4,644	0	0
Manley	4,447	0	0

For alterations and repairs to Nos. 14 and 15, Dorset-street, for Mr. W. T. Botting. Mr. Haynes, architect:—

J. Vear & Co. (accepted)	£395	0	0

For alterations in rear of premises, No. 122, High-street Borough, S.E., for Mr. T. D. Hill. Mr. T. W. Barry architect:—

Thos. Shuff	£489	0	0
Hearle & Sons	435	0	0
Jarvis & Sons	413	0	0
W. B. Downs	395	0	0
H. Bodien	377	0	0
*W. B. Downs	365	0	0
*Thos. Shuff (accepted)	350	0	0
*H. Bodein	327	0	0

* Revised estimates.

For alterations at the Grapes Public-house, Seven Dials, for Mr. W. Wright. Mr. T. W. Barry, architect:—

C. Everard	£980	0	0
W. Pringle	880	0	0
T. Shuff (accepted)	745	0	0

For alterations and additions to Mr. Harrod's Stores, Brompton-road. Mr. Alfred Williams, architect:—

Larter & Son	£1,189	0	0
Martin, Wells, & Co.	1,182	0	0
Langmead & Way	1,126	0	0
Benstead & Sons	994	0	0
Sprake & Foreman	989	0	0
Patman & Fotheringham	943	0	0
Stimpson & Co.	939	0	0

For erecting twelve houses in the Haringay-road, Green-lanes, N., for Mr. J. T. Pickburn. Mr. Smithers, architect:—

Harper	£4,906	0	0
Pawson	4,200	0	0
Henderson	4,200	0	0

For completing certain works at No. 61, Russell-square. Mr. Wm. Paice, architect:—

W. B. Downs & Co. (accepted).

For the erection of studio at Kensington. Mr. Wm. Paice, architect:—

Bodien (accepted).

For new roads and sewers for the London Land Company, on their Estate at Chingford Station, Essex:—

Philbey, Romford	£1,100	10	0
Dunmore, Horney	893	0	0

The Egypt of the Past.

EGYPT has always been a fertile land to the historian. From the seventeenth century, when the most extravagant and absurd ideas were promulgated and blindly accepted by the reading public of that period, until the present day, which has brought forth the sound and durable works of Wilkinson and Brugsch, and Dr. Birch's numerous monographs and treatises, the bibliography of Egypt flows along in uninterrupted streams. To the list of works which are of profit and entertainment to the reader, Mr. Erasmus Wilson's "Egypt of the Past" must be added.* Though not so large as the histories of the first two writers above mentioned, and not pretending in any way to be exhaustive, this work rightly commands a place in the libraries of all who are desirous of keeping themselves *au courant* with the latest developments of thought and contemplation about the many mysteries which, in spite of all that has been said and written upon Egypt, still cling with undiminished force to the land of the Nile. Mr. Erasmus Wilson devotes his first chapter to the origin and early inhabitants of Caucasian type; Thinis, the capital of Mena; the first Pharaoh; the Osiris myth, which embodies the whole scope of moral philosophy and the eternal condition of the soul in a future world; and a summary of the events of the first dynasty, the date of which may be placed at a distance of about six thousand years from our day. The salient points of the history of this remote dynasty include not only the erection of Thinis, but the Mausoleum of Osiris at Kom-es-Sultan, the diversion of the bed of the Nile, the building of the Pyramid of Sakkarah, and the formulation of two of the principal chapters of the Ritual or the Book of the Dead. Literature at this time was not altogether unknown, for we have written evidence of the progress of research in anatomy and medicine during the reign of the successor of Mena, and the flint flakes which formed the surgeons' knives and lancets are still preserved. The late Prisse d'Avennes, one of the most accurate draughtsmen of Egyptian antiquities,—an art in which no one has excelled him but the lamented Joseph Bonomi,—found at Thebes a small case containing a few very fine flakes of silex, of the size of a fish-scale, neatly mounted on little cedar-wood handles, evidently a set of lancets. But the use of a useful article must not be held to favour, according to the author, a developmental state of man as implied by the term "stone period," when stone was his only resource, since metals must have been in use among the Egyptians at the opening of the first dynasty, and possibly much earlier. A second chapter treats of the second and third dynasties; the language of the Egyptians, once so full of difficulty and doubt, was fairly well read by many, although, strange to say, without a universally accepted system of transliteration; the pyramid and tombs of Meidoum; the worship and cult of the sacred bull; and the building of the Serapeum. Mr. Wilson's remarks on the history and development of the language are apposite and lucid, but the consideration of the matter requires a large and comprehensive treatment, which would interfere with the limits proposed by the author to his work. A good grammar of the language with reference to the Coptic and Semitic philology with which it is involved, is still a desideratum with us. All that have yet been written are crude, tentative, and imperfect. The best and most readily obtained is probably that written by M. Le Page Renouf, for Messrs. Bagster & Son, at the suggestion of the late Mr. W. R. Cooper, an ardent archæologist and lover of Egyptian history, to whom in a very great degree the foundation of the Society of Biblical Archæology, and the formation of the series of "Records of the Past," is admittedly ascribed. There is, however, no doubt that the desire of learning to read Egyptian hieroglyphics is extending among us. Perhaps some day the Universities of Oxford or Cambridge may see the propriety of stimulating this really important branch of scientific knowledge by endowing a scholarship, or even the chair of a professor with the funds necessary for this purpose. Dr. Birch's "Introduction to the Study of Egyptian Hieroglyphics," London, 1857; Chev. Bunsen's "Egypt's Place," London, 1848-1867; M. de Rougé's "Christomathie Égyptienne," Paris, 1867; Brugsch-Bey's "Hieroglyphische Grammatik," Leipzig, 1872; the "Grammaire Démotique," published at Berlin in 1855; and many other works on this language, would enable any competent scholar, with sufficient leisure at command, to master the difficulties of the language in a comparatively short space of time, an acquaintance with the cognate languages not being really so imperative as might be supposed.

Of the builders of the Pyramids, and of the Sphinx, and the obelisk worship of the fourth dynasty, to which Mariette attributes the date of 4235 B.C., and Lepsius 3122 B.C., while Wilkinson is content with the assignment of the less distance of 2,450 years before the Christian era,—the author has much to say. A succeeding chapter relates the principal events from the fifth to the eleventh dynasty, say from 3951 B.C. to 3064 B.C., if we accept the furthest position assigned by Egyptian chronologists, or from 2240 B.C. to 2080 B.C. if we accept the more moderate theories of Sir Gardner Wilkinson. The history of those early dynasties is obscure; of their remains the chief are the pyramid of Unas, the tombs of Thi and Ptah-hotep, the pyramids of Meri-ra-pepi and Meren-ra, the city of Zan or Tanis, the family of Antef, and the expedition to the land of Punt, or "the South," in the reign of Sankhara, the fifty-eighth monarch of the Royal Fasti commemorated in the Tablet of Abydos. The productiveness of the black soil of Egypt, we are told, annually enriched by the inundations of the Nile, has become proverbial. By the expenditure of very little labour, always a cheap commodity in Egypt, the population was supplied with everything necessary for food and raiment, but luxury and refinement clamoured for more. Caravans of Arab traders made regular journeys between the Nile and the South, and returned laden with spices, perfumes, balsams, frankincense, and precious woods. The South was the "Ophir" and the "Punt," or "Pount," of the Egyptians, and its produce was sought after most eagerly. Punt was a generic name for the whole southern region; it lay to the south of Abyssinia, between Bab-el-Mandeb and Cape Guardafum, and at a later period embraced the opposite coast of Arabia. Brugsch, whose authority and statements have been very generally accepted throughout this work, mentions an obscure tradition that Punt was the original home of the gods, the Ta-neter, or "Holy Land," whence the Theban triad of Amen, Maut, and Khons, the father, mother, and son, travelled to the Valley of the Nile, and there laid the foundation of the Egyptian empire. On the coast of the Delta, which, at this remote period, was in all probability a very swampy district, densely overgrown with the low vegetation usually occurring in the warm marshes of tropical latitudes, and which was first brought under cultivation in the vicinity of This or Thinis, and Memphis, the towns of Tanis and Heracleopolis Parva had been founded by Semitic wanderers over the sea. These colonists gradually penetrated into the interior country, and there came into collision with the Egyptians coming from the north, and adopted their culture and their manners. At the same time, however, it is recorded by the talented but anonymous author of Baedeker's "Egypt," they retained their independence under kings of their own, who, during the period of the sixth, seventh, and eighth Egyptian dynasties, form the ninth and tenth contemporaneous dynasties of the Heracleopolites who, from the year 2691 B.C. onwards, ruled over the Delta, and perhaps also the whole of Lower Egypt. The eleventh dynasty, which closed the sway of the Heracleopolites, was not esteemed by the Egyptians as a strictly legitimate line.

The twelfth dynasty finds Egypt still in an unsettled state. Amenemhat I., the founder of the line, builds a wall along the eastern frontier

* "The Egypt of the Past." By Erasmus Wilson, F.R.S., Author of "Cleopatra's Needle, with Brief Notes on Egypt and Egyptian Obelisks." With forty-six illustrations. London: Kegan Paul, Trench, & Co. 1881, 8vo.

of the Delta, to oppose the invasions of the Asiatic races, and founds the temple of Karnak, so well known to us from all illustrated works on Egypt. Subsequent monarchs add to the fortresses, temples, and public buildings, which, as in their magnificent desolation, so, too, in their monumental teaching, still form a prominent feature of the country. One of the principal political events in this age is the regulation of the traffic between Egypt and Central Africa by Usertesen III., or "the Great," to whom, in recognition of his meritorious and memorable reign, Thothmes the Great subsequently erected a memorial temple, that his name might be remembered with as much sanctity in Nubia as that of Snefru or Sennefern, of the third dynasty, was in the valleys of Sinai. The space at command on this occasion does not allow us to say much of the "Hyksos" or shepherd kings, the exponents of the political power of the shepherd colonists, whose power was first felt in Egypt in the fourteenth dynasty, although they had entered the country long before as Semitic immigrants during the twelfth dynasty, upwards of 2,000 years before the Christian era. These newcomers, meeting with kindred spirits among the seaports of the Delta, and allying themselves with these and warlike Arabian tribes, at length became powerful enough to defeat the standing armies of the Pharaohs and obtain possession of the whole of Lower Egypt. Three dynasties belong to the victorious Hyksos: the fifteenth to the seventeenth; but they ruled during the fourteenth also, through the nominal reign of the Xoite kings. They applied the name of the Egyptian god Set to their own gods (Be'alim); and the andro-sphinxes yet preserved at Tanis with the portrait-heads of their monarchs prove that they employed Egyptian artists in their service. Perhaps, too, they themselves acquired a knowledge of Egyptian plastic arts. It is at the close of the Hyksos period that Abraham and Joseph arrive in Egypt, just before the success of the war of independence, the overthrow of the dynasty, and the erection of the new empire by Aahmes, who, succeeded by a long line of Thothmes I.-IV., and Amenhotep I.-IV. gives the crowning point of culmination to the imperial system of "Egypt of the Past." The foreign campaigns, extensive religious changes, numerous architectural erections, and enlargement of the boundaries of government which occur during this period are well described and carefully explained by Mr. Wilson, who has never failed to utilise throughout his book the newest evidences and the latest information which has been brought to light and accepted concerning the ancient history of Egypt. Of the nineteenth dynasty, made famous by the names of Rameses I. and II., and Seti or Sethos I.; of the twentieth, equally illustrious for its third Rameses, and succeeding monarchs of the same name, much is related, but we must refer the reader to the pleasant and instructive pages and careful illustrations of the book under notice if he would acquire a large fund of accurate information which has been herein sifted and condensed in a way which is both creditable to the author and thankfully acceptable to those who cannot spare the time to go through more prolix narratives of those times. Rameses III., the most splendid and wealthiest of the Pharaohs, won most of the treasures that he applied to the immense works of the Memnonium, the temples of Memphis and Heliopolis, and that dedicated to the god Khunsu at Karnac, from the foreign enemies who fell beneath his yoke. Part also he derived from mines, quarries, and commercial enterprises; for his fleets, like those of the Royal Lady Pharaoh Hatasu (the Elizabeth of Egyptian history, if we may compare English with Egyptian dynasties), brought spices and rarities from the rich shores of the Indian Ocean. For thirty-two years he filled the throne of Egypt, and devoted the last part of his life, which was broken by no great wars, to the domestic welfare of the valley of the Nile, which under his orders was planted with shady trees,—a deed which won for him perpetual gratitude. The fame of his wealth has, however, outlasted that of his achievements; and it was the superabundance of his riches which alienated him and his children from the severe simplicity of an earlier time. He lived, says Ebers, surrounded by a harem, in whose pestilent soil conspiracies were constantly fostered, to which he was nearly falling a sacrifice, and he ended his days as the mere tool of the priests, enervated and enfeebled, and scorned by his contemporaries, after sharing sovereignty with his son.

The concluding chapters of Egyptian history, as told by Mr. Wilson, who brings his book down to the close of the thirty-first, or second Persian dynasty, present to us the usual picture of imperial and national decadence. The growing power of Assyria had absorbed the kingdom, which had already fallen a prey to the Ethiopians. Psammetichus, with a league of twelve governors, and aided by Greeks and Carians, threw off the Asiatic yoke. A short period of revival ensued, but finally, under the Roman emperors, Thebes, the ancient capital of the mightiest sovereigns of the world, at length reduced to the condition of a provincial city, witnessed strange and unwonted changes of fortune. Many of the rock-tombs became the cells of recluses, many venerable monuments and noble portrait-statues were reduced to ruin on the ground of being the work of the heathen, and many temple-halls transformed into Christian churches. Much in the same way, the pious abbot of St. Alban's destroyed the Celtic literature which he found in buried chambers on the site of the ancient city of Verulam, and the evangelising pioneers of the Roman Christian church utilised the edifices dedicated to the gods of Rome, which they found ready to suit their purpose in many a city of Britannia. Many of the existing Egyptian architectural and historical remains will soon be hopelessly destroyed; shepherds feed their flocks where palaces once reared their imposing masses, and the inhabitants of the remoter villages, that have sprung up amid the ruined magnificence of bygone centuries, have so little respect for the remains of an antiquity whose teachings they cannot grasp, that they burn the finest fragments in their lime-kilns, cut up statues, pillars, and columns into mill-stones, build wretched huts with the finely-hewn blocks, and even chip the carved stones into small pieces in the vain hope of finding a forgotten or a hidden treasure. To the student, as well as to the ordinary reader, no small gain will accrue from a perusal of Mr. Wilson's work, which partakes of the character of a synoptical view of the history, language, and literature of Egypt, at the same time that it is full of suggestions which may lead some among us to view Egyptian relics in newer lights, and in ways that we have hitherto failed to adopt. The illustrations, both coloured and drawn on wood, are well done; they are fairly representative of the principal remains, and to a work which aims at being popular rather than abstrusely profound, they are indispensable. Its moderate size contrasts well with larger volumes, but for all this, little that is of importance to be said will be found to have been omitted. The lists of dynasties and the explanations of hieroglyphic characters will be found useful for reference and comparison with the detailed records in the body of the work. Mr. Wilson, in his preface, alludes to the newest discovery of twenty royal mummies in a subterranean excavation in the Western Mountain, opposite Thebes, and hints at the possible incorporation of their history into a second edition of his book. We can only trust that he will be enabled to carry this proposition into effect with as little delay as possible.

DIAMONDS AND PRECIOUS STONES.

There are few persons, even among those who are not the possessors of diamonds or others of the higher class of precious stones, who would not be conscious of the interest attaching to the subject. It is not merely that the objects treated of are in themselves very beautiful in texture and colour, but that they are surrounded by such attractive associations. They have formed the adornments of beauty and the appendages of luxury and power and magnificence in all ages. On the title-page of the work *apropos* of which we offer some remarks on the subject,* the very words,—"Diamant et pierres précieuses: bijoux, joyaux, et orfèvreries," seem to glitter on the paper. All the associations with the subject are courtly and sumptuous, so much so that Thackeray's satirical story of the "Great Hoggarty Diamond" seems a debasement of the great gem to the playing of a part quite below its proper associations.

A distinction may be drawn between those precious stones which are found in a more or less regularly-crystallised form, and those which do not crystallise and are found in irregular forms. The list of crystallised stones is, of course, headed by the diamond, which in its natural state is usually found either in cubes or in forms closely related to cubes, and formed, as it were, by the paring off of the angles of the parallelogram. The ruby and topaz belong also to the order of crystalline stones, which take mostly the form of six-sided prisms, either with parallel sides, or diminishing to a point at either extremity like two hexagonal cones placed base to base. The emerald and beryl also crystallise in hexagons, but with small diagonal facets at the angles. The sapphire is a crystal of six sides, two long sides opposite to each other, a long hexagonal prism. The topaz crystallises rather variously, most often in eight faces. The quartz, of which there are several varieties under what may be called specific names, such as amethyst, false topaz, &c., forms hexagon crystals with or without pointed ends. The turquoise, one of the most beautiful in colour of all the precious stones, is never found crystallised, but always in comparatively smooth, rounded forms showing a different type of origin from the crystallised stones. Almost the only other substances of value that do not occur in crystallised forms are pearls and corals, and these, of course, are formed under different circumstances from purely mineral stones, and belong to a different class.

A considerable portion of the first part of the treatise before us is occupied with considerations as to the various prismatic forms which can be artificially produced from the natural prismatic forms assumed by diamonds and other stones, and the theoretical and practical means of defining and proportioning them. There is also a good deal of information in regard to the various tests which may be applied to ascertain the genuine character and the degree of purity of crystallised stones. In regard to the relative hardness of various stones, this is naturally determined by the power of one stone to make scratches on another. If a diamond is scratched with one of the points of a crystallised topaz, the topaz point is blunted, and the mark which will be seen on the face of the diamond is only the dust of the topaz, which can be brushed off with the finger. But if the topaz is scratched with the diamond, the latter is unaltered, and the surface of the former is marked by a striation which can only be removed by further polishing down. It is on the base of this process of comparison that a kind of scale of comparative hardness has been formed represented by ten substances, of which diamond is the highest and graphite the lowest in the scale. It is a curious indication of the immense importance of chemical conditions of combination in determining the outward aspect of a substance, that these two extremes of the scale, the brilliant and hard diamond and the soft black graphite, are both chemically the same substance,—pure carbon.

The most valuable diamonds are those which are entirely colourless. Those with a blue tinge, though still more rare, are not so highly valued, as the actual beauty of the pure ones outweighs the rarity of the blue variety. One of the finest of the blue variety is, we believe, in the collection of Mr. Beresford Hope. Diamonds of a red tinge take still a good place; green diamonds are tolerably numerous, and rank lower; yellow ones are very common, and the least esteemed. The estimation of the value of a diamond is made according to a regular system of appraisement, for an account of which we refer the reader to the book, merely mentioning that it will surprise many of those who are not conversant with the subject to learn what a large proportion of a diamond is often ground away to dust in cutting it so as to make the most of its brilliancy. The greatest diamond in the French Treasury, the Regent, weighed, we are told, 410 carats before cutting, and 136½ after cutting, which seems an immense loss in size; but we presume it really increased the marketable value of the gem. Of course, the diamond dust taken off in cutting is not allowed to be lost, but it is useful chiefly for practical purposes, in forming in its turn the means of grinding down the faces of other diamonds, for this superb stone will yield to no tool but one made from its own substance.

The brief history, with the portraits of some of the great diamonds of the world, makes an interesting chapter in the work, and one cannot but be strangely struck with the extraordinary

* Diamant et Pierres Précieuses: bijoux, joyaux, orfèvreries, au point de vue de leur Histoire et de leur Travail. Par E.J. Jannettaz, E. Fontenay, Em. Vanderheym, et A. Coutance. Deuxième Édition. Paris: J. Rothschild. 1881.

importance attached to these small pieces of crystallised carbon, some of which have been the subject of diplomatic negotiations, and of even worse forms of fighting. According to the authors, the Regent, before mentioned, is admitted to be the most remarkable diamond in the world; but this may be national prejudice. It has had a remarkable history, and was at one time stolen and entirely lost, as was supposed; and on another later occasion was pledged by the French Government to a German banker in respect of a loan. Our own Koh-i-noor is ranked next; and there is a partial history and a drawing given of a mysterious diamond, the Mogul, which was in the treasury of Aurungzebe in the seventeenth century, but which has disappeared, unless, as some persons think, it is identical with the Koh-i-noor.

Those who are interested in learning to what processes the diamond is subjected to bring it to its best form will find some information on these points given, with one or two illustrations of the operators at work, which are, however, rather too small to show the *modus operandi* very clearly. It is, though, sufficiently described. The three principal operations are cleavage: then what our French authors call *brutage*, which is a rough formation of the shape previously to its being finished by the cutter, whose work forms the final stage. The cleavage is done when the diamond is not of a good shape originally, or has faults and imperfections which can advantageously be cut away. The work is carried on with a cutting diamond inserted by means of cement in a copper matrix at the end of a short stick, the diamond to be cut being inserted in a similar stick; thus a sufficient leverage is obtained, and an incision is made in the diamond to be operated upon, in one of its natural lines of cleavage (the direction of which is deduced from the angles of crystallisation), and it can then be split along this line of cleavage with a knife and a hammer. If the diamond is naturally found in a good shape for working upon, and free from blemish, there is no need for cleavage; but the *brutage* or rough-shaping is the only stage before the final cutting and polishing. The rough shaping is carried on by two diamonds worked upon each other, also carried at the ends of sticks as in cleavage, but of shorter and stronger ones, as the diamond has to be shaped by mere force in rubbing and beating one against the other, and requires the exercise of considerable strength. In both cases the operator must be very well acquainted with the habits of crystallisation of the diamond, and the rough-shaper, of course, really decides its ultimate form, the work of the cutter being really rather polishing than cutting. The polishing is done on a wheel served with diamond-powder in very fine olive oil. The powder comes from the cleavers and shapers, the former of whom wear leather aprons, one side fastened round their waists and the other side to the edge of the table at which they work, so that all minute fragments may be collected.

The latter part of the work is occupied with remarks upon jewelry and goldsmiths' work generally, with illustrations; considering the subject from an artistic point of view. In this light, however, this part of the subject is not treated so exhaustively as to call for any special consideration in our columns, where so much has been said on the subject of artistic workmanship; and our language is rich in books on this part of the subject. The special interest of the book we have been speaking of lies in the thorough statement which it gives of the qualities of the diamond and other precious stones, and of the theory and practice of working them. In regard to this, which is its main object, the work displays that logical treatment of the subject *ab initio* which is such a praiseworthy characteristic of French technical publications generally. This is the prosaic side of the subject certainly; and some persons, especially of the sex whose privilege it is to be decked with these beautiful quintessences of colour and light, may think they would rather contemplate the beauty of the finished object than follow its history into the workshop. But they must not forget, in admiring the jewels with which they set off their own beauty, that there is a moral in connexion with them. It is given in a concentrated form by Herrick, in a little poem wherein he cautions some fair "Julia" or other against being proud of her beauty and of her sparkling eyes:—

> "Whenas that ruby which you wear
> Sunk from the tip of your soft ear,
> Will last to be a pre-ious stone
> When all your world of beauty 's gone."

STRAWBERRY LEAVES AND BLACK DIAMONDS.

The coronet of an English Marquess, as many of our readers are aware, is a golden circlet, on which four pearls are interposed between as many golden strawberry leaves. The rank in the peerage is marked by several characteristics. Originally the President of the Marches,—there was a *Marquis de Septimanie* in Carlovingian times,—the distinctions which now attach to the title in England, of "Prince," and "Most Noble," are those of the eldest son of a Duke, to the heir of which, as originally a sovereign title, the above dignities apply. And some English Marquesses, as Lord Londonderry, with 60,000 acres of landed property, and Lord Bute, with 116,000 acres, may well look down on many a German or Italian Duke.

It is of the first of these magnates that we now have to speak, as having added,—shall we say, a new lustre to his coronet?—at all events, as replacing the ancestral pearls by black diamonds. In other words, Lord Londonderry has added to his rank, wealth, and illustrious descent the rare novelty of becoming a retail coal dealer. The expression may raise a smile, but we are by no means sure that it may not be a smile of that agreeable kind which is permitted to those who win. At all events, Lord Londonderry is now doing what many persons who are inconvenienced by the magnitude of their coal bills have long begged and prayed some great coal-owner to do,—selling his own coal retail in London. We have before us a note from the wharf, St. John's Wharf, Millbank, on which what is intended for the coronet of a Marquess, is duly stamped,—*apropos* of which we recommend those whom it may concern to have a correct drawing substituted for what we can only call a diagram. Joking apart, if the Marquess of Londonderry shows that by fair and open dealing he can afford to reduce the price of Wallsend coal to the Londoner by 15½ per cent., there will be many persons of opinion that he has added a new lustre to his coronet by so doing. We observe that on the day on which the price of 22s. a ton for Newcastle coal, delivered within four miles of the Wharf at Millbank, is quoted by the agents of the Marquess, six of the most respectable firms in the London coal trade advertise best Wallsend coal at 26s. In the same paper, however, there is an advertisement of apparently the same quality of coal on sale by a proprietary company at 18s. a ton. We do not affect to be in a position to advise our readers on the subject, further than to hint that it will be well for them to put the question to the test. It has long been matter of doubt and debate how it was that the price of coal at the pit's mouth was quintupled or sextupled by the time the mineral was put on our fires in London. Very much has been said as to a coal "ring." The truth of this will now be put to the test. The quality of coal has to be considered in the first place. We apprehend that there is no better than that which the Marquess of Londonderry can supply; but here we await the opinion of the expert.

There are several kinds of "Wallsend" coal, and the size of the "double-screened" coal, as delivered to the householder, is an element of value. The expenses and risks of delivery are large, and the temptation to the individual dealer to cut in and undersell a ring, if such there be, and if they keep up a fictitious price, is great. Therefore, it will be a metropolitan benefit to have this matter set at rest, as it is likely now to be. If Lord Londonderry can send into our cellars, within four miles of Millbank, the best Newcastle coal at 22s. a ton, there is no doubt that the merchants will have to come down to that price. We speak with due reserve, knowing that there is a difference between the beginning and the end of any new enterprise. But the usual elements of failure seem absent in this case. There is no needy urgency, no want of capital, no want of thorough practical knowledge of the case, no want of command of the mineral to be sold. Under these circumstances, the difference between 26s. and 22s. a ton is worthy of very serious attention. If Lord Londonderry can permanently bring down the price of coal in London by the simple and legitimate mode of dispensing with intermediate agency between the pit in the North and the edge of the wharf on the Thames, he will be better deserving of a statue than some persons who have been or are to be gratified by that mark of the gratitude of their contemporaries.

THE TRANSACTIONS OF THE INSTITUTE OF ARCHITECTS.

If we felt some doubt, during the progress of last session of the Institute, as to the advisability of spending so much in printing for immediate use incomplete abstracts of the papers read, we have no doubt whatever as to the advantage of issuing the whole Transactions of the session in a volume like that now before us. When the papers were issued in their complete form during the progress of the session they were necessarily hurried in regard to revision, and, coming out in this pamphlet form, we should surmise that their natural fate often was to be thrown aside until the volume was complete for binding, and very possibly never looked at again. Coming to the subscribers in the complete form in which the present volume comes, printed on excellent paper, and supplied with admirable and carefully-drawn illustrations, the Transactions certainly assume a more attractive form than they have ever assumed before. The only drawback lies in the absolute necessity of printing a certain amount of the matter twice over, in order to supply the immediate report of the paper necessary as a basis for the discussions. It becomes, however, in this light, simply a question of funds. If the Institute can afford it, the result seems to us quite worth the extra trouble, when we consider it as a means of representing adequately what has been done during the session. In this respect the matter seems to concern not only members of the Institute, but also the manner in which the doings of that body are presented to the outer world. We hope that, notwithstanding the semi-private form of publication to which the Transactions of a society are limited, it will be thought worth while to give to a large section of the public press an opportunity of forming and expressing an opinion upon the merits of this year-book of the central architectural institution of the kingdom, and of the result we should feel no doubt. We say this without partiality, having by no means always supported the action of the Institute, or the manner in which their Transactions were got up; but we feel sure that no cultivated and impartial reader could take up this volume without being struck by the varied interest of its subjects,—artistic, archæological, and practical,—and the very thorough manner in which they have been gone into. So little seems generally known in the ex-architectural world as to the work the Institute of Architects is really doing,—the reports in the daily papers being generally of the most meagre description,—that we imagine many non-professional readers would be considerably surprised to find so important a volume as this issued as the result of one year's deliberations.

As a practical book of reference on several important subjects, this volume has something like a permanent value. We find, first, the very important subject of barrack-planning and construction, treated by Mr. Ingress Bell, both historically and practically, and with typical plans of what has been done in past and in modern days. One of these plans of an old barrack, that in the Savoy neighbourhood, has a value in itself, as it is a hitherto unpublished plan of an old and interesting corner of London in its former state. The plans of the typical modern English barrack are in most respects good model plans, though we are unable to understand why it should be supposed that only with the officials of the War Office could such plans have been matured; and we quite concur in the remarks made in the course of the discussion in regard to the conduct of the Government in selecting a plan out of a competition as the best plan for cavalry barracks, and then taking the planning into their own hands, and leaving the architect with the privilege of putting the outside shell to it. This illustrates only too well the average Government idea about architecture in this country; but in any case the essay, with its illustrations, forms a useful contribution to the literature of the subject. We may point out one defect in the plan given of married soldiers' quarters in connexion with brigade depôt barracks; all these are residences with one small bedroom only. It may be presumed that married soldiers, like other people, will have children; indeed, as there is a schoolroom provided in connexion with the block, it would appear that the War Office has contemplated this contingency. It is not desirable that there should be only one bedroom for parents and

children after the latter have passed infancy, and the going back to this arrangement in Government barracks is to be deprecated. If considerations of space render an extra room impossible, the solution would be found in providing a turn-up bed for the children in the living-room, to be let down at night. But there is no evidence that the authorities have considered the subject at all.

Another practical subject of far more general interest at present, that of electric lighting, is illustrated both with pen and pencil in the paper read by Mr. Slater, and which will be found to be a very clear and useful *resumé* of the state of the matter at present, as affecting the great public question of artificial lighting for everyday use; and the diagrams accompanying it, and illustrating one or two of the leading systems, are very well executed, and add much to the usefulness and interest of the paper. On the matter of Quantities, which formed the subject of another lengthened paper and discussion during the session, we have previously expressed our mind. The subject is chiefly of interest to professional men only; they will find in this volume most of the arguments for and against the undertaking of quantity-surveying by the architect very fully given, and, like the artist whose colours were mixed for him, and who "had nothing to do but shove 'em on," the reader of the Quantities paper and discussion will have nothing to do but read the arguments which are all prepared for him, and then make up his mind which is the best. Last, but by no means least, among the practical papers we have the very full and able one by Mr. E. C. Robins, which in its full form as given here is a much larger and more elaborate essay than either was or could have been actually read at the meeting; and though in general we should not approve of the system of publishing in Transaction volumes what was not really said at the meeting, there is a reasonable excuse for it in this case, in consideration of the very great importance of giving a general summing up of the subject. In this respect we have no hesitation in saying that this volume of the Transactions is worth possessing, if only on account of the paper and discussion on this subject of sanitary science. Those interested in the subject will find there an admirable all-round view of it by an architect who has given much thought to it, and a discussion embodying the views *pro* and *con.* of a number of gentlemen, nearly all of whom had acquired a special right to speak on the subject; for in this respect the discussion was a very well-ordered one, and there was very little indeed of the mere talking for the sake of talking, which it is usually very difficult to keep out of such discussions.

In the archæological department of the Transactions the most important subject is the Roman villa at Brading, of which, we are glad to see, the Institute have been able to publish some very good illustrations, including coloured lithographs of some parts of the mosaic floor designs. The other archæological paper, by Mr. Stevenson, bearing the title, "Historical Documents," has less practical usefulness. The writer of it, in common with others of the party to which he belongs, seems unwilling to see two sides of a question; and because every relic of an old building and record of an old custom is interesting, as it unquestionably is, he puts aside the fact that there are at times still more important considerations bearing on the requirements of the present day, and that the due fulfilment of these may not be compatible with the preservation of every morsel of old brick or stone merely because it is old. The paper was the occasion of a smart and somewhat unkind retort by Sir Edmund Beckett, who, however, certainly had the best of the argument in a common-sense point of view.

The paper which was read upon Persian architecture and construction, written but not read by Mr. Pardon Clarke and Mr. Hayter Lewis, is, we are glad to see, also supplied with illustrations of the general plan of the style of building referred to, and of the diagrams of the typical form of fretted roofing belonging more or less to all styles connected with or influenced by Arabian architecture. The paper would, perhaps, have been better named "Modern Persian Architecture," or "Persian House Architecture," as this is the part of the subject it more especially illustrates. As Mr. Fergusson remarked in the discussion, to propose to treat "Persian Architecture" as a whole in a single evening's paper would be to seem ignorant of the great extent and intricacy of the subject.

In conclusion, we may observe that the result quite bears out the correctness of the views of the present management of the Institute in regard to diminishing by nearly one-half the number of subjects to be treated of during the progress of a session, and setting apart a separate evening for the full discussion of each subject. To obtain fourteen or fifteen good papers in one session, such as shall really show thought and consideration, and be practically suggestive, is next to an impossibility, as every secretary who is in earnest in his business has found to his cost. Hence, in such a case comes the almost absolute necessity of filling up with mere perfunctory papers, which are read to oblige the secretary, or because the reader of them wishes to bring himself into notice. The reduction of the number of papers makes it much more possible to secure really good ones; and we have here a volume of which we may say that nearly all the contents are worth considerate reading. We may assume that some part at least of the successful result is due to the assiduity and intelligence of the secretary, Mr. William H. White, in whom the Institute have found the right man in the right place.

STEAM LOCOMOTION FOR STREET TRAMWAYS.

Under the auspices of the Liverpool Tramways Company and of the Corporation of Liverpool, some trials are about to take place in that city to test the capabilities of tramway locomotives. One of the locomotives that will compete,—that made under Matthews's patent,—we had an opportunity of seeing last week at the works of Mr. F. W. Jackson, Kingsbury-road, Ball's-pond, favourably known to some of our readers as a manufacturer of builders' plant and machinery. Mr. Matthews's engine is in all essential particulars a miniature railway locomotive, weighing about five tons, but combining certain modifications to meet the exigencies of street tramway traffic and the requirements of the Board of Trade. The successful application of steam locomotion to street tramways, under the conditions and restrictions to which we refer, has been an exceedingly difficult problem to solve, if, indeed, a solution has yet been arrived at. Upon this point, the Liverpool trial may afford some evidence. For our own part, we are bound to confess we look rather to electric power than that of steam to remove existing difficulties, but that may not be yet. To conform with a condition imposed by the Board of Trade, all working parts of the engine are encased so as to prevent the frightening of horses. To meet this particular requirement, it would only be necessary to enclose the working parts on the outside, but the mud and dust of street traffic render it desirable that the cylinders, pistons, cranks, &c., should be completely encased, and this is effected in Mr. Matthews's engine, in which the whole of the driving machinery is arranged on the outside of the frame-plates, and enclosed in a close casing. The engine can be driven from either end,—a necessary provision for all tramway engines which do not travel continuously on circular routes, but which need reversing at the end of each journey. It is one of the conditions of the Board of Trade that the driver of the engine must be right in front, so that he may keep a thorough look-out, and have perfect command of the machine. In the engine which we are describing the boiler is of the locomotive type, working, however, with a pressure of 150 lb. of steam to the square inch. The water is carried in side tanks, in which is placed a patent condenser for the exhaust steam, the tanks being connected by a pipe. Smoke is prevented by the use of smokeless fuel. The regulator and reversing levers are placed at each end of the engine, and at each end there is a powerful brake to be operated by the driver's foot. The engine is covered by a roof, and the boiler is enclosed with a casing, the upper part of which is fitted with sliding glass panels or windows. The total height is about the same as that of a passenger tram-car. The firebox is necessarily at one end only of the engine, and as it is not proposed to employ a stoker in addition to a driver, it is obvious that the driver can only be near the stoke-hole when the engine is travelling in one direction, and, indeed, even when he is driving from the firebox end of the engine, he will hardly be able to bestow any attention on the fire. Under these circumstances, arrangements are made whereby the fire, being made up before the commencement of each run of four or five miles, will need no further attention until that run is completed. Other conditions imposed by the Board of Trade, and which Mr. Matthews believes he has satisfactorily complied with, are: that there shall be no steam or smoke given off by the locomotive; that there shall be no noise like that caused by the blast of a railway locomotive or a steam road-roller; that the engine shall be provided with a steam brake capable of bringing it up, when going at full speed, in its own length; that the wheels of the car which is being hauled shall also be fitted with steam brakes, acting, of course, simultaneously with those on the engine; and that where the speed exceeds eight miles an hour the steam brakes are to come into action automatically. Nearly all the working parts, such as cylinders, piston, cranks, wheels, and axles, are of steel, and the workmanship appears to be excellent. In the design of the engine, special attention has been brought to bear on the combination of simplicity and convenience, the working parts being as few and simple as possible, with the view of securing thorough efficiency and economy of maintenance. The cost of this locomotive, we understand, is about 500*l.*

THE SANITARY CONGRESS AT VIENNA.

The meetings of the *Deutscher Verein für öffentliche Gesundheitspflege* and the *Verein für Gesundheitstechnik* have this year been held at Vienna, and were convened for the same time, in order that each might in some measure profit by the deliberations of the other, and that subjects of interest to both associations might be treated in joint discussions. From their titles it will be seen that the first named (and more important) society has for its object the practical application of sanitary measures, while the latter deals with the technicalities of hygienic science.

Associations dealing with sanitary matters abroad would seem to have originated from older societies of a more strictly medical character, the importance which sanitary reform has acquired during late years as a social question having led to the bodies which were at one time branches of the societies to which reference has been made becoming independent associations. The choice of Vienna was not inappropriate as the seat of this year's deliberations, the Austrian capital having lately given much attention to sanitary matters; and the attendance of representatives from all parts of Germany was evidently by no means lessened on account of the Congress meeting in a neighbouring State. The municipal bodies of Munich, Königsberg, Breslau, Halberstadt, Berlin, and Dantzic were represented; the last-named city by Herr von Winter, under whose energetic administration the recent important improvements in drainage were carried out. The Prussian Ministry of Public Works, The Hamburg Medical Board, and the Universities of Leipsic, Königsberg, and Pesth also sent delegates, and amongst the guests were also Herr Lammers and Herr Lorent, the celebrated hygienists from Bremen, and Mr. Lindley, jun., chief engineer of the Frankfürt Sewerage Works.

The preliminary social meeting which is customary on such occasions in Germany, took place at the rooms of the Musical Association, and friendly greetings were exchanged by the various members of the Congress, amongst whom the presence of Herr von Pettenkofer (the founder of the present system of sanitary engineering in Germany), was noticed with special pleasure by his friends.

The President of the Congress was Duke Charles Theodore of Bavaria, himself a medical man, and in his somewhat arduous duties in the three days' meetings, he seems to have been successful in pleasing all parties. His opening address referred to the importance of practical sanitary measures, and to the past activity of the Society in dealing with them, though encountering the opposition of old prejudices and customs.

The central committee was formed of representatives of both societies, and after the municipal and other notable personages present had addressed the assembly, the separate Associations commenced their meetings.

Taking first the proceedings of the Society for Public Sanitary Measures, we find that

a paper on "The Hygienic Requirements of the Situation and Use of Cemeteries" was read by Professor Hofmann, of Leipsic, who expressed his opinion that the injurious effects of burying-grounds when near dwelling-houses had, as a rule, been exaggerated; and that any development of carbonic acid in graves of a certain depth was equally liable to occur in excavations for wells or other purposes. He considered that the custom of burying many in one grave was reprehensible, maintaining that where separate graves of 3½ square yards surface measurement, and of 1¾ yard depth were practicable, no danger could be experienced by adjacent dwelling-houses, provided that the situation were rightly chosen and a due order of interment observed. He referred to chemical analyses and statistics of mortality, as refuting the suggestion of infection arising, or of wells being contaminated, from the proximity of churchyards to habitations. He dwelt on the necessity of choosing a dry soil, and a situation free from chances of inundation, as an excessive quantity of water caused a more rapid decomposition to take the place of the natural slow and equable oxidation of organic substances. As a normal rule he suggested that 11 yards was a sufficient minimum distance for dwelling-houses to be situated from a cemetery. Dr. Siegel, of Leipsic, confirmed the statements of his fellow-townsman, and as to the time which should elapse between interments he suggested ten years for adult graves and five years for children's, provided that the site of the cemetery had been suitably chosen, and that the final decision on such a question rested with competent authorities. After twenty years' cessation of interments, he considered that building over a burying-ground was allowable,—of course, after removal of any coffins or of any human remains. In the discussion which followed, the importance of the subject was fully recognised, but the views of the readers of the papers were in some cases dissented from.

The second day's proceedings dealt with the general subject of drainage, and more particularly with the question whether the system of main channels caused the generation of noxious gases, and the consequent spread of infectious diseases. Reference was made to the discussions which have often taken place in English professional circles on this subject, and to the efforts made by the more exact German school of hygienists to arrive at a solution of the problem. Dr. Soyka recorded the facts at which he had arrived by means of experiments made in the hygienic laboratory of Von Pettenkofer. He made a vigorous attack upon the opponents of the modern system, and remarked that in his report on the outbreak of typhus at Croydon, Dr. Buchanan had neglected certain important factors in forming his opinion, and that certain results were really accidental, instead of being consequent on the system of drainage. He then alluded to the improved health of Hamburg, Frankfürt, and Dantzic, since the modern plan of drainage had been adopted. The city of Munich afforded him elements for some interesting arguments. That city has 321 streets without any drainage, seventy-seven with old *cloacæ*, while only thirty-five have sewers of modern construction. The mortality from diphtheria was highest in the undrained streets. As to typhus (which is known in common with diphtheria to be most prevalent in low-lying situations) the mortality in parts of the city recently drained was less in the epidemic of 1875 than in the previous one; and the reduction of mortality was greater in the low-lying streets than in those at a higher level. Dr. Soyka cited these instances as affording a potent argument against those who blame the modern system of drainage for certain epidemics of infectious diseases.

In his address on the same topic Dr. Von Roszahegyi, of Pesth, confirmed the statements of his colleague, and remarked that his own practical experiments at Munich and Frankfürt had led him to the conclusion that the air in drains is carried forward with the stream, and follows the descent of the sewer, while currents of air in a contrary direction are unfrequent and limited in extent. He considered that no perceptible influence is exercised by wind or by the temperature of the exterior air. After some remarks from Herr Von Pettenkofer and Mr. Lindley, Dr. Lissauer, of Dantsic, fully confirmed the preceding speaker's remarks about the direction in which sewer air is carried. There had been cases, he admitted, of defects in pipes (capable of being easily remedied) having admitted sewer-gas into houses, but he maintained that where cases of illness had occurred they had been caused by a want of resisting power against some prevailing epidemic, and not from direct infection. He, however, quite admitted the necessity of keeping sewer-gas out of houses, and went into some details as to the most suitable preventive appliances. The result of the discussion was highly gratifying to the delegates of such capitals as have seen the sanitary and economic advantages of the modern system of drainage, and have not hesitated to make the pecuniary sacrifices necessary in the interests of the public health.

The other society did not enjoy such a large share of public favour in its first two days' sitting, but the more limited scope of its operations readily accounts for this fact. Amongst the matters treated were "The Principles of Systematic Drainage as applied to Cities," and kindred subjects. Some interesting details were also given as to the progress made so far in the preparations for next year's Hygienic Exhibition at Berlin.

For the concluding day's proceedings both the societies were again united, the subject for discussion being "The Advantages and Disadvantages of Heating by Air," a topic interesting from a theoretical as well as from a practical point of view. The first address was by Dr. Märklin, of Wiesbaden, the president of the larger society, who spoke in favour of the present system of heating by air as being economical, and with proper management, free from any inconvenience in use. Dr. Von Fodór, of Pesth, spoke at some length, remarking that air thus heated loses none of its moisture, and even gains a little when passing through the channels used. He also dwelt on the facility with which the present system gave an agreeable warmth, but pointed out that a want of compliance with the proper rules for using air for heating purposes was sure to produce an unsatisfactory result. He concluded by observing that in a supply of hot air it was preferable, from a sanitary point of view, to have a large quantity at a moderate degree of warmth, rather than a relatively smaller quantity at a higher temperature.

The usual complimentary speeches were delivered at the close of the proceedings. On the previous evening the members of the Congress had been entertained in a hospitable manner by the municipal authorities. Besides the meetings we have recorded, the programme of the Congress included excursions to the Vienna water-reservoir, and to the Semmering.

The *National Zeitung* of Berlin, in commenting upon the meeting, remarks that an attempt was made to get through too much in the short space of time during which the Congress lasted. In addition to the detailed discussions we have referred to, the question of the use of alcohol was also debated at some length. The suggestion is made that when time is so limited, the papers should be printed and distributed, being taken as read. The saving of time would thus give more opportunity for those discussions which form such a valuable feature at scientific congresses.

ART AND THE CONDITION OF THE PEOPLE.

At the annual meeting of the Burslem Schools of Science and Art, a few days ago, Mr. William Morris, of London, delivered an address to the students, in the course of which he said:—Hold fast to distinct form in art. Don't think too much of style, but set yourself to get out of you what you think beautiful, and express it as cautiously as you please, but, I repeat, quite distinctly and without vagueness. Always think your design out in your head before you begin to get it on to paper. Don't begin by slobbering and messing about in the hope that something may come of it. You must see it before you can draw it, whether the design be of your invention or nature's. Remember, always form before colour and outline, silhouette before modelling, not because these latter are of less importance, but because they cannot be right if the first are wrong. Now, upon all these points you may be as severe with yourselves as you will, and are not likely to be too severe. Furthermore, those of you especially who are designing for goods, try to get the most out of your material, but always in such a way as honours it most. Not only should it be obvious what your material is, but something should be done with it which is specially natural to it, something that could not be done with any other. This is the very *raison d'être* of decorative art; to make stone look like ironwork, or wood like silk, or pottery like stone is the last resource for decrepitude of art. Set yourselves as much as possible against all machine work. (This to all men.) But if you have to design for machine-work, at least let your design show clearly what it is. Make it mechanical with a vengeance, at the same time as simple as possible. Don't try, for instance, to make a printed plate look like a hand-painted one. Make it something which no one would try to do if he were painting by hand if your market drives you into printed plates. I don't see the use of them myself. To sum up, don't let yourselves be made machines, or it is all up with you as artists. Much as I hate the iron and brass machines, the flesh and blood ones are more terrible and hopeless to me. No man is so clumsy or base a workman that he is not fit for something better than that. Well, I have said that education is the first remedy for the barbarism which has been bred by the hurry of civilisation and competitive commerce. To know that men have lived and worked mightily before you is an incentive for you to work faithfully now that you may leave something to those who come after you. What next is to be thought of after education? I must here admit that if you accept art and join the ranks of those who are to rise in rebellion against the Philistines, you will have a roughish time of it. "Nothing for nothing and not much for a dollar," says a Yankee somewhere, and I am sorry to say that is the rule of nature also. Those of us who have money will have to give of it to the cause, and all of us will have to give time, and thought, and trouble to it. And I must now consider a matter of the utmost importance to art and to the lives of all of us, which we can, if we please, deal with at once, but which emphatically claims of us time, thought, and money. Of all the things that are likely to give us back Gothic art in England, the cleaning of England is the first and the most necessary. Those who are to make beautiful things must live in a beautiful place. Some people may be inclined to say, and I have heard the argument put forward, that the very opposition between the serenity and purity of art and the turmoil and squalor of a great modern city stimulates the invention of artists, and produces special life in the art of to-day. I cannot believe it. It seems to me it stimulates the feverish and dreamy qualities that throw some artists out of the general sympathy. But apart from that, there are men who are stuffed with memories of more romantic days and pleasanter lands, and it is on these memories they live, as I say, to my mind not altogether happily for their art, and you see it is only a very few men who could have even these doubtful advantages. I abide by my statement that those who are to make beautiful things must live in beautiful places, but you must understand I do not mean to claim for all craftsmasters a space in those gardens of the world, or of those sublime and awe-inspiring mountains and wastes that men make pilgrimages to see; that is to say, not a personal share. Most of us must be content with the tales of the poets and the painters about these places, and learn to love the narrow spot that surrounds our daily life for what of beauty and sympathy there is in it. For surely there is no square mile of earth's inhabitable surface that is not beautiful in its own way, if we men will only abstain from wilfully destroying that beauty; and it is this reasonable share in the beauty of the earth that I claim as the right of every man who will earn it by due labour; a decent house with decent surroundings for every honest and industrious family; that is the claim which I make of you in the name of art. Is it such an exorbitant claim to make of civilisation, of a civilisation that is too apt to boast in after-dinner speeches; too apt to thrust her blessings on far-off peoples at the cannon's mouth before she has improved the quality of those blessings so far that they are worth having at any price, even the smallest? Well, I am afraid that the claim is exorbitant. Both you as representatives of the manufacturing districts, and I as representing the metropolis, seem hitherto to have assumed that, at any rate, there is not one family in a thousand that has established its claim to the right aforesaid. It is a pity though; for if the claim is to be considered inadmissible, then it is most certain that we have been simply filling wind-bags and weaving

sand-ropes by all the trouble we have taken in founding schools of art, National Gallery, South Kensington Museum, and all the rest of it. I have said education is good, is necessary to all people; neither can you if you would withhold it, and yet to educate people with no hope, what do you expect to become of that? Perhaps you might learn what to expect in Russia. Look you, as I sit at my work at home, which is at Hammersmith, close to the river, I often hear some of that ruffianism go past the window of which a good deal has been said in the papers of late and has been said before at recurring periods. As I hear the yells and shrieks and all the degradation cast on the glorious tongue of Shakspeare and Milton, as I see the brutal, reckless faces and figures go past me, it rouses the recklessness and brutality in me also, and fierce wrath takes possession of me till I remember, as I hope I mostly do, that it was my good luck only of being born respectable and rich that has put me on this side of the window among delightful books and lovely works of art, and not on the other side, in the empty street, the drink-steeped liquor-shops, the foul and degraded lodging. What words can say what all that means? Do not think, I beg you, that I am speaking rhetorically in saying that when I think of all this I feel that the one great thing I desire is that this great country should shake off from her all foreign and colonial entanglements, and turn that mighty force of her respectable people, the greatest power the world has ever seen, to giving the children of these poor folk the pleasures and the hopes of men. Is that really impossible,—is there no hope of it? If so, I can only say that civilisation is a delusion and a lie; there is no such thing and no hope of such a thing. But since I wish to live, and even to be happy, I cannot believe it impossible. I know by my own feelings and desires what these men want, what would have saved them from this lowest depth of savagery: employment which would foster their self-respect and win the praise and sympathy of their fellows, and dwellings which they could come to with pleasure, surroundings which would soothe and elevate them; reasonable labour, reasonable rest. There is only one thing that can give them this—art. I have no doubt that you think this statement a ridiculous exaggeration; but it is my firm conviction nevertheless, and I can only ask you to remember that in my mind it means the properly-organised labour of all men who make anything; that must at least be a mighty instrument in the raising of men's self-respect, in the adding of dignity to their lives. Once more, "Nothing for nothing and very little for a dollar." You can no more have art without paying for it than you can have anything else, and if you care about art, as you must when you come to know it, you will not shrink from the necessary sacrifice. After all, we are the descendants and countrymen of those who have well known how to give the lesser for the greater. What you have to sacrifice is chiefly money: that is, force and dirt,—a serious sacrifice, I know; but perhaps, as I have said, we have made greater in England aforetime; nay, I am far from sure that dirt will not in the long run cost us more in hard cash even than art will. So which shall we have, art or dirt? What is to be done, then, if we make the better choice? The land we live in is not very big, either in actual acreage or in scale of fashion; but I think it is not our natural love for it only that makes us think it as fit as any land for the peaceful dwellings of serious men. Our fathers have shown us that, if it could otherwise be doubted. I say, without fear of contradiction, that no dwelling of men has ever been sweeter or pleasanter than an ancient English house; but our fathers treated our lovely land well, and we have treated it ill. Time was when it was beautiful from end to end, and now you have to pick your way carefully to avoid coming across blotches of hideousness which are a disgrace, I will not say to civilisation, but to human nature. I have seen no statistics of the size of these blotches in relation to the unspoiled or partially-spoiled country; but in some places they run together so as to cover a whole county, or even several counties, while they increase at a fearful rate,—fearful in good earnest and literally. Now, while this goes on unchecked,—nay, unlamented,—it is really idle to talk about art. While we are doing this, or letting it be done, we are really covertly rejecting art, and it would be honester and better for us if we did so openly. If we accept art we must atone for what we have done and pay the cost of it. We must turn this land from the grimy backyard of a workshop into a garden. . . . . When you have accepted the maxim that the external aspects of the country belong to the whole public, and that whoever wilfully injures that property is a public enemy, the cause will be on its way to victory.

ARCHITECTURAL EDUCATION.*

UNIVERSITY COLLEGE, LONDON.

I PROPOSE for the present session to select the subject of Greek architecture for treatment in detail. Greek is the architectural style which, within certain narrow limits, approaches nearer to absolute perfection than any other, and it may, with perfect truth, be called the fountain-head alike of modern and of all Classic architecture. Should the result of this attempt seem to warrant it, I shall propose, in another session, to expand, in the same manner, the treatment of some other part of the course.

The Course B deals with the science of architecture, that is to say, with materials, and with construction (as the art of putting materials together in a building is called). We shall take the principal natural building materials, such as timber, stone, and marble, and the principal manufactured ones, such as bricks, cement, and iron, and try to become familiar with their appearance, their properties, their strength, their fitness for use in a building, and the indications of their being of good or bad quality; and when we know something about each material we shall try to follow it out in the building, and consider the parts of a structure in which it may be best employed. Thus, after timber will come floors, roofs, and various framings. After bricks and cements, we shall consider brickwork and such subjects as the bond of bricks, and foundations. The building-stones lead us to walling, masonry, arches, vaults, and the most difficult constructions that the builder has attempted; while, after considering iron, we shall learn something about fireproof floors, iron roofs, and other applications of iron to building.

These lectures on materials and construction are included in the course of study recommended to civil engineers. The materials and methods employed by the builder and the architect are, to a large extent, the same as those with which the engineer has to deal, though they are usually employed in larger masses in his structures than in ours, and under different conditions, requiring, more often, very close calculation of the stresses they have to resist. I trust that the engineering students who may attend the course will give the work of this class a due share of attention. Some of them have carried off the highest prize which it has to offer. Others have failed to obtain a certificate, and have been chagrined at their failure. Yet the lecturer, the professor, the examination papers, and the system of making answers, are the same for all. Success depends solely upon the pupil. It may be impossible for him to be the first in any given year; but, with ordinary abilities, nothing but application is required to secure a certificate of having passed the examination with credit. Want of time has prevented hitherto, and no doubt will still prevent, much attention being given by this class to joinery, plasterers' work, and the other finishings of a building; but some care will be bestowed upon the construction of drains and the sanitary fittings connected therewith, though for the full study of sanitation I must refer you to the lectures of my accomplished colleague, Professor Corfield.

I shall direct attention, also, not only to the properties and use of these materials, but to their defects and failure. It cannot be too strongly impressed upon the mind that from the day the workman leaves a building the tooth of Time begins to attack it. Forces of all kinds tending to produce decay and ultimate destruction are at work, and while structures of colossal strength, like the pyramids of Egypt, may keep them at bay for thousands of years, ordinary buildings are not long before they begin to suffer. The failure of buildings, and the precautions to be taken to avert it and to remedy it when it has become serious, will therefore form one of the subjects of this course.

The collection of diagrams illustrating courses A and B, prepared through many years, as I have already stated, by Professor Donaldson and Professor Hayter Lewis, now reaches to many hundreds of examples, chosen with special reference to the purposes of these classes, and represented in drawings of great excellence. These are, by the kindness of the two past professors, still available for the purposes of the class. The larger portion of them relate to the Art course, but there are a considerable number bearing upon Construction.

Some useful specimens of building materials of various sorts are available for illustration of the lectures on Construction. The series of specimens is, however, not extensive, and I am taking steps to increase it, so as in a short time to make it very serviceable as an aid to instruction. The collection of illustrations is also constantly increasing. I have added, and shall add, diagrams, prints, and photographs, and I hope occasionally to make use of photography in another way,—that is to say, to exhibit once, if not oftener, some illuminated photographs, by way of giving a more vivid representation of ancient buildings than is possible by the aid of drawings or photographs seen in the usual manner.

Course C.—The course of lectures on Practice is not so long a course as either of the others, and is intended chiefly for young men who have become to some extent familiar with the routine of professional work, and especially for those who are about to start in practice, or have recently begun practice on their own account. It is my desire in this course to put the student in possession, to a certain extent, of the results of experience, so that he may know what he is likely to have to do or encounter when acting as an architect on his own account. I need hardly point out that a pupil or assistant, especially in a large office, while probably enjoying ample opportunities of working on plans and specifications, is not always,—in fact, not often,—brought into contact with the negotiations that the architect with whom he is has to carry on, may not see much of the supervision of works, and, in short, looks at the transactions relating to a building from the point of view of an irresponsible *employé*, and not that of a responsible professional man. The aim of these lectures is to teach students some of the things which they would otherwise have to find out for themselves when entering practice, and which they had far better know beforehand.

The course travels over the following subjects, beginning with what is most likely to be familiar, at least in part, and proceeding to questions that are more and more special,—the preparation of plans and specifications, and the ordinary routine of building operations, including planning for special purposes and requirements; the preparation of all the required documents, conditions of contract, &c.; the principles on which estimates are prepared, the supervision of buildings, the usual mode of stating building accounts, and the professional charges which the architect is entitled to make. The next series of subjects in this course deals with those aspects of architectural practice which relate to law. Foremost, and of great importance, the London Building Act, and other Acts regulating buildings which have been founded upon it. Then the law of light and air, of contract, of the tenure of land and houses, and some account of arbitrations and of such questions as are most commonly litigated in connexion with building operations. Lastly, I shall endeavour to give you a brief account of that class of professional work which all architects are liable to be called upon to perform in connexion with existing buildings, such as surveys for dilapidations and various purposes, valuations, and the like.

I am sure that it will be of service to many a young architect to be warned and instructed beforehand about his routine, his charges, his Building Act difficulties, the restrictions he has to cope with when building on leasehold land, or the risk he runs where ancient lights are interfered with, rather than to have to buy his experience in these and similar matters at an expense of money to his client and of vexation to himself.

To this outline of the course of lectures I propose to add some account of the method pursued. The objects to be kept in view are twofold,—first, to convey information; secondly, to make the students think for themselves.

A large portion of the lectures is unavoidably devoted to giving information. It is of great importance to fix in the minds of the students those facts relative to their future profession which are most needful for them to know; so, of necessity, much of the time which the pro-

* Opening lecture of the courses in Architecture and Construction at University College for 1881-82, delivered by Professor T. Roger Smith, on the 10th inst. (see p. 480, *ante*).

fessor and his classes spend together is devoted to telling, or illustrating, or recalling the most important of those facts.

I am very desirous of inducing the students to draw. It is by the pencil that an architect learns as well as designs, and if it is possible to stimulate the use of the pencil to any extent by what passes in this class-room, it will be most satisfactory to me and serviceable to yourselves. I trust that the sketches which I make on the black-board will be always copied in your note-books, and that you will make sketches from the diagrams hung up. I shall continue the practice which Professor Donaldson established of lending the diagrams to students, and I shall be delighted if they are much borrowed and much copied, and I shall have pleasure in offering prizes for the best sets of sketches illustrative of the lectures A and B, and shall hope to find that there is a keen competition.

But the most serious part of my task remains behind. Can I teach the students not merely to know something about buildings or parts of buildings, or to draw them, but to understand them?—feel their value as works of art or as specimens of construction, and penetrate through the outward and tangible aspect of a material thing to that inspiring something,—that reason, or design, or contrivance, or historic import which gives to a congeries of bricks and stones and mortar a value which in some cases is literally beyond all price? Can I make you understand why the choir of Westminster is lovely, or what the secret principles are which hang the fretted roof of its Lady Chapel in mid-air? Can I enable you to study, and to some extent comprehend, ancient designs, and so take the first step towards yourselves becoming designers? I do not know, but it will be my endeavour to do something of this sort, and if I can see that even to a very small extent I have been successful in making you think for yourselves, I shall be far more satisfied than if I find your minds crammed full of facts and dates, and matters which can be learned by rote, and which it is often possible to know without understanding them.

The method of lecturing established by Professor Hayter Lewis will be continued, at least through this session. It is a method more serviceable to the student than agreeable to the Professor; but I believe it affords a very good means of learning what is taught, and reduces to a minimum the risk of mistakes in your notes. The plan is this. The heads of a portion of the lecture will first be dictated slowly, sentence by sentence, and are to be written down by the class as I read them out; and then, after this is done, I shall go over and explain the portion of the subject which the notes cover. This ought to ensure correctness in your notes, and gives an opportunity for revising them to a certain extent; but I value it chiefly because it leaves the students free to listen with their eyes as well as their ears (and, believe me, the eyes help you wonderfully to understand what is said), without being distracted by the effort to follow the lecturer and fill the notebook at the same time. I may perhaps now and then vary this plan for a single lecture. Occasionally, at any rate, it will be desirable for you to hear, and me to give you, a connected discourse not disturbed by the breaks to continuity which such a system entails. I shall be sometimes glad, especially when trying to show you the principles that underlie architectural rules or practice, to be as uninterrupted as possible, and you will probably be the better for having occasionally to give continuous attention. When this is done I will take care that an outline of the heads of the lecture is provided for each of you, so as to leave you free to follow me.

It has been the custom, and one which I hope to follow as an additional means of interesting and instructing the classes, to take the students to one or two of the great buildings of London and to some large builder's yard, when the opportunity will occur of seeing in actual fact some of the matters which form the subject of our lectures, and where, perhaps, the habit of examining buildings and works in progress may be encouraged, and the method of investigating ancient work learned.

A notice of the routine pursued here would be incomplete were I to omit the examination and prizes. The examination, the results of which determine the prizes, takes place at the close of the session; it is entirely in writing or by sketches, the questions being printed, and the prizes are publicly presented at the college. An alteration has been made this session, by which the work of the entire year will be treated as one whole. Formerly it was divided into two portions, and the arrangements were such that only half the work done by a student was the subject of the final examination. An attempt to remedy this last year by holding two examinations was found inconvenient in practice, and this time the examinations at the close will cover the work of the whole session in each class. An examination, properly looked at, is an admirable feature in a course of instruction. It enables a student to recognise the progress that he has made, and compels him to make some use of what he has learned. I shall probably, therefore, introduce one additional examination during the session in each of the classes A and B, not to be counted towards the award of prizes, but solely for the purpose of aiding students. Let me add that it is most desirable that every person attending the class should attend the final examination, and do his best to obtain, if not a prize, at least a certificate. The prizes include two silver medals given by Professor Donaldson, and bearing his name, together with valuable prizes of books. The certificates are given to as many students as obtain a certain proportion of marks out of the total possible; and it is fair here to point out to you that the best way of obtaining a good proportion of marks is not to write long answers, and to bring in irrelevant things which the student knows, but which form no part of the correct answers to the question; but to write accurate and clear replies, which shall, on the one hand, answer every part of the questions, and, on the other, shall not travel beyond the questions, and to illustrate them, wherever possible, by well-drawn sketches. Where an answer is given, wholly or partly, by a sketch, I always, in marking the paper, first allot as many marks to it as would have been due to a correct reply in writing, and then add something more for draughtsmanship if the sketch shows any merit.

Thus far it has been my aim to show to you, gentlemen, what this college has been doing for years past, and what I, as its Professor, propose to endeavour to do in the coming session for such of you as become students. I must not close without some remarks upon what you must do for yourselves, and upon the degree in which our work here may be an aid to you in that which occupies you during the greater part of your time.

I have already said that in an office you learn practice,—in the class-room you learn principles. If this be so, it is not difficult for you to see that as you master principles here, you will find they enable you rapidly to get a firm hold upon practice elsewhere. Take the most important branch of your work, in the office or out of it,—your drawing. The arrangements of these classes do not, it is true, provide for instruction or, except just incidentally, for practice in drawing; but there is hardly a part of either the construction or the architectural treatment of a building which you will not draw far better when you know the reasons for its taking the shape it does. The simplest part of your work,—the working out of plans,—will explain what I mean. The beginner is often in difficulties as to the thicknesses of brick walls. I hope, when he has been through the part of this course which refers to brickwork, that the sizes of bricks and the mode of combining them into walls will be made clear to him for life. Another illustration may be taken from a more advanced sort of work. The elevation of a building ought to have,—I think, will have,—more interest for a student who knows something about the features employed, than if he simply copy them unintelligently. For example, if the Orders occur, he who knows something of how and where they originated, what their earliest forms were, and where they were matured, will draw with more understanding and pleasure, and will, therefore, be sure to draw them better than one who only knows that he has gone through a rather irksome task in drawing them out after some typical example. The man who has some general acquaintance with the forms of architecture and its history will be prepared to deal with whatever period or style he has to work at, as something not quite strange to him. The same thing is true of materials and constructions. When, for example, you understand the reason of the shapes and relative sizes of the timbers in a roof, and why their joints are shaped as they are, and what purpose each part has to serve, you will feel more interest in drawing such roofs as you may have to put into plans, and you will undoubtedly draw them with fewer mistakes. When you have been told what are the main peculiarities of the leading building-stones, or the sorts of timber most used, and when you know what marks indicate good quality, and what the reverse, you will not only find a walk round a building instructive, but may soon become able to make yourselves useful in aiding, to some extent, in the superintendence of buildings. At any rate, after having mastered some of the elementary principles of materials or of construction, you will be able to take in and assimilate the information which the accidents of practice bring within your reach.

As a general rule, I believe that a young man who has already spent some months or a year in an office is more likely to get benefit from these classes,—especially from the Construction class,—than one quite new to the subject. On the other hand, I believe, as I have stated, that to a youth just fresh from school or college, the opportunity of some systematic and scholastic teaching on subjects connected with his profession is of importance,—so much so as to outweigh any disadvantage arising from his being new to the subject. A student so circumstanced should attend the Art class, and that only, in his first year, and should take the Construction class the year after. If, however, a student has been a year in an office (much more if he has been a longer time) it may be advantageous to him to attend both classes in the same year. This is, however, partly a question of the amount of time he can give to the work at home which attendance here involves.

I hope it will be distinctly understood, and always borne in mind, that the student who wishes to get real benefit from these lectures must devote some time to them at home each week, besides attending his hour here. The notes should be carefully written out in ink, from the rough notes made in the room, and the sketches made from the black-board should be carefully and neatly copied into the permanent note-book. The books of reference mentioned should be consulted; but most and chiefly, everything connected with the subject of the lectures of which illustrations can be found should be drawn. The diagrams afford a mine of wealth of this sort, and the generous practice of lending them, under proper restrictions, to copy, affords an opportunity of making the fullest use of them. Much information may be gained by copying, sketching, or reducing these diagrams; but the student who wishes to make the most of his opportunities should also draw or sketch such illustrations in other books, or such photographs, or such pieces of actual work as come under his notice, and are of a nature to elucidate the subjects being treated. I have had the pleasure to receive excellent sets of illustrative sketches in previous sessions, and I repeat that I sincerely hope this may be the case in the present session.

Allow me to express my hope that most, if not all, students will attend the Art class. I believe it to be of the greatest possible importance, and that attendance at the Science class alone is a very incomplete and one-sided mode of education, even for an engineer or a surveyor, much less for an architect. It is hardly possible to convey to you how keenly a critical observer is sometimes made to feel the disgraceful want of knowledge which English architecture too often betrays. Features which are inaccurate are constantly to be met with in designs otherwise so simple that a very small amount of education would have insured correctness. Features that are incongruous are frequently put together, and spoil the effect of many a building which, had its author's cultivation only been such as his talents deserved, might have been a complete success. Of course, attendance in the Art class is no guarantee of correctness; but a very considerable amount of such information as no architect, no draughtsman, no civil engineer, ever ought to be without, is put within the reach of the students of that class, and I can venture so far as to say that no young man of intelligence who has gone through the course and worked at it fairly and thoroughly, ought to be able,—I think I may say would be able,—to design such incongrous elevations and details as would be found, if we went to look for them, within a hundred miles of the centre of this great metropolis.

As to the Professional Practice course, it is not designed for beginners, and probably few students who have been less than three years in an office will be able to reap the full advantage of attending it; while I hope that to many

who are much more advanced these lectures may be serviceable. They have been attended during the short time that they have been given by architects in practice as well as by senior students, and, as already explained, they will be directed specially to the requirements of those who are beginning, or are hoping soon to begin, practice.

In conclusion, perhaps, I may be pardoned if, passing away from the subject which has occupied our attention, I say one or two parting words about work and study outside these walls. In fact, I feel as if I could hardly close without some allusion to your own studies. Many topics might be touched upon; but I will limit myself to a passing remark or so upon each of four,—drawing, practical work, books, and the study of ancient buildings.

Before anything else, it is of importance to you to draw, and to draw well. You ought to be able to represent, fairly well, anything you see. And if you wish to attain this power, nothing is so useful as studying the human figure. The Slade school here is the best school for the purpose that I know; but those who cannot give the time in the day-time may be able to draw at one of the schools of art where the antique is studied in the evening. With your drawing-instruments you ought to be able to work as easily as an ordinary draughtsman using the pencil alone. To handle the tee-square and dividers thus readily requires long practice; but till this facility is completely attained, the instruments will always be a little in your way. Long before that time, however, you ought, so far, to master the use of them that all your ink lines shall be true and even, all your circles really round, and all your right lines really straight; and if this degree of steadiness has been perfectly mastered in a student's first twelve months, it is a not discreditable performance, and perfect command of the instruments will follow in time. Practice sketching things you see, especially portions of buildings; and, in short, strive to become, in every sense of the word, skilful, artistic, and rapid draughtsmen. Above all things, practise yourselves in designing. The power of originating architectural compositions may be latent in many of you; but effort is as much required to bring out that power as to make manifest any other latent capacity or gift. Design is fostered by study; but a man may be studious without a particle of inventive power, or may perhaps neglect invention for the attainment of knowledge, and by so doing impair his ultimate success as an architect. Practise designing, therefore.

Next in importance to drawing comes practical work of any sort. The most useful of all is to go into a workshop and learn to make something belonging to a building. By the time he has become able to make a four-panel door, a youth will gain such an acquaintance with construction as will prevent his making half the mistakes which disfigure most working drawings turned out by young hands. But whatever piece of practice of any sort is within reach, examine it, and get a share in it. The commonest office work done intelligently may impart valuable knowledge. To trace drawings or copy specifications, if only the young clerk determines to understand all that goes under his hand, is a means of gaining all kinds of instruction, and a six-roomed house, if only it be watched closely from day to day, would afford a fund of information as to materials and construction. Do not, therefore, neglect or despise the humblest opportunity of seeing or sharing in any sort of practical work which comes in your way.

The use of books has already been considered at some length. I should like to suggest that the student should not only by degrees form a library of the best books of reference (taking care to get the best), and that what he buys he should read; but that he should make use of the fine public libraries accessible in London, and in not a few of our great towns. There are a few good architectural books in the library of this college, free to students. There are some, I believe, at Sir John Soane's Museum; and the three great art libraries of the Royal Academy, the South Kensington Museum, and the Royal Institute of British Architects, supplemented by the Library of the British Museum and the loan library of the Architectural Association, furnish the London students with the means of consulting every book of reference that exists, and every illustrated treatise on our art, with little inconvenience, in some instances at absolutely no expense, and in other cases for a merely nominal fee. Do not, therefore, neglect the magnificent opportunities for making use of good books which exist within your reach.

Last, but by no means least, comes the study of ancient buildings. This is alone the source of inspiration and of accurate knowledge for the architect. Set it down in your minds that your best opportunities are those which give you time to measure or sketch some good example of English or foreign architecture, and that your training will remain incomplete unless one good long journey, or more than one shorter one, shall have enabled you to study examples on the Continent of Europe as well as English ones. It is not buying prints and photographs which puts knowledge into your minds; it is the process of patiently watching, examining, and, so to speak, absorbing the peculiarities of your subject while you draw it, that enables you really to know it; and, let me add, this is much more thoroughly accomplished by the process of making a set of geometrical drawings from the solid work than by representing it in a perspective, however cleverly and prettily that may be done.

If the variety and extent of study which is here hinted at,—prolonged, as it ought to be, through a series of years, and, in fact, more or less kept up through life,—seem formidable, let me remind you that the profession of an architect is not an easy one, and that it is only by unremitting, careful, and studious work that the student can fit himself for the discharge of its various duties and render himself equal to its responsibilities. But in almost every department of these studies there is much to interest and even to fascinate the mind. There is hardly any amusement undertaken for pure pleasure which is so enjoyable as a sketching tour through a district rich in works of architecture. There are few professions where the anxieties and hard work inseparable from all the real business of life are lightened by so many occupations of a kind which it is a pleasure to engage in, and none, so far as I know, where the advantages of variety of employment are so fully enjoyed. A calling such as you will find architecture to be, if you heartily throw yourselves into it, demands that those who engage in it should fit themselves for it by sufficient training and assiduous study. It will be my part to attempt to offer to my students a portion of this training, and I trust that those of you who join my classes will come prepared to study with such assiduity as to command, as well as deserve, success.

EXHIBITION OF WORKS OF ART APPLIED TO FURNITURE, 1881: AWARDS.

The following is the report of the judges appointed by the Council of the Society of Arts to make the awards of silver and bronze medals offered by the Society to the Designers and Art Workmen whose work was in the Exhibition of Works of Art applied to Furniture, held in 1881, at the Royal Albert Hall.

1. The collection of works of art included many branches of artistic handicraft, such as carving and inlaying in wood, ivory, &c., cabinet work and fine joinery, painting on various materials like wood, glass, and pottery, glass-cutting, the process known as *pâte sur pâte*, beating and chasing metals like silver and brass, wrought-iron work, modelled and glazed stoneware, and decorative needlework. The arrangement of the objects had been undertaken by the various exhibiting firms. A definite space had been assigned to each firm, who decorated it with hangings or with painted and gilt moulded work, or wood panelling, &c., and then disposed within it the various objects of furniture, &c. We were much pleased with the general good taste displayed in the separate divisions and in the aspect of the Exhibition as a whole.

2. In bay No. 1, occupied by Messrs. Crace & Son, the important cabinet of carved walnut wood was distinguished for its excellence. A number of hands, it was stated, had been employed upon the carving, which called forth our admiration. It was, therefore, not possible to single out one art-workman to whom a medal might have been awarded. For the same cause no distinction could be awarded in respect of the admirably-inlaid octagon table of walnut wood, the design for the ornamental border of which has been made by Mr. J. D. Crace. The painting done upon a cabinet of satin wood, by Mr. Herman Scholz, as well as the daintiness of his rendering of the little figures of boys in the medallions, merit the distinction of a bronze medal. In this bay a tray and set of tea-things, in a dark olive-green body, ornamented with applications of well-depicted forms in white paste (*pâte sur pâte*), exhibited by Messrs. Mintons, and designed and executed by M. Solon, we especially commend as worthy of a silver medal.

3. The decoration of the side of a room, exhibited by Messrs. Morant, Boyd, & Blanford, remarkable for the excellence and finish of the work, was based upon a scheme good in its proportions, and the blending of the delicate tones of colour adopted, with those of the damask panels, and the details of the ornamental forms used, redound to the good taste of the designer, Mr. V. Barnard. Messrs. Morant, Boyd, & Blanford also exhibit a satinwood cabinet, and we consider that Mr. H. Reich, who inlaid the frieze of interlacing garlands upon the front of the drawer and the central ornament of the flap, should be rewarded with a bronze medal.

4. Near bay No. 2 hung three red lustre plates, the work of Mr. W. de Morgan, to whom a silver medal should be given for suitability of design to the materials employed, as well as for the fine tones of colour and lustre obtained.

5. In Messrs. Jackson & Graham's cabinet and chimneypiece, of a so-called Oriental Greek character, extraordinarily delicate and perfectly fitting marquetry work, and very finished cabinet-makers' work, attracted attention. A bronze medal is due to Mr. A. Reich, the marquetry-worker, and a bronze medal to Mr. A. Baldwin, cabinet-maker; to Mr. Marchant, who is understood to have assisted in the cabinet work, we award one of the Society's certificates. Beneath the chimneypiece in rosewood, with plaques of inlay of ivory, ebony, and mother-o'-pearl, designed by Mr. Allwright, was a wrought-iron grate, of simple design, in good taste, made by Mr. Sayer, a member of the firm of Messrs. Feetham & Co., who exhibited other grates and fire-irons of good pattern and workmanship. A piece of embroidery, designed by Mrs. Alfred Morrison, who prescribed the colours and selected the materials used, greatly pleased us by the excellent distribution of Oriental motives, as well as the beautiful harmony in colour displayed in it.

6. The walnut seat for a vestibule, understood to be a copy of an old French design, reflects great credit in respect of its workmanship upon the exhibitors, Messrs. Gillow & Co. The carving, by Mr. M. Anderson, of the pendent heads of the canopy, and scrollwork on the arms of the seat, is well done. Carving in satinwood of garlands, on a small scale, but in high relief, and also of medallions, with a layer of satinwood upon a ground of ebony, in imitation of cameo-cutting, executed by Mr. Ross, to decorate the satinwood cabinet, made for the Empress of Russia by Messrs. Gillow, showed much skill in the execution, but in a direction of doubtful taste.

7. The carving of panels of boxwood let into a rosewood cabinet exhibited by Messrs. Holland & Sons was commendable.

8. In bay No. 6, some lightly-constructed furniture, including a stand in dark wood, after a Japanese model, and some chairs after good models of the Chippendale and Sheraton period, shown by Messrs. Howard & Co., was particularly noticeable for its gracefully designed and well-cut ornamental details. A rosewood chimneypiece showed good cabinet-maker's work. The designer of these pieces is Mr. Randal, whom we select for an award of a bronze medal, as well as for his design for a white metal fire-place and fittings. Some extraordinary specimens of glass cutting and engraving, by Mr. Northwood, who has produced a very remarkable *fac-simile* of the "Portland vase," probably unique as a work of glass-cutting of modern times; and a vase, called the "Milton vase," designed by Mr. Pargeter, of the Red House Glass Works, were exhibited by Mr. Pargeter. To the glass-engraver, Mr. Northwood, we award a silver medal.

9. Messrs. Wright & Mansfield contributed several excellent examples of inlaid work of the English eighteenth-century style, in the manner of Chippendale, Adam, and Sheraton, as well as work enamelled and decorated in the style of designs by Pergolesi. Awards of bronze medals were made to Mr. Thomas Hinton, the foreman workman, and to Mr. Victor Reich, the marquetry-worker, and of certificates to Messrs. Samuel Bryne, Charles Humphreys, and Thomas Miller, cabinet-makers, by whom the more important of these works were produced. The

carved and gilt mirror frames and girandoles in the style of the eighteenth-century English, and of Louis XV. French periods, especially three placed over the sideboard, were noted for superior workmanship, the carving being done by Mr. John R. Wingfield.

10. The modelling of the relief ornament carved by many hands, in a deep red mahogany mantelpiece and cabinet exhibited by Messrs. Collinson & Lock, was particularly good, and we award a silver medal to Mr. Webb, the modeller, for this and for many other specimens exhibited. His design for metal sconces was distinguished for richness in arrangement of conventional foliage, well grouped, and modelled with good effect of low relief and harmony in flowing lines. The metal-worker who wrought this design in brass is Mr. Singer, to whom we award a bronze medal. Of a different style, but of much excellence, the design being by Mr. Lock, the modelling by Mr. Webb, and the actual metal-work by Mr. G. Price, was a mirror frame of *repoussé* oxydised silver. We award a bronze medal to Mr. G. Price for his metal-working. The whole of the collection of furniture exhibited by Messrs. Collinson & Lock was noticeable for the completeness of workmanship throughout.

11. Some wrought iron by Mr. Sidney Phelps, of Sidney Sussex College, Cambridge, deserves mention, especially the panel for a balcony, which was of a good style of design, with interlacements of rod iron and beaten leaves of plate iron. The figures in the small panels, of deep modelled relief in terra-cotta, designed and executed by Mr. G. Tinworth, are full of expressive action, and we consider that a certificate should be awarded to this artist. We award a second certificate to Mr. G. Tinworth, the designer of the large flattened, circular bowl, executed in stoneware, and shown by Messrs. Doulton; and a certificate to Mr. Edward Sears, for his careful and clean painting in monochrome on two tiles, called respectively "A Saucy Companion" and "An Odd Chicken." We desire to commend the skill displayed in two delicately-carved birds in lime-wood, the work of Mr. W. Perry. Two panels of painted glass, suitable for the decoration of a house or hall, representing "Art" and "Science," appeared to us to show a right appreciation of the application of coloured design to glass, without detracting from its utility as a window through which light has to pass.

12. In bay No. 9, containing articles exhibited by Messrs. Gregory & Co., the reproduction of an old English arm-chair, enriched with carved and turned rails, and a little tea-table, were highly finished in workmanship, and commendable for the lightness of their construction. We award a bronze medal to Mr. W. P. Collins, the designer of these articles. To the designer, Mr. T. W. Hay, of the woven hanging, for the drawing and arrangement of details, as well as for good harmony of colour, we propose to award a certificate.

13. The well-proportioned framework or walnut panelling, for the dining-room or hall, shown by Messrs. Johnstone, Jeanes, & Co., in bay No. 11, was excellent in design, but, in our opinion, the effect would have been better if simple wood panelling instead of tapestry had been used. As it was, it produced the impression of an open screen which had been filled up, rather than of a wall.

14. The carving of the students of the School of Wood Carving, South Kensington Museum, was meritorious; and the pilaster executed by Miss Eleanor Rowe, of this school, showed good feeling for flow of line and the modelling of surfaces. It may be well to mention here that a principal aim of this school is to cultivate the production of wood-carving in a broad style, and at a cheap rate, similar to that used so largely for decorative purposes in the eighteenth century in this country. The works of this school are not, therefore, intended to compete with more expensive and more highly-finished wood-carvings.

15. We award a silver medal to Mr. R. Gleeson, for the suitable and graceful fan-mounts, which he has designed and executed, especially that of ivory, mounted with Mechlin lace. The inlaid amboyna-wood table, the work of Mr. Thomas Jacob, gained the distinction of a bronze medal, for the beauty of the marquetry work.

16. In concluding our report upon this Exhibition, we are of opinion that annual exhibitions, at which are shown various classes of fine art applied to industry, such as those represented at the present Exhibition, might be usefully supplemented were designers for all sorts of handicrafts and manufactures to be encouraged to submit drawings and sketches of designs which have actually been carried out. A section was allotted for such drawings at the Paris Exhibition of 1878; and, in our opinion, much useful instruction and information might be gained from such an annual display of designs to the benefit of producers and consumers.

George Godwin (F.R.S.).
Montague Guest (M.P.).
Edward J. Poynter (R.A.).
Alan S. Cole, Hon. Secretary.

August 5th, 1881.

The Viscount Hardinge wrote to express his regret at being prevented from attending the meeting.

LIST OF AWARDS.

Silver Medals.

M. Solon, for olive green tea-service, *pâte sur pâte*, (Messrs. Minton); Mr. de Morgan, lustre plates; Mr. Webb, modeller and designer (Messrs. Collinson & Lock); Mr. R. Gleeson, for carved fan mounts; Mr. Northwood, for glass cutting and engraving (Mr. Pargeter).

Bronze Medals.

Mr. H. Scholz, for painted furniture (Messrs. J. G. Crace & Son); Mr. Vernon Barnard, designer of side of room (Messrs. Morant, Boyd, & Blanford); Mr. J. R. Randal, furniture designs and design for fender (Messrs. Howard & Co.); Mr. Albert Reich, marquetry-worker (Messrs. Jackson & Graham); Mr. H. Reich, marquetry-worker of cabinet (Messrs. Morant, Boyd, & Blanford); Mr. William Allwright, designer of rosewood chimney-piece, inlaid with ivory, ebony, mother-of-pearl (Messrs. Jackson & Graham); Mr. Baldwin, cabinet-maker (Messrs. Jackson & Graham); Mr. T. Hinton, foreman cabinet-maker (Messrs. Wright & Mansfield); Mr. Victor Reich, marquetry worker (Messrs. Wright & Mansfield); Mr. Singer, for beaten brass-work (Messrs. Collinson & Lock); Mr. G. Price, for beaten oxydised silver frame (Messrs. Collinson & Lock); Mr. W. P. Collins, designs for furniture (Messrs. Gregory & Co.); Mr. T. Jacob, for marquetry top to table.

Certificates.

Mr. Marchant, cabinet-maker (Messrs. Jackson & Graham); Mr. C. Humphreys, cabinet-maker (Messrs. Wright & Mansfield); Mr. T. Miller, cabinet-maker (Messrs. Wright & Mansfield); Mr. S. Byrne, cabinet-maker (Messrs. Wright & Mansfield); Mr. M. Anderson, carver (Messrs. Gillows); Mr. T. W. Hay, designer of woven silken fabrics for room decoration (Messrs. Gregory & Co.); Mr. G. Tinworth, terra-cotta panels; Mr. G. Tinworth, designer and modeller of flattened round bowl, shown by Messrs. Doulton; Mr. Edward Sears, for painted tiles; Miss Eleanor-Rowe, for carved wood pilaster; Mr. W Perry, for carving in wood; Mr. Sidney Phelps, wrought-iron work; Mr. W. C. Codman, designer of panelling (Messrs. Johnstone & Jeanes).

IMPROVEMENT IN THE FIRING OF KILNS.

In no respect has the art of manufacture, in any of its main branches, made more advance during the present century than in what regards the economy of heat. Let any one glance back to the ancient modes of melting iron, of making steel, of burning lime! How rude and simple were the earliest procedures! To make a bonfire, and throw the ore or the limestone on it, or to bank up charcoal with mud to keep in the heat, were the first attempts at reduction. Small wonder that such was the case, when the very theory of combustion was unknown. It is but comparatively recently that manufacturers have become aware how much invisible fuel, as well as how much unused heat, was allowed to escape from the open mouth of the furnace. In our domestic consumption of coal, indeed, we keep to the good old plan (for the coal merchants) of sending some 70 or 80 per cent. of our heat and unburned carbon up the chimney. But in the processes of metallurgy, and in the production of steam, we have already effected very great economy, and not a year passes without some improvement in that path in which John Ericssen, in the construction of his caloric engine, was the pioneer.

A new application of the theory of the economy of heat has recently been made in one of those industries in which old wastefulness, and we may even say savagedom, have long maintained their ground. By no class of working men have improvements been more steadily and wrathfully resisted than by the brickmakers. The old brick-kiln was a mode of applying heat conspicuous for its simplicity, —not to use a harsher term. Mr. James Dunnachie, of the Glenboig Star Fire Brick Works, near Glasgow, has here been taking a leaf out of the valuable receipt book of Dr. C. W. Siemens, with signal success. His efforts have been directed at the same time to the use of gaseous fuel for burning his fire-bricks, and to the economising the heat produced by combustion. The first requisite was supplied to him by the "Wilson gas-producer," an invention which is closely connected with the Cleveland district. The construction of the new cellular kilns, we suppose, is due to the invention of Mr. Dunnachie himself.

The kiln is described as consisting of a series of ten separate chambers, all of the same size, and each having a capacity to hold 13,000 or 14,000 bricks. The chambers are arranged in two rows of five each, 24 ft. apart; the whole being covered by an iron roof. Gas and air flues are built under the chambers. The object of the arrangement is to draw successive charges of bricks, from chamber after chamber, utilising the heat that passes from one for raising the temperature of the next. Thus when the work of one chamber has been effected, and the bricks which it holds have been thoroughly burned, the current of gas from the gas producer is turned into the next chamber, and the atmospheric air requisite for combustion is made to pass through the first chamber, from which it extracts the heat no longer than required. The calorific power of the mixture of gas and heated air is intense, and the burning of each set of bricks is effected in from eighteen to twenty-four hours. It is expected that when the whole set of apparatus is brought into regular daily work a clamp of bricks will be thoroughly fired in twelve hours. In the best type of coal-fired brick-kiln hitherto constructed a firing takes from four to five twelve-hour shifts; that is to say, from forty-eight to sixty hours.

The economy in heat, if not quite equal to that in time, is said already to reach 50 per cent., as compared with coal firing, and is anticipated to reach fully 75 per cent. We can see no good reason for doubting the promise. A very perfect utilisation of heat is conceivable by means of these several chambers. The air passing from the bricks actually being fired at a very high temperature, raises the walls of the second chamber almost to a red heat, before the actual firing commences. The question of the regulation of blast, and of the serial heating of the chambers, is one of which the detail is susceptible of very great modification, as to which practice will, no doubt, be the best guide. But as it is the aim of the engineer to make the steam produced in the boiler part with all its heat in the form of mechanical power, and issue cool and damp to the external air when its work is done, so is it the object of the kiln-master first to heat the air to the temperature of flame, and then to rob this air of the whole of this imparted caloric, heating, in the rush of the great draught through the flues and chambers, first the walls of each cell, and then the contained charges, to such a degree as to reduce the firing specifically given to each charge to the minimum of the exact dose of heat required for the perfect firing of the bricks.

OUR NEW DOCKS.

We observe that Cardiff, which is a port of much larger trade than Swansea, is also on the alert for improvement. An application was made recently by the town authorities to the Marquis of Bute, the great land and coal owner of the locality, either to sell his dock to the Corporation, or to build a new one, and the Marquis announced his intention of doing the latter.

This great enlargement of our dock accommodation is a feature of no small importance as regards the industrial progress of England. It has a special and direct interest for the building trade. At Leith, at Liverpool, at Folkestone, at Swansea, at Milford, we have had to describe new harbour works. Cardiff, and London herself, are preparing fresh accommodation for their shipping. It may be said that the dock-builders have the courage of their hopes. Of all those great industries by the returns of which the movement of British wealth can be measured, —coal, iron, copper, lead, tin, zinc, textile industries, railway traffic, shipping,—it is the last alone that has maintained an unchecked increase, year by year, for the last ten years. Its vitality seems more independent of the general activity of production than that of any other occupation, which no doubt is due to the fact that shippers have two strings to their bow, and profit alike when the world demands the product of our looms, forges, and factories, and when we have to ask from the foreigners what we cannot produce at home. Since 1851, our gross tonnage has risen from 16,000,000 to 37,000,000 tons. But we can hardly expect so swift a march to be continuously maintained.

ROMAN ANTIQUITIES.

At a meeting of the St. Paul's Ecclesiological Society, held in the Chapter-house, St. Paul's Churchyard, on Tuesday evening, Major Heales in the chair, an interesting lecture upon the Roman antiquities discovered in Warwick-square, Newgate-street, was given by Mr. Alfred Tylor. The principal objects discovered (recently described by Mr. Tylor before the Society of Antiquaries) were exhibited, the most prominent being a leaden ossuarium and a glass cinerary urn found within it, and a very fine vase of serpentine, which, when found, contained a coin which dated from about 54 A.D. Mr. Tylor, in the course of his remarks, touched upon the relation of the Mithraic religion to Christianity, a subject suggested by various emblems found on some of the remains, and adverted to the excellence of the cast lead-work exhibited by the ossuarium. The exact positions in which the various objects were discovered, their depth from the surface, and the nature of the stratum in which they were found, were delineated on some very complete coloured drawings made by Mr. Tylor. In some interesting remarks he traced the principle of heredity in Christian and other symbols as seen in Roman sculptural remains, coins, &c., and subsequently he indicated the course of some of the principal Roman roads in Britain.

In the discussion which followed,

Mr. Milman, director of the Society of Antiquaries, observed that the objects discovered by Mr. Tylor were far superior to any that had yet been found in England. The fine serpentine urn was unique in this country, and almost unknown on the Continent. Mr. Franks, a great authority on such subjects, had expressed the desire that the objects found by Mr. Tylor should become a part of our national collection, and in that desire he heartily shared. The value of Mr. Tylor's discoveries was greatly enhanced by the extreme care with which he had recorded the exact positions of the various objects when found. In conclusion, Mr. Milman referred to the excavations about to be undertaken for the completion of the Inner Circle Railway by carrying it through what was a very interesting portion of Roman London, and said he was glad to learn that the attention of Mr. Price and other antiquaries who had made Roman London their study would be given to the progress of those excavations.

The Rev. Charles L. Acland, Hon. Curator of the Museum at Colchester, gave an epitome of Roman methods of interment, as illustrated by the contents of that museum, and urged that all who were connected with or interested in public or semi-public institutions such as museums should exercise watchfulness in localities where "finds" were likely to be made, in order to secure for public collections the objects found. Somehow or other, workmen who made these finds always knew exactly where to go in order to sell (generally for a mere trifle, such as the price of a pot of beer) objects of priceless value to the antiquary. Unfortunately for the public, there were people who would buy such things, and "ask no questions," and thus, no doubt, many specimens of great interest were kept hidden away in the hands of private persons, until it was forgotten whence they came, and perhaps they were ultimately lost, and so never reached a public museum, where they would be seen by those most competent to form an opinion upon and deduce lessons from them.

The Rev. Mr. Mayhew having offered a few observations, a vote of thanks was, on the motion of the Chairman, tendered to Mr. Tylor for his interesting lecture.

Ironworks and Collieries.—The prospectus is in circulation announcing the registration of Newton, Chambers, & Co., Limited, with a capital of 650,000*l.* in 20*l.* shares. This firm has existed nearly a century, and the reason for sale is that some of the numerous trustees on whom the properties and works have devolved on the successive deaths of the partners, have no power to continue the working beyond the approaching termination of the deed of partnership. The names of well-known and experienced noblemen and gentlemen appear on the board, and the terms of purchase are certified by competent engineers to be fair and reasonable, being based on the low prices at which they stood in the firm's books on the 31st December, 1880.

DOORWAY OF THE CHURCH AT WETZLAR.

We have frequently had occasion to call attention to the remarkably interesting church of Wetzlar on the Lahn, and we have noticed, in a previous number, the proof which the unfinished front of that church presents that Mediæval builders erected their buildings after the English manner, and not in the mode common at present on the Continent; that is to say, the details and ornamentation were worked before the stone was fixed *in situ*, instead of the stone being put up in block, and carved afterwards. It also proves that each separate feature of the building was finished off as it was erected, and not left to receive its finishing touches after the completion of the main edifice.

The doorway which we illustrate in our present number corroborates these facts in a very remarkable manner; for, although the walls of that part of the church are not carried up half their height, the whole of the ornamentation of the doorway is complete, and even the greater part of the statuary is fixed in its place. This consists of a beautiful figure of the Madonna attached to the centre pier, and those of the four Evangelists in the jambs. In the tympanum is a "Majesty," with statues of Mary and John the Baptist, and two angels offering incense. The lower part of the tympanum is ornamented by thirteen niches, probably intended to be occupied by statues. Looking through this doorway, which, by the bye, has never been supplied with doors, the lower portion of the more ancient west front is to be seen, with its very remarkable double portal, adorned with curious imitations of snakes or worms, carved in a black basaltic stone. The date of this front seems to be uncertain, though it is probably a work of the eleventh century.

The later doorway, like all the more modern portions of the church at Wetzlar, is constructed of fine red sandstone, which has resisted the weather excellently, and retained the sharpness of the sculpture in an extraordinary degree. We should like to ask some of our scientific readers how they account for the fact that the red sandstone of Germany retains its surface after many years of exposure to the air, whereas the English red sandstone, which seems to be of a similar formation, appears to have stood less well than any stone used by our Mediæval architects. The dampness of the climate would certainly not account for this, as the cathedral of Freiburg, in Breisgau, is remarkable for the wonderful state of preservation of its stonework, yet Freiburg is notorious as being one of the three places in Europe where the greatest amount of rain falls.

NORMAN DOORWAY, JEDBURGH.

We reproduce in our present number a drawing by Mr. G. H. M. Addison, of a late Norman doorway, from Jedburgh Abbey, a fine example of Transitional work. The ravages of time and weather have made sad havoc of the detail, leaving just enough to make us wish for more. During the revival of Gothic architecture, of which we are still reaping the benefit, all the periods received their due meed of attention except this, which may probably be attributed to the fact that it is essentially opposed to that economy in the stone-work so necessary in modern building. Perhaps no style is more suggestive to the designer in terra-cotta.

CASE FOR ORGAN: ST. MARTIN'S CHURCH, BRIGHTON.

This organ stands at a height of 18 ft. from the floor of the chancel. A recess, 15 ft. wide and 20 ft. high, is prepared to receive the frame, reservoirs, and heavier parts of the instrument, whilst the front shown in the drawing projects 6 ft. beyond the face of the wall. An effort has been made in designing the case to show the actual disposition of the various departments of the organ, and not to construct a mere screen of pipes and woodwork, having no relation to that which lies behind.

The "great organ," the diapason pipes of which show above the key-board to the right and left of the player, is divided into two parts, and projects to the full extent of the 6 ft. already referred to. This department is thus divided in order that the player may not be too much overshadowed by the projection, nor so much boxed in by solid woodwork as to be unable to hear what effect he is producing.

The carved panels which show between the pipes of the "great," and come immediately above the key-board, are kept back, and advance but little over the head of the player. The "swell organ" stands, at a little higher level, immediately behind the "great," and is hidden by the open panels already mentioned.

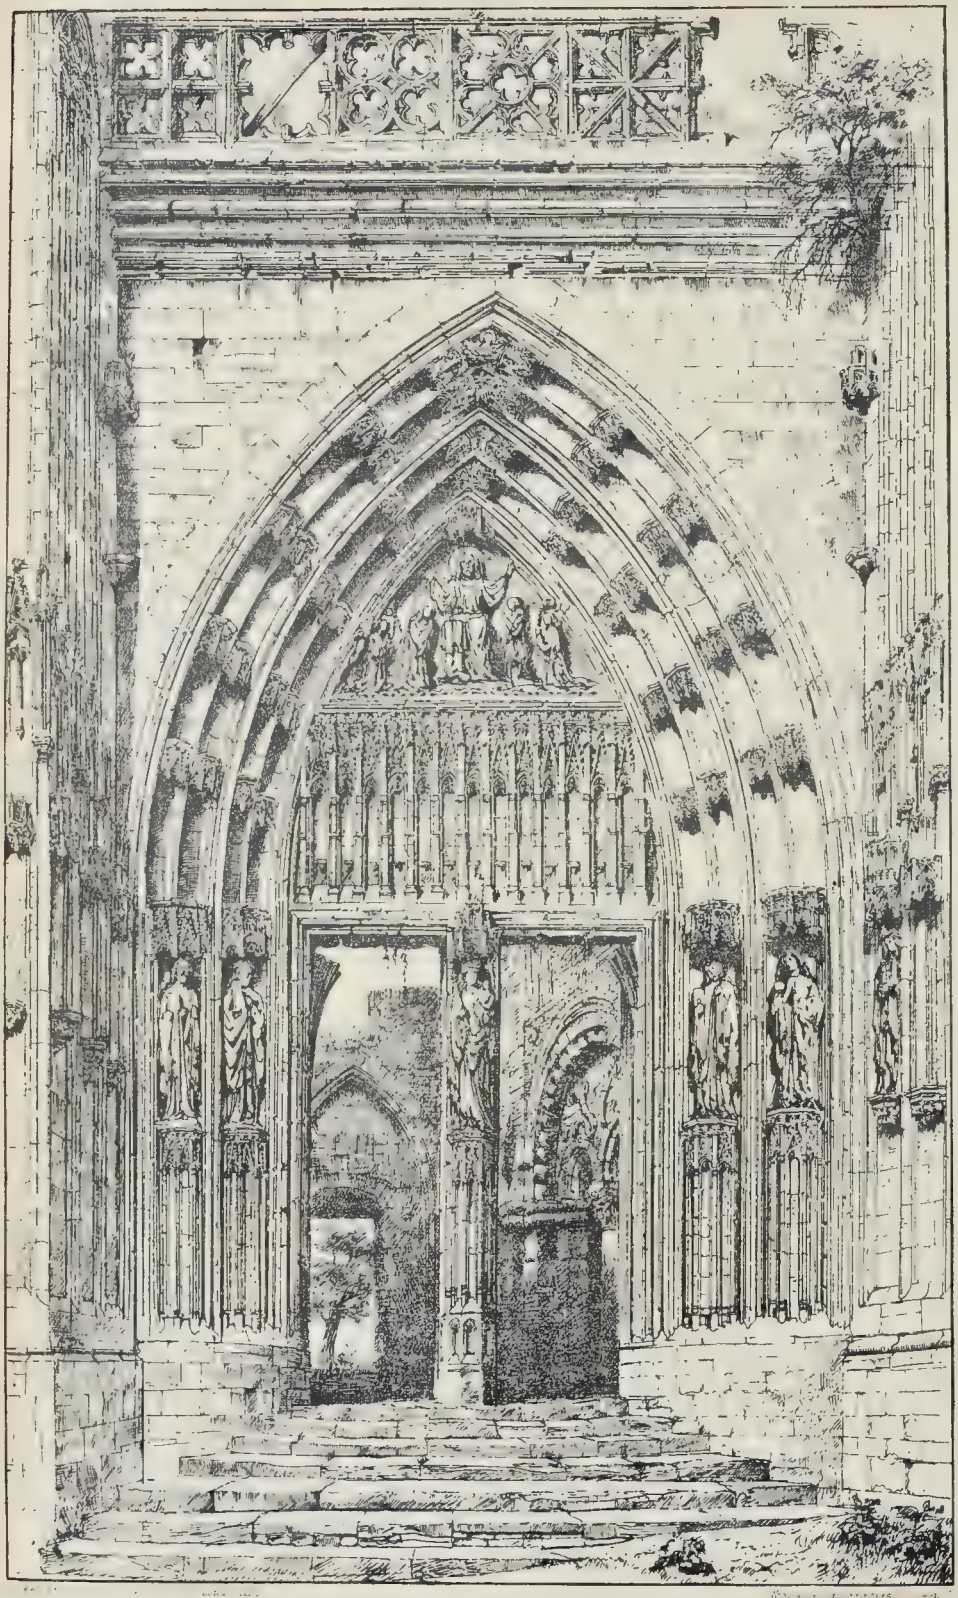
The "choir" organ projects, and forms the crowning feature of the design.

The "pedal" organ stands at the back of the recess, which is 10 ft. deep.

In building the church, preparation was made for placing the feeders and blower over the sacristy, and not in the recess with the organ itself. By this means the violent pumpings which so frequently occur are scarcely audible, and the danger from fire is lessened. The walls of the organ-chamber are constructed hollow, and a plastered ceiling stands above the instrument, only a portion of which is as yet erected. No part of the case is yet up, but the frame is prepared to receive it when funds permit. Messrs. Hill built the organ. Mr. Geo. Somers Clarke, jun., is the architect.

SCHLOSS BRÜHL, ON THE RHINE.

We present our readers this week with a view of the upper part of the principal staircase of Castle Brühl, a "cabinet piece of the Rococo style," that of Louis XIV. The ceiling especially is noticeable. Acting upon the impression that the slender Rococo ornamentation is not effective enough to divide the large horizontal space of the ceiling, and that a repetition of the frescoes in the three stories would be tedious under the treatment of that kind of painting, a gallery is formed at the summit of the walls, above which are introduced the final paintings at a height of about 14 ft. Powerful shades were thus produced. The castle was erected at the beginning of the last century, from the designs of French architects, for the Elector of Cologne. It is now the property of the German Emperor.



THE MANCHESTER AND LIVERPOOL DISTRICT BANK, SANDBACH.

This bank has been designed for an increasing population. The banking-room is entered by a commodious vestibule at the junction of High-town and Hope-street. A substantial angle-turret, the upper part of which is half-timbered, is the most prominent feature over the main entrance, the half-timber work being balanced by a pair of dormer gables on the front elevation. The main roof is hipped at each end, and covered with tiles. The architects were Messrs. Barker & Ellis, of Manchester, and the contractor was Mr. John Stringer, of Sandbach.

OFFICIAL INSPECTION OF HOUSES.

The Croydon Medical Officer of Health, Dr. Philpot, says in his last Report to the Local Board of Health:—"This arrangement of special inspections, which was instituted by your committee some few years ago, has worked very well. The number of householders who have applied for inspection of their houses shows how much the privilege is appreciated, and how many householders, alive to the dangers of defective houses, are glad to avail themselves of the assistance of the inspectors. Perhaps if it were more generally known that any occupier, by applying at the Sanitary Office, 8, Katherine-street, can have the sanitary arrangements of his house examined, without charge, by one of the Board's House Inspectors (who have now a very large experience), there would be still more applications. I have noticed that public companies have been formed for the purpose of inspecting houses, charging a fee for the examination. But it seems to me that the duty of house-inspection comes fairly within the duties of the public sanitary officers. One defective house may be a source of danger to the whole neighbourhood.

Station Roofs.—We understand that the walls of the Society of Engineers' meeting-hall in Westminster-chambers are covered with drawings of various recently-erected iron roofs in illustration of Mr. Arthur T. Walmisley's paper, which is to be discussed at their next meeting on November 7.

CASE FOR ORGAN, ST. MARTIN'S CHURCH, BRIGHTON.—Mr. George Somers Clarke, Jun., Architect.

INTERFERENCE WITH THE USE OF THE ELECTRIC LIGHT.

GLASGOW INSTITUTE OF ARCHITECTS.

At the fourteenth annual meeting of the Glasgow Institute, the President,

Mr. John Honeyman, F.R.I.B.A., in the course of his observations in moving the adoption of the report, said year by year new topics required their consideration. That which seemed to be more immediately pressing was the question brought formally before them by the Master Masons' Association regarding the measurement of mason-work, and there were other questions connected with contracting demanding attention. Moreover, there were questions of more general interest to the community on which they as a profession might be expected to express an opinion. At the present moment there was at least one subject of the kind which, he thought, should be taken into their most serious consideration without loss of time. He referred to the proposal of the Corporation to secure a monopoly of electric lighting in the city and suburbs. Unfortunately, at first sight this seemed a sensible proposal, and the great majority of men did not take the trouble to look at anything of the kind a second time unless almost forced to do so. In reality such a monopoly—like everything else bad in principle—would be found pregnant with most pernicious consequences. It should not be necessary to point out to a constituency which boasts of its Liberal principles, and its abhorrence of Protection in any shape, that the principle of a monopoly is bad; and yet it would seem that the citizens of Glasgow were prepared quietly to acquiesce, without one word of remonstrance, in the creation of a monopoly of the very worst description—obstructing the practical application of scientific discovery, and prohibiting the use—for that was really what it would amount to—of an invention of the greatest utility; the general introduction of which would benefit the public health more than the most costly sanitary scheme which had been suggested. The excuse, of course, was that the gas monopoly must be protected. But where was this new departure of their Town Council to end? If they made the gas bad enough they might find it as necessary to secure a monopoly of paraffin oil and put a shilling or two on the gallon. The thing was almost too absurd for serious argument. If we made a bad bargain of the gasworks we must bear the consequences, and our experience in connexion therewith should at least teach this, that science was not like a distinguished living statesman—she gives no rash pledges of finality. The electric light was the light of the immediate future, but who could tell what might be next, and next? and it would indeed need a very strong case to be made out,—a very urgent necessity, in short,—to justify the creation of an obstructive monopoly, in defiance of every sound principle of political economy. It would be out of place to say more on the subject now. With the view of quickening their interest in it, he would venture to give one illustration of how injuriously the proposal might affect their clients,—in other words, their fellow citizens. In a large block of buildings containing shops and counting-houses he purposed having a continuous elevator, worked by a small steam-engine, which should have sufficient surplus power to supply all the tenants with electric light. It was quite evident that the cost of the daily supply of light would be a mere trifle,—the engine and attendant being required, at any rate; and if it were supplied to the tenants gratis, much more than an equivalent would be obtained by increased rents and constantly occupied premises. Now, the question really came to be,—Is such an arrangement to be prohibited, because, forsooth, the Gas Committee must get 50*l.* of profit out of that property? Let them, he said, get their 50*l.* by all means; no one wished to repudiate their responsibility, but what he wished to point out was that the man who improved the annual value of his property by the free use of electric lighting, to the extent of say 300*l.* a year, even if he paid that 50*l.*, was a gainer by his freedom to the extent of 250*l.* Now, what the committee wished to do in order to secure this 50*l.* was to prohibit the intended economical production of electricity, and so, in effect, confiscate the 250*l.*; not to supply electric light at all for years,—as even the words of our progressive Lord Provost seemed to indicate; and when they did vouchsafe to allow it, the tenants would be left to the tender mercies of the Gas Committee, and most of them knew something of these. The supply would be connected with the house, not as the proprietor or the tenant wanted, but when, where, and how the officials of the Gas Office thought proper, who, after probably making a thorough mess of good walls and ceilings, would charge whatever they thought proper for their trouble. And lastly, they would charge whatever they chose for the supply of electricity, and interfere with the use of apparatus which the user might prefer, allowing no choice of accumulators, lamps, or anything else. Knowing, as they did, how such things affected property, he felt strongly that a certain responsibility rested upon them in the matter, and that it deserved their most earnest and immediate attention.

A meeting of the newly-elected Council (Glasgow Institute), took place immediately after the general meeting, Mr. John Honeyman was re-elected president; Mr. James Sellars, jun., vice-president; Mr. John Burnet, 167, St. Vincent-street, auditor; Mr. William Landless, treasurer; Mr. William M'Lean (of William & C. J. M'Lean), writer, 196, St. Vincent-street, secretary.

A NEW COUNCIL CHAMBER AT GUILDHALL.

At the meeting of the Court of Common Council, on the 20th inst., Mr. Fricker (chairman of the Special Guildhall Improvement Committee) brought up the report of that committee on the reference of March 31st, 1881, to consider the whole question of a scheme for the complete arrangement and improvement of the courts and offices in and around Guildhall. He said that the present chamber was utterly inadequate. There was accommodation for something like 130 or 140 members, whereas the number on the list was something over 200, and they were often inconveniently crowded, and had to breathe a very impure atmosphere. On March the 31st a reference was made to his committee to consider a scheme for the complete re-arrangement and improvement of the courts and offices around Guildhall. The committee did not at the present moment desire to recommend the Court to carry out any very extensive improvements; indeed, they refrained from expressing an opinion as to what sum of money might be afterwards required for carrying out that which was foreshadowed on the skeleton plan, and turned their attention to the construction of a new Council-chamber. What they recommended was simply the erection of a new Council-chamber on the north side of Guildhall, to occupy the position now occupied by the Court of Exchequer, the Chamberlain's office, the Town Clerk's office, and the Architect's office. The diameter of the chamber would be 54 ft., surrounded by a corridor 9 ft. wide, by means of which ready access would be obtained to every part of the chamber, and great facilities afforded for warming and ventilating the interior. The Lord Mayor and aldermen would, according to this design, enter the court from the dais at the eastern end of the Guildhall through an anteroom, the commoners' entrance being from the existing corridor. Sitting accommodation for all the commoners (206 in number) would be provided, the seats being arranged concentrically to the Lord Mayor's chair, and on a rising stage. Each member would have his own definite seat, as is now the case in the aldermen's court-room. Seats for twenty-five aldermen and the Recorder would be provided on a raised bench on either side of the Lord Mayor's chair; and for the principal officers, below and in front of the Lord Mayor. There would be a gallery round this chamber to accommodate about 300 of the public, and over the Lord Mayor's chair there would be a reporters' gallery. In the centre of the chamber would be a table for the exhibition of plans, papers, models, &c., and immediately opposite the Lord Mayor would be the City Seal and the Bar, as at present, with considerable additional space for petitioners. Adequate provision would also be made for taking divisions, the respective tellers being situated at a distinct point in either corridor, the members passing out right and left into the corridor, returning by the bar of the Court. As regarded the dimensions of the building, the external diameter would be 78 ft.; internal diameter, within screen, 54 ft.; the corridor, 9 ft. wide; internal height from floor to dome, 61 ft. 6 in.; internal height to top of lantern, 81 ft. 6 in.; and the external height to the vane would be 100 ft. The replies of the Architect as to the question of ventilation, which had had their serious attention, were entirely satisfactory. The Architect told them that the building, without the fittings, but including the permanent offices for the Town Clerk, which would be beneath the floor of the chamber, but level with the pavement in Basinghall-street, would be about 35,000*l.* If they fitted up the chamber with furniture and fittings of the same quality and description as in the library, the cost would be something under 2,000*l.* In order to carry out this plan they must remove some of the present offices, and provide temporary accommodation for the officers while the building was being constructed. The Architect estimated the cost of such temporary accommodation at about 1,200*l.* He moved that the Court agree with the committee in their report, and that it be referred back for execution.

The motion was carried amidst loud applause, and it was referred to the Coal, Corn, and Finance Committee to provide the necessary means for carrying out the work.

THE NEW DOCK AT SWANSEA.

The new east, or "Prince of Wales," dock at Swansea, opened by H.R.H. last week, is constructed in what was formerly known as Fabian's Bay, a large expanse of soft mud and shingle inside the harbour mouth, through which ran a channel, communicating with the ancient shipping place called Port Tennant. There was at first a good deal of controversy as to the advisability of doing away with so good a refuge for ships running into harbour before the wind as the soft bottom of Fabian's Bay, but that was overruled, and, by the Swansea Harbour Act, 1874, the construction of the present dock was sanctioned. The estimated cost was then 300,000*l.*, but that has since been reduced by leaving parts of the work, such as the walling and locking of the half-tide basin, temporarily incomplete. The area of water enclosed in the East Dock is 23 acres, which gives a length of 2,320 ft., a breadth varying from 500 ft. to 340 ft. and a depth of 36 ft. There is a slight difference of 2 ft. between the depth, from coping to bottom, on the north and south sides, because of the requirements of the coal drops. The outer cill of the lock will have on it 32 ft. of water in ordinary spring tides. This is one yard deeper than was originally contemplated, but the Harbour Trustees thought it necessary in order to provide for the ever-increasing size and draught of water of the class of steamers which now almost monopolise the carrying trade, and also in view of the further deepening of the entrance-channel by dredging. The inner sill of the lock will have a water depth of 27 ft. at ordinary spring tides. The length of the quay walls round the dock is about a mile. It was first intended to make a half-tide basin with entrance-gates in the usual way, but with a view of saving present outlay, and as the engineer (Mr. Abernethy) reported it would be no less efficient, it was decided that the basin should be for the present a tidal one. Its water area is 4½ acres, length 400 ft., breadth 400 ft., length of quay walls 1,000 ft. The lock is no less than 500 ft. long by 60 ft. wide, and has all the latest appliances. In this respect Mr. Abernethy has planned several modifications since he constructed the Alexandra Dock at Newport. The length of the lock quay wall from the dock to the tidal basin is 622 ft. Near the south-eastern corner of the new dock, or rather nearer to the lock than to the corner, has been prepared the entrance to a large graving-dock, 500 ft. long, which will be hereafter excavated.

By way of securing tranquil water just outside the tidal habour, and with a special view to prevent the prognosticated difficulties of entering when south-west gales are blowing, a fine horn or pier has been constructed of solid concrete, which projects 500 ft. into the sea, and will presently be backed and supported by a triangular stretch of earth-work, running backwards from the outer point to the adjacent copper works.

The total amount of excavation effected at the new dock is no less than 1,200,000 cubic yards. The work of excavation has been mainly done, and of course vastly accelerated, by the employment of powerful machinery and appliances. No less than fifty engines have been in use at one and the same time,—namely, five steam navvies or "devils," fourteen locomotives, twenty steam cranes, and eleven portable engines for

various other purposes, such as working winding gear, mortar-mills, &c. The masonry is chiefly of local Pennant sandstone, worked at the contractors' own quarries at Red Jacket; at Messrs. Thomas, Watkins, & Jenkins's Townhill Quarries, or elsewhere in the immediate district. No less than 40,000 cubic feet of granite blocks have been brought from the Penryn Quarries to form the coping stones, quoins, &c., and some portion of the lock. The bottom of the lock is lined with bricks, of which the round number of 500,000 has been supplied by the Mill Lands Brick and Tile Company, Neath.

The works have been kept dry by a pair of Cornish pumps, erected near the seaward entrance, and capable of lifting 1,600 gallons per minute. There are six lock-gates, each leaf of which weighs 70 tons. They have been built on the spot, of greenheart timber from Demerara, and pitch pine from America.

The new harbour railways, including seven miles of siding accommodation, with junctions with the adjacent Great Western Railway and Midland Railway lines, are progressing towards completion. The rails, which are wholly new and of steel, are supplied by the Dowlais Steel Company, and all the sleepers are well pickled. The whole of the coal-drops, capstans, gates, sluices, and other machinery in connexion with the dock will be worked by hydraulic power, the central point of which lies near the south-eastern corner, where a fine engine-house is constructed. This is being fitted with six great boilers and two engines, from the Elswick works of Sir Wm. G. Armstrong & Co.

None of the coal-drops are yet completed. There is space for the erection of five drops or tips on the Great Western Railway Company's wharfs, and three on the Midland Company's wharfs. All the foundations, &c., are ready, and most of the metal-work and other machinery is on the spot, but time has not allowed of their erection before the royal visit. The distinctive difference between the drops at the new and previous docks will be this, that at the New Dock the loaded trucks of coal will come down along the level railway to the tip, whence they will be lifted on the hydraulic platform to the height of the shoot, and, after being emptied, they will pass away over the high level. This exactly reverses the operation now in vogue at other docks in Swansea, where the full trucks occupy the high and the empties the low level lines. Under the new system, when the empty truck is discharged from the hydraulic lift on to the high level line, it will pass away by its own gravitation down a gentle incline, and thus save a great deal of labour.

The channel embankment, extending from the new cut to the east pier, is not walled, but sloped to the extent of 3 in 1, and faced with "slag" from the copper works. Around the dock, especially to the north and west, there is ample room for high and low level railways, drops, warehouses, sidings, &c.

As a backwater, the new dock has the waters of the Tennant Canal, which connects Swansea and Neath and other places by a thoroughly efficient system of water carriage. To the eastward of the dock, and extending for miles as far as the river Neath, there is a great deal of level uncultivated land, known as "the Bog," which affords ample space for the deposit of ballast and the erection of works, &c.

The consulting engineer of the Harbour Trust in the creation of this, as of the previous docks of Swansea, is Mr. Jas. Abernethy, President of the Institution of Civil Engineers. The work of carrying out his plans has been performed by Mr. A. J. Schenk, the resident engineer, Harbour Office. The contractor is Mr. Thomas Andrew Walker, of Cannon-street, London, whose resident general manager has been Mr. W. R. Parker, who has had for assistants Mr. Clifford and Mr. Conolly.

For the docks pure and simple, the contract price was originally 197,000*l.*, but was subsequently increased by 8,000*l.*

The *Cambrian* of the 21st inst. (to which journal we have been indebted in giving the foregoing account) contains some interesting details of the other docks of the port, of which Messrs. George & James Abernethy were the engineers. Telford reported upon the improvement of the harbour in 1827.

Beverley Waterworks.—These works are now fairly commenced. The first sod of the reservoir was lately turned by Mr. J. R. Pease, the Company's chairman. Mr. J. F. Fairbank, of Westminster, is the Company's engineer.

THE FISH-MARKET QUESTION.

Since our article of the 8th inst. on this subject was written, several other proposals besides those enumerated by us have been made. The three principal ones are the suggested acquisition of a large site in the Blackfriars-road (referred to in Mr. Leeuw's letter in our last, p. 530); the scheme propounded by Mr. W. J. Glenny, of King's College, in conjunction with Mr. A. T. Walmisley, C.E., for the extension of Billingsgate Market; and the scheme for a central market put forward by Messrs. Cayley and Boyes, in conjunction with Mr. H. H. Bridgman, architect.

The scheme propounded by Messrs. Glenny and Walmisley suggests the provision of a retail fish and fruit market, extending from London Bridge to the existing market at Billingsgate. It is proposed to widen Thames-street and to re-construct the whole of the existing warehouses and wharfs on the south side between London Bridge and Billingsgate, and to increase the height of them until the present rental is not only attained, but exceeded. The existing market covers about 31,350 square feet. The proposed re-construction, according to this scheme, would provide (its propounders say) an additional market of 72,710 square feet area, besides an increase of 1,000 square feet to the existing market, 7,200 square feet to the landing-stage, and 4,455 square feet to Thames-street. The retail and public entrance would be on the level of London Bridge. There would be continuous steam lifts for passengers, and hydraulic lifts and steam cranes for fish. In the additional width to Thames-street space would be gained to provide for sufficient cranes and lifts with convenient tramways to unload as many wagons as could occupy the space and convey the fish to auction stations on both levels if necessary. The expense of new approaches would thus, it is claimed, be saved, while ten times the quantity of fish could be unloaded in a given time.

The scheme with which Mr. Bridgman's name is associated is a bold one. It proposes the erection of a large market of two floors, 225 ft. wide and 940 ft. long, on the mud bank which covers the foreshore of the Thames on the Surrey side between Waterloo and Charing-cross Railway bridges. The superstructure would be supported on iron girders carried by three rows (running longitudinally) of iron columns resting on caisson foundations, the columns in the front row being 100 ft. apart. The whole of the columns would pass up through and support the sub-floor, and would, of course, also carry the girders of the principal floor, which latter would be covered in by an iron roof of one span, somewhat similar to that over the St. Pancras terminus of the Midland Railway. The principal floor of the market would be on the level of the roadway of Waterloo Bridge, and would have an area of 191,250 square feet, or 4⅜ acres. The east end of this floor would be approached from Waterloo Bridge. There would be a sub-floor at a level of about 25 ft. below this principal floor, and about 25 ft. above high-water mark,—thus permitting barges, &c., to pass underneath,—and this sub-floor would afford more than four acres of space available as standing room for fishmongers' carts and other vehicles. The proposed structure would project from the Surrey shore as far as the second pier of Waterloo Bridge, the frontage following the curve of the river. On the river frontage, on the level of the principal floor, would be a terrace walk, 25 ft. wide, supported by cantilevers, on to which terrace a long row of retail shops would open. The back elevation of the proposed market would be distant from the wharfs and business premises at present existing on the Surrey shore 60 ft. at one end and 100 ft. at the other end. With respect to the intervening space, which is now mud during about ten hours of the day, it is proposed to convert it into a deep-water dock or channel so as to allow barges to pass to or from the wharfs at any state of the tide. The immediate proximity of the proposed market to the Charing Cross branch of the South-Eastern Railway, which is on a level with the principal floor of the market, would allow of one or two short junction lines being made to run right into the market; and as the South-Eastern line is readily accessible from all the fish-carrying lines, fish by the train-load could be run into the proposed market, the plan of the principal floor showing four lines of rails running its whole length, with standing room for three lines of carts and vehicles between (in addition to a larger standing space in the centre of the market), so that the fish could be sold direct from the railway trucks and carted away at once by the purchasers. Provision could also be made for the landing of water-borne fish. At the west end, the proposed market could be approached by foot-passengers direct from the footway (which would be widened) of the Charing Cross Railway Bridge. Access for vehicles passing to and from the principal floor and sub-floor of the market is provided by an inclined roadway (with gradients of 1 in 18 and 1 in 20) from Belvedere-road. The chief access for vehicles to the principal floor of the market will be by two gateways opening on to a space between the east end of the market and Waterloo Bridge. These are the leading points of the scheme, which, as it appears to meet many requirements desiderated by those who have given evidence on the subject before a Committee of the Corporation, will no doubt receive due consideration. However pressing may be the necessities of the case, and whatever action may be taken by the Thames Conservators and other bodies with regard to the scheme, we must confess that the prospect of another enormous roof planted broadside on to, and some distance into, the river, is not likely to be agreeable to those who would not sacrifice everything to utility.

THE BISHOP'S DOWN GROVE SPA, TUNBRIDGE WELLS.

A number of gentlemen visited the picturesque and historicallly interesting locality, Tunbridge Wells, on Tuesday last, with the view of inspecting the additions and improvements that have been made at the Bishops' Down Hydropathic Sanatorium, and which render it a very complete establishment of its kind.

The first additions consisted of a handsome Turkish bath, comprising a spacious cooling-room, three hot-rooms, shampooing-room, all heated and ventilated on approved principles; a steam-laundry, engine-room, and boiler-house. These completed, the old mansion was stripped of its high-pitched tile roof, the walls were strengthened, and two stories of bedrooms raised thereon, and a large block of buildings was erected to the east of the old house. These latter contain a spacious dining-hall, 60 ft. by 35 ft., and 13 ft. high; a drawing-room 65 ft. by 33 ft., and of a similar height; and a recreation-room 48 ft. by 27 ft., having a well-arranged permanent theatre therein for amateur performances. There are two stories of bedrooms over the two large rooms, and the new kitchen is situated over one end, the dining-hall occupying the height of the two lower stories.

A wide and handsome corridor paved with encaustic tiles forms the old mansion or central block, as also leading from the grounds. All the corridors and passages are warmed by hot water at low pressure, as also the large rooms, the latter having, in addition, the ordinary open fireplaces. The kitchen offices have been fitted up with every modern appliance, so that the preparation and service of a dinner for 150 or 200 persons is a work of comparative ease. The additions have been carried out from the designs and under the superintendence of Mr. Benjamin Tabberer, architect, of Coleman-street, London. Messrs. Willicombe & Oakley, of Tunbridge, are the general contractors. Messrs. Benham & Sons, Wigmore-street, have executed the kitchen fittings; and Messrs. Weeks & Co., of Chelsea, the heating apparatus, introducing their Patent Caloric Batteries in the large rooms. The lifts are by Messrs. Waygood & Co., and the encaustic tile paving is by Messrs. England & Sons. The furniture has been provided by Messrs. Gillows, of Oxford-street, London, and both in design and solidity well sustains the reputation of that eminent firm.

The system of baths connected with the establishment is of a very complete character, and embraces all the latest appliances in hydro-therapeutics, including the electric baths, &c.

The proprietary have adopted the albo-carbon light for the illumination of the new *salle-à-manger*, the drawing-room, and the theatre or recreation-hall. In this system of lighting (which is at least remarkable for its simplicity) ordinary gas is employed, but prior to ignition is passed through ornamental vessels containing the albo-carbon material, the vapour from which so copiously reinforces the gas with carbon as to treble, if not quadruple, its illuminating power, and also renders the flames (which would

otherwise be yellowish and wavering) intensely bright and steady. One great advantage of this process is that the jets of gas in use are considerably reduced in number, with a proportionate decrease of heat.

The Albo-Carbon Light Company may be congratulated on having secured, through the enterprise of Mr. Dick and Mr. Young, and the taste of the architect (who supplied the designs), an excellent opportunity for illustrating the effects of their system.

The amount expended is said to be about 15,000*l.*

As a winter residence, the Bishops' Down Grove Spa offers many attractions to the invalid and to those who are desirous of breathing a purer air than is afforded by London and its immediate neighbourhood during the prevalence of the smoky fogs which envelope the metropolis for so large a portion of the year.

QUESTIONABLE ROAD-MAKING IN HACKNEY.

Some grave statements were made at a meeting of the Hackney Vestry last week, relating to the construction of Cazenove-road, Stamford-hill, which is at present in progress. Mr. W. J. Walker, one of the members, drawing attention to the subject, said that the manner in which the road was being constructed was a disgrace to the locality. He condemned the material which the contractor was using, stating that it consisted of the most offensive and deleterious stuff that could be conceived, and that the ratepayers' money was being wasted. He moved that in the opinion of the Vestry the present condition of the road, after having been six months in the hands of the contractor, and presumably under the superintendence of the surveyor, called for a searching inquiry into the present system of road-making in the parish. Mr. Butler, in seconding the motion, said the materials included pieces of old iron, old shoes, meat-tins, and other similar objectionable refuse, which had worked themselves up to the surface through the pressure of the traffic displacing the large boulders. The motion was ultimately adopted.

OPENING OF THE JOHNSON HOSPITAL, SPALDING.

Many of our readers will remember that in March, 1879, over sixty sets of competitive designs were received by the trustees, when the one selected was that of Mr. G. G. Hoskins, F.R.I.B.A., of Darlington (who has been successful in other hospital works already mentioned in our columns), shortly after which the work was placed in the hands of Mr. James Bulling, of Ollerton, near Newark, and has been carried out under the supervision of Mr. Wallis, clerk of the works.

On the 12th inst. the hospital was formally opened by the Bishop of Lincoln.

The aim of the architect has been, so far as externals are concerned, to present a building which, whilst in material construction corresponding with St. Peter's Church, to which it is adjacent, should at the same time bear upon the face of it evidence of its own all-important purpose; and, as to the interior, airiness, thorough ventilation, convenient ingress and egress, good lighting, and a favourable arrangement of aspects, have all been carefully studied and effected with the greatest possible success. The bricks used are of the same character and quality as those employed in St. Peter's Church; the eaves cornice, and other work of a like description, are formed of purpose-made bricks; the sills, copings, and other dressings are of Ancaster stone, and the entrance steps of Park Spring stone. All the external walls are hollow. The front of the building faces to the eastward, and on passing into the main entrance the first room that presents itself to one's right on the ground-floor is the operating-room, which is a one-story building, measuring 20 ft. by 16 ft. 9 in., and provided with ceiling-light and all the necessary convenience for surgical operations. Next in order in the front of the building is the surgeon's sitting-room (17 ft. 6 in. by 15 ft. 9 in.), from which only the main corridor has to be crossed in order to reach the consulting-room (16 ft. by 15 ft. 9 in.), and adjoining which is the surgery (16 ft. by 14 ft. 6 in.). Next in order come the dispensary and its attendant offices, all of which are so arranged as to afford the greatest possible comfort and the least possible inconvenience to those who may need the benefits of this department. The dispensary waiting-room is at the extreme north of the building, measures 24 ft. 6 in. by 19 ft. 6 in., and is fitted up with all the offices essential to a well-constructed dwelling, whilst to reach the dispensing-room (16 ft. by 13 ft. 6 in.), procure the requisite medicines, and pass out, the patients need but to pass along the main corridor, delay a moment at a hatchway provided for the purpose, and then make their exit by a door in the east wall. Ascending the main staircase, we find that all the wards are arranged on the first floor, occupying the extreme north and south respectively. Provision is made for twenty patients,—ten males and ten females,—the former being destined to occupy the north and the latter the south wards. The larger wards, which will accommodate eight patients each, are within convenient reach of two smaller wards, which will accommodate two patients each. Adjoining all the wards are the nurses' rooms. They are furnished with windows looking into both the larger and smaller wards, as also are the nurses' sculleries. The internal face of the walls of all the wards is finished in Parian cement; whilst the carpenters' and joiners' work throughout the building is of pitch pine, selected and varnished. Speaking-tubes are conveniently arranged to connect the various departments.

BATHS AND WASH-HOUSES FOR BETHNAL GREEN.

There is every prospect of Bethnal Green being shortly supplied with public baths and wash-houses. A special meeting of the Vestry was held last week to take into consideration the propriety of putting into force the Public Baths and Wash-houses Act. Mr. Jones, in moving a resolution in favour of establishing the baths, observed that the Act had been adopted in several parts of the metropolis, and in the majority of instances its effects had been of the most satisfactory character. In Whitechapel large numbers of the residents did their laundry work on the premises, the conveniences afforded being much appreciated. The Paddington baths cost 50,000*l.*, and notwithstanding this large outlay they had proved to be a paying concern. Bethnal Green had a toiling population, to whom a bath would be an appreciable luxury, but it was denied the people because there were none to be had, or otherwise they were in the hands of private persons who imposed almost prohibitory charges. The motion was referred to the consideration of a special committee.

A NEW STATION ON THE CRYSTAL PALACE RAILWAY.

For some time past building has been going forward on a large scale in the neighbourhood of Busby-hill and Grove-park, Camberwell, some hundreds of houses having been erected in the locality within the last year or two. The residents in the district having represented to the London, Chatham, and Dover Railway Company that the two nearest stations,—Denmark-hill and Peckham-rye,—are both at a considerable distance and equally inconvenient, we understand that the company have determined upon the erection of a new station which will shortly be proceeded with. It is said that the new station will be placed about midway between the Denmark-hill and Peckham-rye stations, which will accommodate the large population which has recently sprung up in the locality.

PROPOSED NEW BUILDING ACT FOR THE METROPOLIS.

At the meeting of the Metropolitan Board of Works on the 21st inst., the Building Act Committee reported that, in their opinion, it is desirable that fresh legislation should be sought with relation to various matters appertaining to buildings and streets in the metropolis, and they recommended that the matter be referred back to them, to settle the details of the proposed measure, and that a reference be made to the Parliamentary Committee to give such notices and to take such steps as may be necessary to obtain legislation during the ensuing session of Parliament.

The recommendation was agreed to without discussion.

PATENT RECORD.*

APPLICATIONS FOR LETTERS PATENT.

4,367. S. E. Simpson, Birmingham. Dwelling-houses, &c. Oct. 7, 1881.

4,376. J. Carter, Uxbridge. Constructing and glazing roofs, &c. Oct. 8, 1881.

4,391. B. W. Spittle, Wednesbury. Attaching door-knobs to their spindles. Oct. 10, 1881.

4,423. W. A. Barlow, London. Slates. (Com by T. Finger, Coblenz, Germany.) Oct. 11 1881.

4,425. T. Stokoe, Headingley. Apparatus for heating rooms, greenhouses, &c. Oct. 11, 1881.

NOTICES TO PROCEED

have been given by the following applicants, on the dates named.

October 11, 1881.

2,539. M. Delmard, Plumstead. Chimney-top or cowl and ventilator. June 10, 1881.

2,686. A. Damman & A. Cassard, Brussels. Parquet flooring. June 20, 1881.

3,708. A. C. MacLeod, Shrewsbury. Floors or surfaces for skating upon. Aug. 25, 1881.

4,297. B. D. Healey, Brighouse. Asphalte apparatus. Oct. 4, 1881.

October 14, 1881.

2,561. C. H. Pennycook, Glasgow, Bars for holding glass for window and roof lights, &c. June 13, 1881.

2,629. G. A. Wright, Portsmouth. Materials for forming blocks for buildings, &c. June 16, 1881.

2,786. T. Carder, Chudleigh. Kilns. June 25, 1881.

3,839. C. D. Abel, London. Firegrates for burning dense fuel. (Com. by A. Godillot, Paris.) Sept. 3, 1881.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending October 15, 1881.

954. J. Taylor, Clapham. Paving-blocks for roadways, &c.

A piece of metal is driven into the upper part of the end of the wooden block, and may either be level with the upper surface of the block or raised a little above it, to give a foothold for horses, &c. March 5th, 1881. Price 6d.

1,025. J. Peer, Salford. Furnaces, fire-grates, &c.

Bars of an I shape are used, which, when placed together, form passages for air, which is afterwards admitted into the fire through the fire-clay back, and thereby the smoke is consumed. (*Pro. Pro.*) March 10, 1881. Price 2d.

1,026. S. Rideall, Manchester. Construction of buildings, &c.

In the construction of wooden buildings, planks are used for the covering thereof with grooves a short distance from each edge and on one side of the plank. These planks are laid a distance apart, grooves uppermost, and other planks are laid over them, grooves downwards, with the outer edges of the grooves resting in the grooves of the lower planks. (*Pro. Pro.*) March 10, 1881. Price 2d.

1,038. W. R. Lake, London. Water-closet apparatus, &c.

This is an improvement on Patent No. 4,037 of 1879, in preventing the escape of noxious gases and effluvia, and effects to this object by a variety of improvements in details, which are stated in fourteen claims. (Com. by A. Edwards, Philadelphia, U.S.A.) March 10, 1881. Price 8d.

1,044. R. Douglass and J. Douglass, Coventry. Apparatus for the cure of smoking chimneys.

A box is fitted to the fireplace, the front of which is a sliding plate, in which plate are whirligig ventilators. The box is placed a little above the fire, and as the current of air enters the chimney it is whirled round by the vanes of the wheels, and meets and overcomes any down-draught. March 11, 1881. Price 6d.

1,047. C. S. Rolfe, Westminster. Appliances for preventing the efflux of gases from drains, &c.

This consists of various forms of traps. (*Pro. Pro.*) March 11, 1881. Price 4d.

1,051. F. Arnold, Birmingham. Hydro-carbon cooking and heating stoves.

In place of a single wick case, two or more are used, so far separated as to allow an adequate supply of air to reach the flames. A cone is arranged above the flames and an air-passage is slotted of sufficient width for both the flames, but so arranged that the combustion is perfected when placed under the draught of the chimney. March 11, 1881. Price 4d.

The Gale of the 14th inst.—Nearly 100 cases of dangerous structures were reported to the Building Act Office of the Metropolitan Board of Works, in consequence of the gale on the 14th inst., in connexion with which buildings, excepting in one instance, no loss of life occurred.

* Compiled by Hart & Co., patent agents, 28, New Bridge-street, E.C.

INTERNATIONAL COMPETITION FOR THE VICTOR EMMANUEL MONUMENT.

M. Otto Schulze, an architect resident in Rome who was present at the Museo Geologic Agrario, in the Viâ Santa Susanna, on the 22nd ult., when the last models were arriving in connexion with the above competition, states that 220 competitors had sent their works in by the afternoon of that day, and there were still a few more to be received. The city of Rome itself furnishes naturally a considerable number of the designs, viz., not less than forty. The exhibition of the entire collection will be opened in the middle of November. The maximum of 10,000,000 lire laid down in the conditions has been largely exceeded by not a few of the competitors, one of whom has sent in a design which would cost 100 millions to carry out. Most of the competitors, however, are within the sum allowed.

SEWER WORK AT BROMLEY.

Sewerage works are being carried out in Bromley by Mr. Potter, contractor, under the direction of Mr. Alfred Williams, C.E.; Mr. Garton, in the service of the Board at 3*l.* 3*s.* per week (appointed by the engineer), being the inspector. Serious charges are made against the latter to the effect that certificates have been given and moneys paid for work not done to a large amount,—the local *Telegraph* says to the extent of 1,000*l.* in concrete alone. A committee of the Board is investigating the matter, which has caused much excitement in the district.

SANITARY CONDITION OF THE YEOVIL PEASANTRY.

Sir,—Within the last few years the Yeovil Corporation has spent 30,000*l.* for a water-supply to the town. When the gentlemen composing that body decided to take that course, they had to deprive the river Yeo of part of that stream,—which, by the bye, had so often assisted in causing the floods on King's Sedgmoor. A certain noble landowner claimed the sum of 3,000*l.*, with costs, which the Corporation refused to pay. Consequently, a meeting was held before certain commissioners, at the Westminster Palace Hotel, where it is said the swearing and the rate-book widely differed. After all this hard swearing and enormous outlay of public money for the town, let us see the sanitary state of some of the houses. On the 15th of October I had occasion to pass by a place called Gore Knap, and the first thing that attracted my attention was a row of fifty-two houses, or rather hovels, with rooms about 10 ft. square, paved with broken bricks and stones, and filled in with dirt, from 6 in. to 10 in. below the level; some of the floors being 3 ft. 6 in. under the level of the path. In a rain-storm the water rushes in on these floors. Until three months ago there were only three water-closets; now there are two or three new ones put up, about 14 ft. from the front doors, which are public for any one. The only water-supply to these houses is that of a well 60 ft. deep, and yet they are not a quarter of a mile from the water-works, while the main pipe passes by them in suggestive proximity. There being but one w.c. to eight or nine houses, these poor people take it in turns to draw water out of the well in order to clear away the soil. This being by no means an easy or a pleasant task, it is often neglected, and then all sorts of disagreeable expedients have to be resorted to, such as ramming with broomsticks or pokers, clearing out with fire-shovels, &c. I saw two or three in a state quite unworthy of a corporate town like Yeovil, with its courts and boards and public officials. They were literally running over.

These houses have no gardens on which they can grow 5*s.* worth of vegetables. They are scarcely large enough to hang out the people's clothes,—those who have any. To see poor little children sitting about on the damp stone, brick, and mud floors looking as pale as death, their parents without money, fire, or food, is heart-rending. These houses are neither water nor wind tight. Many have as substitutes for beds a bag of straw, with scarcely any bed-clothing. Their food consists of potatoes and dry bread, and not half enough of that. The wages of these men are from 9*s.* to 12*s.* per week, and no work half their time. The poor women add a little to the miserable income by gloving,—say 1*s.* 3*d.* to 1*s.* 6*d.* per week. The best men are only offered 10*s.* per week for farm-labour when they are wanted.

I wonder whether there is any inspection of nuisances in this fashionable country town. I should like to know for whom between 30,000*l.* and 40,000*l.* were spent. I went into one house, where two families sleep in one of these small rooms. One poor woman, with seven children, was crying because she had no food to give them.

Sir, I cannot conceive any persons worse off in any part of Ireland; and yet in this very town there are charities which ought to bring in to the poor no less than 10,000*l.* per annum. The people of Gore Knap, Yeovil, told me that when they were fortunate enough to get a bit of land some had to give at the rate of 12*l.* per acre per annum for it. What will become of the poor of Yeovil during this coming winter is a puzzle to

G. Mitchell,
"One from the Plough."

P.S.—These houses are let on the average at 2*s.* per week. Many of the people never taste butcher's meat unless they chance to be in a club. The visits of the clergy are like angels' visits,—few and far between. Schooling is from 2*d.* to 4*d.* per week.

"THE VICTORY OVER SEWER GAS."

Sir,—I see by your foot-note to Mr. Mineard's letter that you are afraid of being inundated with letters on this unsavoury subject,—and with some reason, I think,—but I shall keep this as short as I can, and hope you will be able to allow it a corner, just to show that Mr. Mineard's system and the supposed necessity for ventilating *down* the soil-pipes rests upon a fallacy. Mr. Mineard writes of "the air current tending upwards, but always checked by the sewer-gas generated in the soil-pipe, which, *being heavier*, was trying to go down."

Is the sewer-gas generated in the soil-pipe heavier than air, and if so, why? It consists of a complex mixture of gases, none of which, except the carbonic acid, which is only present in small quantity, is heavier than air, and the sulphuretted hydrogen is very much lighter. Even if the gases were heavier than air at the same temperature, yet being generated by the fermentation of sewage they are heated by that same fermentation, and so are rendered lighter than they would be if cold. This is a point which is often overlooked with relation to carbonic acid. In many books on ventilation it is stated that, as the air expired by men and all animals consists chiefly of carbonic acid, and as carbonic acid is heavier than air, it will fall to the floor of a room and should be withdrawn there. Truly, carbonic acid is heavier than air *at the same temperature*, but the carbonic acid breathed from a man's lungs is at a temperature of nearly 100 degrees, and is therefore vastly lighter than the ordinary cold air of a room, and therefore rises to the ceiling. We all know the case of the monkey-house at the Zoological Gardens, which it was desired to ventilate on correct scientific principles, and without draughts. The question was, where should the outlets for the foul air be? The scientific (?) men said that as the foul air it was desired to get rid of consisted chiefly of carbonic acid, and as carbonic acid was heavier than air, the outlets should be at the bottom of the house. Accordingly, the builder made a row of outlets just above the floor, and none at all in the upper part of the house. It is not known whether any foul air ever did come out at these outlets,—probably it did when it had had time to get thoroughly cold, but the monkeys were all dead long before that.

I wonder that Mr. Mineard, who seems to be a practical man, has not detected the fallacy of his theory that the gas generated in a soil-pipe has a tendency to fall in that soil-pipe. The Engineer to our Association has, in the course of the last year, inspected hundreds of houses fitted with open soil-pipes and a proper intercepting trap with air inlet, and has always found that the air current was in at the inlet and up the soil-pipe. The engineer to the Edinburgh Association has found the same, and Dr. Alfred Carpenter, of Croydon has found the same. How could this be if the gas generated in the soil-pipe were heavier than the air?

I quite admit that in the majority of cases the current is a feeble one, because if the pipes are in a tolerably good state, no great amount of fermentation of sewage is taking place in them, and no great amount of sewer-gas is being generated. In some cases our engineer has reported that the current of air in at the trap was enough to "tear the hair off his head," but that has generally been when the soil-pipe was inside the house and in a warm position, or where it was outside and heated by the sun. I also admit that in such soil-pipes the air current is momentarily reversed when a flush of water is sent down the pipe, but this does no harm. A puff of air from the pipe is sent out at the air-inlet of the trap; but, in the first place, it does not often happen that anybody is standing over it just at the moment; and, in the second place, if the pipes have been well kept, and frequently and thoroughly flushed, he does not perceive any smell even if he is. After the momentary reversal the air resumes its usual course, in at the inlet and up the soil-pipe. I do not mean to dispute Mr. Mineard's "Victory over sewer-gas" at all. It is like using a steam-hammer to crack nuts. Nobody ever doubted that if he liked to connect an upcast-pipe with the foot of a soil-pipe, and burn a gas-jet in the upcast-pipe (or, still better, take it up a warm chimney), he would get a current of air down the soil-pipe, and it did not need Mr. Mineard to go "on a visit to the North" to find that out. I merely maintain that such an elaborate and expensive system is quite unnecessary; that the desired current of air can be maintained through drains and soil-pipes by much simpler and less expensive means; and that so long as there is a free current, the occasional reversal of the direction of it is not of the smallest consequence.

Cosmo Innes, M. Inst. C.E.,
Secretary London Sanitary Protection Association.

Sir,—The above title is scarcely warranted either by the facts as set out in Sir Henry Cole's letter of the 1st or by Mr. Mineard's explanations.

I am glad to find that the untrapped wastes from bath, lavatories, &c., existed only on paper, and these errors admitted there is much in the sanitary arrangements of the building I admire.

I take exception to the distance the sewer, or drainage, gas has to be fetched. Its success depends upon:—1. Gas constantly alight; 2. Tight joints; 3. Air inlets to servants' water-closet, or others close to, must be carefully proportioned to those which are remote from the heating chamber.

Mr. Mineard ridicules the idea of defective joints occurring, and also the cost of the gas consumed. The *Sanitary Engineer* of New York, October 1st, page 499, describes a defective soil pipe joint, which is not unknown this side the Atlantic; nor can the annual cost, representing a capital outlay of 50*l.*, be disregarded; the suggested ¾-in. pipe to servants' water-closet does not provide an adequate air inlet.

I agree with Mr. Buchan that "the forces employed are costly," and, if victory is obtained, a strong garrison must be left in charge of the fortress to watch the enemy.

A system which will give reasonable security, economically, and especially in a self-acting form, is, to my mind, much preferable.

I have since 1875 be'd on to the principle I have used at the Post-office here, which simply provides an air inlet inside the sewer trap, and the soil-pipe carried above the roof, surmounted by an exhaust cowl,—the method being now compulsory in these towns where the model by-laws, issued in 1877 by the Local Government Board, have been adopted. Some of the expensive traps and cowls afford additional security, but these details depend upon the length of the proprietor's pocket

John Parker,
Borough Surveyor, Bridgwater.

The Birkenhead Borough Hospital.—Last week the Mayor (Mr. W. Laird) met the executive committee of this institution, at the hospital, for the purpose of formally handing over the extensions which have recently been made to the building. These additions were rendered necessary by the taking into use of another ward, not hitherto required. A second story has been added to the centre building, which contains four bedrooms for the use of nurses and servants. On the north side an annexe has been erected, containing a new operating-room, 18 ft. by 18 ft., lighted by three large windows and skylights, and approached from the principal staircase, between the ground and first floors. Below is a waiting-room for visitors, lavatories, and cloak-room, and in the basement large store-rooms. It will be remembered that the hospital was originally built by the late Mr. John Laird, and it is to the generosity of his son (the present mayor) that the town is indebted for the recent work, by which it has been considerably enlarged and completed. The contractor was Mr. Alexander Bleakley, of Birkenhead, and the whole of the work was carried out from the plans and under the superintendence of Messrs. Aldridge & Deacon, architects, of Liverpool. The cost of these alterations is about 1,000*l.*, the whole of which has been defrayed by the liberality of the mayor.

THE ARCHITECTURAL ASSOCIATION.

The opening *conversazione* of Session 1881–82 takes place this Friday evening, the 28th.

The syllabus of papers for the Session is as follows :—

Nov. 11.—Address from the President, Mr. Aston Webb.
Nov. 25.—"The New Examination, and what it involves." By Prof. T. Roger Smith.
Dec. 9.—"Barnacles." By Mr. Cole A. Adams.
Jan. 6, 1882.—"A Chat with the Younger Members on the Writing of Specifications." By Mr. Ewan Christian.
Jan. 20.—"Architectural Inconsistencies." By Mr. Philip E. Masey.
Feb. 3.—"The Treatment of Sculpture with Architecture." By Mr. Hugh Stannus.
Feb. 17.—"Physical Science in Relation to Architecture." By Mr. J. Slater.
March 3.—"Ideal Dwelling-Houses." By Mr. E. Ingress Bell.
March 17.—Members' *Soirée*.
March 31.—"Sundry Working Drawings." By Mr. J. P. Seddon.
April 21.—"Some Thoughts on the Principles of Design and Style in Church Architecture." By Mr. B. E. Ferrey.
May 5.—"Coloured Decorations." By Mr. G. Aitchison, A.R.A.
May 19.—"Markets." By Mr. John Hebb.
June 2.—"The Influence of Ritual on Church Architecture." By Mr. E. Eldon Deane.

COMPETITIONS.

Birkenhead.—Designs are invited in competition for a New Town-hall in Hamilton-square. A preliminary competition of sketch designs is open to all, and the authors of five of them will be selected to compete finally. Mr. Chas. Barry has been appointed to act as referee in both cases. The style of architecture is to be such as will harmonise with the adjoining buildings. Each of the five competitors will be paid 75*l.* towards his expenses, and the author of the design placed first will be employed to act as architect, and be paid the usual commission, 5 per cent. The cost is not to exceed 42,000*l.*

Oldham Free Library, Museum, and Art Gallery.—The first premium (100*l.*) has been awarded, we understand, to Mr. Thos. Mitchell, architect, of Manchester, for design marked "F.S.A." The style adopted is Domestic Gothic, and the arrangement appears to meet all the requirements of the Town Council. The second premium (50*l.*) has been awarded to the authors of of the design marked "Practical,"—Messrs. Wright & Rawcliffe, of Burnley. There were twenty-six competitors.

East Looe Church.—The Committee for the re-building of the East Looe Church have received thirty-three designs. Almost from John o'Groat's to Land's End do the competitors hail. The 29.h ult. was the last receiving day, the Committee meeting about a week later to view, and, if possible, select. Four designs were put aside, as being most suitable, to be sent to London for an architect to report on their respective merits, and to ascertain how far the condition as to cost had been adhered to by their authors.

Buenos Ayres Government Buildings.—The number of plans received by the Argentine Consulate in Hamburg for the competition of the new Government buildings at Buenos Ayres within the time allowed for sending in from German architects is no more than five.

SURVEYORSHIP ITEMS.

West Ham.—Mr. Lewis Angell, engineer and surveyor to the West Ham Local Board, has been awarded a honorarium of 200 guineas, with salary increased to 800*l.* per annum, without any interference with his private practice. Mr. Angell declined 1,000*l.* per annum with limitation to consulting practice.

Hereford.—For the appointment of City Surveyor, at 250*l.* per annum, one hundred and forty-nine applications were received, and the committee selected the following five gentlemen to attend a special meeting of the Council, viz., Messrs. J. Parker, Bridgwater, borough surveyor; T. Tylecote, Halifax, assistant surveyor; A. Holt, Beverley, borough surveyor; E. Kenworthy, Handsworth, surveyor to Local Board; W. L. Franklin, Reading, assistant surveyor. Ultimately Mr. J. Parker was elected.

West Sussex.—At the meeting of the West Sussex magistrates in connexion with the Michaelmas Quarter Sessions on the 20th inst., Mr. Thomas Skinner, of Horsham, was, on the recommendation of the County Highways Committee, elected County Roads Surveyor, at a salary of 100*l.* per annum.

OBITUARY.

Mr. Thomas Fraser, C.E.—The death is announced of this gentleman, who for some years has filled the post of Burgh Engineer for the city of Edinburgh. Mr. Fraser in 1855 entered the Burgh Engineer's office as principal assistant to the late Mr. Charles M'Pherson, whom he succeeded in 1872, after serving about six months as *interim* chief of the department. He was actively employed in carrying out the new paving and drainage arrangements provided for under the recently-passed Municipal and Police Act. About two years ago he was disabled by a complication of ailments, which eventually developed into consumption, under which he has succumbed. Mr. Fraser, who was about fifty years of age, died a bachelor.

THE NEW COMEDY THEATRE, PANTON-STREET.

Sir,—I am fully aware of your disinclination to publish complaints, but when the public safety is involved it is your duty to depart from such practice. The following words concern the new theatre (Royal Comedy), built under new laws and special superintendence for the protection of the public. Listen to my experience. Declining to add to the already high prices by paying an extra shilling (our theatrical extras are far too many) for booking a place, I resolved to go into the pit. Arriving some fifteen or twenty minutes before the doors were advertised to be opened, I found a crowd of about 100 persons had already assembled. I leave it to your imagination as to how many arrived during the succeeding fifteen minutes. At last a crack was seen between the double doors, which resulted in an immense and disagreeable compression of one's body. But no one appeared to advance towards the interior of the building. During that time I felt for those who were quietly, but not willingly, squeezed against the angles of the reveals of the doorway; but as no doubt they felt more than I fortunately did on that point, I turned my thoughts to my own protection. After some time, having undergone as nearly as possible breakage of my wrist, I reached the aforesaid crack, which turned out to be the partial opening of the doors, forming a kind of narrow funnel, just room enough for one person to get through sideways. Close to the edge of the door was the money-taker, at the top of some eight or nine stone steps behind the payer, who, had he stepped back 18 in. must have found himself falling down, and down which I nearly did fall, having found my poor feet, not recovered from being trampled upon, entangled in part of a lady's costume, how got there is easily guessed at. I may say here that the gallery-door appeared to me to be only a few inches from that of the pit; and no doubt the delighted "gods" were undergoing the same process of crushing, and, consequently, the two crowds must have been mixed up in the centre. Had the pressure burst open the pit-doors I should not have liked to have been among the first fifty, who would have been pushed down the stone steps.

Is this the result of the new laws for the protection of life and limb? If so, away with the laws and let the public seek to protect themselves. Is it possible that legal sanction has been given to such an arrangement? If not, how came the house to be opened? I suppose the laws impose a penalty for opening without a certificate; and unless the certificate is refused—which I saw was applied for last week—until the means of entrance be altered there must be an accident. I also perceived that a report was presented at the meeting of the Board of Works last week saying that two doorways at the Opera Comique had been widened and altered satisfactorily. Have those who have to report upon such cases inspected the doorways at the Comedy Theatre? The arrangement of the pit is bad. One gangway only down the centre; the seats (every alternate one with a back) running from this to the side walls, holding about thirteen or fourteen persons. Should the end person wish to go out, he has to squeeze past twelve or thirteen others before accomplishing the feat. I had to sit all the time with my toes only resting upon the floor, and even then the seat before me pressed most miserably against my shins. It was an impossibility to place my feet down flat. I also found that the spectators at the back of the pit could only see as high as the heads of those on the stage—my prospect was half way up the scenery, the ceiling under the dress circle being so low and oppressive. The ancestral shades of the ancient foot-lights are here in use. Some houses have improved on that ridiculous arrangement by having the lights below the stage floor. Of the other parts of the house I am not able to speak, not having yet visited them. The curtain is quite below criticism: a discredit to Messrs. Howell & James. This, Sir, is our improved London Theatre, built, as I have said, under new laws and special superintendence.

Y.

THE INSPECTION OF THEATRES, &c., IN THE METROPOLIS.

The Building Act Committee of the Metropolitan Board of Works, reporting to the Board at its meeting on the 21st inst. with reference to the question of the inspection of theatres and other places of public amusement in the metropolis, stated that the architect is authorised by the 21st section of the Metropolis Management and Building Acts Amendment Act, 1878, to enter and inspect such places, and they now recommended that the Assistant Architect be also authorised by the Board in writing, under their seal, to enter and inspect the same. This recommendation was agreed to.

THE DRAINS OF ANCIENT ROME.

Sir,—In your issue of the 8th inst., under the heading of "Sanitation in Ancient Rome," appears the statement that the Cloaca Maxima, constructed under Tarquinius Superbus, was a common sewer, and that it ranks with the best sewers of our times, as regards excellence of construction. This is a mistake. The Romans did not pour fæces into underground sewers: these were used exclusively for carrying off the storm water to its natural destination,—the river. It is a well-known fact that about fifty years ago corporate bodies seized upon and used water-drains for carrying sewage, and to this arbitrary and senseless act we are indebted for that great nuisance of our degenerate age, —gigantic sewers on the pernicious *combined system*,—the very worst extant.

Chas. Kroll Laporte.

UNPROTECTED CHURCHES IN EAST ANGLIA.

Sir,—I have read with interest the paragraph in your paper on this subject, in as far as lightning-conductors are concerned. There is another precaution which, however, is neglected, and that is the fire protection generally of the sacred edifices of this country. Most of the cathedrals have, certainly, hydrants, fire-engines, and at Canterbury Cathedral there is a "Merryweather" steam fire-engine, which will throw a jet of water over the pinnacles of the Bell Harry tower; but I think I am correct in stating that there are not a dozen churches that po sess any means whatever of putting out a fire. Fires in churches increased during the last and severe winter to an alarming extent. Now a church is just the building where fire apparatus can be fixed with excellent effect and at small cost. Most churches have high towers or spires; in these should be fixed a tank with a main from tank to basement; two hydrants would suffice, one to command the organ-loft, and the other the vestry and body of the building. Water could be readily pumped up by means of a hand crank-pump in order to keep the tank full, and this need only be done four times a year in order to keep the tank free from foul water. Two hundred pounds on the architect's estimate would in most cases suffice to carry out the fire-extinguishing machinery in an effectual and workmanlike manner. There is more money-value damage done by fire to our churches than by lightning, and invariably the cause is the heating apparatus. There has been a law passed in Sweden to the effect that every church shall be provided with at least a London Brigade hand-pump, and my firm has already sent some hundreds to the churches in that country. In many of our old and valued churches there should be at least two hand-pumps,—one for the organ-loft and the other for the vestry, and a dozen fire-buckets,—the whole lot of which would not cost beyond 15*l.* to 20*l.* per building.

J. C. Merryweather, M.I.M.E.

DEFECTS IN HOUSE BUILDING.

Sir,—I took a house about a year ago, and have ever since been annoyed by a most unpleasant smoky smell. Sometimes smoke comes through the floor of my basement passage in volumes, but usually there is nothing visible, merely an unpleasant smoky smell pervading the whole house more or less. The house is very badly built, and the party walls are quite hollow. There are, I fancy, cracks both in my own and my neighbour's chimneys through which the smoke finds its way into the party walls, and from thence gets into the rooms. My landlord sent some men who pulled up the flooring and plastered the walls between the joists and the ceilings, with the result of making matters rather worse on the whole.

What I am anxious to know is whether any architect or builder among your readers has had a similar case to deal with, and has dealt with it successfully. If so, I should like to be put into communication with him.

E. K. Heavey.

HYDRAULIC DIFFICULTIES.

Sir,—In your issue of the 8th inst. "Greenhorn" desires some information on the subject of "Hydraulic Difficulties." I think a good way of getting over his trouble will be to sink an iron cylinder in the well with a solid bottom. It would be somewhat expensive, but most effective. J. C. M.

EXPERIMENTS ON TRAPS.

Sir,—I was somewhat surprised on reading a letter in your issue of to-day signed "P. J. Davis," in which he states that the action of the "Eclipse" trap is the same as that of the "O." Now, in the face of the experiments made at the lectures to which P. J. D. refers, and at which I know he was present (as I saw him there), by Mr. J. Stevens Hellyer, in which it was shown clearly enough that the "Eclipse" trap was not siphoned, either by the momentum of the water or by the siphonage set up by the action of the same, whereas the O trap was completely emptied, I marvel that he should risk his reputation as a practical man by making such an assertion, and I must say I am extremely sceptical as to the alleged result of the experiments conducted by Mr. Fullen, and as to the originality of the improved trap mentioned. P. J. D. appears to be eating his own words, as it was only the other week that I read a letter of his in a trade contemporary on the "Eclipse" trap extolling its virtues in every way. James Rankin.

* * Since the above was in type, we have received notes from Mr. John Smeaton, Mr. Daniel Emptage, and others, challenging the statement made by Mr. Davies, but we cannot find room for them.

Books.

Modern Architectural Designs and Details. New York: W. T. Comstock. London: Trübner & Co. 1881.

This book, which, like a good many architectural publications which reach us from America, has no author's name on the title-page, is a collection of what would be called, we presume, model plans and designs in domestic architecture, chiefly for country-houses. The production of a book of this class in England is usually the work of an architect who brings it out on his own responsibility; in the United States it seems to be generally a speculation of a publishing firm, and apparently intended to provide designs for those who wish to be their own architects, or, at all events, to have a certain "say" to their architect in regard to the design and construction of their house. This book differs from some other American publications of the same class in that the designs are the work of architects whose names are given in each case, and comprise, we are told, "original drawings made by a number of prominent architects of different localities, prepared expressly for this work." We are not sufficiently acquainted with the prominent names in the profession in the localities referred to to know what their status in their own neighbourhood is; but the plans, views, and details are evidently the work of practised hands, and the whole are very well and carefully drawn, the book in general showing a much superior stamp of workmanship to that of many American architectural works that have been sent to us.

The general style of the houses shown exhibits more or less the influence of the new English taste in domestic architecture, though with a larger admixture of woodwork in the exterior design, and but little of the cut brickwork which is so much the fashion among us at present. The method of execution of the drawings does not, however, distinguish material very well. From the marking of the elevations it is evident that some of the houses are finished externally, for a part of their height, with tiles or shingle, with generally the ground-story of either brick or stone. The system of dividing the upper portion of the windows into very small panes, leaving the lower portion nearly clear, has evidently established itself on the other side of the water, and is introduced in almost every design.

It is difficult to say exactly what it is which prevents these designs from appearing inviting to the English architect's eye. The style of drawing, though most commendably neat and finished, is not such as to make either elevations or views effective, and it is possible that some of these houses may look a good deal more interesting in execution than they appear on paper as here drawn. But making allowance for that, there is a deficiency which we feel at once in turning over the book; a want of feeling for the picturesque side of architecture, whether considered in mass or in detail. This is the more apparent, because the intention obviously is to be picturesque, and some of the buildings, *e.g.*, that on Plate 45, "House at Short Hills, N.J.," are prettily grouped in regard to disposition and skyline. But there is a kind of prim character about the whole which results, perhaps, from the deliberate attempt to imitate the manner and style of houses of the Old Country without any innate sympathy with it. If the architects who made these designs are trying to give the old English house over again, they have not succeeded, and they would, perhaps, have done something a good deal better if they had looked less to precedents which they have not the genuine instinct for. The interior wooden details are all very carefully drawn, and with a desire to do what is in good taste, nor is there much in them that can be said not to be so, but there seems a very great sameness and want of invention in them. The best treatment in detail is in the drawings of the house at Fairmouth, N.J., by Messrs. Rossiter & Wright, Plates 65, 66, 67. The architecture of the house is exceedingly simple, but there is a distinct character about it, and the treatment of the woodwork is in very good taste. Throughout the volume the wooden details are usually what is suitable to wood, and so far are in good taste, but they seldom get beyond deserving just that praise and no more. The constructive details of the woodwork are carefully and minutely given, and generally the woodwork is well put together, though in some of the external woodwork there seems a deficiency in throating and other such precautions against weather. The specimens of perforated ornamental brass panels for ventilating openings, given at the end of the book, seem far too naturalistic for design in this kind of work: they should be more flat and conventional in type.

We looked over the plans with some interest to see if there were any points in house-planning that could be noted as suggestive or differing in any important points from general practice here. We observe that in nearly all the plans a "china-closet" contiguous to, and in most cases opening directly out of, the dining-room, seems to be considered an essential; in one case it is called "butler's pantry," and as, in another case, there is a sink shown in it, we presume it answers to what we shall call the butler's pantry here; but it is much too close on the family dining-room for our notions. A merit which may be noticed in the plans generally is a considerable variety and picturesqueness in the shape and proportions of the sitting-rooms,—more, on the average, than we generally find in English houses, where we run so much into respectable parallelograms in our sitting-rooms. In one house designed for the sea-side, instead of a dining-room there is a "dining piazza," a large extended verandah, in fact, for open-air dining; a good feature in a hot climate, but one which English sea-side weather would leave us little chance for here. We observe that in nearly all the plans the w.c. and bath-room are in the same apartment, a most objectionable arrangement, long since discarded in all well-planned English houses, and quite unworthy of the refinement of civilisation to which in matters of domestic life the Americans have attained. We can scarcely imagine that this represents the usual arrangement in good American houses, even on a moderate scale; but if it does, it should be altered.

To country-builders and proprietors who are unable to obtain the assistance of an architect, the book will be useful.

Miscellanea.

Church's Joint-maker.—We are not disposed to think that the method of joining leaden pipes patented by Mr. Church, and illustrated n our advertising columns, is likely to supersede the ordinary mode of "wiping" by hand, but under certain circumstances we have no doubt that it may be advantageously used. As our readers may have noticed, it consists in the provision of boxes, or moulds, of various sizes, so arranged that a joint may be cast, and any intelligent workman, duly reading the instructions, can, in the absence of a plumber, do this. In some cases, moreover, pipes are so shamefully ill-placed that it is not possible to make a fresh joint in the ordinary way, and then, as it seems to us, Church's method might be adopted with advantage.

The New Town-Hall at Huddersfield, which has cost nearly 40,000*l.*, was formally opened on the 18th inst.

A Technical School for Huddersfield.—The memorial stone of a building which is being erected in Huddersfield for the purpose of a Technical School, was laid on the 19th inst. by the Master of the London Clothworkers' Company. For some time the demand for technical instruction in Huddersfield has been continually increasing. So far as was possible this demand has been met by the Mechanics' Institute, with which the new school is to be associated, but the means at disposal were found to fall short of what was required, and steps were accordingly taken to extend the range of operations, which up to the present have met with great success. Subscriptions to the new building, which will cost about 12,000*l.*, have been given liberally. It is worthy of note that the funds have been chiefly contributed by the residents of the town and surrounding districts, aided by a grant of 2,000*l.* from the Clothworkers' Company. The subjects intended to be taught comprise pure and applied mechanics, machine and building construction, chemistry, especially as applied to dyeing, scouring, and bleaching; experimental physics, embracing light, sound, heat, magnetism, and electricity; mechanical drawing, and its application to machine and building construction; pattern designing, and its practical application to the loom, and other branches of the textile trades; and such other subjects in primary, technical, and industrial education as the council may from time to time think necessary. Mr. Edward Hughes is the architect of the new building.

The Forthcoming Health Congress at Brighton.—Brighton is looking forward with much expectation to the Health Congress and Sanitary Exhibition, which is to be held in the Royal Pavilion in December next (from the 12th to the 21st). The Mayor-elect (Mr. Alderman W. H. Hallett, F.L.S.) is taking an active interest in the affair. He is supported by an influential committee, and the arrangements are being made upon a very extended scale, with good promise of success. Dr. B. W. Richardson will deliver the inaugural address at the Congress, and we believe that a special feature in connexion with the exhibition will be the erection of a number of artisans' model dwellings in the grounds of the Royal Pavilion. There will be eight sections or classes, of which Class III. will include house sanitation and hospital construction and appliances; Class IV. will be devoted to industrial dwellings; and Class VI. to house decoration and fittings. The exhibition will include a loan collection of works of art from South Kensington. Mr. William Hamilton is the honorary secretary. Intending exhibitors should apply early for space.

Party Walls.—An application for an injunction to restrain Messrs. Cow, Hill, & Co., of Bread-street, Cheapside, from pulling down a party-wall was heard before a Divisional Court of the Chancery Division, consisting of Mr. Justice Cave and Mr. Justice Kay. The Union Assurance Society, who are now in possession of the next house, which was partly damaged by the late fire in Cheapside, are reinstating the buildings, and have received notice from the Commissioners of Sewers to repair the party-wall. This they have done. The defendants have received a similar notice, but instead of repairing they commenced to pull down, and, according to the affidavit on which the motion for an injunction was made, this was being done for the purpose, not of repairing the wall, but in order to put up larger buildings. The Court granted an interim injunction over the 2nd of November to restrain the further pulling down, on the managing director of the Union Assurance Society giving an undertaking to be liable in damages.

Conder's Bible Hand-Book.—We understand that a third edition of this work, reviewed in our columns on its first appearance in September, 1879, is in the press. It is, perhaps, without precedent in the case of any work dealing with Biblical subjects, for the authors to have received, as has been done in the present case, high tributes to the value of their work from an English Primate, a Roman cardinal, and a Jewish Chief Rabbi.

Value of Land at Fulham.—On Tuesday last Messrs. Driver & Co., of Whitehall, sold by auction, at the Mart, Tokenhouse-yard, some small detached plots of land in Crown-road, Munster-road, and Margravine-road, containing together 2 acres 3 roods and 10 perches, which realised a total sum of 4,840*l.*, or at the rate of about 1,720*l.* an acre.

The Camberwell and Peckham Improvement.—At the meeting of the Metropolitan Board of Works on the 21st inst., the Works and General Purposes Committee submitted plans of additional widenings in the main thoroughfares of the Camberwell and Peckham improvement, at an estimated total cost of 8,600*l.*; and recommended that the same be approved and adopted, and that the said thoroughfares be widened to the extent shown upon such plans,—*i.e.*, from 50 ft. to 60 ft. in certain parts. Mr. Dresser Rogers, in moving the adoption of the report, pointed out that the thoroughfares affected formed a main artery of traffic to an exceedingly crowded and rapidly-increasing district of the metropolis, for whereas by the census of 1871 the population of Camberwell parish (which includes Peckham) was 111,000, and the number of houses 17,000, the census of this year showed the population of the district to be 187,000, and the number of houses to have increased to 27,000. Mr. Rogers incidentally stated that some of the building frontages already let by the Board on the line of the widened thoroughfare had realised four times the rental anticipated, and it was the opinion of the Superintending Architect of the Board that the proposed extra widening of the thoroughfare would still further enhance the value of the building frontages, and that the Board would be recouped to a far larger extent, *pro rata*, by the letting of building frontages than had been the case in any other improvement. The recommendation of the committee was agreed to by a large majority.

A Year's Building in Edinburgh.—At a meeting of the Guildry of Edinburgh, on the 21st inst., Mr. R. Hutchison was re-elected Dean of Guild. He subsequently submitted a statement as to the business of the Dean of Guild Court for the past year. It appeared that the number of applications for warrant to erect buildings, and to execute additions to, and alterations on, property within the jurisdiction of the Edinburgh Municipal and Police Act, 1879, was 466. This included applications by the Procurator-Fiscal against parties proceeding with work requiring warrant of the Court without such, and against proprietors of property in danger requiring immediate steps for their safety to be taken. Of these applications, 440 warrants had been granted, including thirteen for fines and costs against wrong-doers. The warrants granted were for two churches, 202 villas, 113 tenements of shops and dwelling-houses, and 334 alterations and additions, with stall, conservatories, &c.

Edinburgh Health Society.—This is the title of a society of which the inaugural public meeting was held on the 21st inst. Its object is the promotion of the laws of health in Edinburgh and the vicinity. Treasurer Harrison, in moving a resolution, said he regarded the Town Council in a great measure as a Health Society; and related what had been done by the operations of the Improvement Trust in improving the health of the city, the death-rate having been reduced from 26 per 1,000, at which it stood in 1863, to 20 per 1,000. Typhus fever, he was glad to say, was now no longer epidemic among them. Dr. Walter C. Smith, in seconding another resolution, referring to the work of the Improvement Trust, remarked that they had still too many dark, airless closes in Edinburgh, and many houses which were not fit for human habitation. There was still a heavy burden of shame upon the city that there were so many of such houses, and that they were occupied by their fellow-citizens.

Typhoid Fever, with a fatal result, having been generated by the unsanitary condition and overcrowded state of the Exeter Post-office, the Sanitary Authority desired to inspect the establishment, in order that they might direct the necessary steps to be taken to improve the condition of the building. The Postmaster declined to permit the entry of the authorities, but yielded when a magisterial order was presented. The state of affairs in the telegraph department was so bad that the Town Council pronounced the building to be dangerous to the health of the city.

The Royal Albert Hall Choral Society.—The Season will commence on Wednesday, 2nd November, with a performance of Handel's "Judas Maccabæus," when the Orchestra will again be increased by the band of the Coldstream Guards. Mendelssohn's "Elijah" will be given on the 23rd November. Sullivan's "Martyr of Antioch" and Berlioz's "Faust" are to be performed.

Civic Banquet to the Royal Academy.—On Wednesday evening the Lord Mayor and the Lady Mayoress, in accordance with the annual custom, entertained at dinner in the Egyptian Hall, Mansion House, the members of the Royal Academy of Arts. The Lord Mayor, in proposing "The Members of the Royal Academy," expressed his regret at the absence of Sir Frederick Leighton, the President, and associated with the toast the name of Mr. Street, who, after dwelling upon the great value of the exhibitions of works of old masters at Burlington House, alluded to the difficulty the Academy still found in prevailing upon the owners of such valuable works to part with them, even for a time. Turning then to the unseen work done by the Royal Academy, of which little was known by the public, he briefly described the schools of the Academy, in which masters, models, and casts were provided, and some 400 students were at present receiving instruction. They were taught by competent masters, and were visited by twenty-three visitors elected by ballot from among the members of the Academy. Thus the students were brought into intercourse with some of the most distinguished artists of the day. Referring to Blackfriars Bridge, and certain works contemplated at the Guildhall, he expressed a hope that when the architect had done his part, the sculptor and the painter would be called in to complete the decoration of the structure. He hoped that the arts of architecture, sculpture, and painting would be so cultivated in this City that in future years people might think of London as they now thought of the old centres of civilisation and art elsewhere in Europe. The toast of the Royal Scotch Academy was responded to by Sir Daniel Macnee, and other toasts followed.

A Cathedral for Liverpool.—In his primary visitation charge, delivered on the 19th inst., the Bishop of Liverpool said,—The third chief want of the diocese of Liverpool is one which I feel great difficulty in handling. I refer, of course, to the want of a cathedral suited to the size and wealth of our diocese, and to the importance of the second city in Great Britain. I approach the subject with delicacy. It is a far wider and deeper one than most people suppose. I am often asked, "When are you going to begin your cathedral?" But few seem to realise what the idea involves. Let us consider well what we are talking about. Let us count the cost. We must remember at the outset that in this matter the new diocese of Liverpool starts at an immense disadvantage compared to every new diocese of modern times. We have everything to do from the very beginning. We have not a church in our city which is fit to be converted into a cathedral. We have no site for a new cathedral, except one behind the Gymnasium, in a disused cemetery, which many, perhaps, would dislike; and any other site would cost an enormous sum. The cathedral itself, to be worthy of Liverpool, would cost a quarter of a million before it was finished. If any one comes forward with a princely offer like that of the ladies who have built Edinburgh Cathedral,—or if any one will do in Liverpool what has been lately done at St. Patrick's and Christ Church Cathedrals in Dublin, or at St. Finbar's in Cork,—I shall be deeply grateful. For anything I know, it may be in the heart of some one even now to do this.

Building in the United States.—Judging from an announcement recently issued by the Bricklayers' Union in New York, it would appear that the demand for labour in the United States is unusually keen. The Union gives notice that its members are to cease work henceforth at all establishments which are not paying a minimum of four dollars a day. In some cases, it is said, as much as five dollars a day, or over six pounds a week English currency, has been paid to workmen. The rise in the rate of wages, it appears, has proved a serious misfortune to the great building firms who have large outstanding contracts to perform.—*Daily News.*

Solomon's Temple.—It is reported, says the *Times* correspondent, that the Sultan has given orders for the remains of Solomon's Temple to be restored, and the surrounding place to be cleared of all rubbish. On that place stands the Mosque of Omar, the revenue of which is said to amount to 150,000*l.* a year. Hitherto this sum has always been forwarded to Constantinople, but for the future it is to be appropriated for the above-mentioned purpose. This act of the Sultan is believed to be a result of the visit of the Crown Prince of Austria to Jerusalem.

The Rhind Lectures in Archæology.—Mr. Joseph Anderson, Rhind Lecturer in connexion with the Society of Antiquaries of Scotland, delivered the opening lecture of this year's course in the Freemasons' Hall, Edinburgh, on the 17th inst., taking as his subject "Scotland in Pagan Times." The second lecture, delivered on the 20th inst., was on "Viking Burials." The third lecture, given on Monday last, treated of "Celtic Art of the Pagan Times."

TENDERS

For schools, Higham, for the Walthamstow School Board:—

Hawkins	£6,091 0 0
Bentley	6,035 0 0
Fuller	5,898 0 0

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under ..... 4s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

Terms for series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under ..... 2s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

REPLIES TO ADVERTISEMENTS,
Addressed Box ——, Office of "The Builder,"
Cannot be forwarded, but *must* in all cases be *called for*, and the Office Receipt produced.

THE CHARGE FOR A BOX IS AS UNDER:—
For "Situations Wanted" Advertisements ..... 3d. per Week.
For all other Advertisements ..... 6d. per Week

PREPAYMENT IS ABSOLUTELY NECESSARY.

*** Stamps *must not* be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, King-street, Covent-garden, W.C. to
DOUGLAS FOURDRINIER, Publisher,
Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

Best Bath Stone.
WESTWOOD GROUND,
Box Ground, Combe Down,
Corsham Down,
And Farleigh Down.
RANDELL, SAUNDERS, & CO., Limited,
Corsham, Wilts. [Advt.

Box Ground Stone
Is the best for use in all exposed positions, being a well-known and tried weather stone.
50,000 feet cube in stock.
PICTOR & SONS,
Box, Wilts. [Advt.

Doulting Freestone and Ham Hill Stone of best quality, in blocks, or prepared ready for fixing. An inspection of the Doulting Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK, Norton-sub-Hamdon, Ilminster, Somerset. — Agent, Mr. E. WILLIAMS, 73, Charlotte-street, Portland-place, W. [Advt.

Doulting Stone and Ham Hill Stone, of best quality. Prices and Estimates, including delivery to any Station, on application to Staple & Hann, Quarrymen, Stoke-sub-Hamden, Ilminster. Agent, Mr. E. CRICKMAY, Langbourn-chambers, 17, Fenchurch-street, E.C. [Advt.

Asphalte.
Seyssel, Patent Metallic Lava, and White Asphaltes.
M. STODART & CO.
Office:
No. 90, Cannon-street, E.C. [Advt.

Asphalte.—The Seyssel and Metallic Lava Asphalte Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms, granaries, tun-rooms, and terraces. [Advt.

Immense quantities of
DRY WAINSCOT,
DRY MAHOGANY,
DRY WALNUT,
in all thicknesses.

F. W. REYNOLDS & CO.
ACORN WORKS,
EDWARD-STREET, BLACKFRIARS-ROAD,
London, S.E.,
HAVE FOR SALE THE FOLLOWING
NEW AND SECOND-HAND MACHINERY,
AT REDUCED PRICES.

ONE 8-H.P. PORTABLE STEAM ENGINE, as good as new. First-rate make, with all improvements. To be sold at a reduction.

ONE 8-H.P. PORTABLE STEAM ENGINE, in use a few months only. In capital condition. To be Sold at a great reduction.

ONE 7-H.P. PORTABLE STEAM ENGINE, quite new. To be sold at a reduction.

ONE 6-H.P. PORTABLE STEAM ENGINE, quite new. To be Sold at a reduced price.

(These Engines are fitted with the Patent Feed Water-heater and the Patent Steam-blast Tube-cleaner.)

ONE 2-H.P. HORIZONTAL ENGINE, with VERTICAL BOILER, combined.

ONE 3-H.P. HORIZONTAL ENGINE, with VERTICAL BOILER, combined.

ONE 3-H.P. HORIZONTAL ENGINE.

ONE 4-H.P. VERTICAL ENGINE.

ONE 8-H.P. VERTICAL BOILER.
This Engine and Boiler have been thoroughly overhauled and put into good Working Order. WILL BE SOLD AT A VERY LOW PRICE.

NEW GAS ENGINE (2-h.p.), Simon's Patent, to be Sold cheap, having no further use for it. This Engine is as good as new, and in thorough Working Order. A BARGAIN.

ONE COMBINED MORTAR-MILL and ENGINE (Portable). Very strong. (See illustration on p. vi.)

ONE MORTAR-MILL, with 6 ft. 6 in. Revolving Pan. Reynolds's "Spécialité," with Timber Bed complete. Second-hand.

ONE MORTAR-MILL, with 7 ft. Pan. Reynolds' "Spécialité," Second-hand, but as good as new. With Timber Bed complete. To be Sold Cheap.

ONE CIRCULAR SAW-BENCH, with rising and falling Spindle, and 30-in. Saw. As good as new.

ONE CIRCULAR SAW-BENCH, for 36-in. Saw, with Self-Acting Feed Motion.

ONE HAND-POWER CROSS-CUT SAW-BENCH (Second-hand), with 18 in. Saw.

ONE PANEL PLANER, to Plane Wood up to 16 in. wide, 30/.

SIX BAND-SAWING MACHINES, for foot or steam power, with 18-in. pulleys, price 10/. 10s. each.

FOUR MORTISING MACHINES, light make, suitable for Blindmakers or Joiners, for fixing to bench, 6/. 6s. each.

SIX do. do. do. on strong pillar stand, 7/. 7s. each.

ONE 9-inch CENTRE SELF-ACTING SLIDING, SURFACING, and SCREW CUTTING LATHE, with 12-ft. Gap Bed, full Set of Change Wheels, Sliding Stay, and Overhead Motion complete. To be Sold cheap. Inspection invited.

SEVERAL DRILLING MACHINES, various sizes.

ONE TOOL GRINDING MACHINE (with Seven Stones), Trough and Cocks complete, for Plane and Moulding Irons.

ONE 20-TON LIFTING JACK (Haley's Screw Jack), with Wood Case, to be Sold a great Bargain.

BRICKMAKING MACHINERY, quite new
Will be Sold Very Cheap:—
A Double Set of MURRAY'S CRUSHING ROLLERS (Hedgehog and Plain), and
A HORIZONTAL MIXING MILL. These Crushing Rollers and Mixing Mill are offered at a Great Sacrifice.
ONE HAND-POWER BRICK PRESS.
See Advertisement, p. vi.

ABOVE MAY BE SEEN,
Together with a large Collection of Steam and Hand-Power Wood-Working Machinery,
"IN OPERATION," at
F. W. REYNOLDS & CO.'S,
ACORN WORKS,
Edward-street, Blackfriars-road, London, S.E.
(Within Three Minutes' Walk of Blackfriars Bridge).

The Builder.

A Burning Social and Industrial Question.

IT is now some weeks since our attention was pointedly called, from a source very intimately connected with the direction of the scientific industry of Great Britain, to the problem, which was then felt to be about to become urgent, of the application of convict labour. The great works at Chatham and at Portsmouth, on which a large portion of such labour has of late been occupied, are at or about their close, so that the question, which is admittedly a very difficult one, calls for immediate attention.

The difficulties which beset this question may be classed as mechanical, moral, and economical. Of these the last are the most perplexing. It may be conceivable,—and we hope to show that it is very practicable,—to organise, under military guard, a system of convict labour which, to say the worst of it, cannot be more heavy on the operatives, or more difficult to guide within exact limits, than was the toil that erected the pyramids of Egypt. The moral objections apply chiefly not so much to an organisation of this kind, as to the employment of convict labour on the highways, or in any public situation, where the humiliation of the prison dress, the loaded rifles of the sentinels, or even the physical restraints upon the captives, may be thought to add appreciably to the sufferings, and, moreover, to harden both their hearts and those of the spectators of the toil. Of this we have ample evidence in Italy, where the spectacle of men in sulphur-coloured or red clothes, and even at times in irons, at work on the roads under the muzzles of the rifles of the sentinels, was not an unusual sight,—at all events, a few years ago. This difficulty, however, may be called a local one, and hardly arises except in case of such a wide distribution of convict labour as in itself is in many other respects unadvisable.

There remains the economical question: to wit, how far is it just to the ordinary labourer to affect the market demand for labour, and thus to lower, it may be, the ruling rate of wages, by the competition of labour which is in a certain sense gratuitous,—that is to say, of the labour of hands that must be fed and supported by the State, whether they work or not? And this objection applies with equal force to pauper labour. That it must be a serious difficulty is evident from the fact that, while the numbers of criminal offenders convicted, in 1880, in England, Scotland, and Ireland, amounted to 15,643, and while the able-bodied paupers, in the same year amounted in England to 111,169, and in Ireland to 9,278 (in Scotland the able-bodied paupers are not distinguished), such appeals as those which have been heretofore made in our columns as to the employment of wasted labour on "Lands that want Hands" have as yet failed to lead to practical results.

It is a natural suggestion that the employment of prison labour in supporting prison establishments, is a proceeding which is not liable to insuperable objections on either moral or economic grounds. But here come in what we call the mechanical difficulties, that is to say, within the precincts of the prisons there is only room for an employment of a limited number of prisoners, on such trades as they may be able to work in. There still remains a large bulk of convict population,—the whole number has been estimated at about 20,000,—for whom there is no indoor work. Are we, then, to regard these men as subjects for vengeance, or for reformatory treatment? That is the first question. They are sentenced to hard work. Well and good. But is that work to be of a brutalising or of an improving character? There is, we apprehend, little doubt that evidently useless work, such as the treadmill, or the shot drill, is the first. And we hold, believing in the nobility of work, that all distinctly useful work has in it something, however little it may be, elevating to the character of the workman. The most uninstructed agricultural labourer may rank very low in the scale of civilisation, but he stands on a step appreciably higher than that occupied by either the idle pauper or the convict on the treadmill.

If these views be true,—and we do not hold that they are either novel or debateable,—the question as to the proper mode of dealing with the large amount of convict and pauper labour which is likely to be absolutely wasted and lost to the country assumes the form of the least difficult of the three cases of dilemma. It becomes a mechanical difficulty where and how are these numerous strong men to be set to useful work, without either ousting the honest labourer, lowering his wages in the market, or presenting the demoralising aspect of men on whom our common burden,—that of working in some way for our bread,—is imposed under conditions that not only humiliate the worker, but degrade the dignity of work.

We venture to suggest a solution of this problem. The total area of bog in Ireland is estimated at 2,830,000 acres, nearly one-seventh of the entire surface of the island. Of these bogs there are 1,576,000 acres of flat bog, the remaining 1,254,000 acres are mountain bog. Without entering into chemical details,—which however, we are fully prepared to do,—we may state as an uncontradicted fact that nothing but well-directed labour is required to convert the greater portion, if not all, of that land, now waste, into the richest pasture or corn land. Drainage is the first, and in many cases the only, requisite, to effect this change. Burning the surface of the bog, after draining, has in some places had an admirable result. Claying the bog, by extracting the clay which lies below and forms an impervious bed, and placing it as a top dressing, is the method which has been followed in other cases, as in our own Bridgwater levels, with the result of turning waste swamps into the richest pasture or hay-growing lands in the kingdom. Whichever of these methods be adopted, there is the remarkable characteristic that only labour is required. No more capital is wanted than will suffice to feed the workpeople. In some cases, probably, steam-power would aid in the work of drainage. But even that would be fed from the spot, as the turf possesses very great advantages as a steam fuel if the flues of the boiler be designed properly for the consumption of turf. It is only last week than an "Ulster Landowner" writes to an English daily journal to say, "The great flat bogs, such as the bog of Allen, can no doubt be converted into most valuable land, but the expense would be great, and the work could only be undertaken as a whole, involving the execution of very great works. No owner of a few hundred or thousand acres on the fringe of the bog can drain this portion while tens of thousands of acres behind him remain undrained."

Here, then, are present all the elements for the solution of more questions than one. There is a great work to be done,—a work so large that it is beyond the reach of any private enterprise. Nor does it, for reasons into which it is unnecessary now to enter, present any temptation for joint-stock enterprise. On the other hand, it is a work involving immense national benefit. All neighbouring landowners would be enriched by the reclamation of this enormous bog. The island would have almost a new county added to its productive area. No money need be sunk in the bog. It is only requisite to apply to it that muscular force which is fretting itself into deeper poverty and misery by enforced idleness. Of course, proper engineering direction is required. But that is at the command of the Government. It is not necessary here to enter into any detail on that point. That the proper mode of attacking the bog is a matter for ready scientific determination every Woolwich cadet is aware. What is required is simply, enough labour under scientific direction As before said, it may be a question whether steam power may not be called in with advantage. No doubt, all pumping, if pumping be requisite, could be effected by convict or pauper labour, and would be self-supporting, or remunerative, if so effected. But when we consider that even the most clumsy and extravagant form of boiler will supply the power to effect this pumping at one per cent. of the cost of human manual power (taking that at the cost of wagon-filling on an English railway), and when we reflect that we want the work to be done, as

well as the men to be employed, we think no unnecessary strain should be put even on convict labour.

Local accommodation, such as our railway navvies are in the habit of providing for themselves, would, of course, be requisite. Proper military surveillance of the district and of the labourers would be essential. The mark system might be introduced, for the encouragement of the men; a certain number of marks having a definite time value for the shortening of their term of punishment, and even providing them with something with which to begin the world again when free. Not a single labourer in the three kingdoms could have a word to say, justly, against such a plan. The work is altogether unlikely, in our time at least, to be attempted in any other way. The result of it would be to provide an extended field for the labour of the Irish agriculturist. In most cases of any new industrial suggestion the *pros* and *cons.* are many, and it may be difficult to foresee which scale of the balance will descend. As to the reclamation of the Bog of Allen,—or, for that matter, of any other bog to be selected by the expert,—by labour that is now wasted or worse, we can see a great many *pros*; but we have to wait for an exposure of the *cons.* that cannot be met.

THE EDUCATIONAL AND TECHNICAL VALUE OF PUBLIC COLLECTIONS.

The practical value of public collections in the service of education is evidently taking a foremost place in matters of general public interest. From Classic times at least, the fashion of collecting has existed. Roman consuls furnished their houses with Greek works; Cicero condemns Verres, a governor of Sicily, for his wholesale seizure of precious objects made by workmen of Corinth and Delos. As Roman splendour declined so did early collections become dispersed in the misfortunes of wars and plunderings carried on by Huns, Goths, and Lombards. Until the Renaissance the practice of collecting lay in abeyance. Cola di Rienzi is considered to have revived it; but he is not credited with having had more than a desire to possess antiquities. His friend and admirer, Petrarca, was, it appears, more of an antiquary, having a keener insight into the virtues of works of art. Still there was scarcely a genuine amateur collector until the great Lorenzo di Medici arose. His times are marked by the establishment of the Florentine Accademia which he furnished with statues, busts, and other pieces of ancient workmanship. His school for sculptors stands high as having been the training ground of Michelangelo. Under Lorenzo's patronage a love for the fine arts seems to have spread with rapidity, and Italian artists and art-workmen soon abounded in great numbers, to supply the wants of their art-loving patrons.

In the antiquaries of the seventeenth and eighteenth centuries a sense of spreading some sort of useful and serious instruction was certainly alive. But even when Winckelmann produced his "History of Art," the value of technical teaching to artists and manufacturers in respect of materials and modes of workmanship does not appear to have been realised in this country. Prolix discourses by a Martinus Scriblerus, and anecdotes by a Horace Walpole sometimes still serve as models of style for the utterances of a few of our *virtuosi* and *cognoscenti*. The idea of giving to great numbers of persons some "technical instruction" by means of collections is virtually modern.

Much as individual curators and keepers of public collections have endeavoured to lay clearly-defined lessons before the public, Select Committees of the House of Commons and Royal Commissions will probably be the framers of schemes or *curricula* of instruction of which public collections are to be the exponents in this country. The British Museum was commenced as an emporium of things esteemed for being "rare and curious." It has in due course slowly developed branches which have some special knowledge in view, such as ethnology, archæology, natural history, &c. The National Gallery propounds a history of painting, the National Portrait Gallery tells us about portraiture, and the South Kensington Museum had for its mission at starting the culture of consumer's and producer's taste in the many ramifications of artistic handicrafts.

From the period of the Italian Renaissance to the present, the learned Müller has assigned three phases of people's appreciation of works of art. The first he considers is artistic, when "ancient works of art were taken up with joy and love, and collected with zeal,"—"there was little interest felt in them as historical monuments; enjoyment was the object." This period of sentiment, within the present century, finds many votaries. It is present in Shelley's apostrophe to a Greek vase. It is perpetuated by Mr. Ruskin, following whose lead is an army of disciples to whom "a thing of beauty is a joy for ever," and nothing more. The second period is the "antiquarian," when nomenclature of antique statues was much attended to. The basis of knowledge then put forth was antiquity rather than perception of artistic principles. The antiquarian period still survives. Müller's third period is the "scientific"; and this is marked by numerous attempts, philosophically and historically, to investigate art, "and to supply circumspect explanations of art." At the British Museum and the National Gallery there are evidences of this scientific period. At South Kensington the manifestations of its influence are just now various.

For some years the collections at the Kensington Museum had for their aim what appeared to be the technical explanation of the industrial arts. The museum was started on grounds totally distinct from those of any existing public collection. It did not concern itself with either ethnology or archæology. The backwardness of our artistic manufactures was a cause of its creation. The country seemed to have awakened to its want of instruction as to how materials had been used and the different processes which had from time to time been employed in the production of works of art. And so South Kensington Museum came into being, to tell artisans and designers, their employers and customers, what had been done, and was being done, in artistic handicraft. "Technical instruction" was an officially used term in 1852. When Marlborough House contained the nucleus of the present inestimable collections belonging to the South Kensington Museum, a system had been devised for acquiring objects which, in the first place, were to be of "technical (manufacturing) or scientific interest." The generic divisions of the collections so formed were to be ruled as far as possible by character of materials,—like wood, stone, glass, metal, &c.; whilst the *species* of these generic divisions would be "the technical embodiment," or processes, "as, for instance, cast, hammered, moulded, carved, blown, &c." Date, local origin, &c., were of subsidiary importance. Besides this carefully-considered scheme or policy for the formation and arrangement of the Museum, classes existed for giving "technical instruction" in various branches of art. These classes were the offspring of the older schools of design, the reports upon which, dating from 1841, are devoted to the establishment of a system of practical and technical instruction in the fine arts. At Marlborough House, Professor Semper taught practical construction, architecture, and plastic decoration. He and his students had an opportunity of showing their skill when they were charged to execute the ornamental metal work for the funeral car of the Duke of Wellington, which is now shown in the crypt of St. Paul's. Then there were other classes for teaching the principles and practice of ornamental art applied to surface decoration, including woven fabrics, paperstaining, embroidery and lace-making, porcelain, &c. These were conducted by the late Mr. Octavius Hudson, whose name as a nineteenth-century purist in Gothic decoration is associated with restorations at Lichfield, Ely, and the Lady Chapel of Chester Cathedral. But these classes for "technical instruction in art" have fallen into comparative desuetude. Perhaps the City Guilds' new Technical Institute may revive them. In any case, however, they are beside the immediate question of the technically instructive value of the collections at South Kensington.

This question may possibly attract a lion's share of attention next session from the Select Committees who propose to formulate the educational and technical functions of public collections generally. This possibility is all the more likely if a glance be taken over the numerous sections of which the South Kensington Museum is now composed. Its main buildings contain all sorts of works of fine art, paintings, sculptures, pottery, furniture, glass, textile fabrics, metal works, ivories, &c. In annexes are materials for building construction, models of machinery and of ships, a piscicultural collection, scientific instruments, educational apparatus, to say nothing of an immense department devoted to Indian art. This apparent complexity of collections is astonishing when disconnected from antecedent causes of its development. As a step towards elucidating its meaning, the collection of modern small arms and ordnance has recently been dispersed, a portion going to Birmingham and another to Sheffield. The collections of building construction, an intelligible evolution of the technical classes held under Professor Semper, are, it is reported, to be broken up. Besides these clearances, changes and developments are going forward in other parts of the Museum. The collections of works of art are undergoing re-arrangement. The old classification by materials and processes is being undone, and heterogeneous gatherings of works assumed to have been produced in various countries are taking its place. A museum of casts, for some years a dream of the Duke of Westminster and Lord Cowper, has been announced by Mr. Mundella to be in progress of formation. Special loan exhibitions of objects to show national phases of art are being organised; and throughout the country, and even abroad, all sorts of valuable, and perhaps unique, works of art are constantly peregrinating.

The functions of the Kensington Museum in circulating works of art have often been commented upon. They would appear sometimes to derange the normal collections which probably deserve a grant of fixity of tenure not to be impaired by perils of travel by land and by water. Hundreds of localities in the United Kingdom, awakening to the cry for artistic technical instruction, cannot be eager for the disintegration of a central normal collection. To a small extent, localities could supply themselves and be supplied with original works of art, and the hiatus in their collections could, no doubt, be filled with reproductions of typical famous works. From 1842 Government has acknowledged the value of making reproductions of works of art. It was felt to be as necessary in responding to the wants of provincial centres as to those of a normal central collection. National monuments in foreign countries were not purchasable. Even victorious conquerors could not transport Trajan's column, the Bayeux tapestry, Michelangelo's "David," or the Bhuddist gateways from Sanchi, without being reprobated for their acts of Vandalism in defying the spirit of modern right. Study of such works was none the less necessary for students. Copies were accordingly obtained of them and many others; and the system was ratified by a convention or agreement for assisting the making of copies, which was entered into by the Prince of Wales and the princes of the reigning houses of Europe in 1867. The copies, as obtained, took their places amongst original objects, and representative series of works in various materials were thus formed. This aspect of the utility of reproductions is now undergoing modification. The copies are no longer in the ranks of the general series of works. They are brought together by themselves and are destined to become the nucleus of a "Museum of Casts." The project of a museum of casts is adopted from cognate collections at Berlin and Munich. Its achievement will be advantageous to students of historical art, and will result in forming an adjunct to a museum of industrial fine art. It will, however, be independent of artistic technical collections for the instruction of producer and consumer. Points like these seem to fall within the scope of the inquiries of the Royal Commission now engaged upon furthering technical education.

Up to about 1876 the administration of the Kensington Museum had endeavoured to classify sections of objects in accordance with the principles enunciated in 1852. An unexampled collection of works of the potter's art was arranged: goldsmiths' and jewellers' works were placed together, carvings in wood and cabinetmakers' work formed another section, metal works another, textile fabrics another, and so on. The handicraftsman pursuing his industry in one or another of such divisions, could come to South Kensington and consult the works which belonged to his craft. From time to time there had been special exhibitions of works of various crafts. There had been one for cabinetmakers, a later one for embroiderers, another for jewellers, another for enamellers. During this year, a different series of exhibitions has been commenced. Spanish and Portuguese works were collected; and probably Scandinavian,

Italian, French, German, Russian, Chinese, and American collections may follow. The aim of these national exhibitions is apart from that of the preceding "craft" exhibitions. Their importance lies, in enabling connoisseurs and amateurs, as distinct from artisans and manufacturers, to discuss the nationality of art works. An ethnical interest is thus appealed to. For instance, in the Spanish and Portuguese exhibitions, there were splendid embroideries which Oriental travellers pronounced to be from Persia and Goa. Ornate plate was by some held to be Flemish. Finely-chased salvers, marked even with the Medicean "palle," were declared not to be Italian, ivory carvings were known to be French Gothic, and many delicate enamels, usually considered to be "Cellini" work, were placed in the Spanish collection, although labelled as being of French or Italian origin. Hence many inducements were offered for interesting controversy upon what could be the appreciable characteristics of "Iberian" art.

The theory that art is to be nationalised is gaining ground, and the arrangement of objects at South Kensington is being attempted in this direction. Its logical basis may be questioned by those who recall the dissemination of styles of art throughout Europe, which followed from the journeys of artists like San Gallo, Torrigiano, Cellini, Holbein, and many others. Into a large court have lately been brought sculptures in marble and stone, modelling in terra cotta, enamelled earthenware, furniture, plasterwork, metalwork, glass, &c., all considered to be of Italian work. As in the case of the reproductions and casts, technical arrangement showing crafts becomes superseded by "national" or "ethnical" arrangement. From this point of view the instructive purposes of the South Kensington Museum might be deemed to be entering a new phase. This new phase may be strange to foreign countries, who, struck with admiration of the original intention of the Kensington Museum, have been devising the establishment of "Industrial" museums for the artistic technical instruction of their artisans and manufacturers. As we write, the final arrangements are reported to be in progress for inaugurating at Berlin a German copy of our South Kensington Museum. This Berlin Museum is to be an Industrial Museum based upon what were the ruling principles of the South Kensington Museum before the present idea of converting it into a Museum of Ethnical Arts had taken root.

Our national collections, regarded as accumulations of materials for educational purposes, may be likened to the storage of facts possessed by a teacher. How they are to serve in special branches of instruction depends upon the teacher's treatment and presentation of them to the public. Study of archæology, ethnology, mineralogy, palæontology, ornithology, animal physiology, and technology, may each be advanced if the facts concerning them are kept in orderly and immutable arrangement, subservient to the particular branch of knowledge concerned. To aid the popular perception of such principle will, no doubt, be a chief object with the Select Committees next year. Museums should not, chameleon-like, be allowed to change their colours. The "circumspect explanation" of objects in public collections, and the definition of the precise *educational* purpose of each collection, are of public importance, and may be advantageously taken in hand.

THE SOIL AND ITS INFLUENCE ON HUMAN HEALTH.

At the recent meeting of the German Society of Natural Philosophers and Physicians at Saltzburg, the eminent Dr. Pettenkofer read a valuable paper on the subject of the influence of the soil upon human health. The subject, he said, was one of the oldest in sanitary science, but it possessed of necessity a permanent interest, as it was constantly presenting itself under new aspects. The soil, the air, and the water had been from time immemorial regarded as the principal factors in the problem of the salubrity of localities. It was these which made a place healthy or the reverse. In recent times there had, in Dr. Pettenkofer's opinion, been a tendency to look too exclusively to the air and water, and to neglect the influence of the soil in sanitary questions. But the ground on which men built their houses, and on which they passed their lives, must always take a pre-eminent place in the determination of all sanitary problems. Dr. Pettenkofer pointed out that air is almost invariably in motion. The average speed at which it moves over the ground at the earth's surface is about 10 ft. per second. Even in a so-called calm, the air is not still; it is still moving at the rate of about 1 ft. 6 in. per second. Hence, even in abysses, and the most secluded valleys of the country, or the narrowest lanes of cities, the air is never really stagnant. Nearly the same may be said with regard to water. All water as it falls from the clouds is of nearly homogeneous composition. It is but very slightly impure. From the soil, however, water, like air, takes up certain impurities. These are generally removed from the air much more quickly than from the water. The circulation of water and its purification from foreign elements are more complicated and less expeditious matters than in the case of air. Nevertheless the process of purifying water goes on even in the drains and sewers of cities, but more especially in the great natural drains, the rivers,—like the Isar, at Munich; the Elbe, at Dresden and Hamburg; the Thames, at Oxford and London; or the Seine, at Paris or Rouen. It was in the soil that impurities were most obstinately and longest retained. The influence of the soil showed itself most clearly in the case of epidemic diseases. Malaria has always been recognised as dependent on the soil of the localities where it is found. But it was not less true that cholera, typhus fever, yellow fever, perhaps even the plague itself, likewise depended on, or were connected with, the condition of the soil. What we have still to settle is the question, "How?" It has been attempted to explain the epidemic appearance of such diseases by assuming that they were propagated through the air or water, or both. But it is incorrect to regard either air or water as the true cause of epidemics. This is generally to be found in the soil. One proof of this Dr. Pettenkofer found in the fact that ships at sea were inaccessible to cholera. It had been observed that when persons were attacked by cholera on the high seas, only those who came from the same localities caught the disease, while the other passengers escaped. It was only exceptionally that the epidemic broke out on board a vessel, and then only when the passengers and crew were in frequent contact with an infected locality on shore. But even on land there were places safe against epidemics. Thus, Lyons, in the south of France, in spite of its large traffic with Paris and Marseilles, where cholera was raging, remained free from the disease. The only explanation that could be found was the condition of the soil or ground at the former city. Still more surprising was the immunity of Versailles from cholera, when Paris, with which it was in constant and immediate communication, was the scene of an outbreak of that epidemic. The investigations of the German Commission on Cholera have clearly shown that epidemics are localised, and that they are caused by the condition of the soil.

What is that, asked Dr. Pettenkofer, in the condition of the soil which is able to produce such an effect upon the health? He answered that probably it would be found in a vast number of minute infinitesimal organisms,—so minute that millions of them might, if collected, lie on the head of a pin. Dr. Nägeli has distinguished such organisms, and presented a faithful and vivid picture of them as they rise from time to time out of the ground. He makes a distinction between soil that is pestilential or unhealthy, and soil that is healthy or free from pestilence. This distinction does not coincide with the presence or absence of a certain kind of fungus, as this is found growing everywhere. However, if the disease is attributable to the same species of fungus generally found growing in every place, then the same forms of these little organisms must produce different effects under different circumstances. It is the task of hygienic science to examine the conditions of the soil favourable to the development of these organisms and their entrance into the human system. It has long been known that by means of drainage and cultivation or tillage an injurious unhealthy soil, like that of the malaria districts, may be deprived of its dangerous character. Even in ancient times canals were cut by the Romans in order, by drainage, to reduce the evil effects of the malaria, though these works had subsequently been destroyed and forgotten. Certain diseases have their favourite haunts in alluvial soil on account of the porous nature of that soil. The spaces and interstices of this soil favour the circulation of air and water. But the same may, to a certain extent, be said of some kinds of porous rock, as is proved by the appearance of cholera in rocky places like Malta. Exact investigations respecting the air in soils have shown its importance from a sanitary point of view. On thoroughly dry soils the ground-air does not absorb any more carbonic acid or organic matter than the air above the ground. This has been shown by experiments with the air brought by Dr. Zittel from the Libyan Desert. The subterraneous or underground air circulates in the soil, although but slowly. During the greater part of the year it penetrates into badly-built dwellings, and conveys into them the fungous germs of disease. In this manner the soil influences human health, and there are only too many dwellings subject to this influence, which is the more baneful the worse they are ventilated. Our houses, in fact, draw or suck the air out of the ground like so many cupping glasses. From a hygienic point of view they are, indeed, less rational than the old pile dwellings of primeval humanity, or than even the village cottages of the present day, whose floors are covered with mud plaster. This was illustrated in the case of an outbreak of cholera at Dantzic, where out of a group of nine cottages, seven modern-built ones, with cellars and plank floors, were visited by the epidemic, while the only two with mud plaster escaped. Accordingly, it appears that in our houses we must pay more attention to the soil on which they are built. Such arrangements should be made in their construction that we should no longer be compelled to take to flight when an epidemic breaks out. A proper method of sanitary construction would enable us to withstand successfully a siege, so to speak, by the cholera, in which case it could be said with greater truth than ever that "a man's house is his castle." Dr. Pettenkofer regards it as the duty of Governments to take the initiative in this matter. Not less important than the air is the water. All organisms require moisture. There are two degrees of moisture to be distinguished: first, that in which the pores of the soil are occupied by air and water in common; and, secondly, that in which the water has entirely driven out the air. In the first case, we have a damp soil; in the second, we have underground water. The intimate connexion between typhoidal diseases and the underground water has been long recognised. When underground water rises higher than the average, typhus disappears, but when again the water in question sinks below its average level, typhus increases. This had been shown clearly by observations made in Berlin. Any apparent exceptions such as places visited by typhus, though without underground water, yet having a porous soil, or again the unimportance of the level of underground water near rivers, did not invalidate the argument. As, amongst us in Europe, the abdominal typhus fever depends on the rainfall and the level of the underground water, so in India does the cholera depend precisely upon the like causes.

With regard to the theory attributing cholera, typhus, and all zymotic diseases mainly to the water we drink, Dr. Pettenkofer advanced some arguments against its unconditional acceptance. The malaria poison, for instance, does not enter the water. The *baccillus malariæ* has been proved to be an organism living in the air, not in the water, of the infected districts, and it was from the air that they penetrated into the human system, and ultimately into the blood. The real cholera germ has not yet been accurately ascertained or identified. It is still doubtful whether it is disseminated more by water than by air. The drinking-water of places visited by cholera has often been entirely given up without preventing the re-appearance or continuance of the epidemic. The city of Basle, for instance, possesses the purest drinking-water which is brought down from the Jura, but has not been protected by it from the disease. Dr. Pettenkofer, however, would not question the importance of the water we drink, in regard to this question. Far from denying the value of good waterworks, the speaker dwelt on the importance of pure drinking-water. The *bacteria* question, too, was one of the highest importance, but the theoretical deductions on that subject required to be practically employed and confirmed by practical experiments. To the observations of a Pasteur there needed to be added the practical applications of a Lister, in order to make them of value in sanitary or surgical science, and in the same way mykological investigations would require to be completed by

hygienic researches. It had been observed that in the case of very concentrated and very diluted fluids used as nutriment, the very small organisms usually found in those fluids in their normal condition are destroyed. An inference drawn from this, that dirt is no danger to health provided it be only thoroughly concentrated dirt, could not be admitted. In villages the dirt is not stronger or more genuine dirt than in towns. In the latter it is only covered up more, and, therefore, the more dangerous. In villages, too, the more cleanly dwellings were the healthier. But granting that concentrated dirt may hinder fungous vegetation, there still remains for hygienic science the task of ascertaining what must be the proper degree of this concentration, and to consider the conditions favourable to the injurious vegetation in question. Sanitary science was, in fact, one unceasing battle against dirt. As the growth of these minute fungi is increased by moisture, it might be thought that all would be right if everything were kept from the damp. However, we are not able to prevent everything from becoming damp or to prevent the dissemination of germs in a thousand different ways. It is in any case good to avoid or to draw off moisture. Dr. Pettenkofer strongly condemned the use of ground reservoirs for rain-water and other such pits, as they contribute to keep the soil thoroughly moist, and are thus very injurious in the neighbourhood of dwelling-houses. They serve, in fact, precisely like a sort of artificial inundation.

The doing away with the moisture or dampness of soils, or at least the diminution of damp, is the main advantage of the various systems of drainage. The value of drains might be exaggerated, but we must beware of underestimating them. Statistics prove that every city which has laid down a system of drainage has greatly benefited thereby. Further, Dr. Pettenkofer referred to the self-cleansing process going on in the soil through the agency of certain very low organisms. The formation of saltpetre through certain fungous growths, shows that these minutiæ are capable of acting not only injuriously, but also beneficially. Hygienic science, at the present moment, stands in view of a practically boundless world of possibilities. But this must not discourage us from action. Hitherto hygienic science has been guided chiefly by feeling, instinct, and so-called commonsense; it is only recently that it has been established on a scientific basis. Cleanliness plays in public life an important part. Cleanly persons live longer and more healthily than the dirty. We ought to respect the sanitary system in common use, even though it still lacks a scientific foundation. But scientific criticism is necessary to refute false ideas, and to get rid of what is superfluous and hurtful. In conclusion, the speaker said that the advancement of sanitary and hygienic science, both in theory and practice, was one of the most important duties of the State.

SOME ASPECTS OF HERTFORDSHIRE.

THE very fact that Hertfordshire is so close to London helps to make it different from other counties, for it is the immense contrast between a very rural county, such as this, and an enormous metropolis within half an hour by rail, that furnishes it with a noticeable characteristic, that is to say, its metropolitan but thoroughly rural nature. For there are few counties in England in which, as a whole, there is a larger proportion of woodland, or which are more thickly wooded. From Hatfield to Hertford, for example, the eye is struck with the continual woods, and with roads and lanes overshadowed by innumerable well-grown oaks. Equally also the picturesqueness of the villages, the many cosy red-brick old-fashioned houses, half hidden by clematis and roses, which are to be found throughout the county, help to make the contrast more marked in the mind of any one who, a short time before, has left the metropolis, between this rural county and the great town which is so near. But whilst this is one of the general aspects of this county, it is one which, while it will strike an intelligent man who may or may not be an architect, yet is not that aspect of it which principally makes Hertfordshire, as a county, of very considerable interest to the architect, and especially the young architect. For Hertfordshire is, if we may coin a phrase, essentially a "residential county." It is quite astonishing to see the number of gentlemen's residences which are passed mile after mile,—not lordly palaces, such as Hatfield, which, we need not point out, is a unique and an historical palace, but fair-sized "mansions," standing in well-kept and bright gardens, in small parks, or in park-like land. If a young architect were to start from Tring in the west, and go directly pretty nearly through the middle of the county to Sawbridgeworth in the east, he would see more examples of what may fairly be described as averaged-sized gentlemen's houses than in any other county in England. As we have already said, we exclude from this the great and noticeable house of Hatfield, which all young architects should visit, and even great but lesser houses, such as Panshanger, looking down from its trees over the green slopes and shining Maran as it sweeps beneath the dark green oaks or broadens into the quiet lake reflecting the overhanging trees and the stately swans, or Knebworth with its twelve fantastic vanes. *Apropos* of this house there is a story that the late Lord Lytton used to delight to take his guests outside the house and ask them to count the weathercocks, and when they could only make the number twelve, he would add that there were thirteen, and that the thirteenth was himself. But the number of the average houses, and the singular fitness of the country, with its wooded knolls, its grassy slopes, and its abruptly undulating nature for residences, will make a journey through Hertfordshire a very profitable one to an architect who goes with his eyes and mind well open. He will see much that he may usefully imitate, and much also that will show him what to avoid; he will see many instances of good, and not a few examples of bad taste in building. He will notice houses placed on spots which there can be no question should have been avoided, and others placed with excellent effects, both as regards picturesqueness and health. Here is a handsome house put right at the bottom of a slope, where, if a fog is to be found, it will certainly exist, without a view, and which cannot be reached without a rapid descent, nor left without a tedious ascent. On the other hand, he will see a similar house placed just below the topmost swell of the hill, which shelters it from the winter winds with a garden beginning the slope, which broadens out into a smooth green descent studded with well-shaped trees, which in its turn draws the eye to the lower slopes, and the misty distance. He will notice one house with a northern aspect, as if the owner, and all who came after him, were disciples of the late Canon Kingsley, and desired to get each blast of the cold winds, and not the gleams of sunlight which make a southern aspect so precious in the winter season, and, indeed, for the greater part of the year in this not too warm land of ours. These are some of the points which will strike the architect who wanders through Hertfordshire, but even where there does not happen to be a house situated, there are so many spots on which a house might well be placed that the county affords, as it were, lessons in the placing of houses which, if carefully taken to heart, can scarcely fail to be of value when the architect has to advise on the situation of a house in a neighbourhood less fitted for houses than Hertfordshire, because the eye, getting familiarised with what auctioneers term "eligible sites," at once picks out the best position when a spot has to be fixed upon in some other part of England.

Equally also the number of the houses makes it possible to notice secondary matters, or rather matters of detail, so to speak, such as the position of stables, one of the most difficult points in regard to country-houses; for it is so common to find the stables too close, or, on the other hand, too far, and the means by which they shall be at once handy to, and yet removed from, the house, is often a difficult practical point. Again, few men wish to spend a large sum on the decorative effect of stables, and yet no man of taste wishes his stables either to be out of keeping with the house of which they form a part, or so absolutely without beauty and architectural fitness as to be positively an eyesore. Thus passing from one house to another in Hertfordshire, lessons can scarcely fail to be learned in regard to this eminently practical point which so often gives no little trouble to both architect and owner. In the same way Hertfordshire affords an easy study of lodges and gardeners' cottages, which, again, are buildings in erecting which economy and harmony generally have to be united. These are all matters which affect the architect very seriously, professionally, and may do much to make or mar the beauty of our English homes. When, therefore, we get a county so rich in natural beauty, and a beauty of a peculiarly English character,—one, too, essentially very fitted to the habits and the desires of the man of means, or of the country gentleman of the present day, who makes his home in the country—so near to London, so easy of access and study, so well covered with houses, from an ancient palace of the Tudors to the modern dwelling-house of the Australian merchant,—it may fairly be said that Hertfordshire is most interesting to all architects, and especially to those who are at the beginning of their career.

TYPHOID EPIDEMIC IN LONDON, AND A PROPOSAL FOR A GRAPHIC INDICATION OF ITS LOCALITY.

THE *Lancet* calls attention to the fact that a severe epidemic of enteric fever is prevailing in London. In the week ending the 22nd of October there were fifty-three fatal cases, or thirty above the corrected average. The general hospitals contain an unusually large number of cases, and at some of the hospitals many applicants have been turned away. The fever is of an unusually virulent type. We call upon all such friends of sanitary reform as may be able to contribute any information, to give their attention to the subject of a monthly Disease Map of London. It would be easy to construct such a map, if reports were drawn up at the hospitals, dividing the patients, under each head of disease, according to the locality from which they come. It would then at once become evident whether any epidemic of the kind were local or general. If it proves that the cases are equally distributed over the area of London, it will be evident that it is by attention to the general rules of health that the danger is best to be met. But if it prove that certain localities are most affected, an indication of the utmost sanitary value will be afforded. The block map on which the monthly states are laid down should distinguish the districts of the different water companies, and also those of the different principal sewers by which the area is drained. Thus, when the Homerton district is indicated as containing numerous cases, the first remark is that the water is supplied to it by the East London Water Company, the second that it is drained by the Hackney Wick Branch sewer. Furnished with this guide, the observer who has the localities of the different cases attacked to mark on his map will be at once enabled to see whether it is to the water supply or to the drainage that he is to look for the immediate causes that aggravate the epidemic. If it should prove that the Kingsland-road forms a boundary east of which fever is manifestly more prevalent than westward of that line, a significant suggestion for inquiry will be given as to the effect of the use of the river Lea water. If the depression and outfall line which runs southwards from Upper Clapton to the north loop of the Thames near Poplar, prove to be the axis of the densest part of the map, it will show that the Metropolitan drainage system has to be overhauled. If the cases follow the run of the river, the effect of the wholesale pollution effected by the present arrangements may become evident. In such a case it would be worse than idle to express any anticipation, except one, and that is, that the information which such a map would afford at a glance would be of the utmost sanitary value.

If nothing points to district causes of disease, such as those arising from bad water, bad drainage, bad milk, or overcrowding, the need will be only the more apparent to seek for and root out such nests of fever as have been recently identified in Marylebone, for example, by a coroner's inquest, held on the 27th ult. The facts put in evidence at that inquest are of a distressing nature. Not only so, they are of a nature very alarming for the vicinity. However charitable any locality, or any class of society, may be, there can be no doubt that at the same time a stimulus to charity and a guide to the directions in which it may be most usefully applied would be given by such maps as we suggest. A certain number of fever cases coming from a certain locality would at once direct attention to that locality, if the cases were graphically referred to their proper districts. The aid of the local medical officers of health would be invoked, and the map would thus be completed, not from hospital returns alone, but

from all that comes within the purview of the Registrar-General. And when those persons who are unconsciously living in danger of infection from neglected neighbourhoods, or from the hopeless misery of silent poverty, had it once brought plainly before their eyes what was the sanitary state of their neighbourhood, the very instinct of self-preservation would be awakened, and the local medical men would be likely to obtain an aid to their disinterested exertions that would prove of the utmost value, both in relieving misery and in preventing the incubation, spread, and seeding of infectious diseases.

The idea of a disease-map, as our readers may be aware, is not new. Some years back we called attention to the great value of the scheme when introduced by a medical officer of the navy; but these maps regarded the normal distribution of diseases in the country. They showed, for instance, how consumption haunts wet subsoils; how rheumatism lingers in mountain valleys and in the hollows of the chalk uplands; how certain localities are favourable and others unfavourable to heart-disease. We do not undervalue this study. On the contrary, we think it is one that should occupy a large space in the attention of every medical man.

But what we now suggest is of a different nature, although quite in harmony with existing disease-maps. The difference in the two cases is such as that which exists between a general statement of average barometric readings over a given country, and a daily or weekly statement of barometric readings in each given locality. Our disease-map would resemble the latter. Its value would be double. First, it would be a guide to the expert; secondly, it would be a warning to the inexpert. To the first it would show where to set to work in order to insure safety; to the second it would furnish a strong incentive to give substantial aid to such work.

THE LONDON FISH-MARKETS QUESTION.

After a debate lasting nearly five hours, on the 28th ult. the Metropolitan Board of Works, by a very narrow majority, has sought to shelve the question relegated to it by the Home Secretary,—at any rate, for the present,—for by adherence to the decision unexpectedly arrived at the Board would preclude itself from taking the necessary steps to promote a Bill in the next session of Parliament which should confer upon it the necessary powers to erect a fish-market or markets, although by a resolution arrived at more than three months ago, they unanimously pledged themselves to this course. Those who listened to the debate could not but be struck by the persistent manner in which the majority of the members, while (with one or two exceptions) admitting the necessity of something being done, contended for the adoption of sites in localities with which they happened to be more particularly connected. They did not take a broad view of the wants of the metropolis as a whole. It was alleged by the opponents of the particular site recommended for adoption by the Works Committee (*i.e.*, the site in Blackfriars-road), that its selection had been precipitately determined upon in order that the Board might be able to go to Parliament and score a victory against the Corporation, and we fear that this charge is not altogether baseless; for, whilst some of the speakers disclaimed any desire to "disestablish and dis-market Billingsgate," there were others who boldly ennunciated the view that they hoped the action of the Board *would* do away with the old market altogether, on account of its smallness of area and the difficulty of approaching it. The speakers who were against the adoption of the Committee's report, in support of their view that the recommendation contained in that report was hastily arrived at, and therefore ill-considered, urged that the fact of the Board's selection of one site after another was a proof of indecision. One of the speakers, who advocated the erection of a fish-market in York-road, King's Cross, sought to show that this point was the centre of the metropolis, and he tried to convince the Board that his knowledge of the topography of London was exact by the simple expedient of drawing on the map a circle radiating from King's Cross as a centre! In this way it would be easy to show Hyde Park Corner, or the spot whereon once stood Mile-End Gate, to be the centre of London. The same gentleman, arguing against the Blackfriars-road site,—not only because it was not, in his opinion, sufficiently central, but because the direct railway route to it was through the heart of London, *viâ* the Underground Railway from King's-cross to Farringdon-street and Snow-hill, and thence by the London, Chatham, and Dover line *viâ* Ludgate-hill and Blackfriars,—spoke of the deleterious effect upon the fish of the air of the underground railway; but seeing that the transit of the fish-trains underneath London would take place mostly in the early hours of the morning, and that their passage from King's-cross to Lodgate-hill would occupy not more than ten minutes, and remembering that fish-trains from a distance have to pass through longer lengths of tunnel on some lines, there does not appear to be much in that argument. The same must be said as to the difficulty which the speaker conjured up of fish-trains being unable to reach the proposed market in Blackfriars-road owing to their inability to ascend the steep incline between Snow-hill and Ludgate-hill stations. It is true that the gradient referred to is a heavy one, but nevertheless, heavier goods than fish, viz., coals, are hauled up it, on their way south, by thousands of tons every week,—to an extent, indeed, only limited by the exigencies of the passenger and mixed goods traffic. The several companies having running powers over this bit of line "shove through," in the words of one of the station officials, as much coal as ever they can, and would "shove through" more if they could. A point that might well have been taken against the proposed market in Blackfriars-road, if it had depended for its railway service entirely on the railway *viâ* Farringdon-street and Ludgate-hill, is the already exceedingly-congested state of the traffic on the line; but, as a matter of fact, *détours* to the west and south-west, *viâ* Kensington and Clapham Junction, and to the east and south-east, *viâ* the Thames Tunnel and New Cross, would enable fish-trains coming from the north or north-east to reach the Chatham and Dover line south of Blackfriars Station without passing through the City at all. It was the primary object of the supporters of the Blackfriars-road site to erect there a market which should mainly, if not entirely, receive the railway-borne fish entering the metropolis. Indeed, the site, being to the south of Southwark-street, has no river frontage, although, it was suggested, a wharf for the landing of water-borne fish might be established in the neighbourhood of the railway bridge, and the fish there landed conveyed into the market. Now the evidence of fishermen, smack-owners, salesmen, and others is unanimous in at least one point, and that is, that the railway companies' charges for the conveyance of fish are so great that what is called the "offal" fish,—*i.e.*, the fish which is most abundant, and therefore most within the means of the poor to purchase, if it could only be got to London in sufficient quantities,—will not bear the heavy cost of railway carriage, and so, we learn that, although the "harvest of the sea" is abundant, hundreds of tons of sprats, herrings, &c., can be put to no other use, when caught, than to manure farm lands. In view of this fact, it was very well pointed out by some of the members of the Board that whatever market might be established for the reception of railway-borne fish, it was eminently desirable to provide new, or at any rate to preserve existing, market accommodation for water-borne fish, and to encourage the growth of the traffic in such fish, in order to compete with the railway companies, and so, possibly, induce them to lower their rates of carriage for this important article of food. "A railway manager," said one of the speakers, "is a man without a conscience," and for this reason it was urged that whatever was done the Board should give no encouragement to railway monopolies. Another speaker put this case:—Assuming a new market for railway-borne fish to be established in Blackfriars-road, and that Billingsgate, enlarged and with improved approaches, would receive the water-borne fish, would not the retail fishmonger carrying on business, say, at Kensington or Bayswater, be under the necessity, in order that he might buy in the most advantageous market, of visiting first Blackfriars-road and then Billingsgate, or *vice-versâ*, to his great loss of time and the increase of the traffic over the bridges? Answering this question in the affirmative, the speaker proceeded to argue in favour of a market which should be capable of receiving both the rail-borne and water-borne fish, and such a site, he pointed out, was the one at Bankside. Doubts were expressed whether the proposed market, or any new market, wherever placed, would be a success, for it was truly said it is much easier to erect a building for a market than to create a market itself in a new locality. Columbia Market was instanced as an illustration of this. Many side issues and details not affecting the main question were incidentally raised, and one of them was whether, in the proposed market, it was advisable to have retail shops. Retail shops in a city market, said the member who has been quoted as having no very high opinion of railway managers, were vestiges of the time when Materfamilias lived in town and used to do her own marketing. The City had ceased to be a place of residence, and had become "the mere battle-field of avarice."

The whole question, as is evidenced by the able reports of the Engineer and the Superintending Architect of the Board, is one demanding great care in the attempt at a solution. The matter is again to come before the Board, but it must not be forgotten that it is still under consideration by the Corporation of London, who may possibly take such steps in the near future as to greatly diminish, if it does not entirely remove, the necessity for the Board's taking further action in the matter. Should this be the result of the "late-present" agitation on the subject, it will be, as was hinted during the debate, a tribute to the astuteness of the Home Secretary in using the Metropolitan Board of Works as a lever to move the Corporation of London.

Shortly stated, the course of the debate, of which we have reviewed the leading incidents, was this:—The Works and General Purposes Committee presented a report, in which, after weighing the merits and demerits of various proposed sites, they recommended the Board to approve of the site in Blackfriars-road suggested by the Engineer and Architect, and to apply to Parliament in the next session for power to acquire that site for the purposes of a fish-market. This site, about six acres and a half in area, is traversed from north to south by the London, Chatham, and Dover Railway, and has its main frontage to the east side of Blackfriars-road (extending from Southwark-street to York-street). It is estimated to cost 530,000*l.* to acquire. The erection of the market buildings, and the necessary arrangements for the bringing the fish-trains into the market, are estimated to cost 300,000*l.*, so that very nearly a million of money would be required to carry out the scheme. The chairman of the committee moved the adoption of the report, whereupon an amendment was moved to acquire a site in York-road, King's-cross. This amendment was duly seconded, and after a long discussion, a show of hands was taken, when the amendment was rejected by 25 votes against it to 4 for it. Another member then moved, as a rider to the original motion, "That the Board do also provide a site at Shadwell for a fish-market, and that the Board apply to Parliament for powers to make a waterside fish-market on the site referred to." This proposed addeudum was rejected by 18 votes to 9 on a show of hands, and by 21 to 9 on a division. On the original motion, for the adoption of the report of the committee, being put to a show of hands, there appeared: For the report 17, against it 16, showing a majority of one in its favour. A division being demanded, this state of things was exactly reversed, for while 16 members voted for the adoption of the report, 17 voted against it, showing a majority of one against the motion, which was consequently negatived.

The Sanitary Assurance Association.—At the ordinary meeting of the Council of the Sanitary Assurance Association, held at the offices, 5, Argyll-place, Regent-street, Oct. 26th, Professor Hayter Lewis, F.S.A., in the chair, certificates were issued under the corporate seal of the Association to those subscribers who had carried out the recommendations of the Association with regard to the sanitary arrangements of their houses. These certificates are signed by the chief sanitary officer of the Association, Professor Corfield, M.D., and the surveyor, Mr. Mark H. Judge, and they guarantee the satisfactory condition of the houses to which they refer, the inspection, report, and supervision of the work where alterations are necessary being made personally by both officers. The certificates are issued subject to an annual inspection of the property, for which the members are charged a small fee.

THE OPENING *CONVERSAZIONE* OF THE ARCHITECTURAL ASSOCIATION.

The fortieth session of the Architectural Association was opened on Friday evening, the 28th ult., with the usual *conversazione*, the number of ladies and gentlemen present being, apparently, greater than ever. The large galleries on the ground-floor have become utterly inadequate to the needs of this annual gathering, and but for the courtesy shown by the Council of the Royal Institute of British Architects in placing their rooms at the disposal of the Association, the *conversazione* would have to be held elsewhere. As it was, the whole of the galleries and rooms were somewhat inconveniently crowded, though the Entertainments Sub-Committee this year wisely provided musical entertainment upstairs as well as downstairs. In the large gallery, Messrs. Coote & Tinney's band went through a well-selected programme with much credit, whilst in the Institute meeting-room, after the speech-making was concluded, some part-songs and glees were well rendered by the Artists' Rifle Volunteers Musical Society, conducted by Lieut. W. H. Thomas. There was a large and varied display of architectural drawings, oil and water-colour paintings, and objects of art manufacture. In the Institute Library, there were displayed a number of delicately-executed pencil sketches of Italian buildings, by Mr. F. Baggallay; a series of charming water-colour drawings by Mr. F. C. Penrose; and some of the excellent photographs (chiefly of old-fashioned inn-yards in Southwark) issued by the Society for Photographing Relics of Old London. In this apartment, too, were on view a number of panels in Japanese lacquer-work, lent by Messrs. Levy Bros.; and a case containing specimens of the manufactures of the Venice and Murano Glass and Mosaic Company. These included reproductions of Roman Murrhine and vitreous pastes, imitating agates, jacinth, sapphires, &c., and a specimen of modern Muranese "Soffiati," after an example in the Municipal Museum at Murano. The walls of the Institute meeting-room were covered with the drawings and sketches made by the Architectural Association's first Travelling Student (Mr. H. H. Kemp), and the drawings which had obtained the other prizes offered by or through the Association. Mr. Kemp's drawings and sketches well merited the encomium bestowed upon them by the President, and, indeed, the draughtsmanship exhibited in all, or nearly all, the sheets displayed on the walls of this room was, as Professor Kerr remarked, of a high order of excellence. In the large gallery downstairs a series of cartoons for wall decorations, designed by Mr. H. Walter Lonsdale for Messrs. W. B. Simpson & Sons, was exhibited, as well as a number of oil and water-colour paintings. Foremost amongst the water-colours, both in number and excellence, were those by Messrs. R. Phené Spiers and Aston Webb. The architectural drawings shown in this gallery included two frames containing measured drawings, by Mr. Sydney Vacher, of Lusignan Cathedral, Famagosta, in the island of Cyprus. Mr. Vacher also lent some specimens of Persian armour. Messrs. Doulton & Co. lent a fine collection of Lambeth art pottery, and close by were a couple of medallions in mosaic work, lent by Mr. F. Garrard, of Millwall. Messrs. Shuffrey & Co. exhibited a stove and mantel, and a well-designed wall-paper; and the Gateshead Stained Glass Company showed some ornamental glass vessels. Messrs. Liberty & Co. exhibited, among other things, some India matting and an Indian embroidered coverlet. Messrs. Gillow & Co. sent some good cabinets, and a panel of gold tissue (modern French) embroidered with a subject after Jean Goujon. The Art Furnishers' Alliance made a large display of cabinets and other articles, some of them designed by Dr. Dresser. Messrs. Gregory & Co. exhibited cabinet-work and some Turcoman curtains. In the smaller gallery were some cartoons for stained glass by Mr. H. W. Lonsdale, the subjects being selected from "As you like it" and "The Merry Wives of Windsor." Here were also shown a number of sketches (by Mr. W. H. Lynn, R.H.A., and several other gentlemen), of buildings seen during the Association's excursion to Worcester in August last, besides an excellent series of photographs of the same buildings taken by Mr. J. H. Robinson, architect, Dublin. Mr. J. D. Crace lent two or three water-colour drawings, including a study of the beautiful ceiling decoration of the Scuola di San Rocco, Venice. Miss C. H. Spiers and Miss Welby contributed some well-executed water-colour sketches of flowers. Messrs. Morant & Co. lent some fine specimens of Venetian and Cordovan wall-leathers, including one from the Palace of the Popes at Avignon, painted by Joseph Vernet. Messrs. Jeffrey & Co. showed specimens of stamped leather and wall-papers, designed by Mr. Walter Crane, together with some original designs by Mr. Crane and other artists.

About nine o'clock Mr. Aston Webb, the President, took the chair, and proceeded to present the books and other prizes gained by the members of the Association during the past session. To the winner of the Architectural Association *Travelling Studentship* (Mr. H. H. Kemp) he presented the Bronze Medal of the Association and a cheque for 20*l*. The second prize (a bronze medal and two guineas) in this competition was taken by Mr. F. G. Hooper; and the third prize (a bronze medal) to Mr. W. A. Pite. The *Essay Prize* went to Mr. A. T. Ellison. The *Architectural Union Company's Prizes*, for the two best series of measured drawings of existing buildings in England, or of portions of buildings, erected previously to the eighteenth century, were awarded as follows,—First (5*l*.) to Mr. Edward Dawber, for his drawings of Red Mount, King's Lynn; second (2*l*. 10*s*.) to Mr. A. Hemingway, for his drawings of Furness Abbey. The *Class of Design Prizes*, for the two best series of sketches submitted in the class during the session, were awarded: First (3*l*. 3*s*.), to Mr. W. J. H. Leverton; second (2*l*. 2*s*.), to Mr. G. W. Ward. In this competition, the work done by Mr. E. D. Pickford, of Weymouth, received "honourable mention." In the *Class of Construction*, the first prize (3*l*. 3*s*.), for the best series of studies submitted during the session, was taken by Mr. W. A. Powell, and the second prize by Mr. W. J. Lander, Mr. C. Dunch's work being accorded "honourable mention." In the *Elementary Class of Design*, Mr. Lander and Mr. Dunch were bracketed as equal for the first prize. The *Colour Decoration Class* prize (3*l*. 3*s*.) was carried off by Mr. J. H. Ince. The *Association's (Silver) Medal*, offered for the best design for a middle-class school for 250 boys, was not awarded, the judges not considering any of the sets of drawings submitted to be sufficiently up to the standard.

The distribution of prizes being concluded,

The President delivered a brief address, in the course of which,—after thanking the ladies for their presence and encouragement, and the Council of the Royal Institute of British Architects for the use of their rooms,—he shortly reviewed the progress of the Association during the past session, which he was pleased to be able to say had been satisfactory in almost every way. The last session would be especially remembered from the fact that during its progress the first studentship ever attached to it was founded. The intention of founding it was mentioned by his predecessor, Mr. Ernest C. Lee, at the opening *conversazione* last year. The suggestion was Mr. Lee's own, and he set to work with great energy to accomplish this object, and, being heartily supported by the subscriptions of past and present members, in a very short time the sum of nearly 700*l*. was promised, and the success of the fund was assured. Before the session was over, Mr. Lee had the satisfaction of awarding the first Architectural Association Travelling Studentship to Mr. H. H. Kemp, upon the result of whose trip, as displayed in the sketches exhibited on the walls, Mr. Lee, the subscribers, and the Association were to be congratulated, and especially so because Mr. Kemp's sketches had set before future holders of the Studentship a very high standard of excellence. The classes of the Association had been well attended during the past session, and their prizes well competed for, though the open prizes had been poorly contested,—an experience shared by other societies. Mr. Webb went on to say:—The briefest notice of last session could not omit the mention of one who very suddenly passed away during its course, and who was a great friend to our work,—the late Mr. William Burges. We were all looking forward to a paper which he had promised on Queen Anne architecture, when he died in the midst of his work,—but recently elected to the Royal Academy, and leaving to young men, above all things, an example of strict integrity and a high standard of honour in his profession, doing all the work he undertook with great thoroughness, and with his whole might. But a new session is now upon us, and we have had to look forward and consider how, with our increasing numbers, we can best increase the usefulness of this Association and meet the enlarged demands which are year by year made upon it. Mr. J. D. Mathews, our treasurer, has suggested a series of lectures which should, in conjunction with our classes, be so arranged as to afford assistance to such of our members as may intend to present themselves for the compulsory Examination about to come into force under the auspices of the Royal Institute of British Architects. This suggestion, I am glad to say, received the support of, amongst others, Professor Roger Smith, and the desirability of these compulsory examinations having been decided on by our representative professional body, we have determined to do as much as is in our power to conduce to their success, though, as a matter of detail, I venture to think that the postponement of the first examination from next Spring to next Autumn would be advantageous. We are well aware that these lectures are a departure, and a very important departure, from the system of mutual help and instruction on which the Association has hitherto been worked, but we, like all other foundations, must, if we are to continue our usefulness, conform to the altered conditions and requirements of the times. The Committee think they may be congratulated on securing the services, as lecturers, of two men so able and so well known in the Association as Mr. Blashill and Mr. Tarver. But when all this has been done, the student must not think that the Association can provide him with all the education, in conjunction with his office work, that he will require. This is not so. He will have still to avail himself, in addition, of some of the many other opportunities and instruction that are now open to architectural students in London, viz., the Architectural School at the Royal Academy, with Mr. R. Phené Spiers as master, and the very valuable Academy lectures; the lectures at University and King's Colleges; the South Kensington Museum Reading-room; the Architectural Museum; the Institute Library, &c. All these are open to the student, who was probably never so well supplied with means of improvement as at present. Still, there is a lack of completeness and cohesion amongst these means of education which I think somewhat detracts from their general usefulness, and a strong head is wanted to gather up the threads and work them into a comprehensive scheme whereby our present somewhat driftless education may be more systematised and the various opportunities open to the student be made, as a whole, more accessible to him. The Architectural Museum, for instance, containing, as it does, an invaluable collection of casts, languishes sadly in Tufton-street, whereas in a position more accessible to us here, its usefulness might be largely increased, to the mutual advantage of the Museum and ourselves. Some day, perhaps, we may see a united attempt made towards the foundation of an architectural college, where our societies may be properly housed, and where our students, assisted by our own professors, could pass through a course of systematic study, say for two years, proceeding then to an architect's office, and finishing up with a one or two years' trip on the Continent previously to entering on the real business of life. But these are only dreams, I am afraid, and a long way at present from fulfilment. Turning to matters of more general architectural interest, we naturally, at the commencement of a new architectural year, ask ourselves what we are now aiming at and working for: what development we have made, and how far we have advanced towards the attainment of a style distinctive of our own day. A new style seems like the philosopher's stone,—hard to find, and it is doubtful if ever it can be found, while some go so far as to think that if we found it we should not like it. The leading academical styles, as I may call them, are largely discarded for the moment in favour of a style with principles not yet formulated and capabilities not fully tested, and therefore not easily learned or taught; and the want of a certain directness of aim under these circumstances is, and indeed must be, noticeable, together with a certain lack of enthusiasm compared with even ten years ago; and it is to be hoped that the increasing attention that has most properly been paid to sanitary matters is not to be given at the expense of the architect's first work, design. For the last fifty or sixty years English architecture seems to have been going through

a course of archæological studies, taken, curiously enough, in something like their original natural progression, but with that progression accelerated a hundred-fold. Some, perhaps, amongst my professional hearers, may remember when the influence of Stuart & Revett was still felt, and Grecian was thought to be the only true architecture. They may remember how since their youth they have been hurried on from Greek to Roman or a freer Classic style, through all the turmoil of the various stages of the great Gothic revival; then introduced to a glimpse of the dainty conceits of "Queen Anne," and even "Georgian"; and finally have found themselves somewhat bewildered and out of breath as they wonder whether, having been brought up to this point, they are going to be carried on still further and brought face-to-face with a real Victorian style, or whether, having come to the brink, as it were, they shall turn back and begin the long round again. This is a question which the young architects of the day (many of whom are members of this Association) will have to answer, and on their diligence, enthusiasm, and imagination the answer must depend. We appear now to have revived all the styles without succeeding in doing more than to revive them. We have hardly revivified them or advanced them much beyond the point at which they were left by their originators. Indeed, we may almost say that the Italians are the only people who have ever succeeded in doing this; but art in those days was part of the life of the people. There was a living interest in it among all classes, and all were able more or less to appreciate and criticise it. A great artist (architect, painter, or sculptor) was held to have conferred, by his works, as much honour and benefit on his country as the bravest soldier or the most successful statesman. From the way, therefore, in which these various styles have been revived and in turn discarded, we seem drawn to the conclusion that they were each brought to the highest perfection possible before they were abandoned by the old men themselves. Now we have reached a further stage, when all the various epochs of architectural design have been in turn tried, and in some sense found wanting; and now, if ever, a departure must be made. But should this departure be made, it will depend for its life as much on the intelligent interest and support of the general public as on all the energy of our own profession, though the two must go hand in hand to ensure success. In all arts subsidiary to architecture, there has long been an increasing general interest, and architects justly claim a share in the initiation of this. Since, and commencing with, the Gothic revival, great attention has been paid to furniture, decoration, needlework, and even ladies' dresses,—all of which have from time to time been designed by architects. So great an improvement has been made in the manufacture of these, that architects are now enabled to give less time to them and more to architecture proper,—the real building in brick and stone. We have now certain well-known æsthetic villages not far from town, where people live in "cots," and fill their gardens with sunflowers,—where ladies dress to suit the houses, and where anything but red brick and white-barred windows are absolutely tabooed. We cannot all live in "cots," even if we wished to, or be surrounded with the quaintness these villages furnish; but the improved taste of the public might assist us to check the miles of dreary stuccoed sepulchres, as they may almost be called, with which the suburbs of London and other large towns are increasingly burdened. Year by year an overwhelming stretch of Portland cement stucco is laid upon us, thicker and thicker. Millions of good money have been spent on these houses, and miles and miles of them have been built, and we cannot remove them, though they fortunately show, in most cases, a great desire speedily to dissolve themselves. But surely it is the fault of the public if this class of building is allowed to still further increase. Let but the speculating builder be given to understand that it is to his interest to supply something of a better character, and he will speedily take means to do so. The æsthetic villages I have referred to at least show that houses may be built of honest materials, be let at moderate rentals, and yet pay; and that palatial monstrosities, badly built, badly drained, and badly planned, are not a necessary evil of the nineteenth century. Great efforts have been made of recent years to improve the dwellings of the labouring classes, and much has been done, but they hardly require it more than the dwellings of the middle classes in our suburbs. Doctors tell us that porous walls, decaying plaster, and very little drainage, are all prolific sources of disease, and yet this is hardly an exaggerated description of the houses I speak of. It rests with the public, who have so far improved in the internal decoration of their houses, to require that their construction, sanitation, and design should be also improved. Mr. William Morris, in an admirable address which I have seen in the *Builder* of to-day [p. 537, *ante*] puts the matter far better than I can when he says that a reasonable share in the beauty of this earth is the right of every man who will earn it by due labour, and that a decent house with decent surroundings for every family is the claim made in the name of art. Our churches have been nearly all restored. Let us now set to work to restore something like design into our residential streets, and, more fortunate than church-restoration, it will probably be a long time before a society is started to oppose it. An attempt has recently been made to improve the stuccoed fronts of London houses by painting them in colours,—dark red being much favoured,—but, to my mind, this only makes matters worse, and it is to be hoped the fashion will not spread. As to the interiors of such houses, many of the ladies who have favoured us with their presence this evening well know the effort necessary to drape or otherwise hide the irrepressible marble chimney-piece, and in summer time to conceal the register-grate, and the vain effort to subdue the rampant cornice to something like subjection to a prettily-designed paper. While in our everyday life we are surrounded by so much that is bad and utterly commonplace, it seems too much to hope that an occasional grand church, public building, or mansion can affect largely the general taste against so much that is enervating and bad in their everyday surroundings. Architects are powerless in the matter unless backed by general public opinion, because their aid is not sought in the erection of these houses. Painters have set an example of late years of building houses of a design in accordance with the internal decorations, though these are, as a rule, somewhat larger than houses of the class of which I am speaking. Architecture, to be a living art amongst us, when architects can work with the full sympathy of the public and each other, must not, as it seems to me, be kept for display only in our public buildings (though these, of course, will always call forth its highest powers), but must also be found in our houses, so that, by beginning at the lower level, we may work upwards. When a knowledge of and interest in architecture have been more widely extended, we shall soon see the result, not only in our great buildings, but also in our small dwellings, which, it is to be hoped, will some day be "designed in beauty and built in truth."

Professor Roger Smith said it was always a pleasure to attend the opening meeting of the Association, and to see one old friend after another advancing to preside over its year's work after having done much good service for it in previous years. He congratulated the President upon the large number of visitors who had come to support him on that occasion. He trusted that the session upon which the Association was then entering,—and which, in some respects, was a more than ordinarily important one,—might meet with all the success which could be desired. With regard to the Examination which had been established, and the efforts of the members to prepare themselves for it, he should shortly have an opportunity of speaking to them on the whole question, and would only now say that anything which could be done by the Association towards attaining success would have his most cordial goodwill, and, as far as other engagements would allow, such assistance as it might be in his power to give. A member of the Association was now the Professor of Architecture at University College, and on that ground he thought that University College and the Architectural Association classes ought to give one another any assistance that they could. Referring to the presentation of prizes, he said it appeared to him that the work which had been done during the last session in competition for those prizes was very creditable, and that the gentlemen who had obtained the prizes were to be congratulated upon having achieved substantial successes,—successes which were, he hoped, auguries of their obtaining some of the prizes of the profession in after-life. He believed that it was as true with regard to the profession of architecture as it was of that portion of animated nature which Mr. Darwin had studied, that in the struggle for existence only the fittest would survive. It struck him that those who had begun professional life by obtaining these prizes would be the most likely to be successful in after-life. The very effort to secure the prizes offered by the Association and in other quarters would be of lasting benefit to all who had striven earnestly for them, even though they were not actually fortunate in carrying them off. For the time being, the pursuit after the honour of obtaining the prizes offered by schools and academies was keen, and the competitors looked very little beyond it, but the real object of such contests lay behind. It was not for the sake of adding "M.A." or "B.A." to his name that a student toiled for years, but for the sake of obtaining that cultivation of which those letters appended to his name were the index. It needed only a glance to show that the young men who were doing architectural work in the classes of the Association in competition for the prizes offered were fitting themselves for doing excellent architectural work in after life.

Mr. T. Chatfeild Clarke observed that he had listened with great pleasure to the President's address. He was glad to hear the touching reference made in it to the death of Mr. Burges. The young architects of the present day were to be congratulated on the greatly superior opportunities they had of learning their profession as compared with those available when the senior members of the profession were young. He trusted that the opportunities and advantages which young architects now had would be made available by them to the fullest possible extent. He thanked the President for his appropriate reference to the extreme æstheticism of the day, and which was so justly ridiculed in such plays as "The Colonel." With regard to the question of a new style, it did sometimes strike him as singularly surprising that in the present age,—so fruitful in great design, and characterised by so much scientific knowledge,—learned as were our architects as a body, the discovery of any fresh spring of design or of a new style seemed to be impossible. However much that was to be regretted, it was matter for congratulation that the study and practice of the various styles of design that were known had been pursued so thoroughly in the present day by such men as the late Sir Gilbert Scott and the late Mr. E. M. Barry, and others who might be accounted the most polished and accomplished architects of the present age. He was very glad indeed to see that Canon Barry was going to produce a memoir of his brother, because he felt that Mr. E. M. Barry possessed in an eminent degree the qualities of an "all-round" and cultivated architect,—great power of planning, great facility of design, and great knowledge of style,—and for those qualities he ought to be honourably remembered among architects.

Professor Kerr congratulated Mr. Webb upon having attained to the honour,—the very great honour,—of presiding over a society which occupied so important a position in the profession. The Architectural Association was a society absolutely unique in the world. In no other profession, so far as he was aware, would it be possible for the students,—actually the students,—to combine together and form an organisation which should exercise so much influence as the Architectural Association on the profession to which they belonged. The Association had conducted, for the last thirty-five years, an elaborate organisation of self-instruction, properly so-called, with the greatest possible success. The work which the Association was doing, so far as it appealed to the eye, was seen upon the walls of the room. The draughtsmanship which was there exhibited would be adjudged, by all competent observers, draughtsmanship of the highest quality. The architects of the younger generation had this claim to make before the English world of the present day,—that draughtsmanship had flourished amongst them to a degree that was perfectly amazing. In his estimation the architectural profession had made far more progress in draughtsmanship during the last quarter of a century than painters and sculptors. The masterly skill in drawing which was displayed by so many young men in the architectural profession at the present time seemed almost incredible. So great was their skill that they were on the verge of a particular danger arising out of it, viz., the practice of design

upon the basis of mere draughtsmanship alone, without reference to that philosophical basis of construction which, more than anything else, was at the root of architectural art. But the excellent organisation of the Association was, happily, brought to bear upon facilitating the study of other subjects than the admirable but comparatively superficial one of drawing. The substantialities of building and the administration of an architect's office business were subjects for the study of which the Association afforded means to its members. Altogether, a more useful society than the Architectural Association could not exist in any profession, and he was delighted to see so many young men coming forward and joining the Association with the view of making themselves worthy members of a cultivated and gentlemanly, and, what was no small matter in these days, a thoroughly honest profession.

With this the formal part of the proceedings of the evening terminated.

NO MORE RAILWAY TUNNELS.

It is a remarkable coincidence that at the very moment that a project is taking shape for the construction of a tunnel under circumstances of greater risk and probable cost than any which has yet been attempted, trains should be for the first time started by a method which, if it fulfils the sanguine hopes of the inventor, will remove the chief reason for the construction of tunnels through mountain chains.

The railway system, it is well known, is a growth rather than a creation. The speed now common was never anticipated by the fathers of the system. The discovery of the power of the blast, to which that speed is mainly due, was accidental. It was partly due to the nature of the country between London and Birmingham, and partly to the entire novelty of the great experiment then about to be made, that Mr. Robert Stephenson fixed on the inclination of one in 330 as the ruling gradient of our first trunk line, on the principle that the resistance due to gravity should not exceed the resistance due to friction.

The great saving in the friction resistance effected by the use of the iron rail led engineers, somewhat later, to allow very much wider margin as to the resistance of gravity, or, in other words, as to running up hill. Mr. Brunel was the first to adopt concentrated inclines, treating the locomotive after the fashion of a live horse, that can run up a hill at a spurt. But the limits of nature are inexorable, and while an incline of one in fifty is an outside allowance for railways over very difficult country, a rise of one in twenty is the limit of ordinary engine-power, as all that a locomotive can do is to ascend such a gradient without any load.

Different appliances have been tried, in different places, for surmounting steeper inclines. The temporary Fell Railway ascended the Mont Cenis pass at the incline of one in twelve. But a sharp economical limit is fixed by the rapid increase of the dead, as compared to the live, weight. An engine that could just crawl up an incline of one in twenty could draw a train of 150 tons at twenty-five miles an hour on the level.

Here, in fact, is the weak point of the locomotive engine. It has many great advantages. But it is a costly mode of applying power at the best, producing, all things being taken into account, only about one-fifth of the effect due to the mechanical agency exerted. And this cost increases so enormously with the increase of gradient, that it has been found necessary to spend from 100,000*l.* to 330,000*l.* per mile in making tunnels in order to maintain practicable gradients.

On an incline of one in 100, in addition to the loss of power arising from the use of a locomotive engine on the level, there is an additional resistance equal to more than three times that of the train on the level. On an incline of one in fifty, the resistance is between six and seven times as much. The comparative cost of the locomotive method of traction increases at this rate.

The weight of the locomotives on our English lines may be taken at from thirty to forty per cent. of that of the trains which they draw. If we could substitute fixed power for locomotive power (without inducing extra sources of cost), we should then reduce the work that we have to do by from thirty to forty per cent., and also perform the remaining work at a less cost. Thus the same expenditure of power that would take a locomotive and train up an incline of one in 330 would take a train alone up one in 100. And the same expenditure of power that would take a locomotive and train up an incline of one in 100 would take a train alone up an incline of one in fifty.

Now, if by the use of the electric railway we can substitute a light dynamo-motor machine for the great weight of the locomotive engine, an increase, to that extent, of our power of surmounting inclines will be at once given. It is, therefore, with the utmost interest that the architect, as well as the engineer, will watch the development of the application of electricity to railways. While one great effect of steam has been to concentrate mankind in dense urban masses, it is, perhaps, not too much to hope that it may be a result of the application of electricity to redistribute population more widely over the surface of the country.

PAYMENTS IN CASH, NOTES, AND CHEQUES.

A subject of much interest to all persons engaged in the building trade was illustrated by a paper read by Mr. G. H. Pownal, at the Institute of Bankers on the 19th ult., "On the proportionate Use of Credit Documents and Metallic Money in English Banks." While bankers are those whom it is natural primarily to address on the subject, it has even a more lively interest to those to whom Saturday brings an amount of labour and anxiety in the payment of metallic wages which it is necessary to undergo in order to appreciate. The arrangements under which the exchange of the note of time for silver and copper takes place are perhaps susceptible of improvement, to the advantage both of paymasters and of workmen.

The returns of the past fourteen years show an increase in the amounts passing through the London Clearing-house, from 3,257 millions in 1867-8, to 6,013 millions in 1874-5. In 1877-8 they were 6,088 millions; they fell in 1878-9 to 4,885 millions; rose in the year of the election to 5,265 millions, and fell again to 5,009 millions. Mr. Pownal estimated the aggregate bill and cheque transactions of the English banks for the year at the sum of 11,135 millions sterling. It has been calculated that 97 per cent. of the transactions of the wholesale commerce of the United Kingdom passes through the hands of the bankers; but the opinion was expressed at the meeting, and adopted by the chairman, Sir John Lubbock, that the banking transactions do not by any means represent the amount of business done in the country.

As connected with the payment of wages, it is to be observed that more metallic money is paid into the county banks than bank-notes. This is due to the fact that the smallest note, 5*l.*, is generally useless for the payment of wages. The subject of 1*l.* notes was mentioned with reference to this, but not discussed. The experience of Ireland, where 1*l.* notes were certainly of great convenience during the construction of railways, ought to be conclusive on this head. The proportional payments by cheque, notes, and coin in the present year are shown as follow:—

	London	Dublin.	Edinburgh.	New York.
Coin	0·728	1·57	0·55	0·28
Notes	2·039	8·53	12·67	1·02
Cheques and bills	97·233	89·9	86·78	98·7

Society of Arts.—The first meeting of the new session will be held on Wednesday, November 16th, when the opening address will be delivered by Sir Frederick J. Bramwell, F.R.S., chairman of the Council. The following are among the papers which will be read during the session:—"The American System of Heating Towns by Steam," by Captain Douglas Galton, C.B., F.R.S.; "Stained-glass Windows," by Lewis Foreman Day; "Photometric Standards," by Harold Dixon; "Telephonic Communication," by Lieut.-Col. C. E. Webber; "The Causes and Remedies of Bad Trade," by Walter R. Browne, M.A.; "The Production and Use of Gas for Purposes of Heating and Motive Power," by J. Emmerson Dowson; "Gas for Lighthouses," by John Wigham; "The Relation of Botanical Science to Ornamental Art," by F. Edward Hulme, F.L.S., F.S.A.

THE NEW YORK METROPOLITAN MUSEUM.

The last report of the New York Metropolitan Museum has recently been distributed on this side of the Atlantic, and offers several features of interest. The Museum was founded some years since, as will be remembered by many of our readers, "with a view to giving to the American metropolis and the country at large an institution the aim of which was to excite a powerful influence for good on the intellectual character of the commercial and industrial prosperity of the people." When last we had occasion in these columns to refer to the New York Metropolitan Museum, the collections composing it were still in their old home in Fourteenth-street, where they remained very much crowded from want of room. The new report shows us the Museum moved up town to the grand new building in Central Park, where, however, we learn, the accommodation is still far from sufficient to lodge the continually increasing collection of works of art.

While the report in many respects has a tone of congratulation at the results so far obtained, an earnest appeal is made to the public for support. Desirous to remain as far as possible free from Governmental aid, the Museum looks to its subscribers and donors to extend the benefits, not alone effected by the influence of the works of art exhibited, but by the system of artistic and technical education that has been established in connexion with the Museum. The city of New York has already generously presented the building in Central Park, while the Department of Parks has laid an annual grant at the disposition of the Museum authorities but the expenses of the move from the old quarters down town have been heavy, and we are assured that it is alone by the strictest economy that both ends have been made to meet. To secure the maintenance and future of the Museum, its governing body, in the first place, urge that recognition of its educational importance which, as they remark, is fully accorded in Europe to such kindred institutions in the second place, as being unwilling, from political difference from the constitutions of the nations of the old world, to claim a Government grant, and consequent State interference the authorities urge the necessity of a permanent endowment ample for the support of the Museum, and under the constant supervision of those who may have provided the funds. From the public thus so directly appealed to, the Museum certainly has a right to expect a favourable reply, the report showing that between April 1st, 1880, and the 30th of April last, a total of over 1,200,000 persons visited the Museum.

The working of the Museum is not, however, as we have above remarked, confined to the gathering and exhibiting of works of art belonging to the great European industries of the past. It may be mentioned by the way, as a deficiency which it is to be hoped will in time be supplied, that the interesting and beautiful art of North America is represented in no adequate manner in the New York Museum. A very comprehensive system of technical instruction is supplied by the Museum; indeed, it is on the extension and strengthening of this that the authorities lay the greatest stress, and the passage in the report which refers more particularly to this portion of the labours of the institution merits attention at a moment when not only is the subject of technical education attracting earnest attention on both sides of the Atlantic, but when in the international competition in the struggle for superiority, it is the nation which is the best prepared which will infallibly gain the day, the smallest advantage of one over another will give in the wavering contest the victory. In this battle, for such it has become, it is to the technical instruction we afford our artisans that we, as Englishmen, must look, more even than to the reputation we have so long borne in the world; the countries which we generally understand as "foreign" have been pressing close upon us for years, and America, with its ardent activity, now promises to become a rival. In the report of the New York Metropolitan Museum now before us, an acknowledgment is made of the superiority of our system of technical art instruction, and this, coming from such a quarter, we may feel as purely unprejudiced, an absence of prejudice in the consideration of all matters having been ever a ruling principle of American

progress; but the superiority we are supposed to enjoy, we may rest assured, will not be long retained, unless with equal earnestness our authorities honestly endeavour to inquire into and improve each department which may be under their supervision. Technical schools, remarks the report at present under consideration, for the teaching of artisans, are essential to the progress of American industrial art. The time has certainly arrived when America should cease to be dependent upon foreign production of beautiful work in any and every department of industry, when American youths should have the facilities for learning how to produce beauty which German, French, and especially English youths have in technical schools. It may be affirmed that in every kind of mechanical work, however inferior its character among the arts, the mechanic who can design as well as do his work is worth more to himself and to his employers than one who can only follow a director or do that which he has seen done. If American industrial art is to rank with that of European countries it can only be by having educated artisans. There are thousands of young persons in this city whose talent needs only to be discovered and developed for the supply of the highest class of artisanship in every department of beautiful productions. That this talent exists in abundance is already manifest in our schools.

The technical instruction so far afforded in New York would appear at present to be but in an incipient condition, but the subjects chosen for the various courses point to what future energy may lead, from the 143 pupils who a year ago joined the school then opened in the First Avenue and Sixty-eighth-street; drawing and design, modeling and carving, carriage-drafting, decoration in distemper, and a class of no small practical importance, in plumbing, form the curriculum. With the extension of the Museum buildings every hope is expressed that accommodation will be afforded for these technical classes under the roof of the parent establishment. Small as the beginning may seem, in a land of rapid development such as America, we may with confidence shortly look forward to the results of this first step in a new direction.

An appeal is made by the Museum authorities for the increase of the Art Library as essential not alone to the officials in the compilation of their catalogues and the arrangement of the collections, but for the use of the students and the public generally, who must be supplied with an ample fund of authorities for consultation and instruction.

The report concludes with a lengthy list of donations made to the Museum during the past year, additions to the collection in many instances of the choicest and rarest description.

THE HOLBORN RESTAURANT.

This establishment, which during the last few years has been in the hands of Messrs. Gordon & Co., the enterprising *restaurateurs*, is now, and has been for some time past, in course of rebuilding and enlargement. The work is being carried on without any interruption of the business, which is very extensive. The excellent management of the place has gained for it a reputation of a very different kind from that which attached to it, rightly or wrongly, in the days, or rather nights, when it was known as the Holborn Casino.

In order to extend the Holborn frontage, four houses adjoining the old entrance have been removed, so as to give a total length of frontage of 71 ft. 6 in. Here will be the main *façade*, pleasingly designed in the French Renaissance style by the architects, Messrs. Archer & Green. On the ground story there will be three shops (to be let separately), the central entrance, and, at the west end of the *façade*, the entrance to the *buffet* (now open). The whole of the external masonry of this story will be in Shap granite, the upper portion being in Portland stone, with Shap granite shafts and pilasters. Roughly speaking, the site of the buildings resembles in shape the letter T, with the perpendicular portion thickened, and the bottom of it forming the Holborn *façade*. The left-hand end of the horizontal portion of the letter represents the Little Queen-street *façade*, which will have a frontage of about 43 ft. The site extends southwards from Holborn (or along the upright part of the letter, so to speak) for about 170 ft., the extreme distance from east to west (or along the horizontal member of the letter) being about 150 ft. The *buffet* (the entrance-lobby to which has been decorated with tiles, &c., by Messrs. W. B. Simpson & Sons, of St. Martin's-lane) runs back from Holborn for a distance of 98 ft., and has an average width of 16 ft. This apartment is broken up into five square bays or compartments, and the four coves of the panelled ceiling or roof of each compartment (two or three of them come under the upper floors of the front building, the others being top-lighted by means of stained glass lights) are painted on a gold ground with incidents of the chase, vintage, and other subjects appropriate to the place. These paintings, we understand, are the work of Mr. Durham, of the Slade Life School, University College. The whole of the wall surfaces in this apartment are of costly and tastefully-selected marbles, with detached shafts and other architectural members in relief. The effect is rich but subdued, for though mirrors are largely used there is an absence of anything like garishness. The woodwork is of American walnut, with ebonised mahogany frames to the mirrors. The floor, like those in the grill-room and other parts of the new building, is in quiet-toned marble mosaic, and is the work of Messrs. Burke & Co., of Newman-street, whose name is a guarantee for excellence in this department. This firm has also executed the whole of the marble-work in the *buffet*, grill-room, and in other parts of the building. At the south end of the *buffet*, swing doors give access to a lobby from which, on the right, the gentlemen's lavatory is entered (under a solid marble staircase leading up to the smoking-room), and from which, opposite the *buffet*, the grill-room is entered. The grill-room is a fine apartment 36 ft. by 34 ft. by about 12 ft. 6 in. high, and occupies the site of the former grill-room. On the south side is a range of windows, including a large bay filled with stained glass by Mr. Alexander Gibbs, of Bloomsbury-street. These windows, and others in the building, are very good of their kind, but must be regarded rather as pictures on glass than as stained-glass windows. The walls of this apartment are entirely lined with marble and mirrors, the ceiling being panelled in walnut and "muralis" by Messrs. Campbell, Smith, & Co. A notable feature in this room will be the grill, or rather the structure enclosing the grill. This, which is not yet finished, is in Lambeth glazed majolica ware, supplied by Messrs. Doulton & Co., and will be very effective in appearance and cleanly in use. The gentlemen's lavatory, which is about 25 ft. by 17 ft., and the same height as the grill-room, is handsomely and admirably fitted up. Here, *carte blanche* was given to Mr. George Jennings, of Stangate, by whom all the work (including, besides the various fittings, the wall-tiling, the pavement, and the ceiling) has been done, with the same attention to detail and excellence of workmanship and material which characterise the other apartments in the building. Everybody knows what Mr. Jennings can do, and here he has surpassed himself. The ceiling is of enamelled slate, and the walls are covered with ornamental glazed tiles manufactured by Messrs. Minton. The floor is paved with black and white marble. The woodwork used throughout here is mahogany. The water-closets are of his best and simplest kind, and the lavatories are provided with tip-up basins arranged in sets of three in semicircular slabs of white marble, in order to provide as many basins as possible in a given length, and at the same time to afford the persons using them sufficient "elbow-room." The urinals are of the lipped pattern, fixed against slabs of black marble, the compartment divisions being of white marble. The flushing of these fittings is effected every ten minutes by Mr. Jennings's automatic syphon-flushing tanks. On the pavement level, immediately under the lip of each convenience, is a circular disc of black marble, about 12 in. in diameter, a large part of the central portion of which is perforated in quatre-foil form. The use of this perforation will be obvious. Beneath this perforated disc of black marble is a white basin with flushing-rim, and this basin is flushed automatically at the same time as the other parts of the apparatus. This arrangement has been devised with the view of preventing the accumulation of foul-odoured deposit only too common where iron grids are used in similar situations, and it appears to be entirely successful, for although this apartment has been in use by some hundreds of persons daily for the last nine or ten months, no offensive odour is perceptible. The smoking-room, or south-west room on the first-floor, occupies the same position as the apartment known in the old building as the Duke's Saloon. It is about 45 ft. long by 27 ft. wide, and is nearly 17 ft. high to the surface of the ceiling, from the centre of which rises a large lantern-light glazed with stained glass. This glass, as well as that in the windows of the room, is by Mr. A. L. Moore, of Southampton-row, Holborn. The walls of the room have a dado and superincumbent panelling in walnut-wood, Jacobean in style, and admirably executed. This and the parquet flooring and other fittings and decorations of the room are the work of Messrs. Maple & Co. Above the panelled woodwork is a frieze in "Muralis,"—a wall decoration of the merits of which we have often spoken. The cornice is of walnut and "muralis," with *carton-pierre* enrichments. The bronze gilt statues of the "Four Quarters of the Globe" are by Messrs. Elkington & Co., who also supplied the lamps in the *buffet*. The ceiling is panelled in walnut and embossed "muralis." The gas-fittings here and in some other parts of the new building have been made (from special designs) by Messrs. Hulett & Co., of High Holborn. The panels along the north side of the room are filled in with paintings on canvas (having the appearance, until closely examined, of tapestry) by M. Du Mont, the subjects being taken from incidents in the careers of Queen Elizabeth, Mary Queen of Scots, and Lady Jane Grey. On the east side of the room are three openings looking on the balcony of the grand saloon. These openings, of which the central one is the largest, are intended principally to allow the music from the orchestra in the Grand Saloon to be heard by the occupants of the room, and are filled with exceedingly well-designed and executed wrought-iron grilles, by Messrs. Barnard, Bishop, & Barnard, the appearance of which, however, is not improved by the gilding with which they are entirely covered. The so-called "Tobin" tubes are used here for the admission of fresh air, arrangements being made for the extraction of the vitiated air of the apartment by the lantern-light already mentioned. The external glazing of this and other top-lights in the building is done on Rendle's patent system. We may add that the floors throughout are to be constructed on Messrs. Dennett's fireproof method.

With the exception of a small private dining-room adjoining the smoking-room, the only other portions of the new building completed are some of the offices in the basement, such as the butchery, the vegetable kitchen, &c. The principal kitchen is not yet completed. When it is, it will, of course, be fitted with every possible convenience and appliance to facilitate the work of the busy *chef* and his army of assistants. Messrs. Benham & Sons, of Wigmore-street, will supply and fit the necessary apparatus. The walls of all the kitchens, scalleries, larders, &c., are lined with white glazed bricks.

Before concluding, we must say a few words as to the remaining and larger portion of the work not yet carried out, although it is progressing in sections. The general arrangement of the central portion of the building will adhere very closely to the existing plan. Thus the Grand Saloon will be retained in its present position, and its dimensions, when rebuilt, will be about 88 ft. 6 in. long by 49 ft. 9 in. wide, the roof being carried somewhat higher than the roof of the existing saloon. The balcony, 8 ft. wide, and the orchestra, are features which will be repeated in the new building. Access to the new Grand Saloon from the Little Queen-street entrance will be by a corridor very similar on plan to that at present existing; but from the principal entrance in Holborn, direct access will be had to the saloon through a lobby or crush-room, 27 ft. by 24 ft. This crush-room, which will contain the grand staircase, will necessarily be one of the features of the building, but it is not yet commenced. On the first-floor of the front building, and extending the whole length of the Holborn frontage, will be a banqueting-hall, 68 ft. long, 36 ft. wide, and 21 ft. high; together with smaller dining-rooms for private parties, cloak-rooms, ladies' rooms, dispense kitchen, &c.

The work is being carried out from the architects' designs, by the proprietors, Messrs. Gordon & Co., without the employment of a general contractor, the practical supervision of the whole being in the hands of Mr. G. H. Holloway, clerk of works, and Messrs. W. Spencer and T. Holloway, foremen of works. The total cost of

the buildings, which will probably be completed during the next two years, will approach 70,000*l.*

We may add that many little contrivances and details of arrangement in the work already carried out are the embodiments of suggestions made by Mr. Hamp, the energetic manager.

What we have said with regard to this building would suffice to show the enterprise of Messrs. Gordon & Co. But they are known also as the proprietors of the Grand Hotel, Charing Cross (a venture which has proved so successful that it is now being, as we stated in detail some time ago, considerably enlarged), and of Crosby Hall, and are the projectors and proprietors of the First Avenue Hotel, which will have a frontage on the northern side of Holborn extending from Brownlow-street to Warwick-court, with return frontages to both those thoroughfares. The site of this newest of monster hotels is now being cleared, and as soon as this work has been effected, building operations will be commenced. The building (which will, we understand, be erected by Messrs. Gordon & Co., themselves, under the supervision of Messrs. F. & H. Francis, in conjunction with Messrs. Archer & Green, as architects) will not be so sumptuously fitted and furnished as is the Grand Hotel, as it is intended more especially for the use of mercantile and legal gentlemen. Its situation, midway between the City and the West End, and close to the Inns of Court and New Courts of Justice, would seem to be well chosen to meet the wants of commercial men and lawyers. The estimated cost of this building is 100,000*l.*

THE NEW LEIPSIC CONCERT HALL.

The concerts which, for a hundred years past, have been given in the old *Gewandhaus* at Leipsic, have attained a world-wide celebrity. That hall has, however, ceased to satisfy the musical requirements of the present day, and it has accordingly been determined to erect a special *Concerthaus* for the great Leipsic performances of the future. The architects of this elegant and spacious edifice, the erection of which is now on the point of being commenced, are Herren Gropius & Schmieder, of Berlin, whose design was selected from among those of five competitors. The site will be near the Botanical Gardens, and has been presented to the city for the purpose by the owner, Herr Voigt. The estimated cost of the structure is 49,500*l.*, of which 20,000*l.* are derived from a legacy left by Herr Grassi. The exterior of the edifice, judging from the original drawings, will be exceedingly tasteful and imposing. It is in the favourite Romanesque style. In the interior we find three principal divisions, one being the great hall for the well-known grand concerts, a smaller hall for chamber music, and the *foyer*. The grand hall occupies the centre of the building, the smaller hall and the *foyer* being situated each side. The smaller hall will be carried out in exact imitation of the old *Gewandhaus* hall. The dimensions of the great hall may be gathered from the fact that it covers a space equal to that of the Berlin Opera-house, stage and auditorium inclusive. The Leipsic great hall will contain 1,600 seats, with ample room between each row, and wide passages. The orchestra will be arranged so as to be capable of being removed or made of different dimensions. It will be surmounted by a large organ, placed in a gilded recess.

SPOHR'S MONUMENT AT CASSEL.

The bronze monument in honour of the great musician, Spohr, has recently been completed by Herr Hartzer, a sculptor of Berlin. It will be shortly erected in the city of Cassel, on the Theaterplatz. The monument represents Spohr with his favourite instrument, the violin, in the left hand, while the right hand is raised as in directing a band. The general effect is very good.

Cantor Lectures.—The following are the subjects of the courses of the Society of Arts Cantor Lectures for the session just about to commence:—First course, on "Some of the Industrial Uses of the Calcium Compounds," by Thomas Bolas, F.C.S. Second course, on "Recent Advances in Photography," by Captain Abney, R.E., F.R.S. Third course, on "Hydraulic Machinery," by Prof. John Perry. Fourth course, on "Book Illustration, Old and New," by J. Comyns Carr.

THE COST OF IGNORANCE.

Few persons have any idea of the immense sums which we of England have to pay for want of scientific knowledge, as well as for want of taste and artistic power. It is a very mortifying reflection, for example, that while the raw materials from which most of the coal-tar colours are made are produced in our country, the finished and valuable colours are nearly all manufactured in Germany. The crude and inexpensive materials are exported by us abroad to be converted into colours having many hundred times the value, and these expensive colours have again to be bought by English dyers and calico-printers for use in our staple industries. This was forcibly pointed out by Dr. Roscoe, in a paper on "Artificial Indigo," read before the Royal Institution last season, and which we have recently met with in print. It may be useful, we think, to repeat the passage. The total annual value of manufactured coal-tar colours, says the writer, amounts to about three and a half millions; and as England herself, though furnishing all the raw material, makes only a small fraction of this quantity, but uses a large fraction, it is clear that she loses the profit on the manufacture. The causes of this fact which we must acknowledge, viz., that Germany has driven England out of the field in this important branch of chemical manufacture, are probably various. In the first place, there is no doubt that much of the German success is due to the long-continued attention which their numerous universities have paid to the cultivation of organic chemistry as a pure science, for this is carried out with a degree of completeness and to an extent to which we in England are as yet strangers. Secondly, much, again, is to be attributed to the far more general recognition amongst German than amongst English men of business of the value, from a merely mercantile point of view, of high scientific training. In proof of this it may be mentioned that each of two of the largest German colour works employs no less a number than from twenty-five to thirty highly-educated scientific chemists, at salaries varying from 250*l.* to 500*l.* to 600*l.* per annum. A third cause, which exerts a great influence in this matter, Dr. Roscoe thinks, is the English law of patents. This, in the special case of colouring matters at least, offers no protection to English patentees against foreign infringement; for when these colours are once on the goods they cannot be identified. It cannot be too often pointed out that the study of the most intricate problems of organic chemistry, and those which appear to many to be furthest removed from any practical application, are in reality capable of yielding results having an absolute value measured by hundreds of thousands of pounds.

GYMNASTIC HALL AT BRÜNN, AUSTRIA.

A new "Turnhalle" (Hall of Gymnastics) has been completed at Brünn. It consists principally of a hall, 102 ft. long, 52 ft. 6 in. wide, 50 ft. high, pointed arches, elaborate woodwork with gallery running all round, richly coloured; another large room, 52 ft. 6 in long, 26 ft. 6 in. wide, 26 ft. 6 in. high, with wooden ceiling and rich intarsia decorations, panelling, &c. The building is Gothic in style, and outside is of brick, and very effectively constructed. Herr August Prokop is the architect.

WORKMEN'S DWELLINGS, PLYMOUTH.

The foundation-stone has just been laid of four blocks of dwellings which are now being erected by the Plymouth Workmen's Dwellings Company (Limited) on an exceptionally open site at the manufacturing end of the town. The buildings, which are to be four stories high, and on a somewhat new principle, will contain accommodation for ninety-six families in 256 rooms, exclusive of wash-houses (with drying areas attached), pantries, coal-bunks, and cupboards, w.c.s, and urinals. Each landing will contain provision also for drawing water, and for the removal of dust (in shoots) and dirty water. Each dwelling will be entirely separate. The w.c.s will be separate for the sexes. The buildings will be constructed in a substantial manner, and the sanitary arrangements, we are told, will be efficient.

The contractor is Mr. Philip Blowey, of Buckland Monachorum, and the architects are Messrs. Hine & Odgers, of Plymouth.

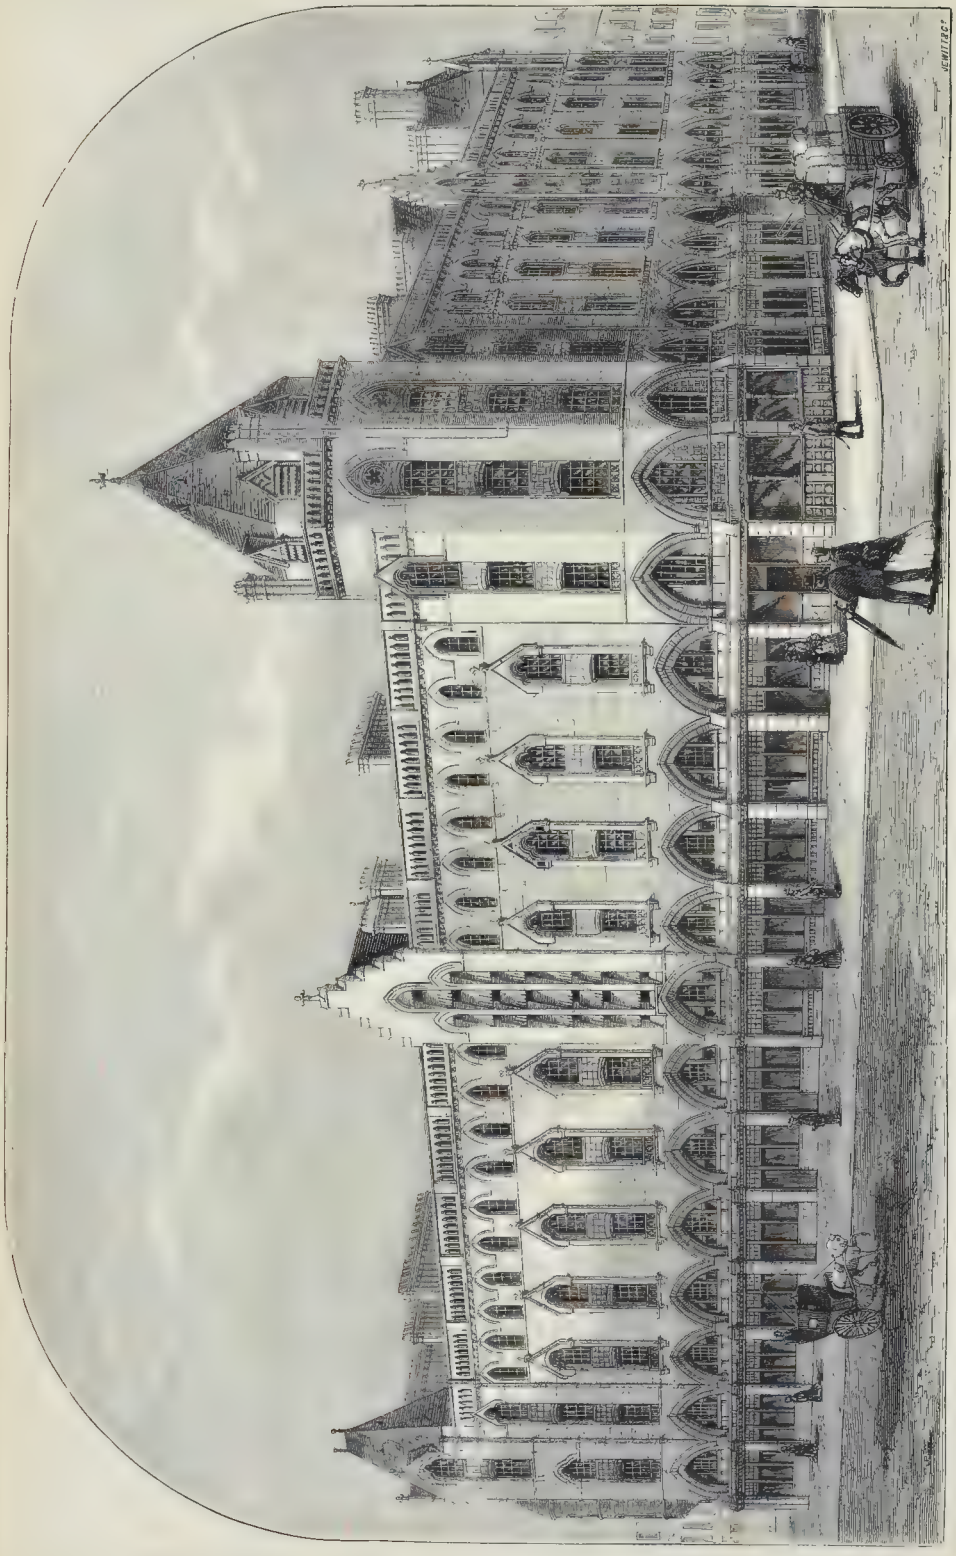
It is anticipated that the new dwellings will be quite as successful financially as those recently erected in Lower-street, from the designs of the same architects, and which pay a clear 5 per cent. after making due allowance for voids, &c.; the rent charged for each dwelling (including use of wash-house and all domestic conveniences) being 2s. 2d. per week, except where two bedrooms are attached, instead of one, in which case the rental is 3s. 3d. per week.

VALUE OF BUILDING LAND AT THAMES DITTON.

Last week a building estate at Thames Ditton was sold in 106 lots, at the Swan Hotel, Thames Ditton, by Mr. Richard J. Collier. The property consisted of freehold building land, having frontages to the river Thames and the high road, from Thames Ditton to Hampton Court, and known as Sumner-road. The estate is situated within a short distance of the Thames Ditton Station, on the South-Western Railway, in a favourite boating and yachting locality, offering eligible sites for the erection of river-side residences. Three new roads, each 36 ft. in width, and named respectively Alexandra-road, Queen's-road, and Oakfield-avenue, have been laid out on the estate. There was a numerous attendance at the sale, and all the lots were sold, with a spirited competition, more especially for the several lots facing Oakfield-avenue, and extending in depth to the Thames. These lots, which have frontages of 20 ft. each, with a depth ranging from 180 ft. to 216 ft., realised from 80*l.* to 90*l.* each, a tavern plot, with a frontage of 40 ft., being sold for 156*l.* The total proceeds of the sale amounted to 3,480*l.*

SOUTH LAMBETH DWELLINGS.

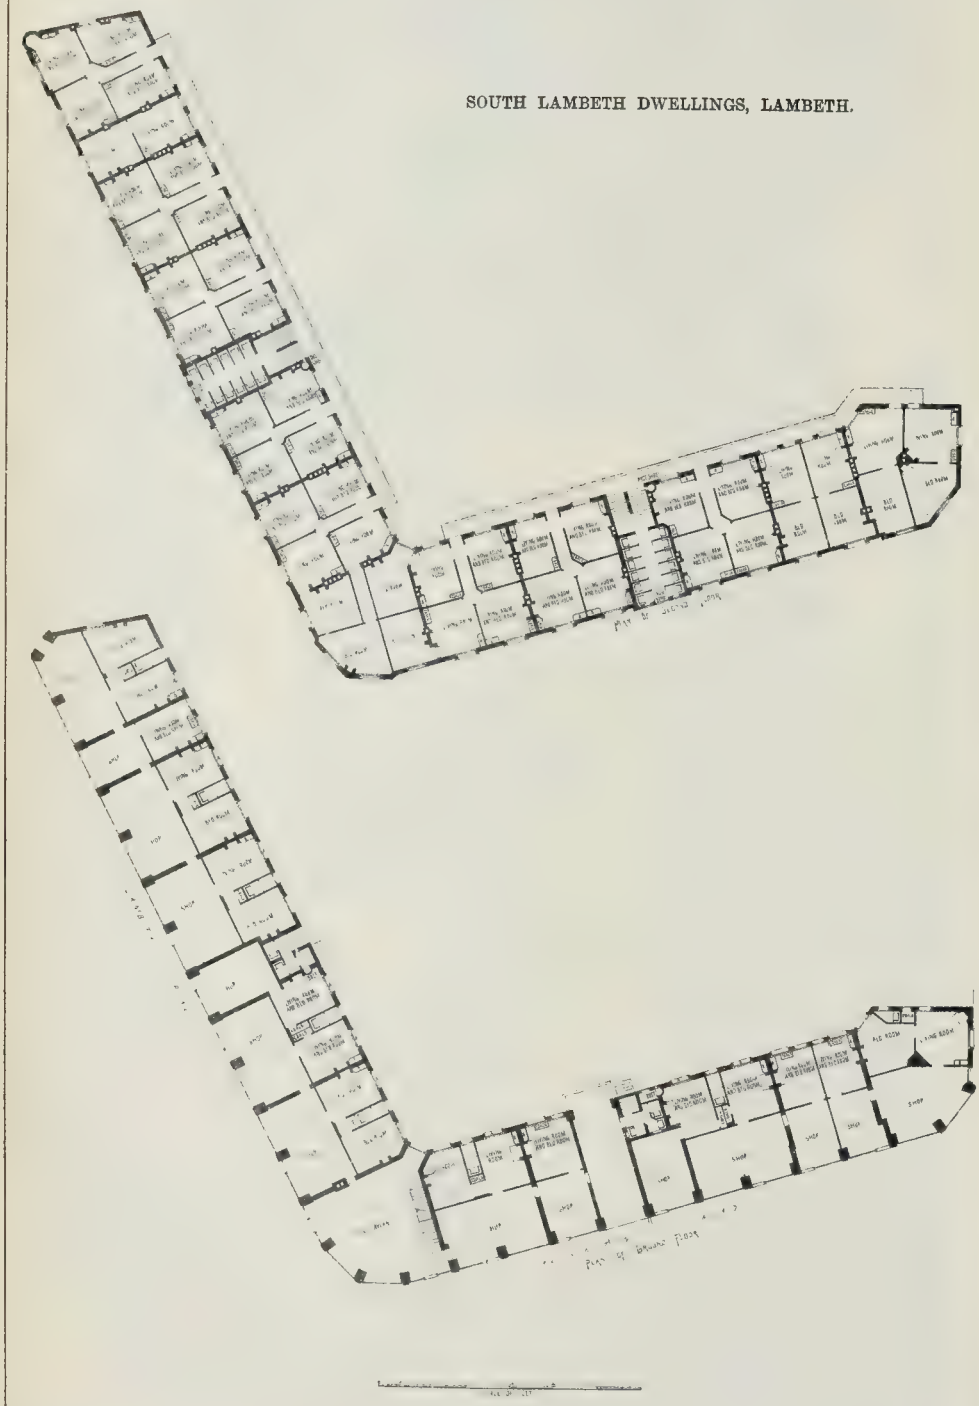
The South Lambeth Dwellings, which have been recently built for the South London Dwellings Company, Limited, from designs by Mr. E. Hoole, of 30, Russell-square, occupy the site of Surrey Lodge, for many years the official residence of the Clerk of the Peace, situated at the intersection of the Kennington and the Lambeth roads.



They form a quadrangle, two sides of which consist of blocks of tenements, while the other two are formed of separate cottages. In the centre is a recreation-ground, planted with shrubs and trees, and provided with gymnastic appliances. All the dwellings are prepared for the artisan class, though one of the cottages is occupied by a lady who collects the rents and exercises a general supervision. The blocks, of which we give plans, with the exception of the ground-floor are divided into separate tenements, entered from a balcony on each floor, and contain suites of four, three, and two rooms, while a number of single rooms are also provided. The octagonal tower at the angle is distinct, being separated by party-walls from the Kennington and Lambeth blocks of building. On the ground-floor of this tower is a coffee tavern, with kitchen, stores, &c., in the basement. On the first floor is a club-room; the three floors above are divided into small bedrooms, and are surmounted by the laundry under the conical roof of the tower. Shops, with living and bed rooms attached, and basements below, form the lower part of the blocks of dwellings.

A large portion of the roof is flat, and serves as drying-ground, being level with the laundries, of which the second occupies a tower at the end of the Lambeth block. The laundries are fitted with coppers, &c., assigned to the various tenants. Water is laid on to each floor, and every tenement has its own water-closet.* One room in each tenement is fitted with Barnard's "Diamond" range, in which bread can be baked, and cooking done. A coal-locker is placed in each tenement and a cupboard in each room.

The cottages have each six rooms, with scullery and offices, and are treated in all respects as distinct houses. These dwellings appear to let well.



The exterior is faced with red brick, with moulded arches, strings, &c., and red tiled roofs. The intention has been to avoid the monotonous and dismal appearance usually presented by industrial dwellings, and to give a cheerful aspect to a large building on a conspicuous site for housing the working class.

* The position of the water-tap and sink at the end o the group of "closets" is open to objection.

DESIGN FOR A CAMPO SANTO FOR INTERMENT AND CREMATION.—M. Adamczewski, Warsaw, Architect.

A CAMPO SANTO FOR INTERMENT AND CREMATION.

The first cremation, or "Feuerbestattung" (fire-burial),—the name by which the resuscitated mode of disposing of the dead by fire is now known,—took place in Germany on the 10th of December, 1878; but it cannot be said that since that date the movement has made much progress. On the one hand, it has to encounter a deep-seated prejudice. On the other, the expenses attaching to cremation are very heavy.

As now practised at Gotha, and under the regulations of the Government, fire-burial is rather expensive. About 50 cwt. of brown coal for preparing the gas are required, for which the prime cost of 50 marks is charged. In only one case have there been two successive burials at one heat,—to use a metallurgical expression; the second involving only an additional outlay of 20 marks for 20 cwt. of coal. A further 16 marks are put down for wear and tear of the combustion apparatus, and 14 marks for attendance. A provisional metal urn for holding the collected ashes costs 2 marks. A charge of 30 marks is made for conveying bodies sent from abroad from the railway station to the cemetery. The other expenses are incidental also to the ordinary mode of burial.

The architect, Adamczewski, of Warsaw, has attempted it, and has solicited the co-operation of the authorities at Gotha to make his plan public. He proposes to make the transition from burial or interment to cremation gradual and less repellant.

The building designed by him, of three stories, as shown in our illustration, is estimated to contain no fewer than 60,000 separate catacombs below and above the ground. The project is consequently only suitable for large cities, such as London, Paris, Berlin, Vienna, &c. The building is surmounted by a pantheon, the centre containing the furnace, which is to be kept burning continually, and which consumes the exhalations of the bodies interred in the catacombs, the latter being connected with the fire by air-conduits. A certain space of time, fixed by individual inclination, may thus be ensured during which a body is to be left undisturbed to the decay wrought by the agencies of nature.

We have been unable to get fuller particulars of the plan of the building, but we may add that, according to its author, it has obtained a prize.

CATHEDRAL, GEORGE TOWN, DEMERARA.

The new cathedral about to be erected at George Town, Demerara, of which illustrations are given in our present number, has been designed by Mr. Blomfield.

The requirements of the climate, which are somewhat peculiar, together with the entire absence of any building material except brick, while the funds are too limited to render possible the importation of stone or granite for the purpose, presented a problem somewhat difficult to solve without sacrificing the dignity of effect and the characteristic features which would be naturally looked for in an Anglican cathedral.

George Town being so near the equator, the widely-projecting eaves and the shady cloister-like verandahs usually associated with the idea of a cathedral in the tropics are not required on the sides of a building standing due east and west; nor is there any objection to large windows and the free admission of light. It is, however, not only necessary for the windows to open widely and freely, but the whole of the lower part of the building must be perforated with openings reaching nearly to the floor, and 8 ft. or 9 ft. high, allowing a free passage for the breeze which George Town is said never to be without. These openings are all fitted with iron louvre shutters easily closed not only to exclude the driving rain of sudden tropical showers, but also to keep out the bats at night, of which myriads infest churches and buildings into which they once gain an entrance. The floor of the building is raised about 7 ft. above the ground, which is much insisted on as affording greater facilities for thorough ventilation.

On the north and south are spacious carriage porches, which the climate renders essential features.

To preserve the cathedral character, the building is made cruciform on plan, with two western towers; but, with these exceptions and that of a retro-choir behind the altar-screen, the whole is treated as a large parish church, which indeed it will practically be, affording accommodation for about 1,200 worshippers without crowding.

The style of the building suggested itself as the most suitable to the climate and the materials proposed to be used.

The whole building might perhaps have been designed for construction in timber had it not been for the ants, of which there are two or three varieties, all equally destructive and insidious. A piece of timber may be to all appearance perfectly sound, though completely eaten away and nothing but dust left within. In the present design there is no timber within 30 ft. of the floor, so that no ant-track can be made to it without being speedily detected.

As stone or granite construction was out of the question on account of the cost, it was finally determined to build the walls of Portland cement concrete, a method of construction now beginning to be largely used and well understood in the colony. The quoins, arches, string-courses and cornices, are to be of brick, and the details of the lower arcading, and other ornamental portions, in terra-cotta sent from England.

The columns are of cast-iron, clustered and banded, and support timber posts and arches as well as the roof in one span externally, but internally divided into nave and aisles. The timber is to be pitch-pine, imported from North America. Internally, the nave and transepts have boarded and ribbed ceilings in a pointed wagon form, and the aisles and choir have wooden groined ceilings. Externally, the roofs are covered with galvanised iron, the roof-covering said to be found most suitable to the climate.

The cost of the building, exclusive of work below the ground-line, the upper part of the towers, and the fittings, is estimated at 20,000*l.*, and it is intended to make a commencement at once with the foundations and the choir. A reference to the ground-plan will explain the general arrangements more clearly than a verbal description.

The Corporation of Accrington have decided to apply to Parliament in the ensuing session for powers to construct about 7½ miles of tramways, extensive intercepting and outfall sewers, precipitation works, a branch canal about a mile in length, and new store-yard, with stabling, sheds, and railway sidings. The plans are being prepared by Mr. E. Knowles, the Borough Engineer and Surveyor.

SOUTHAM.

On the 28th ult., the new sewage-disposal works were formally handed over by the engineer, Mr. Edward Pritchard, C.E., of Westminster and Birmingham, to the committee of the Southam Union Rural Sanitary Authority. The works comprised the laying of a main outfall sewer from the old tanks to new outfall grounds, and the preparation of the outfall grounds for the reception and purification of the sewage, which are comprised of three acres of land of a suitable description, situate near Old Ford Bridge, Welsh-road, about a mile from Southam, which had been purchased by the Sanitary Authority under the compulsory powers of the Public Health Act, 1875, and the Lands Clauses Consolidation Acts. The grounds have been formed into six beds of level formation, having properly-constructed deep drains, sewage-distributing carriers and chambers, and well-formed roads. The system of purification adopted is that of "intermittent filtration," which, whilst giving the best possible results in the purification, affords considerable facilities for the utilisation of the sewage by admitting the proper cultivation of green crops and roots upon the ridges between which the sewage flows, the whole of the beds being thrown up in ridges one yard apart, the sewage being distributed upon the beds from three chambers running down the centre of the ground, connected by disc valves, the pipes to the respective beds being connected with the chambers by flap-valves, so that the sewage can be distributed on any part of the grounds at the will of the manager of the works.

The cost of the works, inclusive of the purchase of the land, has been about 2,500*l.*

INDEX TO THE MINUTES OF PROCEEDINGS OF THE INSTITUTION OF CIVIL ENGINEERS.

We congratulate all who possess, or who have access to, the valuable professional library which is formed by the sixty-six volumes of the "Minutes of Proceedings of the Institution of Civil Engineers," on the completion of that desideratum,—a subject index. Each volume of the "Minutes" contains an elaborate index to its own contents, and there exists besides a general index from volume i. to volume xx., and a continuation of the same from volume xxi. to volume xxx. But the value of the later volumes, which are full of the most detailed, as well as of the newest matter, has been greatly enhanced by the completion of the new index. It may be judged how serious has been the work encountered by the index-makers from the fact that the book only comes down to volume lviii., showing that eight quarterly volumes have been issued, and two years have elapsed, since the index was so far put in form as not to be open for further additions.

It should be noted that the plan of the new index has enabled the secretary, Mr. Forrest, to condense the information given within 374 pages, while the old index for the first twenty volumes contains 367, and the supplementary index 206 pages. This condensation is the result, not of slovenliness, but of the reverse; very great judgment has been shown in the mode in which the fullest indications of the subjects indexed are given in the least space. But perhaps the chief cause of the economy of room is that the plan adopted has been to index subjects alone, the names of authors and of speakers being treated as subordinate. Their names, indeed, are fully given, but not as headings. For example,—in the old index six names of members of the Institution commence the letter G, occupying a third of a column, before the reader comes to "Galvanic Action." In the new index G commences "Galvanised Iron: see iron, wrought, preservation of," "Galvanometers: see electricity, voltaic, gas, coal, general references." Thus "the arrangement is essentially analytical, and the alphabetical arrangement has been combined with a certain amount of classification, thereby affording facility for consultation, by which it is hoped any given subject of inquiry may be reached with the least expenditure of time and trouble." And not only is the plan admirable, but, so far as we have been able to test it, it has been ably carried out.

It will be worth the consideration of the Council of the Institution whether they will not complete this valuable key to the *corpus* of their "Transactions" by printing a nominal index, which shall contain those nominal alphabetical references which are found in the two former volumes and omitted from the present one. In that case, the change now made will be of unmixed advantage. The labour of compiling such a nominal index will be small compared with that which must have been devoted to the volume before us. And while the subject index is a necessary intermediary between the world of readers and the volumes of Proceedings, the nominal index would form a perpetual commemoration of the founders and members of this important society.

THE INSTITUTION OF CIVIL ENGINEERS.

The Council of the Institution of Civil Engineers invite communications, of a complete and comprehensive character, on any of the subjects included in a list which they have published, as well as on other analogous questions. For approved original communications the Council will award premiums, arising out of special funds bequeathed for the purpose.

The Council have awarded the following premiums:—

For Papers read at the Ordinary Meetings.

1. George Stephenson medals and Telford premiums, to Thomas Forster Brown and George Frederick Adams, for their paper on "Deep Winning of Coal in South Wales."
2. A Watt medal and a Telford premium, to John Isaac Thornycroft, for his paper on "Torpedo Boats and Light Yachts for high-speed Steam Navigation."
3. A Telford medal and a Telford premium, to Theophilus Seyrig, for his paper on "The Different Modes of Erecting Iron Bridges."
4. A Telford medal and a Telford premium, to Max am Ende, for his paper on "The Weight and Limiting Dimensions of Girder Bridges."
5. A George Stephenson medal and a Telford premium, to Benjamin Baker,* for his paper on "The Actual Lateral Pressure of Earthwork."
6. A Telford premium, to Richard Henry Brunton,† for his paper on "The Production of Paraffin and Parraffin Oils."
7. A Telford premium, to Charles Colson,† for his paper on "Portsmouth Dockyard Extension Works."
8. A Telford premium, to Christian Hendrick Meyer, for his paper on the "Temporary Works and Plant at the Portsmouth Dockyard Extension."
9. A Telford premium, to Benjamin Walker, for his paper on "Machinery for Steel-making by the Bessemer and the Siemens Processes."
10. The Manby premium, to Joseph Prime Maxwell, for his paper on "New Zealand Government Railways."

For Papers printed in the Proceedings without being discussed.

1. A Telford medal and a Telford premium, to Dr. J. Weyrauch, for his paper on "The Calculation of Dimensions as depending on the Ultimate Working Strength of Materials."
2. A Telford premium, to James Richard Bell, for his paper on "The Empress Bridge over the Sutlej."
3. A Telford premium, to John Lewis Felix Target,† for his paper "Experiments on a New Form of Module for Irrigation purposes."
4. A Telford premium, to William Thomas Henney Carrington, for his paper on "Three Systems of Wire-rope Transport."

LIVERPOOL ENGINEERING SOCIETY.

The usual fortnightly meeting of this Society was held last week at the Royal Institution, Colquitt-street, Mr. A. Holt, president, in the chair. A paper by Mr. Wm. Kissack, Stud. Inst. C.E., on the "Extension of the Promenade at Southport," was, in the absence of the author, read by the Hon. Secretary. The work, Parliamentary powers for which were obtained in 1876, consists of a promenade 25 ft.; carriage-road, 25 ft.; and footpath, 10 ft. wide, formed on an embankment 12 ft. above the level of the shore, enclosing 42 acres of land reclaimed by it. This land was bought by the Corporation at a cost of 9,000*l.*, roads and sewers have been constructed on it, the portion between the roads has been filled up to a height of 2 ft. above the top of the sewers, and is now being sold in building plots. By the sale of the land the Corporation will recoup the whole of the money expended on the works. The sand for the embankment was brought by a line of rails laid along the shore, from the sandhills at Birkdale, a distance of two miles and a half, being filled into the wagons by a steam "excavator," which filled 300 four-cube-yard wagons per day, thus doing the work of seventy men. The embankment is protected by a sea-wall made of concrete, consisting of 1 of Portland cement to 6 of sandstone broken to pass a 2-in. ring. The concrete was deposited in layers 6 in. thick, and punned with a 30 lb. rammer. The toe of the wall, which is 2 ft. 6 in. thick, is 20 ft. out from the face of the plinth, and it

* Has previously received a Telford medal and a Telford premium.
† Have previously received Telford premiums.

rises with a gentle curve to the finished surface of the promenade, where it is 1 ft. 6 in. thick, and is finished with a plinth 2 ft. high, surmounted by an ornamental cast-iron railing. The top of the plinth is 8 ft. above high-water mark of a 21-ft. tide, which is the highest known, and is provided with "weep-holes" at intervals of 6 ft. There is an approach-road to the shore at Sea Bank-road, with a gradient of 1 in 15, and opposite each new street is a flight of steps in concrete. The promenade and carriageway are laid with asphalte on stone pitching, and the footwalk is tiled with Welsh freclay tiles. The works, which comprise 400,000 cubic yards of embankment, 8,000 cubic yards of concrete, 24,000 square yards of asphalting, and four miles of sewers, have been carried out in a creditable manner by Messrs. Gripper & Bayliss, of Westminster, at a cost of 32,000*l.*, and are from the designs of the Borough Engineer, Mr. Wm. Crabtree, Assoc. M.Inst.C.E.

A vote of thanks to the author for his interesting paper was given.

THE GREAT EASTERN COMPANY'S NEW BRIDGE WORKS AT BRICK-LANE.

The old bridge which carries the Great Eastern Railway over Brick-lane is about to be taken down, and a new one of much larger dimensions, as regards both length and breadth, is to be erected in its place. The extension of the bridge has become necessary in carrying out the company's new goods station at Shoreditch, which has now for some time past been in progress. The intention of the company was to extend the present brick arch 23 ft. on the south side, and also to construct a new girder bridge on the north side, 40 ft. in width, and with the view of carrying out the works the company have recently placed themselves in communication with the Whitechapel and Bethnal-green Boards of Works, in whose districts respectively the contemplated extensions are situated. This has led to a conference between the representatives of the railway company and the local authorities, the result of which is that the present old brick arch carrying the line over Brick-lane, which it appears has for some time past been a subject of public complaint, is to be removed altogether, and an entirely new girder bridge erected, with extensions both north and south of the existing structure, having a uniform width across Brick-lane throughout its entire length, of 40 ft. In consideration of the railway company having agreed to demolish the old brick bridge, the local authorities undertake to bear a portion of the cost of the new structure. As regards the progress of these extensive station works, which were commenced upwards of three years ago, it is expected that it will yet take something like twelve months entirely to complete them. The station will occupy the large area of thirteen acres, its length from High-street, Shoreditch, to Brick-lane, being 1,400 ft. or upwards of a quarter of a mile, with a uniform width of 400 ft. The principal warehouse above the substructure covers an area of five acres, 10,000 tons of iron being used in its construction, and the outbuildings include, amongst others, a large fruit-shed, where the Continental fruit traffic, amounting in the busiest part of the season, to about 300 tons per day, will be received. In addition to purely station purposes, it is intended to utilise portions of the structure for market purposes, one side of the substructure being used as a potato-market, whilst it is said that the other side will in all probability form a large fish-market. The estimated total cost of the station when completed is 300,000*l.*

THE NEW ROYAL COURTS OF JUSTICE CHAMBERS.

In anticipation of the completion and opening of the new Law Courts next year, the work of clearing a site on the opposite side of the Strand, preparatory to the erection of the Royal Courts of Justice Chambers, has been commenced within the last few days. The company which has been formed for the erection of the building held its first meeting a few days since, at the offices in Devereux-court, Temple, when Mr. Morgan Lloyd, Q.C., who presided, stated that 54,330*l.* of the authorised capital of 80,000*l.* had already been subscribed. He said the architects estimated that the works would cost 55,000*l.*, and they had assured the Board that such sum would cover the entire cost of the building. The present subscribed capital was therefore very nearly enough for the purpose, and if the architects were right in their calculations, very little more capital would be required, and so far as the works had proceeded, the contracts had been let at sums within the estimates. The contracts already let were for the demolition of the old buildings and for the excavations, and also laying the foundations to the height of 5 ft., which were let for about 6,000*l.* to responsible contractors. The excavations would have to reach a sufficient depth to provide for two floors below the present level of the ground. In reply to an inquiry from a shareholder, the chairman said the directors had not yet secured a right to make a subway under the Strand, but the matter was under the consideration of the Board of Works.

In addition to the several blocks of property opposite the Law Courts which are being cleared away for the new chambers, a large number of offices and other buildings, extending a considerable depth southwards, are likewise in course of demolition.

THE LATE WILLIAM BRODIE, R.S.A.

On Saturday, the 29th ult., Mr. William Brodie who for many years, held a foremost place amongst Scottish sculptors, died at his house in Edinburgh. He was a native of Banff, and commenced life as a plumber and gasfitter. He was imbued with an intense love of the beautiful, and came to Edinburgh, with the purpose of prosecuting his art-studies, about forty years ago. For ten years he toiled hard, scarcely earning sufficient to support existence, and almost unnoticed and unknown. In 1851 he sent a statuette group of "Nell and her Grandfather" to the Great Exhibition, and it was consigned to the obscurity of the lumber of one of the spare galleries. Year after year he sent his works to the Royal Scottish Academy Exhibition; a few were admitted, but he found neither purchasers nor patrons. One afternoon the writer of this notice called on him, and found him in his studio disconsolately gazing on his exhibits that had been returned that morning from the galleries of the Academy Exhibition. "High art," he said, "won't keep my wife and me and the bairns,'so I'll go back to the gaspipes and plumbing." "Ye'll be a great man yet, Willie, if you would only keep up your heart. You stick to your art and I'll stick to you and the bairns, and I'll see that none of us ever come to want," said his wife; but the only reply to her cheery words and encouraging smile was a sad shake of the head. The writer spoke a few consolatory words and, with a promise to call on the following day, left. By the forenoon of the morrow the scene in the studio was changed,—the sculptor and his wife were in tears, they were almost too happy to speak. In the meantime, an Edinburgh merchant had called on Mr. Brodie, and after telling him how much he appreciated his talent and regretted his want of success, handed him a bank-cheque. "That, Mr. Brodie, will enable you to go to Rome and devote two years to study. In your absence I will see that all proper attention is paid to your wife and children." Brodie went, studied, and returned to take rank among the foremost of Scottish sculptors. Up to within a year of his death, William Brodie was constantly employed over works which vividly displayed his appreciation of beauty and tenderness. Many of the statues which fill the niches of the Scott Monument in Edinburgh, the design and erection of his friend George Kemp, were the work of William Brodie, who, at the time of his death, held the office of secretary to the Royal Scottish Academy. He was in the sixty-seventh year.

THE LATE MR. G. R. FRENCH.

We regret to have to announce the death of Mr. George Russell French, architect, who expired on the 14th of October, after a long and painful illness, and was interred at the Willesden Cemetery. In his early career he was engaged in designing and superintending the erection of several mansions and other buildings for noblemen and gentlemen. For many years he acted as surveyor to the Worshipful Company of Ironmongers, and within the last few years retired on a pension. Mr. French entered into several important competitions; for example, the new Houses of Parliament and other buildings. He will, however, be better remembered by his literary labours than his professional practice. He was one of the earliest contributors to the *Builder*, and author of several pamphlets. One entitled "The Palace, the National Gallery, and the Royal Academy," which in 1846 appeared in the *Builder*, in five letters, received favourable notice from the public press, and created much discussion. His chief works comprise a "Genealogical History of England," "Shakspeareana Genealogica," published in 1869, as a supplement to the Cambridge edition of Shakspeare, and a "Catalogue of the Antiquities and Works of Art exhibited at Ironmongers' Hall, London," in 1861, which contains, in addition to numerous illustrations, a store of archæological knowledge. Mr. French was seventy-eight years of age, and died a bachelor.

FRIEDRICH HITZIG.

This noted German architect and artist, who died on the 11th ult., in his seventy-first year, was buried in the same Berlin cemetery in which the remains of his master, Schinkel, lie. The obsequies were attended by several Ministers of State, the members of the Royal Berlin Academy of Arts, of which the deceased was president, and of the Berlin Academy of Architecture, of which he was vice-president, and a large number of architects, artists, and other distinguished persons,—ample testimony to the wide and deep respect in which Friedrich Hitzig was held by his contemporaries. Hitzig may be regarded as the last representative of the Berlin school which arose under the influence of Schinkel. He was the creator of many important works, in which all the varieties of his particular school are well represented. His two last works were the entire reconstruction of the Zeughaus, and the plan for the new Technical High School, both at Berlin. The former he lived to complete, the latter he has left in course of erection. Both works are well worthy of his reputation. Hitzig was of late years the acknowledged head of the entire sphere of arts and architecture in the German capital.

ROBERT HOOKE, ARCHITECT.

How much the London of to-day differs from the London of fifty years ago can scarcely be credited except by those who are old enough to remember its appearance during the reign of George IV. At that time the chief features of the city,—the churches, public buildings, and streets,—presented almost the same aspect to the citizens and wayfarers as they had done during the previous hundred and fifty years; it was the city that arose from the ashes of the Great Fire in 1666. But the removal of the houses in old St. Martin's-le-Grand, to make room for the erection of the General Post Office, and the making of the approaches to new London Bridge, were the beginning of a march of improvement and alteration which has continued until the present time, and goes on at an ever-increasing rate; so that by the commencement of the next century the city, with its palatial offices, gigantic railway stations and trading emporiums, will present an appearance differing far more widely from the London of the Georges than that did from the London of Queen Elizabeth and Shakespeare's days. While some of the houses and streets which are associated with so much that is interesting in our domestic history during the last two centuries yet remain, I venture to ask whether Robert Hooke was employed as architect, and to what extent he assisted in the rebuilding of the city. He is best known by his scientific researches and wonderful mechanical contrivances; but that he attained some fame as an architect is proved by the erection, from his designs, of three large buildings in what were then the suburbs of London. These were Bethlehem Hospital, in Moorfields, erected at a cost of 17,000*l.*, which remained until 1814, when it was taken down and Finsbury formed on the ground; Montague House, Bloomsbury, built in 1678 for Ralph, third Baron of that name (this building was unfortunately destroyed by fire a few years after its construction, but John Evelyn, in his "Diary," speaks of it as a "fine palace built after the French style"), on the site of which the British Museum now stands; and Aske's Almshouses, at Hoxton, an important building, erected for the Haberdashers' Company. For this last work Hooke is said to have been recommended by Arch-

bishop Tenison. Hooke, as well as John Evelyn and Mr. (afterwards Sir) Christopher Wren, after the Fire submitted plans for the rebuilding of the city; and although Wren's scheme was approved by the King, Hooke's model, which was submitted to the Royal Society, found such favour among the civic authorities that it led to his appointment as Surveyor to the Corporation, in which capacity he toiled early and late in laying out the ground for the several proprietors. When a young man, his abilities attracted the attention of Boyle, Wren, and others at Oxford, and his mechanical ingenuity and penetrative sagacity must have been of value in the early days of experimental philosophy. If we consider the large number of churches, in addition to the cathedral, that were erected from the designs of Wren, it is evident that his time must have been fully occupied; and it is from Hooke's intimate connexion with Wren during many years that I am led to infer that many other structures, besides those already mentioned, were built from Hooke's designs, although I have never met with any notice of them.

Thos. J. Hux.*

THE LONDON, CHATHAM, AND DOVER RAILWAY, AND THE NEW VEGETABLE MARKET.

There appears to be a strong probability that the opening of the new Fruit and Vegetable Market in Farringdon-street will be the means of adding considerably to the merchandise traffic of the London, Chatham, & Dover Railway Company. That portion of the company's line between Ludgate-hill and the Moorgate-street and Farringdon-street stations, runs parallel with the market on the east side, on a sharp descending gradient, the level of the railway at this point being about equal with that of the basement of the market. This admits of the railway company obaining easy access to the market basement, which we are informed they have taken advantage of by becoming the lessees of a considerable area of the basement, and that they are converting it into a depot for fruit and vegetables, which they contemplate bringing to the market from the several districts in Kent intersected by the railway. For the reception of this class of traffic four lines of railway are at present being laid down, which will afford accommodation for a large number of fruit and vegetable-laden wagons. As Kent is proverbially known as "The Garden of England" it may reasonably be supposed that the market will be very largely supplied from this district, and that the traffic receipts of the Chatham & Dover Company will be correspondingly increased.

SWINDON.

The cemetery for this rapidly-increasing town is now complete. The site, eleven acres in extent, is charmingly situated on the side of a hill, and from which a splendid view is obtained. The buildings consist of chapel, caretaker's lodge, and mortuary, and are built of local stone, with Bath-stone dressings. The chapel is in the style of the thirteenth century, and will accommodate 100 persons. It has an apsidal end, and a bell-turret. The roof is covered with Bangor slates, with bands of "Eureka" green. The fittings are of pitch-pine; the tiles are from Minton, Hollins, & Co.; and the cresting and finials from Messrs. Cooper & Son, of Maidenhead. The carving has been executed by Mr. Chapman, of Bath. There are four entrances, conveniently situated for access from all parts of the town, and the whole site is enclosed by a substantial iron fence, 8 ft. high, with dwarf wall and stone piers. The drainage consists of agricultural pipes laid 9 ft. deep and 30 ft. apart, and connected to 9 in. mains, and in excavating for these a large number of boulder stones were found, and the ground being "pricked" over for them, some 5,000 tons were got out, and used in the road-making.

The work has been carried out from the designs and under the superintendence of Mr. W. H. Read, architect, of Swindon, whose plans were selected in a limited competition. The contractors are Messrs. Phillips & Powell and G. Wiltshire jointly, and Mr. Gilling has acted as clerk of the works. The iron fencing and gates are by Mr. Affleck and Messrs. Edwards & Co., of Swindon; and the grounds have been planted by Mr. Tucker, nurseryman, of Faringdon. The total cost is about 10,000*l.*

* From *Notes and Queries*.

FULMODESTON CHURCH.

The new Church at Fulmodeston, Norfolk, consecrated on the 19th ult., is erected in the middle of the village, and is intended to supersede the old church, which is very inconveniently situated, and which will for the future be used only for the burial service for funerals in the old churchyard.

The new church consists of a nave and chancel, a south aisle, with three arches opening into the nave, a vestry or chancel aisle, also on the south side, and shut off from the aisle and chancel by ornamental screens. On the north side there is a porch. The style adopted is late fourteenth century. The walls are built of flint, with Bath and Ancaster stone dressings, and internally they are lined with red bricks, with patterns of white bricks. There are open-timber roofs, that of the chancel being panelled and boarded.

At the east end there is a stone reredos, with columns of polished alabaster. The pulpit is also of stone, and has an alabaster cornice and columns. The font is an old thirteenth-century base and columns, with the bowl renewed in accordance with the old. Until now it has stood for many years in the churchyard to Croxton Chapel, Norfolk.

The outer doorway to the porch is also old, and was brought from the old church at Fulmodeston, and re-used. The seats in the nave and chancel are new (oak being used in the chancel). Those in the aisle were brought out of Croxton Chapel and refixed. The altar table and rail were also brought from Fulmodeston old church.

The whole of the works have been executed by Messrs. Cornish & Gaymer, of North Walsham, Norfolk, under the direction of the architect, Mr. Wm. Bassett Smith, John-street, Adelphi.

A NEW WESLEYAN CHAPEL FOR NEWCASTLE-UPON-TYNE.

The Wesleyan Methodists of West Jesmond, Newcastle-upon-Tyne, after worshipping for some years in a temporary iron church, have just laid the memorial stones of a new chapel and lecture-hall. This is part of a project embracing the sweeping away of the debt upon Brunswick Place Chapel, requiring about 13,500*l.* The committee entrusted with the carrying out of the new works some few months back resolved upon inviting a number of London and provincial architects of well-known repute in church building to furnish them with designs from which they might select the one best adapted to the exigencies of the site. The result of the competition was that they awarded the first premium to the design submitted by Mr. J. J. Lish, architect, Newcastle-upon-Tyne.

A lofty tower forms part of the design, and provision is to be made for the placing of a clock in it, high above all neighbouring roofs and obstacles. The chapel will consist of a nave, aisles, and transepts. Behind, or to the south of the main buildings, will be three large class-meeting vestries, a ladies' vestry with cloak-room adjoining, a minister's vestry with lavatory, a "mothers' meeting" vestry, and a tea-preparing room. The contractors entrusted with the carrying out of the works are Messrs. Lishman & Salter, Ryton-on-Tyne.

BOROUGH ENGINEERS.

Mr. Alfred M. Fowler, Borough Engineer of Newcastle-upon-Tyne, complains strongly of the obstacles which have been thrown in the way of the proper discharge of his duty, and has addressed a letter to the Council to denounce the present state of things. Mr. Fowler says he has never had full charge and control of the business and staff. The want of a proper understanding on one side or the other is evident.

The Surveyors' Institution.—The first ordinary general meeting of the session will be held on Monday, November 14th, 1881, when the president, Mr. Edward Ryde, will open the session with an address.

PATENT RECORD.*

APPLICATIONS FOR LETTERS PATENT.

4,503. C. Gall, Halifax. Construction of safety apparatus and fasteners for windows, &c. Oct. 15, 1881.

4,511. B. R. Harrington, Beckenham. Ventilating gullies for drains. Oct. 15, 1881.

4,512. W. A. McCormick, Stoke Newington. Regulating the supply of water to water-closets, &c. Oct. 15, 1881.

4,526. P. Everitt, Great Ryburgh, and A. Barnard, Norwich. Stoves and grates. Oct. 17, 1881.

4,551. G. E. Waring, Newport, U.S.A. Water-closets. Oct. 18, 1881.

4,557. J. A. Hornby, Menai Bridge. Water-closets. Oct. 19, 1881.

4,565. W. M. Farley and J. H. Bond, Torquay. Apparatus for supplying dwelling-houses, &c., with water. Oct. 19, 1881.

4,566. W. A. Martin, Southwark. Open fire-grates. Oct. 19, 1881.

4,568. H. Skerrett, Birmingham. Combining door chains with lock, latches, and bolts. Oct. 19, 1881.

4,578. W. A. Barlow, London. Stoves. (Com. by F. Lonholdt, Frankfort-on-the-Maine). Oct. 19, 1881.

4,590. F. Wirth, Frankfort-on-the-Maine. Chimney-flues. (Com. by the Society "Gesellschaft des Emser Blei- und Silberwerks, Ems, Germany.") Oct. 20, 1881.

4,595. J. G. Shillingworth, London. Sash-fasteners. Oct. 20, 1881.

4,598. G. Pitt, Sutton. Water-closets. (Com. by J. Finck, Baden-Baden.) Oct. 20, 1881.

4,603. Capt. T. E. Clarke, Minehead. Fire-grates. Oct. 20, 1881.

NOTICES TO PROCEED

have been given by the following applicants, on the dates named.

October 18, 1881.

2,809. W. Joy, Aylesford. Manufacture of cement. June 27, 1881.

3,250. D. Grove, Berlin. Steam-cooking apparatus. July 25, 1881.

3,357. C. Walton, Bournemouth. Apparatus for preparing clay, &c., and making bricks, tiles, &c. Aug. 3, 1881.

3,383. J. Shanks, Barrhead. Lavatories. Aug. 4, 1881.

4,001. J. Shanks, Barrhead. Baths, sinks, &c. Sept. 16, 1881.

October 21, 1881.

2,616. G. Hodson, Loughborough. Manufacturer of chimney-pieces, &c., in imitation of marbles, &c. June 16, 1881.

2,633. S. Hodgkinson, Manchester. Window-blinds. June 16, 1881.

3,630. C. Drake, Battersea. Facing bricks. Aug. 20, 1881.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending October 22, 1881.

747. H. Defty, Middlesbrough. Stoves.

The fire-grate is enclosed in a transparent shell or doors so that all air for combustion passes from the back or bottom to the grate. The ovens or boilers are placed above the fire, and a number of small chambers are arranged above to heat air which passes through them and can be led by tubes to any other room. (*Pro. Pro.*) Feb. 22, 1881. Price 2d.

969. R. Crane, Clapham. Grates and stoves.

The flues from the grate pass down again on each side under the bottom of the fire and thence up the back, whereby the smoke is consumed. March 7, 1881. Price 4d.

1,073. G. P. Lempriere, Birmingham. Mechanism for producing tension on the cords or bands of blind rollers, &c.

A helical spring is used, in the axis of which is a screw. The lower end of the spring engages in the groove between the threads of the screw. The upper end of the spring constitutes the axis on which the pulley turns. The screw and the greater part of the spring are contained in a case. By turning the screw a greater or less amount of tension is given to the spring and thereby tightens or loosens the cord. (*Pro. Pro.*) March 12, 1881. Price 2d.

1,091. A. M. Clark, London. Tiling for roofs, floors, &c.

Grooves are made all round the edges of the tiles; and metallic feathers, inserted in the grooves and bedded with elastic cement, connect the tiles together, keep them in their proper positions, and make the joints watertight. (Com. by J. J. Williams, Fairhaven, U.S.A.) March 14, 1881. Price 6d.

1,098. J. Elms, London. Water-closets.

A lower pan is fitted beneath the upper one, and a double-action crank, raised by the ordinary pull, opens the

* Compiled by Hart & Co., patent agents, 28, New Bridge-street, E.C.

upper one, and at the same time closes the lower one and *vice versâ*. The up-flow of noxious gases is thereby prevented. (*Pro. Pro.*) March 14, 1881. Price 3d.

1,112. S. C. Joyce, Wood-green. Surfacing asphalte, &c., to render the same slipless.

A diamond pattern is cut into the asphalte while it is warm. This is either left open or filled in with cement, &c. (*Pro. Pro.*) March 15, 1881. Price 2d.

1,142. R. Marshall, Wandsworth. Appliances for operating Venetian and other blinds.

To the top rail is fixed a bracket, which is slotted. In the slot is a spindle carrying the top and the other laths of the blind. The usual cords and wheels are in the top rail for raising or lowering the blind. (*Pro. Pro.*) March 16, 1881. Price 2d.

1,146. A. Sweet, Hampstead. Water-heaters.

The heater is a cylinder with an inner lining forming a waterway jacket. The water passing through this jacket overflows into one of a series of circular-bearing chambers falling through tubes from one to another, until it reaches the boiling-plate, when it is drawn off. The gasburner is composed of a series of rings, into which are screwed a number of fish-tail burners. A condensation-plate of fireclay is placed above these. March 16, 1881. Price 6d.

1,149. L. S. Powell, Notting-hill, and C. V. Boys, Oakham. Water-pipes.

These are made of elliptical section, so that under the strain produced by the freezing of the water, they will not burst, but yield; and after the strain is removed will return to their original form. (*Pro. Pro.*) March 16, 1881. Price 2d.

1,155. S. J. Payne, Charlton. Manufacture of fire-bricks, &c.

These are made of the following materials:—Clay, graphite, or sand, &c., 7 lb.; Portland cement or hydraulic lime, 1 lb.; silicate of soda, ¼ pint. These are thoroughly mixed and moulded into the desired shapes, and afterwards hardened. After this the goods are immersed in a weak preparation of carbonate of magnesia or silicate of soda. March 16, 1881. Price 4d.

1,171. J. H. Johnson, London. Cocks, valves, or apparatus for regulating the flow of liquids.

The main valve is closed by the pressure of the water in the pipe, and a small valve and passage are fitted to allow the water to enter the chamber below the main-valve piston, and by equalising the pressure to lift it off its seat when the water flows through the main valve. (Com. by J. Zelony, Prague). (*Pro. Pro.*) March 17, 1881. Price 2d.

1,193. W. S. Smith, Highgate. Locks.

To allow of a strong spring being used, a spring catch is combined with the lock which when the bolt is withdrawn by turning the lock handle, springs in front of the end of the bolt and prevents it from being again shot forward when the handle is released. (*Pro. Pro.*) March 18, 1881. Price 2d.

1,781. A. Bell, Edinburgh. Castors.

The castor is made in two parts. The upper part fitted to the leg of the table, chair, &c., and the lower forked swivelling bracket-piece carrying the roller. The upper part has a centre pin or stud, which fits a corresponding socket in the centre of the lower part. A pin passes through the socket and enters a groove formed round the centre pin and holds the two parts together. April 25, 1881. Price 4d.

"THE VICTORY OVER SEWER-GAS."

Sir,—As the opener of this discussion, I hope you will allow me to reply to Mr. Cosmo Innes's criticism in your last issue [p. 558].

1. As to the weight of sewer gas: that depends entirely upon circumstances, and varies in accordance with the cleanness or foulness of house-drains, soil-pipes, and traps under w.c.'s, so that the specific gravity is always varying; but what I contend is, that air impregnated with sewer gas is always heavier than fresh air, and that where there is a current of air either up or down a soil-pipe, its temperature varies but slightly from that of the surrounding atmosphere. The temperature in my soil-pipe this morning was 35 degrees, exactly the same as it was on my roof or the road adjoining my house, proving, I suppose, an entire absence of sewer gas.

2. The temperature of the main drain opposite Sir Henry Cole's house, taken in his presence this morning (Oct. 31st) at 9 30, was 45 degrees: so what the weight of carbonic acid gas at 100 degrees and the ventilation of monkey-houses has to do with this discussion I fail to perceive. I am not engaged in ventilating monkey-houses, so have no desire to dispute Mr. Innes' superior knowledge on that subject.

3. I have myself called attention to the different opinions of the doctors as to the general direction of the air in soil-pipes. Mr. Innes may read more fully in the report already alluded to viz., Conference, May 3rd and 4th, 1877, or, even in the *Builder* of last Saturday, Oct. 29th, p. 537, on the Sanitary Congress at Vienna, where Dr. von Roszahegyi, of Pesth, remarked that his own practical experiments led him to the conclusion that the air in drains is carried forward with the stream, while currents of air in a contrary direction are unfrequent and limited in extent, and no perceptible influence is exercised by wind, or by the temperature of the exterior air. Dr. Lissauer, of Dantzic, fully confirmed the preceding speaker's remarks; but I leave the doctors to differ, not feeling it any duty of mine to endeavour to reconcile their differences, though I feel sure the preponderance of scientific opinion is on my side in this controversy.

4. Mr. Innes says a better plan than mine would be to take it up a warm chimney. Does he not know that there is not one chimney in ten that is built straight enough to take an up-cast ventilating-pipe through, and when he had found one straight enough, he would find no room to spare for his pipe, and still less would he be able to get his pipe up, or make good any joints in it? A moment's reflection will convince your readers, both builders and architects, that the idea is impracticable; and as for carrying the sewer gas up the chimney without a pipe, let them read the short paragraph on "Defects in House Building," by R. K. Hervey, in the next page of the *Builder* to that on which Mr. Innes's letter appears (p. 559), and fancy the effects of sewer gas as well as smoke being constantly pouring into the house.

5. Mr. Innes himself admits all that I contend for, viz.,—1st. That the current up a soil-pipe (when it exists) is in the majority of cases a feeble one. 2nd. That the said current is reversed when the w.c.s are used, and a flush of water sent down the soil-pipe. 3rd. That the air thus reversed is poured out through its intended inlet in the front area; but he says this does no harm, because (mark you) it is not often that anybody is standing over it at the time; also because, if the pipes and drains are kept well flushed and clean, he (the poisoned one) will not perceive any smell. Is this the standard set up by the much-talked-of Sanitary Protection Association, to tolerate an imperfect system, on the chance that no one will be near when the poison is poured forth, or if any one is, then if the poison is very diluted he will not smell it? (I have never heard anything worse from the lips of a fourth-rate speculating builder.) If this is the best the London Sanitary Protection Association can do for us, then Heaven protect us from such protectors!

6. Mr. Innes thinks I am a practical man. I wish I could return the compliment. I should say that my theory is based on practice, and Mr. Innes's practice is based on theory. My practice has been on my own houses, at my own cost, and on my own responsibility. Mr. Innes's Association theorises at other folks' expense, and is not responsible for results.

Then, the bugbear of cost. The Association asks its members to pay a guinea per annum to be told, not what is best to be done, but what is cheapest and near enough (the gospel of shoddy speculation), but when I develop a plan by which the volume of air in the soil-pipes and house-drains can be changed two or three times per minute, with no reversal of the current induced, with both inlet and outlet above the level of all the windows, and by which the traps or cesspools under the w.c.s can be safely dispensed with, but which would cost from two guineas to two guineas and a half per annum (not for advice, but for continuous and efficient working), then it is found too expensive, and is compared to a steam-hammer to crack nuts with; but he admits that it does crack the nut, he admits that it is a victory over sewer gas, and that is sufficient for me. I contend that this nut has not been successfully cracked by any previous method.

In concluding this correspondence for the present, I may state that I shall be very pleased to show the system working at my residence, No. 97, Warwick-road, Earl's-court, S.W., to any one, architect or builder, who is desirous of seeing for himself, and wants the best thing; if, on the contrary, he wants the cheapest, then I am not in it, and it would be useless to trouble himself or me about it. I shall go on with my experiments, and if I meet with further success, you will probably hear of it.

G. E. Mineard.

Sir,—As a practical man of many years' standing, and one who has studied the subject of drainage and ventilation for more than twenty years, I can endorse every part of Mr. Cosmo Innes's statements, contained in your issue of the 29th ult., excepting that in addition to where the closets are in use, I have found the action of the air in the soil-pipe at times reversed; but, as he states, with no bad effect (when the work is done properly). I have stood over the inlet ventilator or sewer interceptor, as the case may be, in a confined yard when the closets were in action without experiencing the slightest smell; but as the result of a practical test,—that sewer-gas does generally ascend is fully proved by the fact that the tops of the closet-traps and outgoings (under the old system) are the parts first found to be perforated G. T. Usher.

COALS FOR DOMESTIC FIRES IN LONDON AND COAL MERCHANTS.

In offering some remarks on "Strawberry Leaves and Black Diamonds," I beg to say that I individually wish success to the venture of Lord Londonderry in bearding the London coal-dealing ring. I am not, however, satisfied that the Marquess will be allowed to hold his own, let alone win. Rings are not easily broken down.

In the first place I may remark that "Wallsend" is now a name,—nothing more,—the seams of coal at Wallsend having been worked out. The coal sent to London by the Marquess may, however, be of good quality for household purposes; but it will not be true Wallsend. Every London coal-dealer may, therefore, strike this term out of his list. "Silkstone" is a good coal for domestic fire purposes, and may take rank with the so-called Wallsend. There are, however, many varieties of coal, all differing in quality,—and of course, to the coal-merchant, in price. Some of these coals are wasteful and dirty, and the coal-merchants do not scruple to substitute the bad for the good, either wholly or by mixture.

I have been a resident and householder in London some thirty years, and up to this time have failed to find one consistently honest dealer, who would supply me with the best coal for the best price. I order and pay for Wallsend or Silkstone, and I may for a time obtain good and clean coal; but, sooner or later, when nine tons or twelve tons have been ordered, delivered, and paid for, they turn out to be dirty, dusty, white-ashy rubbish,—and I am fixed for the winter with coal at 24s. a ton which I would not give 15s. a ton for,—indeed, would not have in my cellar if I could help it. This is my condition at this time. The coals ordered and paid for were to have been Best Silkstone; they are simply rubbish. Of course, the dealer will have no further order from me, but by change I do not find permanent improvement. I therefore, with all my heart, wish success to the Marquess, but I see rocks ahead. The ring will resort to some dodge to reduce the supply the public should get. But suppose the sale is allowed to be open and fair, the demand will far exceed the power of supply, and orders must go unattended to, and, as waiting will not suit householders, they must go to the dealers.

It is really most disgraceful that in England a man cannot be supplied with what he orders, though he makes no demur about the price, and is prompt in payment, but must find his cellars filled with the commonest coals when he ordered and paid for the best. I suppose, however, that it is with coals as with many other things, there is not sufficient of the best to supply the demand. If this is so, the householder who has ordered the best should be told so, and should be honestly told what sort of coals he can have and the price. If then coals and price are accepted there can be no just ground for complaint.

A Cheated and Indignant Householder.

PAPERHANGING.

A correspondent, signing himself "An old D-Trap," writes:—As a paperhanger, although not the regular paperhanger, will you, through your many artistic correspondents, obtain for me some information about "Drop blocks," so wasteful, so very perplexing, and, shall I say, so outrageous; and it seems not to be confined to our own, but to French goods as well. How can it be prevented?

Another correspondent to whom the above was shown sends the following reply:—

Sir,—To make a design "drop" in the hanging is an expedient resorted to by most artists of experience to give greater interest to their designs, and to avoid the monotony of a constant repetition of the same form in unbroken lines all round a room. It has no influence whatever in causing waste; indeed, I am assured by a master paper-stainer of great experience, it most frequently is an aid to economy in quantity. The following instance is a case in point:—Assume that a room, 10 ft. 10 in. high, is to be covered with a design, 21 in. by 21 in. If it joins straight across, seven repetitions of the pattern must be cut to make one breadth, seven times 21 = 12 ft. 3 in., therefore the waste in every breadth is 17 in. If it "drops," 6½ prints (repetition) will be ample, the half print left at bottom of first breadth forming the top of the

second, and so on, the waste being thus reduced to only 6 in. in each breadth.

There can, of course, be no arbitrary rule, rooms being of all heights, and designs of all dimensions, the example taken being the standard size for good patterns. Any one who will work the simple problem for himself with designs of other sizes will find very similar results.

If the first breadth of a drop pattern fits the wall without any waste, "the regular paper-hanger" cuts half a print off the top of every second piece, not breadth, and that is all the waste involved, which is practically very little.

The idea that waste is occasioned by a "drop" pattern being a very prevalent misconception, I am pleased to have the opportunity to assist in removing it.

GEO. C. HAITE.

SMOKY SMELLS.

SIR,—In reply to R. K. Hervey's letter [p. 559], we may say that a similar job to that mentioned by your correspondent came under our notice about four months' back. On examination we found the joints to the 4½-in. brickwork forming the front of the flue very defective, and made worse by the carpenter driving a plug wherewith to fix the skirting-grounds when the work was green. We would recommend your correspondent to have the skirting and grounds taken down to the side wall containing the flues, also the flooring adjoining; cut the joist out should it run lengthways and close to the wall. Then carefully connect the plastering of the lower room to that of the upper. Take out the stove and mantle, render the wall at the back of the same, and as high up the flue as a man can reach; replace all disturbed, and his trouble (minus the builder's bill) will be at an end.

WILKES BROS.

THE GALE OF THE 14TH ULT.

SIR,—The paragraph in your last issue [p. 557] does not show the full gravity of this storm in relation to dangerous structures and loss of life. When a building, chimney, or wall is blown down, it very possibly ceases to be dangerous, and so fails to receive notice in that sense. In my district, the heavy parapets of four houses were blown over into the forecourts; a garden-wall was blown over, with the loss of one, if not two, lives; and several chimney-stacks were thrown down, breaking through more or less into the bedrooms. In one case, the slates were blown from a large roof, and, for the time, had possession of the street and adjoining gardens for a length of 100 yards. Yet I have only had to report upon three dangerous structures arising out of these matters, and, at this rate, the number of 100 reported at the Board of Works would represent several hundreds of accidents more or less dangerous to life.

The lesson we learn from these events is that much greater care is required in executing brickwork, slating, &c., in exposed situations, as well as care with respect to buildings that show signs of insecurity; for there is little doubt that, should a similar gale spring up from the opposite quarter, we should have a similar list of casualties to that now in question.

THOS. BLASHILL,
District Surveyor, Bethnal-green East and South Bow.

HOT-WATER PIPES IN LIBRARIES.

SIR,—I should feel obliged for an opinion from those who have had experience in the heating, by the hot-water system, of public and other libraries, whether any and what objection has been found to arise from the heat given off by pipes running round the room, close to the lower shelves containing books? And what effect has this system on the air of a room where the supply is given by windows and doors only? Would it not be better to place the hot-water pipes in the form of coils in the centre of the rooms, so that the binding of the books would not be affected by nearly immediate contact with heated pipes?

H. W. P.

BROMLEY SEWERS.

SIR,—At page 559 of the *Builder* of the 29th of October, you state that serious charges are made against me to the effect that certificates have been given and moneys paid for work not done to a large amount. I deny having done anything of the kind. A list of that portion of the sewers executed under my supervision is in the hands of the Bromley Local Board; and I court the fullest inquiry as to their value. May I ask you to insert this in your next?

JOHN GARTON.

ACCIDENTS FROM LIGHTNING IN GERMANY.

A TREATISE recently published in Germany by Dr. Holtz, of Greifswald, deals with the question of the progressive increase of cases in which buildings are struck by lightning.

The general results of Dr. Holtz's investigations are thus summed up by the *Rheinische Courier*:—

1. There has not been an increase of storms, nor is such to be apprehended in the future.

2. The increased danger from lightning arises from various causes, such as the continued destruction of woods and trees in the vicinity of inhabited districts. Formerly the numerous tops of trees, &c., served to divide the electricity. Another reason is the increased use of dangerous appliances in and about buildings.

3. These causes being strictly telluric and not atmospheric, and being constantly extending the sphere of their action, a proportionate increase of danger from lightning is to be expected in the future.

4. It is therefore necessary for the use of lightning conductors to be extended, and for the planting of trees to be encouraged. The use of dangerous appliances should also be, as far as possible, diminished, and the destruction of woods be restricted in some way.

The technical press of Germany has given currency to the opinions of Dr. Holtz, which open an interesting field for discussion on a matter of general importance.

TESTING TRAPS.

SIR,—Replying to your correspondent, Mr. Rankin [p. 560], I must in the first place remind him that during the whole of Mr. Hellyer's lectures no mention whatever was made of the momentum of the water in traps. The greater part of the experiments were arranged with a view of testing siphonic action. These two principles are governed by two distinct laws, and have no action in common. It must be remembered also that the experiments placed before the audience at these lectures were not so fixed as to display to those present the momentum of the water, or, in other words, make itself evident, neither was it anticipated.

With regard to the remark that I am eating my own words, I regret to say that there is some truth in it. I judged the "Eclipse" trap theoretically, but having some doubts about it applied the practical test. I must, therefore, apologise to my readers for having (though only slightly) misled them, and as Mr. R. doubts the truth of my assertions as to the action of this trap, he should have availed himself of the opportunity offered to test them for himself. I now repeat my assertion that on this point the action of the "Eclipse" trap is the same as the $\mathcal{O}$, as on reading Mr. Rankin's letter I again put the traps to the test on last Saturday afternoon, in presence of Mr. G. Davis (foreman to Mr. G. Jennings), Mr. J. Harsant, Mr. R. Panario, and several other soundly practical men of the trade.

As I have not seen the letters of Mr. J. Smeaton and Mr. D. Emptage, I cannot reply to them in detail, but think it probable that this will reply to the whole.

P. J. DAVIES.

ENGINEER AND CONTRACTOR.

SIR,—In your issue of the 22nd October, we observe an instance of one and the same gentleman figuring concurrently as Engineer to the Sewerage Scheme of a Somersetshire town, and as the successful competing contractor for a small road and sewer-making job in the neighbourhood of London.

Doubtless the Somerset Local Board is in happy ignorance of the Admirable Crichton-like qualities of its adviser, while on the other hand the directors of the Land Company that wants its road made, may, with readier means of information around them, be congratulating themselves on having met with a real live civil engineer of modesty sufficient to take work from them as a mere contractor.

And yet we, sir, as contractors,—pure, if not simple,—are dissatisfied with such a state of affairs, and address you to draw attention to the anomaly. We should like to have been among the competitors for the works of the Somersetshire town; but we cannot with justice to ourselves submit a tender to the judicial scrutiny of a gentleman who to-morrow may be in competition against us.

CONTRACTORS.

AN EAST END BRIDGE.

IF a bridge were built over the Thames where it is half a mile wide a rise of 1 in 20 would make the centre arch 86 ft. higher than the carriage way at the foot of the bridge. This added to the height at the foot of the bridge above the water level would make up enough height for ships to sail under the centre arch. Such a bridge might be built from Tilbury to Gravesend, and establish the much-needed communication between Essex and Kent. Where the river is only 1,320 ft. wide, the approach on each side might begin 66? ft. inland on each side, so as to gain the same rise. This could be done a very short distance below London Bridge.

A third alternative, which could be carried out anywhere, would be to build a diagonal bridge intersecting the river at such an angle as would give the rise required. Such, as for example, from Tower Hill to Rotherhithe.

W. SCARGILL.

The Padiham Local Board have decided to apply to Parliament for power to construct a new reservoir at Churn Clough, to hold 100,000,000 gallons, at a cost of 40,000*l*.

PROVINCIAL NEWS.

Hereford.—The 500th anniversary of Hereford Cathedral school has been celebrated by commencing the erection of a school-library in memory of the founder, Bishop Gilbert. In addition to the library two new class-rooms are being added, and arrangements are being made for isolating boys in case of illness. The works are being carried out from designs of Mr. Kempson, architect, and the contractor engaged is Mr. Cullis, of Hereford.——Three richly-carved Glastonbury chairs, designed by Mr. Kempson, have been presented to the chapel at the Hereford County College, by the Dean of Hereford. The carved work has been executed by Mr. Robert Clarke.

Lincoln.—The new road,—henceforth to be known as Yarborough-road,—on the west side of the city, connecting the West Parade (late Brick-yard-lane) with the Burton-road, was opened on the 19th ult. Hitherto, the only available route into the lower part of the city from the north-west district, at least for heavy traffic, has been *viâ* Rasen-lane, Church-lane, Minster-yard, Pottergate, New-road, and Silver-street, the Asylum-road being far too steep to be of much service for vehicular traffic. The new road is about 1,300 yards in length, and 40 ft. wide throughout. The steepest gradient is one in sixteen, the average being one in twenty-three. The work has been carried out under the direction of the City Surveyor, Mr. J. J. Henderson.

Liverpool.—At the meeting of the Health Committee of the Corporation of Liverpool, on the 20th ult., Mr. J. Barkeley Smith, the deputy-chairman, made a few remarks on the amount of work done by the committee during the year. The engineer informed him that in his department twelve miles and a half of tramways, including reconstruction and extensions, had been executed; 19,000 square yards of impervious paving had been laid on carriageways outside the tramway limits and in other streets throughout the city. The expenditure on paving works and tramways, &c., amounted to 200,000*l*. In the sewage department four miles of sewers were repaired, four miles of new sewers constructed, twenty-three miles of sewers ventilated, 500 ventilators fixed and manholes brought to the surfaces, 18 miles of public sewers cleansed, 1,325 loads of deposit removed, and 66 miles of public sewers flushed. The total expenditure in the sewerage department was 35,000*l*. The sewerage inspectors visited 10,000 places where complaints were made of defective drainage. The work of the building surveyor's department included the erection of 1,795 houses, 325 alterations of houses, 31 warehouses erected, and 164 workshops erected. In regard to 2,516 dangerous buildings, notices were served, besides 2,000 miscellaneous notices. The committee had every reason to be satisfied with the way in which the engineer's work was done. He was glad to find that their exertions to reduce the death-rate in the city had met with success. The death-rate during the year had been 26·2 per 1,000. The death-rate for the previous five years,—1876 to 1880,—was 27·5 per 1,000, and that for the five years from 1871 to 1876 was 29·5 per 1,000.

Hanley.—Mr. Harrison, C.E., from the Local Government Board, attended at the Town Hall on the 21st ult. to hold an inquiry in reference to an application of the Corporation to borrow 3,000*l*. for paving roads, 2,000*l*. for street improvements, and 600*l*. for a steam roller. The inspector reduced the item for a steam roller to 450*l*.

Great Yarmouth.—The Lands Committee of the Corporation of Great Yarmouth have resolved to subscribe 30,000*l*. towards the proposed docks near the entrance to the harbour. The area will be about ten acres and a half, and the cost, exclusive of land compensation, sidings, and warehouses, 70,000*l*. The docks will be 1,100 ft. long, and 400 ft. wide, with a depth at high water of 24 ft., and 18 ft. at low water. The length of quayage will be about 4,000 ft.

Wolverhampton.—Important alterations in the sanitary arrangements of the Wolverhampton and South Staffordshire General Hospital have just been completed. The hospital has been extended at various times, but these additions, it is said, intensified the sanitary defects of the building. Thus, the main drain was carried below the floor of the building, and beneath the out-patients' wing and the new laundry was an old culvert which carried the sewage into the town drains. These have all been taken up, and a new system of drains has been laid down, which are quite clear of all the

buildings. All the soil and waste pipes, as also the rain-water down-pipes, have been removed from inside, brought down outside, and ventilated, the whole of the waste-pipes being disconnected from the drains by open traps, and the soil-pipes carried above the roof. The whole of the work has been carried-out from the plans and under the direct superintendence of Mr. Geo. Hurst Stanger, C.E., the engineer to the Wolverhampton Sanitary Protection Association. The contract for the drainage has been carried out by Messrs. Horsman & Co., of Wolverhampton; and the contracts for the plumbing have been executed by Mr. E. Jones and Mr. J. Atherton, of Wolverhampton.

CHURCH-BUILDING NEWS.

Lockwood, Huddersfield.—Emmanuel Church has just undergone considerable improvements, including the erection of a carved memorial oak pulpit, in the Decorated style, with the top of open tracery work, filled in with brass grilles. An ornamental reredos is also among the work, which has been executed by Messrs. Jones & Willis.

Colchester.—The repair of the Church of St. Martin, Colchester, is now about to be commenced. This beautiful and interesting church has in the course of years been reduced to a state bordering on ruin. It was inspected by the members of the Royal Archæological Institute on the occasion of their visit to Colchester in 1878, and, at the suggestion of the late Sir G. G. Scott, the chancel ceiling was stripped and the fine fourteenth-century roof exposed to view. The present repairs are confined, for lack of funds, to the work most urgently required to preserve the fabric from the effects of the weather, and include the removal of ceilings and the opening and repair of roofs. The works are under the direction of Mr. E. J. Dampier, of Colchester, the contract being taken by Messrs. Gardner & Son, of Coggeshall.

Cannock.—On the 21st ult. the memorial-stone of the new parish Church, Cannock, now being rebuilt, was laid. The contract for the work has been taken by Mr. Thomas Williams, of London, for 2,430*l.* and he is carrying out the work under the superintendence of the architect, Mr. Nicholas Joyce, of Stafford. The church, dedicated to St. Luke, is of ancient date. It consists of a nave, with north and south aisles, chancel, and western tower. The nave appears to have undergone considerable alteration at the time the south aisle was built in 1753. A great part of the north aisle was rebuilt in 1849. The chancel was the oldest part of the church, in the style of the first half of the fourteenth century, but this had been altered considerably since its erection. Evidence of its having had three different roofs is found by grooves on the east wall of the nave. The last was a modern hipped roof, by which the building was much disfigured. In order to effect the desired enlargement of the church, the entire removal of the chancel was unfortunately inevitable. This will be re-built further eastward, and the style of architecture of the old chancel has dictated the character of the whole of the new work. Two new bays, each about 15 ft. wide, will be added to the length of the old nave and aisles, affording additional accommodation for 240 persons. The western tower will remain as at present, except that the parapet will be repaired and the old angle pinnacles, which are now wanting, will be replaced.

St. Ewe, Cornwall.—The parish church has been recently re-opened after renovation. The architect was Mr. James Piers St. Aubyn, of London. The building exhibits many interesting features, and, unlike West-Country churches generally, has a western spire. The old wagon-headed carved oak roof of the south aisle, and those in the north transept and porch, have been restored; whilst the chancel, nave, and south aisle, have been newly covered. Most of the windows are new, and are in "Wild Duck" stone. Encaustic tiles line the avenues and the chancel floor. There is a new parclose-screen, and the church is seated generally by open benches. The windows are filled with stained glass, by Messrs. Heaton, Butler, & Bayne, of London, and Messrs. Fouracre & Watson, of Plymouth. The chief feature of archæological interest in the building is the exceptionably fine old Perpendicular rood-screen. This is of carved oak, groined on both sides, and full of much handsome detail. Screens of this sort, although common in several of the western counties, are rare in Cornwall. The screen has been underpinned, and a new sill put in; it has been lengthened a bay at each end. Mr. Harry Hems, of Exeter, was entrusted with this work. The general contract, amounting to 2,500*l.*, has been carried out by Mr. William May, builder, of Pool, near Camborne.

STAINED GLASS.

Warminster.—A stained-glass window has been placed in the Chapel of St. Boniface, Warminster. The subject represented is the "Crucifixion," with the figures of St. John and the Virgin Mary at either side. The window is from the studio of Mr. Charles Evans, of Fleet-street, London.

Mitcham.—A painted window has lately been erected in the north aisle of Christ Church, Mitcham, to the memory of Mrs. Ann Nobes. The subject is "Charity distributing her Gifts to the Poor," and underneath it is the appropriate text, "I was an hungered, and ye gave me meat." An ornamental canopy and base are introduced. The window, has been designed and executed by Mr. Charles Evans.

Brighton.—On the 7th ult. a five-light window was placed in the chancel of All Saints' Church. The centre light contains the figure of our Saviour. On each side are figures of the evangelists. The tracery is filled with foliage work, and emblems of our Lord's Passion. The window was the gift of members of the congregation. In the south aisle of the same church is a three-light window, and tracery containing the subject of "Christ healing the Sick." The window is the gift of the curate, the Rev. F. L. Meares. Both windows were designed and executed by Mr. Geo. Rees, Lamb's Conduit-street.

St. Leonard's-on-Sea.—The large east window of St. John's Church has recently been filled with stained glass. The subject represented is the Crucifixion, with the Magdalene kneeling at the foot of the Cross; while on either side are standing figures of St. John and the Virgin Mary, and the two pillars of the church, St. Peter and St. Paul, as expounders of Christ's teaching. Under each of the lights are subjects relative to the life of St. John. There are angels at the top of each light looking towards the figure on the cross. The window was designed and executed by Messrs. Heaton, Butler, & Bayne, of London.

Combmartin (North Devon).—A memorial window has just been placed by Mr. James Staples at the east end of the chancel aisle of the parish church. It is a lofty window, with four lights. In the tracery are the figures of the four great prophets, and above them two angels. In the two middle lights are represented the Ascension of our Lord and the Last Supper; in the left-hand light the Call of St. Peter from his Boat and Nets; and under this, his Receiving the Keys. In the right-hand light is represented the Descent of the Holy Spirit on the Day of Pentecost, and below this St. Peter preaching. The window is the design and work of Messrs. Lavers, Barraud, & Westlake.

Books.

The Book of Scales. By Ambrose Wheeler Holohan. London: Longmans, Green, & Co. 1881.

This book is principally designed for the use of students preparing for entrance into the Royal Military Academies at Sandhurst and Woolwich, but will be found of service by architects' and engineers' assistants also. It gives a larger number of examples, and is more illustrative, than any previous treatise on the subject that we remember.

VARIORUM.

We have before now spoken of the usefulness of Dr. Wershoven's "Technical Vocabulary, English and German." The same publishers, Hachette & Co. (King William-street), have now issued a similar little volume in English and French,—"Technical Vocabulary, English-French, for Scientific, Technical, and Industrial Students." This will be found useful in technical schools, and by many persons besides. It is divided into subjects; and a French index and an English index at the end increase its availability.——"The A B C of Gothic Architecture," by John Henry Parker, C.B. (Parker & Co.), is intended as an introduction to the author's well-known larger works on the same subject. It is written simply, very fully illustrated, and should get into schools. We quite agree with the author that knowledge of this kind acquired in early days will be found useful in after-life, and is seldom forgotten.——"Luxury, Ancient and Modern," in the current number of the *Quarterly*, is a most agreeable piece of reading. The writer ends by boldly declaring "that we are better than our forefathers." A much worse case against the present time, however, could be made out than he presents.——In the new number of the *Nineteenth Century* the Rev. Canon Venables re-urges his opinion that the style of the new cathedral for Liverpool should be Classical, not Gothic, and that Sir Christopher Wren's original design for St. Paul's, with certain modifications, should be adopted. A poem by Mr. Tennyson in this number of the Review will probably take it through two or three editions.——*Knowledge* is the title of an illustrated magazine of science, edited by Mr. Richard A. Proctor, of which the first number is published. It is intended to bring the truths, discoveries, and inventions of science before the public in simple but correct terms,—to be, in fact, the minister and interpreter of science for those who have not time to master technicalities (whether of science generally or of special departments), and will cost but 2d. Messrs. Wyman are the publishers. It ought to succeed.

Miscellanea.

The Tunnel under the Severn.—The Great Western Company's tunnel, four miles and a half long, under the Severn,—which is to be the new highway of traffic from South and Mid-Wales,—is progressing more satisfactorily than at any previous period. The streams of water which flooded the heading, and suspended operations there for a time, have been confined to manageable limits, and the difficulty of ventilation is also overcome. The working of the exhaust-system is so successful that at nearly a mile from the mouth of the shaft the air is fresh and agreeable, and blasting can be done without any danger to the workmen. The engineer anticipates that the tunnel will be completed within five years. It is stated that a good many geological secrets have been discovered while the work goes forward, and among them this, that a spring cut in driving the heading,—full 40 ft. below the Severn,—drew its waters from strata containing very large deposits of salt.

Stonehaven (N.B.).—St. John's Chapel has been re-opened, after alterations. The building was erected in 1859, and was the gift of the late Mr. John Beattie, Stonehaven. The alterations have added considerably to the sitting accommodation in the church. The work has been carried out from the designs and under the personal supervision of Mr. John Watt, Fetteresso, and the contractors for the work were:—Messrs. Gregory, mason; James Murray, jun., carpenter; James Burness, plumber; George Valentine, slater; Alexander Cormack, plasterer; and G. R. Taylor, painter and glazier.

The Whitmore Memorial, Bridgnorth, has been unveiled. It consists of a fountain, surmounted by the figure of Sabrina (goddess of the Severn), in bronze. There is a bronze medallion of the late Mr. Henry Whitmore, who was member for Bridgnorth in five Parliaments, Lord of the Treasury, and Keeper of the Privy Purse to the Prince of Wales. The Whitmore family were proprietors of Apley, and the greater portion of Bridgnorth, for many centuries.

Messrs. Unwin's Premises, Blackfriars. In the account which we gave of these new buildings on the 1st ult., we spoke of the very good basement which they contain. We may add that this is exceedingly well lighted by the use of Messrs. Hayward Bros. & Eckstein's pavement lights, which have given perfect satisfaction to the owners.

Royal Institute of British Architects.—The opening meeting of this Institute for session 1881-82 takes place on Monday evening next, the 7th inst., when the president, Mr. Street, R.A., will deliver an inaugural address.

Newton, Chambers, & Co. (Limited).—The Directors give notice that no further application for shares in the new company will be received after Thursday next, the 10th inst.

West-street Wesleyan Schools, Leek.—Extensive alterations and improvements have been made in these premises. In the large room on the first floor, for instance, used for public purposes, an orchestra, of amphitheatrical form, has been introduced, giving accommodation for a large chorus, and at the opposite end a gallery supported on pillars has been erected, increasing the seating capacity of the room. The old low flat ceiling has been taken out, and the roof timbers wrought to show themselves constructively. There are now in all twenty-six class-rooms for separate teachers, as against ten on the former arrangement. The larger ones are about 24 ft. by 20 ft., and the rest about 15 ft. by 13 ft. This increase will relieve the large room of the class-teaching on Sundays; and it will be used on that day for the general assemblages of the scholars. The works have been carried out to the plans and under the superintendence of Messrs. William Sugden & Sons, architects, Leek. The contractor was Mr. T. S. Bromage; and the painting and plumbing have been done by Mr. H. Stevenson. Mr. Mark Sutcliffe has fitted up the hot-water system; and Messrs. Gent, the electric bells.

Iron under Fire.—The London Stereoscopic and Photographic Company have published three excellent photographs of Messrs. Foster & Co.'s premises in Cheapside, burnt out in September last, and which serve to show the remarkable way in which the ironwork resisted the fire on that occasion. The fire at these premises, it will be remembered, was of a very extensive nature, and the contents of the building were of a very inflammable description. The columns, moreover, were all fully exposed to the action of the fire, as they had no coating (except the paint). The construction adopted by the architects, Messrs. Ford & Hesketh, appears not only to have thoroughly tied the walls together, but probably was the means of preventing the entire collapse of the building during the progress of the fire. The architects might usefully give a full account of the work. The ironwork was supplied by Messrs. Measures, Bros., & Co., of Southwark-street.

Native Guano Company's Show at Aylesbury.—On Wednesday last week this Company held their first show of farm and garden produce at their Sewage Works at Aylesbury, when a company of gentlemen assembled to witness not only the system pursued by the Company in dealing with the raw sewage of the town of Aylesbury, but the products derived from the use of their manufactured native guano. The visitors were struck by the extraordinary size and quality of the productions. The total number of specimens on view was 6,777. The mangels were of excellent quality, as were also the swedes, and called forth keen competition between the farmers of the Vale of Aylesbury. At a luncheon, given in a marquee on the ground, several practical farmers bore testimony to the high fertilising character of the Native Guano Company's manure.

Large Map of France.—The French War Office is preparing an elaborate map of France, on a scale nearly twice as large as that of the Staff map at present in use in the army, the result of a survey specially made by military officers. The sheets, some of which are already completed, are to be engraved by the zinc process. By the use of a great variety of colours much practical information will be afforded, such, for instance, as the condition and elevation of the roads, while even the existence of meadows and vineyards will be noted for the first time.

The Roman Villa at Wingham.—In the Roman villa discovered at Wingham by Mr. George Dowker, the portions brought to light recently are worth inspection. Two of the rooms have ornamented tesselated pavements, and a third, which appears to have been a bath, is decorated also upon the walls with tesselated work in black and white, of which it would be difficult in this country to point to another example. Wingham is only about two miles from the Adisham-road Station on the London, Chatham, and Dover Railway.

Bequest.—The late Mr. William Ward (who died on the 26th of October) has bequeathed the sum of 100*l.* as a legacy to the Builders' Clerks' Benevolent Institution. Mr. Ward was the uncle of Mr. Thomas Peto Ward, the founder of this excellent charity, and the above bequest is the first that has been made to its funds.

Rettie's Patent Scaffold Fastener appears to be getting into use, and, as it seems to us, deserves to do so. It is simple and durable, and saves labour.

Cheadle.—Certain alterations are in progress at the Primitive Methodist Chapel, Cheadle. The chapel will be re-seated in varnished woodwork, and a panelled wall dado will be formed out of the old seat-framing, and painted a dull green. A double vestibule entrance is being built at the front, carried up one story only, and finished with an inscribed pediment and balustrade; above which the main wall (with three-light window) sets back. Internally, the present flat plastered ceiling is stripped off and the timbers of the roof encased with reed boarding, considerably increasing the cubical content. The addition of a small porch at the back will protect the entrances to schoolroom and chapel at this end from cold draughts. The schoolroom on side of chapel is divided from it by a balustraded arcade with sliding shutters, as it is intended to form part of the chapel at large gatherings. The total cost will be about 500*l.* The builders whose tenders have been accepted are Messrs. Samuel Waugh, William Ball, and William Shufflebotham, all of Cheadle. Messrs. William Sugden & Son, of Leek, are the architects.

Builders' Benevolent Institution.—The offer of a hundred guineas, made by an old friend of this Institution, if twenty other friends would give ten guineas each, has been nobly responded to, *three times* that number having sent in their names. The annual dinner took place on Thursday, the 3rd of November, Mr. George Burt, J.P., in the chair. The total amount of the subscriptions and donations announced during the evening was 1,436*l.* 7*s.* 6*d.*, including the hundred guineas referred to and one hundred guineas given by the Chairman. We reserve our report for next week.

Hereford Surveyorship.—Mr. Kenworthy, mentioned in our last as one of the selected, wishes it to be stated that upon ascertaining that private practice was not allowed, he immediately withdrew his name from the election and did not attend the meeting.

The Artisans' and Labourers' General Dwellings Company have purchased a new estate of about ninety-eight acres at Hornsey. The directors are now considering plans for the development of the estate.

TENDERS

For cast-iron, earthenware and brick sewers, and other works at the Sutton Coldfield Sewerage Works. Mr. E. Pritchard, engineer. Quantities by Mr. E. J. Parnell. Contract No. 1.

Wilkes & Co., Bishopsgate, E.C.	£28,653	0	0
Bottoms Bros., Batterseа	21,500	0	0

A New Book on Architectural Æsthetics.

IF we go so very wrong on the subject of architecture in the present day, it is, at all events, not for want of writing and talking about it. Here is a book of nearly 500 pages* devoted to the consideration mainly of the right theory of architecture, what it means and how it is to be pursued. It is, perhaps, doubtful, whether the writing of any number of treatises on this subject will materially influence the practice of architecture. If theories of the art are propounded in literary form, however, it is to be desired that they should be recommended if true, and criticised if false. Now, a good deal that Mr. Eidlitz propounds is true, and some of it is put in an original and thoughtful manner, which merits consideration.

It is not necessary to go into that part of the author's work in which, for the fiftieth time, the view which regards architecture as a mere assortment of ancient styles is denounced. It has been denounced in these columns over and over again, as well as by well-known individual writers in separate treatises. There are a large number of practising architects at the present moment who would fully join in the denunciation; perhaps the majority of those who are of good status in the profession. But such is the force of circumstances and of habit, and of the necessity of making a living, that the very men who denounce the literal reproduction of past styles in theory adopt it in practice; and in many cases their employers would have nothing to do with them if they did not. In some of his remarks the author is hardly fair to the prevalent principles of architects. "Buttresses where there is no lateral pressure, arches of lath and plaster where there is no abutment, columns which support nothing," are not really very common occurrences now with architects of any professional standing. But, for all that, there is a point in the question,—"How many are there who are willing to forego a tower where it is not needed either physically or æsthetically?" Not many, it is to be feared; and for this kind of tendency the competition system is in great measure responsible. This system is sharply condemned in another part of the book, on other grounds, to which this one might have been added.

The central idea of Mr. Eidlitz's preaching, however, so far as architecture is concerned, is the necessity of working from within outwards, if we may so say, in maturing an architectural design, and the paramount importance of constructive knowledge and constructive stability and fitness. "The modern architect," he observes, "but rarely refers an architectural composition to the idea which has given rise to it." and this is a very comprehensive statement of the radical deficiency which is at the root of most of the failures of modern architecture, and which, though not intentionally on the part of any one, is fostered by the system (if system it can be called) of architectural education in England. A pupil learns the style of his office, and the style of his office is the style in fashion at the time. His ambition, if he is a hard-working youth, and desirous to excel, is to make as many sketches as possible of old buildings in the approved style; and his first object when he has a building to carry out himself is to turn these picturesque sketches to account, by introducing them in his elevations and perspective view. Thus, in designing a house, the idea predominant in his mind is not that of a dwelling with so many rooms in convenient relations to each other, and adequately lighted, warmed, drained, and ventilated. The first idea is that of an exterior exhibiting the details and incidents peculiar to the favourite style, within which it is hoped the required rooms and sanitary provisions may be arranged. There may be a feint of doing the plan first, but the real object is the picturesque (or supposed picturesque) exterior.

In reference to this part of the subject, Mr. Eidlitz does good service in pointing out the misleading influence of what is usually called "taste" on the minds of the architects and those who profess special interest in architectural art. What he says is too true; the architect's *taste*, that is, his acquired prejudice in favour of a certain style of the past, "takes the place of reasoning, of study, of knowledge, of judgment, of facts, of ideas, of everything which is a motive of action with other men; and it is his taste which has done more injury to architecture than any or all other causes combined. . . . The architect wilfully abandons the experience of centuries" [*i.e.*, we presume, practical experience] "not because he denies its value, but because he dislikes the use made of this experience by others." A practical sanitarian builds a well-constructed but ugly house; the architect of "taste," instead of aiming at improving the occasion by building a well-constructed and artistic house, says, in effect, "This is ugly,—buildings in such a century were beautiful; let me build one like them," without reflecting that the said buildings were what the men of their time really required, and that it by no means follows that the men of this day require the same stamp of building: he observes that sanitary authorities build ugly houses; he resolves, therefore, to have nothing to do with sanitary matters, since he is emphatically an artistic architect. That is about the position of the matter, and very absurd it looks when put down in a definite form on paper, although many architects act practically on that theory throughout their professional lives, and are encouraged in doing so by their friends. There would be less serious objection to this position, perhaps, if we could be sure that the "taste" which is thus made the predominating influence were the right one or the best one; but there is obviously nothing to determine that, for what is right to one generation is wrong to another. Of the will-o'-the-wisp nature of taste, Mr. Eidlitz adduces as an example the prejudice in favour of Venetian architecture which Mr. Ruskin has been led into. He says, "The architecture of Venice heightened in its picturesque effects by an Italian sky and the ever-present Adriatic, and hallowed by historical reminiscences of the wonderful power and success of a handful of patricians and merchants during several centuries, has left upon the sensitive mind of Mr. Ruskin an indelible impression which dulls his perception to the beauties of architectural art outside Venice, and blinds him to many glaring defects of Venetian architecture itself. Why is he not equitable and just in his judgment, through the mere force of his natural taste?"

Why, indeed? For probably the eminent writer referred to has a more cultivated and refined "taste" than any but a very small number of his contemporaries. Again, says the author, "think of the period of Louis XIV., the Rococo of the European Continent, the palaces of the great built in forms so vile and unmeaning that we regret the tardiness of time and the elements in not wiping them off the face of the earth. . . . . Are we warranted in assuming that the architects of the Rococo were endowed with *taste*? And yet all Europe thought so in their time." The test in regard to architecture is not merely that vague sense called "taste," but it is taste subordinated to logic, to a consideration of the relation between what was wanted and what has been accomplished,—between what ought to have been expressed and what is actually expressed.

In other words, every building should be designed to express the idea of that purpose for which it was erected, and this idea is to influence, not to be influenced by, its style and decoration. The building being in the first instance (in all but very exceptional cases) a structure to fulfil practical necessities, the method of its arrangement and construction is the most important element of all, and that which should most decisively influence its expression. This is what Mr. Eidlitz adopts as the leading principle in architectural design very decisively; and though we need not tell readers of the *Builder* that the view is not a

* The Nature and Function of Art, more especially of Architecture. By Leopold Eidlitz, Architect. London: Sampson Low & Co., 1881.

new one, some of the arguments and illustrations which he adduces in support of it, as we shall mention just now, are somewhat new and very forcibly put. We may say, however, first, that he certainly under-rates the importance of the part played by architectural decoration in contributing to true architectural expression. In Chapter IV. he attacks rather decisively a dictum of Ruskin's, that architecture begins where that which is merely necessary leaves off. Ruskin does not, certainly, in the quotations which the author refers to, put the matter in a very logical or convincing manner. It is unquestionable that what is necessary to the plan and construction is the foundation of architecture; but for all that, it remains true that architectural art resides not merely in these necessities, but in giving due and suitable expression to them. One quotation which Mr. Eidlitz criticises is this of Ruskin's,—"I suppose no one would call the laws architectural which determine the height of a breastwork or the position of a bastion, but if to the stone facing of that bastion be added an unnecessary feature, such as a cable moulding, that is architecture." This is certainly not fortunately put, and we half suspect that if we had the context (the author gives no reference for his quotation) we should find the meaning of the sentence would have some modification. At all events, we know very well that the addition of that or any other form of ornament would not raise the bastion to the rank of "architecture," unless the said ornament in some way assisted the expression of the erection by emphasising some principal point in its construction. The idea of making structural works into "architecture" by adding some ornamental features to them is the very heresy of which the engineers are constantly guilty, and which we have complained of over and over again. But Mr. Eidlitz, in commenting on this, goes too far. He says:—

> "The reflections called up in our minds on reading all this may be stated as follows:—If Salisbury Cathedral, for example, were stripped of every statue, ornament, and moulding which now adorns it, of everything 'unnecessary' to the stability of the cathedral as a structure, would not the naked structure which remained still tell the story of a Christian idea and of the emotions of men imbued with that idea; and would it not thus continue to contribute to the mental health, power, and pleasure of the beholder, and remain a work of architectural art?"

It might still remain a work of architectural art as regarded planning and construction, but it would be a very unmeaning pile. The building would lose not only all its beauty, but most of its expressive meaning. The application of ornament should always have reference to the structure: but, if so applied, it is only carrying the author's own principle one step further. The general distribution of the plan and section expresses the practical objects of the building; the ornament carries the expression further, by its own beauty of detail, and also by its distribution so as to emphasise the leading points of the construction. In this respect it is quite true that a very little ornament well designed and well placed is of much greater value than a profusion of ornament placed without regard to structural expression. But with no ornament at all (it must be remembered that the writer is including mouldings, cornices, and base courses under the general term "ornament") very little expression could be obtained: and architecture *is* expression. Building without expression is simply *building*, not *architecture*. What is required is that the actual necessary facts of the building construction should be realised first, and that the ornamental features should be the higher and clearer expression of these, and in that case they are an intrinsic and important element of architecture. They are not so only when they are thought of and designed first for their own sake only, and the structure merely regarded as a means of exhibiting them.

Mr. Eidlitz is more successful in his next chapter, on "Illogical Reasoning," in pointing out that forms, such as the forms of leaves in nature, are not necessarily beautiful in themselves and in every situation, but are beautiful relatively to their situation, and as the expression of certain conditions of growth. On this account, Ruskin's theory that pointed arches are beautiful because they remind us of the pointed forms of leaves (which the author quotes to show its weakness), is manifestly absurd; indeed, we really did not remember that Mr. Ruskin had ever been guilty of such an absurdity in architectural criticism. Mr. Eidlitz, however, makes a blunder himself in the same sentence, in denying that a pointed arch is especially strong, and that a lintel is a weak form of construction. He must surely be aware that the pointed arch is stronger at the crown, and exercises less lateral pressure, than the round arch, and that the circumstances of its introduction clearly show that this was a main consideration in leading to its first adoption. He must be aware that the lintel is a wasteful form of construction (in stone, at least), using the material in the way which gains the least amount of strength in proportion to its mass.

Architects, on the other hand, will be obliged to the author for the decided tone in which he speaks of the pretensions of lay critics and patrons. Art, he says, can be successful only when pursued for its own sake; architectural art submits to popular interference in the very process of creation. The modern architect "puts his thoughts upon paper, and before he executes them submits them to laymen for approval. There is no art or trade,—there never was one in this world outside of modern architecture,—which is found to be willing to court popular criticism and to abide by its decision before its works are executed. The architect submits to laymen a design of what he intends to do, and thereby admits, what is utterly false, that laymen are competent to compare a series of such designs and select the best, or that they can form a correct judgment of any one of them." A good commentary on the competition system, in which the employment of professional judges is still exceptional. When the subject is a dwelling-house, however, the owner has certainly a claim to see what his architect is going to provide him with in the way of accommodation, and it is hard to say that he is not to have any voice in the appearance of his house, if he really have an opinion on the matter. Most people for whom drawings are made, however, have really nothing worth calling an opinion; they have generally seen something else that they like, perhaps under quite different conditions, and want to have it imitated. They would in most cases be much wiser, if they have got the services of a good architect, in trusting to his judgment, and the architect would often be much wiser if he showed more decision and gave a more decided opinion as to what was best. Architects are often far too complaisant to the owner, who, in reality, requires to be guided, and would, perhaps, in his inmost heart be thankful to the architect who would make up his mind for him, but he is not likely to adopt that line when he sees no evidence that the architect himself has any decided opinion.

The second half of Mr. Eidlitz's book treats of the "nature of architecture," considered under various heads,—"Ideas," "Form and Construction," "Proportion," "Style," "Analysis," &c. The best suggestions in regard to the expression of an "idea" in architecture are contained not in the chapter headed "Ideas," which appears to us not to lead to anything very practical or even tangible, but in that on the "Definition of Architecture," in which are some critical suggestions well worth considering. "A community is supplied with dwellings, school-houses, churches, theatres, libraries, assembly-rooms, and courts. They all afford shelter to the same individuals in various combinations, but under different conditions. It is to the nature of these conditions that we must look for the idea expressed in the structure." The author goes on to say that if these groups are the result of mere physical convenience, then the structure fitted to accommodate these groups is merely a work of mechanical art. We are not sure about that conclusion being inevitable; but, at all events, this way of putting it recognises fully what is so much ignored in modern architecture, the importance of the plan as the basis of architectural expression. What is said on this head is so well put and so suggestive that we will quote it at some length, as an example of the author's style of writing and reasoning:—

> "But if these groups are organised to express an appreciation of an idea illustrated by acts performed within the walls of a structure, either by word, motion, or sound (music); and if by their grouping they indicate an emotion, which is the result of the acts participated in, or merely perceived by the senses; and if the structure is so arranged as to express, or at least to betray in its form, in the modelling of its masses and parts, in its decoration and colouring, an adaptation and expression of the presence, order, magnitude, number, and relation of the groups accommodated in its interior,—then this structure is a work of fine art expressive of an act illustrating an idea. * * * * * *
>
> A meeting-house containing nothing but closely-packed sittings, wherein men and women are stowed with economy of space to listen to a discourse from a pulpit crowded against a wall, is not a work of fine art; for the position of the audience does not indicate an emotion, say the worship of God, which is the result of an act in illustration of an idea, say our dependence on God and His universe, of which we are but an insignificant part. Structures of this class, indeed, perform the act of sheltering men from the inclemency of the weather, but not an act which is the result of an idea. On the contrary, such a structure is merely the result of a physical necessity, for the meeting-house, like the barroom, is constructed for the mere purpose of human stowage, without reference to any possible act of the audience beyond mere existence, and is strictly prohibitory in form and expression of any demonstration which is the result of an emotion. When the men who listen to the discourse make any motion, it must be to leave the place. The limits of the structure forbid any method of grouping other than that of a series of equal human quantities, which have but one desire, viz., to be accommodated without being crowded, and to be protected from the sun and rain.
>
> But when, on the other hand, we see a structure providing for a combination of groupings various in magnitude, elegance, dignity, and richness, which combination, in part or as a whole, represents certain acts of these groups,—say prayer, praise, confession of sins, exhortation, the partaking of the Communion, baptisms, marriages, funerals, ordinations, processions of various kinds, and consultations, such as we find embodied in the nave, aisle, choir, cloister, chapel, vestry-room, chapter-house, and baptistery, of a cathedral,—we may then say that such a structure denotes acts which are the result of ideas, and that it assists the congregation within it in the performance of acts explained by their resultant emotions."

This is really a very good way of stating the distinction, felt by all persons of artistic culture, between merely utilitarian buildings and those which are essentially architectural in their structure and design; and it serves also to indicate the true basis of the relation of plan and structure to what is generally called architectural design, making these qualities part of the design, and not, as the school of Ruskin and his followers teaches, a mere material basis to be overlaid with "design." This point the author elucidates further in some sensible and logical remarks which we have not space to quote. It is on this ground, we presume (though it is not directly so stated), that in another portion of the work (the chapter on "Analysis"), the author makes a plea for the æsthetic suitability of the Mediæval three-aisled church, which many practical men have condemned for modern places of worship. The writer says that "a congregation of men and women spread equally like a plaster over indefinite space is not a picture worth seeing; in fact, it is not a picture at all; it has neither foreground, middle ground, nor background." This is true enough, but it does not follow that the artistic grouping which is desired might not be attained by other means than by interposing columns or piers between part of the spectators and that which they wish to see and hear. We doubt, again, the criticism that follows in regard to railway station construction and the large-span roofs now used, which are objected to as merely a kind of *bravura* construction, unnecessary and opposed to true architectural economy as well as to picturesque architectural effect. "Posts, columns, and piers cannot possibly, in such a structure, intercept anything worth seeing. There is everywhere an abundance of space for these between the tracks." We must deny that a large railway station built on ranks of iron columns would be as convenient or fitting as one with a single-span roof. There are, for instance, officials to whom it is important to see what is going on in every part of the station,—the station-master, for example; and in some stations the carriages are hauled about for shunting by horses which walk in the "six-foot," and very likely those conversant with railway-station work could bring forward other objections. Nor do we see why the fact, that the temptation to make these large roofs "may be found in the love of displaying a mechanical effort," should be necessarily any objection. The love of displaying mechanical effort had a good deal to do with some of the *tours de force* of vaulting in the Middle Ages, which we now admire.

The chapters on "Proportion," "Style," "Ornament," and "Criticism" contain matter which merits more consideration than can be bestowed in the closing paragraph of an article, and we will devote some more words to them in another number; for, in spite of our doubts above expressed as to the ultimate usefulness of theorising, a writer who puts forth a serious and thoughtful effort to improve the theoretic basis of architectural art has a claim to careful consideration at our hands, whether in the recommendation of what seems true, or the criticism of what we think to be wrong.

East Looe Church Competition.—It is reported that the Committee have awarded a London architect, whose motto is "Britain," the first place, and a Cornish one "Thoroughly Good," the second premium of 10*l*.

PRACTICAL SCIENCE IN ENGLAND AND ABROAD.

The industrial energy of the United States affords an example which may be advantageously followed in Europe. It is a matter of some wonder to those of us who can remember the railway system in its cradle, and who are personally aware of the immense start which, five-and-twenty years ago, the forges, the factories, and the railways of England had and held over those of Continental Europe, to see how the spirit of enterprise has spread its wings from our shores. It is to Berlin that one great electrician goes to carry first into practical effect his electric railway. It is from the Alps that the first practical experience, so precious to a mining people like ourselves, in mechanical rock-cutting, and in the application of compressed air to the purposes of mining, is to be derived. And now, in that last new development of the doctrine of the convertibility of the physical forces,—lighting by dynamic energy,—we find ourselves at a distance behind the United States such as must be measured rather in fractions of a century than in portions of a year.

A glance at the map of the United States, with its straight lines of demarcation, so different from those afforded by either the political or the physical geography of the older world, may serve to impress the imagination with a sense of the rapidity with which scientific invention is carried into practical use in America. From Albany to Great Salt Lake is a distance of 38° of longitude. From New York to New Orleans is a distance of 12° of latitude; Akron, (in Ohio), Wabash (in Indiana), Denver (in Colorado), lie wider apart than do Paris, Brussels, and Berlin. From each of these distant points, in one single, and, so to speak, casual, letter from an American interested in the progress of electricity, comes the same story. We regard with a mixture of pride and wonder the few experimental steps which, chiefly at the risk of French, and partly of English speculators, have been taken towards lighting parts of London and some other towns by electricity. Neither in England nor on the Continent have there yet been established general lighting stations, to supply electric light after the fashion of gas-works. In the United States, we are told, "no considerable city is without such an institution." At Salt Lake City an arc-light company has for some months supplied electric light to miscellaneous customers. In Denver, Colorado, a city of 35,000 inhabitants, above 200 arc-lights are supplied to shops, hotels, &c., by a company; the light in each case being furnished at from 20 per cent. to 30 per cent. below the price of gas, as well as being much greater in quantity. The Salt Lake company is said to have been the first in the world to supply electric light in direct competition with gas. The returns to the proprietors are lucrative in each case.

The subject is attacked in America precisely as, thirty or forty years ago, the manufacture of gas was introduced into our smaller towns. A local company is formed, which, of course, has the advantage of the experience attained up to the latest hour. A concession from the patentees of the system chosen is arranged for. Ground is bought, buildings are erected, and engines, boilers, dynamo-machines, and the whole light-producing apparatus are purchased and erected. Powerful engines are employed, with fly-wheels weighing from 8 to 10 tons, in order to have steadiness and uniformity of motion, the absence of which is evinced by that flitting, firefly-like pulsation of light with which we have become familiar on the banks of the Thames. We have not heard of the application of water-power to the service, but of its adaptability near some of the great rivers of America there can be no doubt. Wires are conducted either under or over the streets, to be tapped where required, in the same manner as gas-mains. Automatic contrivances, for the purpose of turning light on and off at pleasure, are supplied with the lamps, which are visited and kept in order by the servants of the company. The result appears to be the advance of electric lighting all along the line.

The use of masts or towers of the height of 200 ft. for the lighting of squares and streets is becoming general. The city of Denver is lighted from lofty towers, and for the price formerly paid for gas four times the area is now lighted by electricity. In the city of Albany 300 electric lights, placed on alternate blocks, have replaced some 2,000 gas and oil lamps. Akron, in Ohio, is lighted from towers; and Wabash, Ohio, by four lights on the steeple of the Court House. In New York there are competing companies, one of which is now supplying 1,000 lights to shops, and is providing for 4,000 more. Most original of all is the application of this source of illumination at New Orleans. In the fever-haunted delta of the Mississippi the comparative coolness of the night is now selected for running the races of the Jockey Club by the light of electricity.

The tariff of the American light companies charges a fixed annual sum for electro-motive power, according to the number of hours for which it is supplied. The companies provide and maintain the lamps; the consumers supply their own carbons. The average price is about 30*l.* per annum for a 2,000-candle light, which is equal to 125 gas-lights of 16 candles each. A shop requiring twenty gas-burners would be better lighted by an arc-light of the strength of 100 gas-jets. In giving this,—the electric light companies' statement,—it must, however, be remembered that for many purposes number and nearness of lights will be more important than actual quantity of light radiated from a single point. As to this, however, we can only oppose scientific scepticism to actual practice. The Americans seem to have found out, in spite of the inconvenience of single points of illumination, that they are on the right track.

We are not writing with the view of recommending our readers hastily to subscribe for any new project of electric light companies, such as we may fairly anticipate will make its appearance in sequel to the above account. But still less do we recommend negligence of the subject. In case of the matter attracting that attention which it seems to us to deserve, we recommend those who take an interest in it not to be satisfied with mere second-hand reports, however brilliant and exact. In point of fact, experience would say, "The more brilliant they are, the less are they to be accepted without proof." What seems to us desirable is the appointment of some steady, cautious, intelligent engineer to visit the American gas-lighted cities as an English commissioner; to see for himself the mode of lighting; to measure the intensity of the light as it comes to the eye; to ascertain the prices, not of the electric light only, but of gas, coal, and other matters with which it has to co-operate and to compete. An impartial and exhaustive report on the electric lighting of the cities of the United States would be a professional paper of such importance that we hope it will not first emerge from the hands of a volunteer or the agent of a speculation.

CONTINENTAL GATHERINGS.

In Germany, at the present moment, a taste for the national art, more particularly the architecture, which at the period of the Renaissance possessed such a character in the land of Dürer and Holbein and their prolific contemporaries, strongly prevails. It is not, it will be seen, that phase of the Renaissance which with us is now in vogue, and which has safely crossed the Atlantic, where, we learn, a new theatre has been recently erected in the Empire City in the "colonial Queen Anne style." In Germany the style chosen is that of the Early, or rather Middle, Renaissance. To Nuremberg, the home of Dürer, we learn from the *Zeitschrift für bildende Künst*, can be traced the origin of this revival. In 1874 Herr Bergau, an architect, having built in that most quaint of the old cities of Germany a house for one of his clients in the style of the Landhaüser of the Nuremberg patricians of the sixteenth century, with all the surroundings in keeping, the garden, the interior decoration consorting with the old furniture, while the modern comforts were in no way neglected, the effort met with immediate encouragement. Herr Bergau found himself amply occupied with commissions from the wealthy merchants of the city; among these one had a ruined castle in the neighbourhood completely restored and furnished in the old style; others contented themselves with the more modest satisfaction of seeing their rooms at home and offices restored in regular "Alt Nürnberger Stil."

In a rather tardily-published review of the architectural drawings at this year's *Salon*, our contemporary, *L'Art*, in speaking of the presence of a number of the competitive plans and sketches for the monument to the French Constituent Assembly,—mentioned by us in these columns some months since,—seizes the occasion to praise warmly the system of architectural competitions. It is a matter of congratulation, remarks our contemporary, that in spite of the protestations of certain established artists, the custom of public competitions, so beneficial to the cause of art, tends daily to become more developed. It is no longer a matter of doubt that all those who take part in such struggles issue from them more skilful and more experienced than they went in. Such contests are a powerful means of artistic education, and in the present day a stimulant of the most fruitful nature. At certain epochs which have possessed a style of their own, which had the good fortune to count among their artists undisputed masters of their art, we can understand that the direct commission produced excellent results; but at present, whatever be the amount existing of individual talent, such is not the situation. Our age is groping its way, and it will alone find it by adopting logically a system which is approved by public opinion, and which in reality is the result of general insufficiency, and of a crowded artistic career. The struggle is open to all, except those who consider it beneath them, and it is difficult to believe that any artist, with the programme of a competition before him, can resist the expression of his artistic conception. Of what is he afraid? The partiality of the jury? But public opinion, that of his brother artists, will invariably prevail, and it can be said that apart from certain exceptional cases, the meritorious works are never overlooked, and when by chance an artist is a victim to injustice, he may feel assured that he loses nothing in the opinion of his professional brethren. Why should we think much of some amount of personal annoyance if the cause of art gains, and if by means of this contact with public opinion it tends to be brought home to all? The enjoyment and appreciation of art must not remain indefinitely confined to the critics, the art-lovers, and purchasers. Our contemporary congratulates, on this ground, the French Minister of Fine Arts for having opened to competition the proposed colossal monument to be erected at Versailles; for, in the competition, while several of the more eminent architects have declined to take part, not a few young and almost unknown men have been brought forward, and against the merit of those rewarded not the slightest demur has been made; if originality seem wanting it may to a great extent be attributed to the binding nature of the programme. Respecting the actual results, our contemporary has only one regret to express,—a regret, on comparing the competition of to-day with that held fifty years ago for the familiar column of July, that in this half-century so small an artistic progress in originality has been made. Here is the position to which we have been led in France by the system of instruction which is called "classic," remarks our writer,—the preconceived idea which carefully sets aside from the education of the young student all that is not Greek or Roman. Let antiquity, by all means, be fully studied, nothing better, but that we should persist in believing that it is sufficient to cull with more or less skill from those great sources details and motives to suit modern programmes, and in this manner to succeed in expressing the conceptions of a new art, is to condemn our age to sterility, or at least to mournful commonplace. If the education were broader, if our academic instruction adopted some of the ideas put forward within a few years past, and the lessons which the critical study of many generations now places at the disposition of the artist, we should not be long in seeing the present state of things modified, for talent and imagination are not wanting; but the ground must be prepared: we must not oblige our artists from the very commencement of their studies to confine themselves to a restricted circle of ideas, which limits their power of thought without satisfying their reason and aspirations. Our extract has been lengthy, but it is interesting to see expressed in full from a foreign source the feeling in the matter of competition that in this country has so many adherents. It is well, too, that young students at home should learn from the experience of their brethren abroad, and understand the true value of, and the lessons to be obtained from, defeat in the "struggles," as our contemporary has put it, of their youthful career.

The cost of the colossal Brussels Palais de Justice, which is now being erected, is a striking instance of an exceeded original estimate. The work, as many of our readers may know, is far from being terminated, and hard upon two

millions sterling have been already expended. The original figure of the estimate was some twelve millions of francs, about half a million sterling. When the huge work was commenced, when the late lamented burgomaster Anspach was in power, the city of Brussels agreed to pay a sixth of this half million, but now the expenses have increased so enormously that the municipality have lately endeavoured to avoid the payment of the seven millions and a half of francs, which is the claim against them. The Brussels municipality have, however, been brought to law by the Government, and it has been decided that they will have to pay a sixth of the total cost of their new law-courts, whatever that sum may be. The wealthy and industrious little Brabant capital will, however, find it no great difficulty to pay the bill in spite of the numerous other and bigger items which it has had within a few years past to settle for its building activity. The changes in the old town are appreciable to those even who may visit for the first time the characteristic Belgian capital, whose charm, a rare feature, has only been added to by the spirit of modern improvement. In few cities in Europe, it may fairly be said, can the old and the new be seen side by side in more friendly and enhancing company than in Brussels. It is interesting and especially instructive, in speaking of modern improvements in Brussels, to notice the recent statement made by a correspondent of the *Pall Mall Gazette* to the effect that since the once befouled and reeking little river Senne has been closed,—over it now runs the grand Boulevard Centrale,—the average length of life in Brussels has been increased by two years, a fact striking enough, we consider, in its suggestiveness.

We have before now spoken of the building activity in Vienna. The Austrian capital at this moment is following wildly the example of Paris; in every direction building is going on, and, as is so invariably the case in great capitals, more particularly at the west end. Those who may remember the feverish period of Hausmannisation of 1872 and 1873, which was followed by, if it did not in a great measure hasten, the terrible financial crisis, the *crac* of the latter year, will, on revisiting the banks of the blue Danube, see those days revived, but without any of the unwholesome excitement that accompanied that movement. On the Franzen's Ring is being built a whole series of gigantic palaces, of which the two first opposite the Volk's Garten, two vast twin palaces of monumental architectural features, are intended to be occupied by the National Museum of Painting and Sculpture; here also will be placed and shown regally the magnificent collections of the Belvedere, the Ambras collection, and various other works of art belonging to the State, scattered throughout the city; a little farther on, on the Parade Platz, another monumental building is being erected for the University, at present in very narrow quarters in the old town; opposite rises a new theatre in the Teinfalt Strasse; and in various directions, but in the same neighbourhood, are rising colossal houses in the style of those which border the "Ring." Near the Belvedere are being built a number of private residences, and the municipality are daily expected to give their authorisation to the plan proposed of transforming the familiar Prater into a Bois de Boulogne.

THE EVER-RECURRING QUESTION OF THE URBAN ACCOMMODATION OF THE WORKING MAN.

A RECENT report of the Dwellings Committee of the Charity Organisation Society calls attention to a subject which has been often seriously discussed in our columns. It is, indeed, one on the due settlement of which the future of urban architecture must in no small measure depend. It is the ever-recurring question of the housing of the very poor.

The question has attained its present magnitude and urgency chiefly from our national reverence for the great rule-of-thumb principle. We are not about to speak with disrespect of what has been a characteristic of the English people at all events since the year 1066, and it has become a classic axiom with us that institutions, including the institution of building cities, in order to prosper in our islands, must grow indigenously from the soil. *Civitas nata, non fit.* At the same time it cannot be denied that there are inconveniences attendant on the plan of never attempting to foresee, and thus to prevent, any inconvenience arising under the unchecked influence of the principle of growth. As London and other great centres have increased in age they have increased in population. The older parts have at the same time increased in value of site, while the buildings have grown more and more dilapidated and unfit for the requirements of modern life. This has led to two changes. Along the main lines of traffic, to which the old ideas of trade still cling, and where the actual exposure of goods to the passer-by is yet considered to promote their sale, new dwellings have arisen, calculated, or, at least, intended, to serve the needs of the retail tradesman. We need not here refer to the fall in the value of such sites which is now being effected by the concentration of custom in certain stores. In the back streets and side ways, at the same time, where there was less temptation to the proprietors to go to the expense of rebuilding, as the houses became older, more decayed, and more shut out from light and air, the class of tenants has descended in the scale of wealth and ascended in numeric amount. More and more tenants, at lower and lower rents, have divided houses, floors, and even rooms between them, and thus have grown up the nests of dense population which have obtained the melancholy but significant name of Rookeries. And thus as the whole population has increased, and as the distance between the richest and the poorest has increased at a still more rapid rate, the question of decent accommodation, near his probable work, for the decent artificer, has become more and more perplexed. The whole process has been artificially complicated and disturbed by the needs of internal communication, which have ploughed the deep furrows of railways and of new streets through our cities, thereby necessarily displacing an undue proportion of the smaller householders and their tenants.

It is evident that if this state of things could have been foreseen a plan might have been adopted by builders of cities which should have carried out, on an adequate scale, the natural growth of the infancy of towns. The main features of that infancy depended on the gradual clustering of minor dwellings round the castle of the lord. For hamlets to grow to well-proportioned cities, it would be requisite either to reserve proportionate areas for the humbler and cheaper dwellings, or to rear large and many-chambered dwellings, such as the Spanish and Portuguese monasteries, or the Italian *Alberghi dei Poveri*. To this, however, the independent ownership of the area of our cities has presented an insuperable obstacle. Each landowner has striven to do what seemed best for himself. Each has forgotten that by bringing his private plot of ground into a common stock, and by receiving his corresponding share of the income of the best arranged possible plan for well-ordered buildings, he would ultimately derive more from his ownership than would be possible in any other way.

Here, then, from time to time, we apply patches; but each patch helps us but little, and that for the two reasons that it is so small and so costly. We are reminded that a population nearly equal to that of Ireland is crowded into the 122 square miles of London, increasing in its density from circumference to centre. The population of a town of large size, some 60,000 inhabitants, is annually injected into this limited space. It is now twenty years since the munificent bequest of Mr. Peabody founded a new system of lodging-houses. But what was adequate for the London of 1860 is quite inadequate for the London of 1880, and it is not so very far an outlook to the London of 2,000 A.D. The Peabody buildings, we are told, comprise 2,355 dwellings, or 5,170 rooms, and are occupied by nearly 10,000 persons, at weekly rents averaging 4s. But this rent is four times that which the very poor can afford to pay; and the possibility of sitting at this rent has only been secured by two contributory causes, neither of which is of a purely business kind. One is the provision of the building fund at a low rate of interest; the other is the sacrifice in the value of the sites, which is said to amount to about half a million sterling. This costs the ratepayers 280*l.*, or 7·5*d.* per annum, for each family so housed. This is hard upon 3s. a week. Thus, given the elements of the value of urban land and cost of building on the one hand, and of limitation of the rent that the working man can afford to pay on the other, the provision of decent and reasonably rented abodes for the poor in the centres of population is one that is quite insoluble on merely commercial principles and data.

Here comes in the question of relief by railway accommodation; and no doubt this is a very important element in the case. But it is far from a simple one. The sites on which we have just seen that it cannot pay to build are left vacant, which pays still less. Then comes the question of the proper setting out of the districts to be inhabited by the workmen along the lines of railway. This is a matter which, if we leave to regulate itself, may in another generation repeat the evils from which we are now suffering in an exaggerated form. Then comes the question of the limiting distance, fixed by the cost of railway travelling. The wisdom of Parliament has provided for the carriage of the working man at a penny a mile. If the companies stand on their rights, that means a shilling a day,—six shillings a week, to be added to the rent of rooms, six miles beyond a metropolitan terminus. It is true that all the companies carry for less than this tariff. But it is also true that they, one and all, have refused to allow any impartial and exact investigation of the question, what does it cost,—in actual expenditure per ton per mile,—to convey third-class passengers, in given numbers by appointed trains. And it must be allowed that the Government regulations as to stopping at every station which were intended to benefit the third-class passenger have directly the opposite effect. As far as working expenses (exclusive of interest on money) go, it would cost less to convey 500 third-class passengers from St. Albans to Moorgate-street without stopping by the way, than it does to convey the same number from Praed-street to Moorgate-street, stopping at each intermediate station. As to this, we can, if required, give detailed proof.

We therefore cannot too strongly urge upon all those persons who, like the Charity Organisation Society, feel the necessity of looking a few years ahead as to the urban accommodation of the working classes, to do their best to secure the thorough investigation, scientific and practical, of the questions to which we have called attention. Where to build, how to build, how to give access to, and at what price to serve, the working-man's quarters of the metropolis, will hereafter become very embarrassing questions, if their solution be left until we are still more in the thick of them.

THE LAST AND MOST IMPORTANT LINK BETWEEN THE EAST AND THE WEST.

TELEGRAPHIC advice from Berlin announces the concession, to the well-known Baron Strousberg, of "a railway along the valley of the Euphrates." No public work out of England has hitherto been suggested which is of more importance to the commerce, the prestige, and the military security of the British Empire than such a line. In the *Edinburgh Review* of January, 1879, was an article on "The Road to India," which rather resembled an official summary of the main facts of the case than an ordinary review article. The writer commenced by showing that as far back as 1834 the Government of the Duke of Wellington had regarded the subject of a communication with India along the old line of Eastern traffic to be of sufficient importance to send out an expedition for the survey of the river Euphrates, down which it was proposed to steam, and "for the elucidation of the question of the best mode of communication between the Mediterranean and the shores of India." The information collected by this expedition, which was under the command of Captain Chesney, with the local rank of Colonel, was so voluminous that it has only partially been published. Comparatively few persons are aware of the existence among the archives of the Admiralty of large scale surveys of the course of the two great rivers, the Euphrates and the Tigris; of a sketch map of the entire district; and of a section, 140 miles long, from near the mouth of the river Orontes, by Antioch and Aleppo, to the banks of the Euphrates near Beles, some 1,000 miles from its mouth. The river, the lower part of which is very tortuous, is, of course, much longer than a railway on its bank might be. The total length of railway, from the ancient war-port of Seleucia, near the mouth of the Orontes, to Grane, or Sonedia, on the Persian Gulf, is stated at 934 miles.

In 1861 the Euphrates Valley route was declared by the *Times* to be "the most important question of the day." "When it is considered," said that journal, "that the proposed Euphrates

Railway will not only supply all the facilities demanded for commerce, but is to shorten the journey to India by almost one-half, the changes impending in this region will appear to claim greater attention, commercially and practically, than any at present to be looked for in other quarters of the globe." In July, 1872, a Select Committee of the House of Commons, with Sir Stafford Northcote in the chair, reported, after hearing the evidence of twenty-eight witnesses, in favour of the construction of a railway "from some suitable port in the Mediterranean to some other suitable port at or near the head of the Persian Gulf."

The time occupied in the voyage to India is thus stated. By the Cape, the old route, it would take from ninety to 120 days to steam from Portsmouth to Bombay. By the Suez Canal the voyage may be accomplished in from twenty-six to twenty-nine days; but the stoppage of the Suez Canal may any day be effected by a very small quantity of gunpowder or of dynamite, the explosion of which would choke this narrow waterway by foundering a vessel in its channel. The time necessary for getting from London to Bombay by making use of the existing line of railway from Calais to Brindisi, and of the Euphrates line from Selencia to Grane, would be, according to figures given by that very competent authority, Sir Henry Tyler, R.E., 349 hours, or fourteen days and a half. If Kurrachee be taken as the Indian port, instead of Bombay, the time can be reduced to 307 hours, or twelve days nineteen hours. By making use of the existing route to Brindisi, and steaming from that Italian port through the Suez Canal, Bombay may be reached in 451 hours (a period which will be extended to at least 500 hours during the monsoon), and Kurrachee in 435 hours. There is thus a gain of from four days nine hours to six days ten hours to Bombay, and five days eleven hours to Kurrachee, practicable over the greatest speed with which the transit can be at present performed.

It may well be asked, "What is it worth the while of Great Britain to expend, in order to reduce the length of the journey to India by five days, or 35 per cent of the interval, measured in time, that now separates them?"

But saving in time is not all that has to be considered. Not only is a line drawn from some point on the Syrian shore to the Upper Euphrates, and thence running parallel to that river to the Persian Gulf, where the sea route recommences, shorter, by 18 per cent., than the Red Sea route at its best, and by more than 20 per cent. during the monsoons; but the whole of the shorter route lies north of the tropic of Cancer. On the present line there is a navigation of 800 miles down the Red Sea and the Gulf of Aden after crossing the tropic of Cancer. The Straits of Ormuz, at the mouth of the Persian Gulf, down which the traffic of the Euphrates line will come, are 200 miles north of the tropic. Thus the Red Sea route is not only 700 miles longer than that by the Euphrates, but the whole of this distance, and about half as much more, are exposed to a fierce tropical heat, from which the travellers by the Euphrates line will escape.

The distance by land from the shores of the Mediterranean to Antioch is 13¼ miles. By the course of the river Orontes it is 41 miles. The difference of level is 269 ft., which gives an average fall of 6 ft. 6 in. per mile for the river, and a gradient of 20 ft. per mile for the railway. From Antioch to Aleppo the difference of level does not require a mean gradient sharper than Mr. Stephenson's original allowance for the Birmingham Railway, 16 ft. per mile.

As to cost, Mr. Andrews, who has for many years advocated the construction of this important link in our communication with our vast Indian dominions, states that the construction of the Punjaub line was attended by far more physical difficulties than appear likely to stand in the way of the construction of the Euphrates line. The transport of material was very costly on the Indian Railway, while for a great portion of the Euphrates Railway the rails and other heavy articles can be brought to within small distances of their destination by water carriage. The Punjaub line was also constructed on the 66-in. gauge, whilst the 56½-in. gauge will no doubt be used on the Euphrates line. The Punjaub line complete, including stations, telegraph, and rolling-stock, together with a magnificent terminus at Lahore, cost only 10,000*l.* per mile.

The exchange of merchandise annually between Europe and the Indian Seas was calculated thirty years ago at 1,300,000 tons, and at a value of 40,000,000*l.* Out of these articles of transport, such items as suffer materially from a sea voyage, and would thus be likely to make use of a railway, such as tea, pepper, and coffee, and also the various articles consumed in the countries on the Mediterranean, were estimated at 692,000 tons. It was further estimated that the carriage of one-tenth of the actual traffic which went by the Cape of Good Hope would pay 5¾ per cent. on the construction of the Euphrates Valley Line. The opening of the Suez Canal has modified these calculations in a double sense. It has greatly diminished the advantage of a railway over an ocean route, but it has at the same time stimulated enormously the traffic between East and West, and rendered the gain of five or six days on the voyage of far greater importance than before.

At the same time, evidence has been collected as to the actual transport between Aleppo and the shores of the Mediterranean, with which the Suez Canal cannot compete, which shows that the local traffic would amply pay for the construction of the 100 or 150 miles of line between the sea and the great river. 181,100 tons of goods were annually exported, in 1857, from Aleppo, and 179,800 tons passed through that city for export. The present cost of carriage from Aleppo to Antioch is from 4*l.* to 6*l.* per ton. Taking these 360,000 tons at the enormously reduced price of 2*l.* per ton would give a gross revenue of 720,000*l.*, or 7,200*l.* per mile, exclusive of passenger traffic, which on the Eastern lines usually amounts to about 40 per cent. of the general merchandise traffic. From Aleppo to Grane, the traffic would have to be created. But the line is the most ancient commercial route in the world, and but little doubt can exist that commerce would flow back to the ancient channel if reopened by modern enterprise.

So far, then, from the need of the Euphrates Railway being obviated by the opening of the Suez Canal, at no period of our history was it more important than at the present moment to open the line of the most rapid communication.

If it be true that the concession is obtained, it is clear that the weight of one of the first powers of Europe must have been thrown into the scale to ensure it, and that something more than a mere commercial speculation has been in the mind of that power. Under such circumstances it is not likely that the execution of the works will be delayed for want of funds. If it be true that a German contractor, backed by that aid without which he would have obtained nothing of the sort from the Porte, has a concession of the Euphrates Valley Railway, we may be certain that the completion of the line will take place at no very remote period of time.

The result of all this consideration is, that if the telegram be true, and if an appeal be made to the capitalists of Europe by Baron Strousberg for the money, we trust that the moneyed men, and the leading men, of this country will not hesitate to take such an interest in the enterprise as to secure the adequate representation of British interests on the Board. It would not be easy to deal a more deadly blow at the vital interests of Great Britain than would be effected by the construction of the Euphrates Valley Railway under such auspices as should, under circumstances to which we need not now more distinctly allude, prohibit that passage over the line of British troops which would be afforded to the troops of other and not friendly powers.

A NEW SOURCE OF COSTLESS POWER.

Costless power, if at all attainable, is so only by means of utilising wasted power; but the amount of power which, so far as regards mechanical effect, for the service of man, is wasted, is so enormous as to be practically boundless. It is in no small degree for this reason that the progress now so rapidly making with respect to both the transmission and the accumulation of power is of such cardinal importance to the future of the human race.

There are many modes in which it has been or may be proposed to utilise electric power in which this axiom has been forgotten. For example, it is very possible to attach a dynamic apparatus to a locomotive or railway train which should give light during passage through a tunnel. But then, the moment that the light was produced an equivalent drag would be put on the motion of the train; and as the steam power produced in the boiler is applied in a very costly way by a locomotive engine, the intermittent and brilliant illumination that could be produced by the train itself would probably cost more than the permanent illumination of the tunnel by petroleum lamps.

But if any motion which is not useful, or is specially one which is prejudicial, can be caught, as it were, flying, accumulated and stored up, we should regard the attempt with the utmost interest. The recoil of a gun is the most striking instance of this waste, being that, so far as the flight of the projectile is concerned, of nearly half the force of the powder. This waste constitutes the recoil. The utilisation of the recoil for the purpose of raising a heavy piece of ordnance on its mountings is thus one of the most legitimate objects of the artillerist.

In the same way, if it prove to be possible to utilise the lateral vibratory motion of a railway-train, which now all goes to damage the way or the plant, for the production of stored electricity, we might at the same time utilise power now wasted and produce a greater steadiness of running.

There is another waste movement, of a like nature, to the utilisation of which we now desire to direct the attention of the inventor. This is the roll of a ship at sea. There is very little doubt that the heavy rolling motion of a large ship is rather hostile than favourable to its progress. In the case of a floating body, which does not roll perceptibly at sea, such as the iron cylinder built for the conveyance of the Obelisk to the Thames, this is clearly illustrated. The naked negros sat astride on the great cylinder undisturbed by waves or surf, and the resistance to the tug was diminished in proportion to the steadiness of the unique vessel that it had in tow.

Now, supposing the accumulation of small power, in the dynamo-electric form, to be a solved problem, it seems to us that not only may our men-of-war be lighted gratuitously, or nearly so, but that greater steadiness of movement may be attained in rough weather.

We do not propose here to adduce a plan for this purpose, cut and dried. But we wish to point out that the object is attainable, and that by more modes than one (provided always that the accumulation is manageable).

Thus the vessel might contain a connected system of heavy pendulums, or of siphon-formed pipes in which water would act as the counterpoise, which at each roll from side to side would force a certain quantity of air through an air-pump, and thus, or even by direct mechanical action, drive a small dynamo-motor engine. Such an engine, *per se*, would be of little use in such a case. But if provided with adequate accumulative capacity, not only might enough power be stored up to light the whole vessel by night, but small cranes or capstans might be so fitted as to be able to do great service in emergency, and to give to the crew an aid far in excess of their own human power, mechanically regarded.

At the same time, whatever amount of power was thus caught from the rolling of the vessel would, in its transmission to the air-pump or other contrivance, have its reaction in proportion to its action; and this reaction would go directly to moderate the roll, and to steady the ship.

The only objection that we can foresee to this suggestion would arise from the fact,—if fact it be,—that the skin-friction, or resistance to the endlong motion of the vessel through the waves, would be increased if the roll of the vessel were diminished. On this point we desire to speak with reserve. But it seems to us that both the experiments of Mr. Froude, and the experience of the obelisk vessel, are against such a hypothesis. A steady vessel may be slower than a rolling vessel, because its keel is deeper in the water, and thus the cross-section is larger, and the skin-friction more in consequence. But give a greater steadiness, without increasing the skin-friction, and we anticipate that the resistance to endlong motion would be less, instead of more. We speak under reserve, with no pretence to dogmatise on the subject, but so at the moment it seems to us.

That the proportion of length of vessel to speed of propulsion is one of a very delicate nature we know from Mr. Froude's experiments. And we have not the slightest doubt that the mechanical saving which is to be effected by the designing and constructing of vessels with a due regard to the speed at which they are to be navigated, must be very much in excess of any possible loss that might be attributed to the control and utilisation of the roll. As to the

methods by which this might be effected we do not propose at the present moment to say anything more. We shall be content if we have called the attention of those princely shipbuilders who are ever on the look out for anything that may diminish the cost, and increase the speed and the comfort, of ocean navigation, to an entirely new field of inquiry. And we say the same with regard to those able men who are now making such brilliant and successful inroads into the darkness that veils the future. That the principle of accumulation of power will effect as great a revolution in ocean navigation as we are now dimly beginning to foresee that it is likely to do in the aid of the minor, or even of the major, industries of the day, we do not venture to assert. But we do say that the idea has enough in it to recommend it to the very careful consideration of those who have at their control the machinery for testing its truth. To steady a berth, a table, or a compass within a rolling vessel has long been a matter for consideration. But the idea of utilising the inconvenient motion which it is desired to counteract is that which we now suggest.

THE DESTROYERS OF FOOD.

In the interest of all who eat bread, who eat mutton, who drink beer, or who drink claret, we wish to call attention to the subject of a lecture which was delivered at the Agricultural College at Cirencester on the 20th of October, on the subject of insects destructive to food-producing plants. We have not seen a copy of the lecture itself, but as far as it is fair to judge from the abstract which has appeared in the daily journals, it would be well to have it printed for a penny, and widely circulated. For there is much good sense in the practical suggestion that while, on the one hand, it is desirable,—as we have long ere this insisted in these columns, —to complete and to publish a full and accurate account of all those pests which afflict the farmer, in the four successive stages of egg, larva or grub, pupa,—which is sometimes inactive as a chrysalis, and sometimes actively predacious,—and imago, or perfect insect, it is also most necessary to give some useful instruction to those who may have neither the means nor the capacity to profit by such lessons in natural history. Such is the good counsel to note the insect pest by his actions,—to watch for his destruction at those crises of his history when it may be most readily effected; and to destroy that aid, comfort, and sustenance which he may otherwise derive from the poor relations of the cultivated plants on which he chiefly preys. Such are the charlock for the turnip-fly, the nettle for the hop aphis, and the wild grasses for the weevils and other devourers of the corn crops.

Considering, however, that not a few of those who attend in youth an agricultural college are likely to do so for the sake of instruction which may hereafter be of value to them as emigrants, we should recommend any writer or speaker on the subject of destructive insects to commence with that family which, from the days of Moses (and long before) to our own, is most to be feared by man. We mean that tribe of *orthoptera* known commonly as the locust. Our indigenous representatives of this vast order,— the grasshopper, the cricket, and a few more,— can give little idea of the consternation caused by these creatures when they come in swarms. That they darken the sun is not a poetic, but a practical statement. In their steady march across the line of country on which they alight nothing that grows is spared. They sweep the face of the land bare; fire has no terror for them,—they simply march on to the bonfires made to keep them off until they stamp them out. No check, no remedy, no escape is known from a swarm of these creatures in their perfect state; but very much may be done by destruction of their eggs. In England we have perhaps little cause to dread the ravages of the *orthoptera*, though it must be remembered that every acre of ground that is allowed to go out of cultivation,—and we have 1,200,000 fewer acres under corn crops than we had in 1871,—becomes a fertile breeding-ground for noxious insects. Not only so, but negligent cultivation, scratching the soil with a hoe or even a donkey plough, allowance of the picturesque growth of weeds, idleness under whatever name it is applied to the soil, is as effective in the encouragement of insect pests as industry is in the improvement of the crops. As man fills and tills the wide wastes of the new world, the locust will gradually become less and less to be feared. But what noxious creatures may not spring from neglected tillage in older countries no one can predict, although the Russians are now learning. It is to be remembered, too, that it is not unfrequently the case that an injurious plant or animal, when introduced into a new locality, multiplies and spreads with astounding fertility. The hungry, ugly, sneaking black rat, that is at home in our sewers and neglected foundations, and that would readily make a meal on an infant in a cradle if left unwatched, is a foreign invader, and has almost entirely displaced the old English rat, which, if a predacious, is certainly a very beautiful, animal, much like a large dormouse, and of very domestic habits, and not, it is to be hoped, either so hungry or so prolific as the invader,— the Dane or Norway rat.

Again, the invasion of our waters by what has been called the "new weed," the "American weed," and the "thyme weed," of which the botanic name is the *Anacharis alsinastrum*, is a case of the extraordinary growth of a foreign pest. It was first found in England, or rather in Scotland, in 1842, in the lake of Dunse Castle, in Berwickshire. In 1851, the Rev. W. M. Hind, writing from Burton-on-Trent in July, says "it bids fair in a short time to block up one of the two streams into which the Trent here divides; and from the fact that the *Anacharis* is a dioecious plant, and that amid all the rivers and lakes into which it has spread in the vast area of country that drains into the Humber, no male plant has ever been found, it is concluded, with some probability, that the whole of this enormous mass of vegetation has sprung from a single plant, accidentally introduced on a piece of timber from North America.

With regard to the phylloxera, which has been attacked in France, Italy, and Germany with a system and intelligence such as has never been brought to the aid of the cultivator in the United Kingdom, it is even now a moot point whether it will not prove victorious over the vine-grower, and allow no respite from its attacks until it becomes extinct from the mere fact of having eaten up all its natural food. It is to be hoped that this will not be the case; but there is much fear that it will. The economic importance of these two scourges of the American and of the European cultivator is such as to lead any writer on the subject of destructive insects to call attention to the great importance of his theme by citing the most formidable cases of depredation.

It is very remarkable, however, to note how that counsel which three thousand years ago was given to the sluggard,—to go to the ant, consider her ways, and be wise,—is enforced on the same individual by insect preachers. It might be said by the ant herself, in the West Indies, and other tropical countries, meaning the white ant or termites. But this destructive creature is not really an ant. It does not belong to the order *Hymenoptera*, the bee and ant tribe, which contains so many carpenters, sawyers, masons, paper-makers, tapestry-hangers, and other insect building tradesmen, besides the famous makers of honey; but to the order *Neuroptera*, which includes the dragon-fly, for its size the most powerful of all creatures on the wing, and the most predacious of those of insectivorous habits in its perfect state. Industry, that is the moral of the story, is the source of wealth, as much almost by what it unconsciously as by what it consciously effects. The man who destroys weeds and keeps his ground clear, from industrious instincts, is rewarded by the destruction of the hiding places and feeding grounds of his insect foes at times when there are no crops on which they can subsist.

Art-Gallery for Wolverhampton. — A gentleman has written privately to the Mayor of Wolverhampton (Mr. J. Jones), offering to erect a building at a cost of 5,000*l.* for an art-gallery conditionally on the town providing a site. The donor has chosen the Mayor, the Rev. J. T. Jeffcock (rector), and Sir Rupert Kettle, as a committee to mature the plan and decide whether a museum shall be attached, and also to obtain promises of works of art, &c. When promises to the value of 10,000*l.* are obtained, or the committee are otherwise ready, the donor, who stipulates that the Mayor shall not divulge his name, will be prepared to begin the building. A site is selected near the public park.

THE PRESIDENT'S ADDRESS AT THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The following is Mr. Street's opening address, delivered on Monday evening last, as elsewhere mentioned:—

Gentlemen and Colleagues, — It is a time-honoured custom that the opening meeting of the session shall each year be devoted to a review of our position, the work we have done during the past year, the losses we have sustained, and finally, the openings which appear to offer themselves for the promotion of that which, above all, concerns almost all of us, —the advancement of the art to which we have devoted ourselves. We all know how much it pleases some of our critics to assert that the objects of this corporation are selfish first of all, and devoted to the improvement of the art and the science of building only in a very secondary degree. I need hardly waste words upon a refutation of such statements. I am content to point to the volumes of our "Transactions" for the most complete answer to them, as well as to the experience of those who have served on our Council from time to time. The real object of the Institute of British Architects is very different; we exist not only because of, but for, our art. It is not because we are architects that we band ourselves together in selfish opposition to the interests of the world, but rather that the interests of the outside world and of the profession may be harmonised and proved to be identical; and equally that our well-loved art may be more studied, more admired, better understood, and more widely practised, not only by ourselves, but by the public outside our ranks. The real interests of the public and of ourselves are identical. The obligation to carry on the business side of our work upon the highest rules of honour or integrity as between man and man is placed in the very front of the conditions of membership of this Institute. We admit of no compromise or conditions; and the condition of membership here is undoubtedly that of working thoroughly in the spirit and traditions of gentlemen. In addition to this, the practical work which we have to do is, by meetings, by reading of papers, and by discussions, to keep up and increase as far as we can the general interest in and knowledge of our art, without which neither accomplished architects nor an intelligent public will continue to exist. Naturally our work of this sort divides itself into that which relates to the scientific and that which is concerned with the artistic side of our art. I think there has of late years been rather a tendency to devote more time to the former than to the latter; but the art of building, the art of draining, and the like are exact, and do not admit of perpetual discussion. The development of attention to the study of novelty in construction is not always for the advantage of good building. Half the inventors whose circulars cover our tables every morning claim as the chief merit of their inventions that they are cheap, and I would that occasionally they convinced us that they were equally lasting. You will pardon me, I am sure, for frankly speaking my mind on an occasion such as this. I maintain that British architects are honourably distinguished for the way in which, as a rule, they deal with all those questions of new forms of construction, of water supply, of drainage, and of the general conditions on which comfort and convenience in our houses depend. English comfort is a proverbial expression almost all over the world, and our architects are fairly entitled to a large share of the credit of its creation.

I wish it were quite possible to make the same assertion with regard to our artistic successes. It strikes me more strongly, the more I think of it, that we cannot quite escape some responsibility for the bad work which is done by builders without our aid. How is it, one may fairly be asked, that, with an ever-increasing body of architects educated and trained more and more carefully, the vernacular architecture of the country becomes worse and worse every day? The vernacular architecture of a country is that which the carpenter, the bricklayer, the mason, the smith, or the plasterer does if left wholly to himself. We all know that the time was when little even of this work was wholly contemptible; take even the last century, and in such work one sees a simplicity and restraint in design, and an absence of vulgar display, which make one feel a charm in work most of which certainly never passed through

an architect's office. Go from the house built in the suburb of an English country town in 1750, to one of the houses which rise in countless numbers on all hands now, and your verdict as architects and as artists must always, I fear, be given in favour of the former. Compare the two and you will find that the taste of the eighteenth-century builder was for simple and good work before ornamental, so that he seldom came to the latter at all; whilst the taste of the nineteenth-century builder is to do everything for display, sacrificing the money which might have made his work at least substantial to an investment in so-called "ornaments" to the show fronts only of his house, which are costly to put up, costly to keep in repair, and hideous in their ghastly unfitness for their place. They have some compo keystones, ornamental railings and balconies, a few lumps of terra-cotta, "elegant" cornices and window-dressings, and highly-suggestive chimney-pots; and for the sake of these the house has walls and floors so thin that every sound can be heard throughout, and so weak that in a heavy gale you rock in your bed. For all this, of course, we are only indirectly responsible, but I do think that we must allow that too many, if not all of us, think too much of the fronts of our buildings, and so have practically brought up a whole generation of builders and workmen to believe firmly that all buildings ought to have a show front, whilst we so often sacrifice solidity to the pleasure of creating what we call ornament that we have led them naturally to assume that ornament is an object by itself to be clapped on to a building at all hazards, and even at the sacrifice of solidity. I should much like to see your attention more and more turned to this large and serious question. It deserves discussion and action. For, depend upon it, some screws must be very loose indeed in our system if all our work is so wholly outside the world as not to influence the vernacular architecture of the people for good. My only suggestion at present is that our duty is to show by example that simple building may be quite as good as extravagant, and that the essence of all good architecture is that it should be solid and lasting before it tries to be ornamental, and that ornament is a feature which grows out of utility, and cannot be applied to a building like a loose-fitting garment to cover defects or to distract attention from parts which are not supposed to be seen. It is unworthy of architects to build what is in its very nature ephemeral, and I wish heartily that, before all questions of style, this vital one of solidity were always present to us when we are making our plans. Depend upon it, the builders who have been trained by architects who never build what is not solidly and well constructed are much more likely to build for themselves in the same spirit and way, than they ever are if they have been otherwise taught. And, after all, it is the work done by builders without the intervention of an architect that we see wherever we move in this ever-increasing city, and in others similarly conditioned. It is work which it ill becomes us to treat as non-existing. It is, on the contrary, one of the very first necessities of the day that we should, in some practical way, deal with it.

There is another question to which the one just mentioned naturally leads, and this is one as to the extent to which we may be able to affect, in the interests of our art, the future architectural arrangements of the streets and buildings throughout our great cities. To state the case in this way is perhaps in fact to answer it, as far as relates to direct interference with or influence over what is done by municipal authorities; though as our Institute boasts properly that it is a British and not only a London institution, our object ought always to be to keep this fact well before us, and to act even out of London whenever the importance of the case demands it. In 1876 the late Mr. Wyatt, in the course of a discussion on Mr. Eastlake's interesting paper on the work and history of the Institute, told us that the author had omitted to mention one proof of the growing influence of the Institute. This he saw in the request which had just then been made to us, to exercise control over the designs and elevations of buildings in Northumberland Avenue; a request which became, I believe, a law to the extent of making it necessary that all these designs should be "submitted" to the Council of the Royal Institute of British Architects. Well, I know not, gentlemen, what the general feeling on this subject is now. Some, I know, agreed with the view which I took at the time, that the position we were taking was a dangerous one, and one that could do no sort of good to our art. The taste of the individual members of a council may be excellent; but there is an unwillingness on the part of a body of men to criticise too severely, or to agree in suggestions as to the alteration of, the work of a brother architect. Opinions differ round our own table as to what is best, sometimes even as to what is good, to such an extent as to end in approval being given to works in a general way to which probably every one of the Council in his own heart can see little good. Nor is this all. The elevations alone, which are not complete without plans, are submitted; modifications of a very simple kind alone can be and are advised, the advice is neglected, and the building is, after all, erected with little, if any, attention to the opinion of the Council of the Institute. In the end, if Northumberland Avenue ever becomes an avenue of buildings, the Institute will have to ask itself whether the control it has exercised has been sufficiently strong, and the result so good, in comparison to that of the streets in which we have not been able to interfere, as to justify Mr. Wyatt's satisfaction. For myself I have no hesitation in saying that it would be better, if we are to have no more power than at present, that we should have less.

I do not think it right to close the few words I have to say on the Northumberland Avenue question without endorsing what fell from my predecessor in this chair on the subject of architects who are members of the Metropolitan Board. He was speaking of the business relations which constantly bring members of our body, as well as the Institute itself, into correspondence with the Metropolitan Board of Works, and he concluded with the expression of an opinion, in which I concur so completely, that I think it only right to repeat it. Mr. Whichcord's words related to the composition of the Board. "Architects," he said, "may be elected members of that Board just as barristers, solicitors, and doctors may be so elected. It would be ridiculous to say that professional men shall not sit at that Board because they may have had a pecuniary interest in some of its public building transactions. But I shall run no risk of censure when I say that a Fellow or an Associate of this Institute, if he be elected a Member of the Metropolitan Board of Works, ought not, from that moment, to have any professional connexion whatever with the purchase of land offered for sale or lease by the Board; nor should he be professionally engaged in the superintendence of buildings to be erected on land which is the property of ratepayers whose agent and representative he is." Such a statement is so obviously right and beyond question, that I am sorry it should be necessary to repeat it.

Upon the broad question of giving general advice through our Council, I feel sure that the Government, or the governing bodies of our great cities, might well, and with advantage to themselves, consult us from time to time on the preliminaries of great building operations; and I have no sort of doubt that we should always be willing to give the best help in our power. Whether the points to be settled are the best routes for new streets, the best sites for great public buildings, or the best openings for architectural improvements, it would be advantageous to every one if the subject were laid before a committee of experts,—such as the Council of this Institute is,—for its advice and opinion. Take such cases, for instance, as the choice of a site for the New Courts of Justice; or as to the choice among various schemes for the placing of the New Government Offices which are even now required; or as to the conditions on which railways are to be brought into London or across our river, and it is obvious that our opinion might well be asked, and almost certainly be acted on, with advantage to the world and without prejudice to any one. In the last case, for instance, can it be doubted that, if we had been consulted, the House of Commons would never have allowed the London, Chatham, and Dover Railway to erect its bridge across Ludgate-hill, and to erect a second and almost equally ill-placed bridge across the Thames, within a few yards only of another built on wholly different lines? Nor would the South-Eastern Railway have been permitted to build the two gigantic and odious sheds on the river side, which have been the ruin of so much of the beauty of the matchless prospect. Such subjects lead me to say how useful a function this Institute might perform if it could keep a more active surveillance on the mode in which the works of deceased artists are dealt with. I am not among the passionate admirers of such a work as the General Post-office, but at any rate it was a consistent design, carried out in an honest and uniform spirit, and complete in outline and character. New wants have arisen since it was built; Rowland Hill has come and gone, and more and more accommodation is required. But it is almost beyond credence, that some of that increased space should have been obtained by a series of erections on the roof of the original building, hideous in themselves, and wholly careless of the effect produced, or even of having in themselves any architectural character at all higher than that of a third-rate house or workshop. Yet so it is. And perhaps it was because for years the porticos and colonnades of another great public building,—the British Museum,—were entirely filled with glass cases and partitions, without any outcry from the public or from us at such a defacing of a consistent and costly design, that the Government which represented the country was so heedless of the monstrosity of which it was guilty, when it made the additions to the Post-office. Nor is it out of place here to ask when the front of the Colonial Office in Whitehall is to be finished? Its architect evidently prepared for the erection of two towers or pavilions at the angles of the front towards Whitehall. His proposals were not acted on,—and there to the present day stands the building with its two most important angles evidently unfinished. Every day a large proportion of the members of both Houses of Parliament, and most of the Ministry, pass under the walls of this unfinished front, without, I suppose, one thought of the injustice done to the memory and reputation of one of the greatest architects of his time. Surely on such a question as this the Institute of Architects, if no one outside will move, ought to take some action.

Then, again, I hope we are all agreed that there is no work in which we can, as a body, do better service to our art, or more certainly show our real sense of its value, than by sturdily opposing all schemes for the destruction of existing works of architectural art, or constructions of historical or archæological interest. We have, as you know, a committee for the conservation of ancient monuments; it is a strongly constituted committee, and its existence cannot be too widely known. There is always work for it to do. Take, for example, the case of the City churches. It is no exaggeration to say for myself, what I doubt not very many of you feel also, that when I return from some foreign travel, and cross the railway bridge into Cannon-street, I feel a pride in the architectural beauty of the City of London, which is never lessened by contrast with what I have been seeing elsewhere. And to what, may I ask, is the beauty of this view owing? There is a magnificent river and a sublime bridge, but beyond and above these a cluster of towers and steeples, of so much variety of design, so skilfully treated, so picturesque from every point of view, as to afford unending delight. In the year 1800 there were 107 churches in the City, in the year 1877 only ninety-five remained, and of these there were no less than thirty-one scheduled as "at present" to be pulled down. Only the other day another of Wren's reputed churches, St. Matthew's, Friday-street, was said to be condemned, and though the particular case is not a strong one, it seems to me high time that this Institute should strain every nerve in order to save any more such regrettable destruction of the buildings to which London owes so much of its beauty. If architects stand by quietly, it may be assumed that there are no artistic objections to such work. We may still permit men to go on in the cheap and easy fashion of making our ancestors' piety and liberality pay for building and endowing churches which we, with all our increased wealth, choose to think we cannot afford to erect; and by the time that all the empty churches (consequent largely on a non-resident clergy) have been removed, and their sites sold for counting-houses, shops, banks, and what not, men will awake to the discovery that the architectural beauty of the City is a thing of the past, and that the loss is irremediable. At the West End I hope the same words of warning are not required. We have been appealed to in reference to a rumour that St. Margaret's, Westminster, was to be taken away. This is a constantly-recurring rumour. The newspapers probably think that every one

wishes it removed. They forget that it has just been refitted at great cost, that it is a building full of architectural and historical interest, and they are not aware that the builders of our great churches and cathedrals, being artists, had never any objections to the erection of small buildings near to, or in contact with larger ones, to which they gave infinitely more value and scale than they otherwise possessed. I am glad to be able to assure you, however, in this case, on the best authority, that there is no foundation whatever for the rumour. It is remarkable to notice how much is lost on all sides for want of some active hands to save threatened works of art. We look round on the Paris, the London, the Florence, the Cairo, the Venice of our youth, and find that on all sides work has been destroyed, apparently mainly for the sake of change, for the loss of which no new building will ever atone. In London there is the well-known case of the colonnade of Burlington House, taken away upon the understanding that it should be rebuilt, but lying in a mouldy heap somewhere on the other side of the river. In some similar limbo, we suppose, are the stones of Temple Bar, for the re-erection of which in some spot not far from its old place, such, for instance, as an entrance to Temple Gardens, one would suppose that funds might without difficulty have been found. Farther to the west is an even more interesting work,—the water-gate at Buckingham-street, Adelphi,—treated in an even more ingeniously spiteful way. For here the lovers of the beautiful have created a garden with lawns and shrubs and winding walks, which one would suppose might have been allowed to undulate as well as to wind. At any rate, even now the level of the garden might be lowered for some distance on either side and in front of the gateway, and Inigo Jones's work might again be seen in its integrity, instead of being earthed up to nearly half its height, and of having its archway used as a receptacle for rubbish, and the decay of its old stonework hastened as much as possible by the piles of damp earth and plants carefully placed against it by the landscape gardener. And, to conclude, there is the case of the church in Edinburgh, for taking down and rebuilding which, on a new site, stone for stone, the railway company were bound to, and did, provide the funds. Here, again, the stones remain in a heap, and the Corporation, unless they are much traduced, have kept the money for their own municipal purposes.

I might easily multiply examples of the same kind. They all seem to point in the same direction,—to the necessity in such a country as ours for the creation of a Government department of the Fine Arts, whose office should be not only to give order to our magnificent but often confused and inaccessible collections, but to take care that our national buildings and our historical monuments are classified and preserved as far as possible from further damage, either at the hands of time and weather, or at the equally-destructive hands of those who (as in the case of the Post-office) have no hesitation in wholly destroying the architectural character of a great public building. I believe that the appointment of such a ministry might be followed very soon among other things by an addition to our museums, which has often been urged strongly,—but hitherto unsuccessfully,—of a museum of casts. Every one admits the advantage to students of art of such a museum. Berlin has shown us the way, and the expense could not be so great as to be a difficulty in the way of so rich a country as this is. Moreover, it seems to be a necessary complement to the other collections which have been accumulated within the present century, as affording the very best means of educating the eyes of a people who are undoubtedly holding their own against foreigners in all artistic matters far better than they did before such museums were first of all formed. The collections at South Kensington, to which all who are interested in our art must always most gladly confess their indebtedness, contain, no doubt, a good many most valuable casts, but they represent only comparatively modern art, and even then are in no degree whatever complete, and they are not, as they should be, exhibited by themselves, or classified in such a way as to be thoroughly useful to students. I hope that we shall keep this subject well before us, and that no opportunity will be lost of pressing upon Government the sense that this Institute must feel of the importance of such an addition to our national collections. It is a feeling which is sharpened in us by the knowledge of the fact that such a museum would, to a very large extent, illustrate the close connexion which ought to exist between the work of the sculptor and that of the architect. The best works of the greatest sculptors have nearly always been their decorations of architecture; and the evidence of this necessary connexion before the eyes of the people is the best way of familiarising them with the fact, and of leading them to feel the want in our own buildings, in which, even when the architect has advertised his desire to see sculpture introduced, the spaces he has left for it are still, as a rule, conspicuous by their emptiness. The Government which, with a large and wise liberality, would deal with such questions as these, would secure for itself perhaps less temporary popularity, but would have the satisfaction of knowing that it more permanently benefited the highest interests of the community than it could by exclusive attention to purely political questions, and as such work ought to be independent of party, what one set of ministers undertook would not be likely to be undone by their opponents or successors.

At the recent Conference, the question of competitions led to much discussion, and the resolutions arrived at have been discussed by the Council, who will ere long lay before you the result of their deliberations. The position which I hope will be taken by you will be to arrange that in the event of a competition being indulged in, due securities should be given for really accomplished assistance, or advice, or judgment on the competing plans, not only in regard to technical questions as to compliance with conditions, but at least as much on true artistic questions, which are even more to be thought of and more vital. But it is, I hope, no part of our business or duty to do so much in the way of facilitating competitions as to lead the world to suppose that we are in any sense whatever admirers or encouragers of a system the defects of which, under the best arrangements, are so many and so patent that the best men keep themselves wholly or almost entirely out of reach of them, with the result that works which result from competitions are seldom those which we look back on with the greatest satisfaction.

Our Conference in its discussions leaned rather to the merely business-like side of our work; but let us hope that this was corrected in some degree by the visits paid to various buildings and collections in the metropolis. Of the latter, those to Buckingham Palace and to Sir Richard Wallace's were the most important. Probably we all regretted that the palace of our well-loved Sovereign was not more worthy, in structure and in decoration, of so great a monarch. Your Council desired me to express their sense of Sir Richard Wallace's singularly courteous treatment of us at Hertford House, in which I am sure I represented the unanimous opinion of our members.

Our numbers still continue to increase. Last year at this time the total number of Fellows and Associates was 716. The additions during the year have been 28 Fellows, 143 Associates, 9 honorary Associates, and 9 honorary and corresponding members; and deducting the losses which we have sustained by death or otherwise, our numbers now stand at 370 Fellows and 491 Associates, a net gain of 19 Fellows and 126 Associates. It is to be hoped that this large accession of new members does not mean that we are reaching a lower level of qualifications so much as that the Institute is becoming more recognised as the centre of our work. A large increase of members involves also an increase of our means, and additions to our library, which is rapidly increasing, and is now of great value. Another addition to our means of doing good work is Mr. Godwin's generous foundation for the promotion of the study abroad of modern structures and building improvements and adaptations. This has the special peculiarity of being open to all British subjects of any age, and though it is not educational in quite the same sense as most of our other prizes, it will, there can be no doubt, be of high value in its results to the profession.*

Melbourne Cathedral.—The *Melbourne Argus* of September 28th, says:—"A donation of 5,000*l.* has been offered anonymously towards the completion of the Anglican Cathedral, Melbourne, on condition that 25,000*l.* is contributed from other sources before the close of the year."

* The remainder in our next.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE opening meeting of this Institute for Session 1881-82 was held on Monday evening last, the President, Mr. Street, R.A., in the chair.

Certificates of Proficiency were presented to Messrs. Arthur Marshall, William Henry Thorp, Alexander Pope, and John Dent Harker, passed candidates in the Class of Proficiency at the twelfth and final Voluntary Architectural Examination, 1881.

The following gentlemen were balloted for and declared to be duly elected, viz.:—

As Fellows:—William Leiper, Glasgow; John Slater, B.A. (*Associate*), Bedford-row; Daniel Brade, Kendal; William Harvey (*Associate*), Whitehall; Capel Nankivell Tripp (*Associate*), Gloucester; Henry Thomas Gordon, Basinghall-street; and William Eade, Ipswich.

As Associates:—Robert Barton Morgan, Birmingham; Lawrence George Summers, Nottingham; John Tweedale, Leeds; Thomas Ames, Bathampton; John Henry Eastwood, Red Lion-street; Horace Thomas Bonner, Lewisham; George Elkington, jun., Cannon-street; Arthur Edmund Street, M.A., Cavendish-place; Arthur Edward Lloyd Oswell, Shrewsbury; George Thomas Poole, Southampton; James Martin Brooks, Wellington-street; Maurice Charles Hulbert, Queen Anne's Gate; George Borer, Finsbury-circus; John Henry Curry, Tulse-hill; Alfred Millwood, Hammersmith; Percy Paul Green, Hampstead; Edward William Mountford, Buckingham-street; John Wardle Bulcock, Blackburn; Arthur John Gale, Surrey-street; William Jacomb Gibbon, Oxford-terrace; Ernest Augustus Eckett Woodrow, Hornsey-rise; Walter Blackwell, Millman-street; Arthur Charles Bulmer Booth, Bennet's hill; James Tolley, jun., Cannon-street; Thomas Batterbury, Great James-street; Richard Mauleverer Roe, Leadenhall-street; John Malcolm, Queen Victoria-street; Henry William Peck, Gower-street; Joseph Porter Power, New Broad-street; Edward Alan Jackson, Chancery-lane; Henry Petit, Welbeck-street; Alfred Augustus Bonella, Montague-street; Henry Gregory Turner, Chancery-lane; Andrew Edwards, Red Lion-square; Peter Dollar, Great Marlborough-street; and Francis Lennox Canning, Westminster.

The President then delivered his inaugural address, the first half of which we print in preceding columns. The delivery of the address concluded,

Sir Frederick Leighton, P.R.A., said,—In obedience to the commands of the Council of this Institute, I rise to ask you to express, by a vote of thanks, your appreciation of the very remarkable address to which you have just listened. The duty thus placed in my hands is doubly grateful to me. As an honorary member of this Institute, I hold it to be a great privilege to be permitted, on such an occasion, to ask for this vote. As a member of the Royal Academy, I rejoice in the opportunity given to me of doing homage on his own throne to that efficient and devoted officer who sits on the right of the president at the councils of the Royal Academy. Gentlemen, I need hardly say that I do not propose to follow minutely the vigorous and lucid address to which we have just listened, but I would ask your permission to address to you one or two observations that have suggested themselves to me on a perusal of the address which I owe to the kindness and courtesy of your secretary. Now, in the very forefront of his remarks, Mr. Street has touched a chord to which every lover of the building art must, I think, warmly respond. He has lamented, as well he may, the vast amount of building work,—if it may so be called,—which rises to the right and left of us in weary acres in all directions, wherein the architect, indeed, has neither hand nor part, and in which a reckless,—I had almost said, a criminal,—structural flimsiness vies with a depraved vulgarity of taste. Now under the first of these vices no doubt the chief sufferer is the occupant; but the effect of the other is more far-reaching. To the great masses of men the sum of their perception in matters of taste is naturally but the result of those fugitive impressions which follow one another, hardly observed at the time, in the daily routine of their lives. Now I know nothing more certainly calculated to numb and deaden whatever latent spark there may be in those masses of a perception of beauty, than the constant inhaling of what I may call the miasma of ugliness. I hope, with Mr. Street, that the frequent example of solid, tasteful, and simple work may exercise a counteracting influence, and I may add,—what he surely thinks, though he did not say it,—that in no more certain way can you contribute indirectly to what I may call the chastening of taste than by promoting the love of solid, sober, and honest workmanship, because with that love of solid and simple workmanship comes of necessity that dignified and sober tone of mind to which meretricious tawdriness is wholly foreign, and, in fact, absolutely repugnant. The contemplation of the uncontrolled production of ugliness in this

country has inspired Mr. Street with a desire to see the establishment of a minister invested with powers of control in certain matters of art, and there is no doubt that in theory, in the abstract, a great deal can be said in favour of such a proposal. There is no doubt that the constant and vigorous influence of a competent minister of art, checking with authority all that is bad in art, and fostering with favour all that is good, would be a most beneficent influence; but I cannot help feeling that there is much to be said on the other side, and that many grave difficulties would beset such a scheme. In the meantime, there is one controlling influence more potent than all, and which I think all of us should make our very best efforts to direct and control. I mean the public taste. That alone is potent in the long run for what is good and what is bad in art. I believe, however, that so long as there exists amongst the public a grotesque indifference to beauty, and a callous indifference to ugliness,—until the people have a higher sense and a more refined perception of beauty, the career of the true architect will be, I fear, a lifelong struggle against the solid and serried ranks of the Philistines. But amongst those schemes for which the aid, if not the initiative of the Government is indispensable, I am glad to see that our President gives prominence in his address to one in which I have taken a great interest for some time,—I mean the collection of a large and scientifically comprehensive museum of casts, such as we see already in Berlin, and not only there, but, either in completion or in process of creation in several Continental cities, as, for instance, in Paris and Munich, and even in little Switzerland (I forget whether at Berne or at Zurich). When we consider that in all contemporary scientific research, or in nearly all, the keynote is evolution, and when we consider further how faithfully the evolution of the tone and temper of nations is mirrored in their art, and how much we learn, that we cannot learn elsewhere, of the history of nations from their arts, it does strike me as very extraordinary that in this country, which is the very stronghold,—nay, the very cradle—of evolution, so little should have been done for the study of that great principle in art. While biology, anthropology, sociology, and philology have received much attention in connexion with the theory of evolution, it is curious that archæology should have taken a place in relation to this subject so little adequate to its merits as a guide to the study of mankind, quite irrespective of its intensely fascinating interest viewed on merely artistic grounds. That a perception of this shortcoming is ripening in minds in which it may eventually lead to practical and fruitful action I venture to say that I have some reason to hope, and I do not doubt that some day, possibly not very remote, the young English archæologist may study at least the rudiments of his science without the necessity of going to a foreign country for that purpose. I will only touch upon one more point. So loyal an Academician as Mr. Street could not fail to have alluded to the development which the study of your great art has taken of late in the schools of the Royal Academy. But he did not allude to one matter which I know has at least as much weight with him as with me. I allude to those provisions by which the Royal Academy has sought to more closely knit together the three arts which are its care, and to eliminate and set aside any barriers which may have existed hitherto between class and class, and which may have prevented the interchangeability of the study of the three arts by all students alike. These provisions are made as inducements as well as privileges. I very earnestly hope that they will be very freely used, and that they may conduce to the consolidation of the three noble arts, which are akin. I have much pleasure in moving that thanks be given to your President for the very excellent address which he has just delivered to us.

Mr. A. J. B. Beresford Hope, M.P., said he felt it to be a very great privilege to be allowed to second the vote of thanks which had been moved with so much taste and elegance by the President of the Royal Academy. It was an extremely masculine, able, sensible, well-spoken, and admirably-composed address which Mr. Street had delivered. He used all these adjectives not for the sake of piling up a fluffy, fulsome compliment, but strictly critically, and as definitions as accurate as on the spur of the moment he could give of the qualities of the address. Having known the heart-searchings and the trouble and anxiety of preparing similar, though, he was afraid, far inferior addresses to be delivered by him from that chair, he was entitled, he thought, to congratulate Mr. Street on the triumph he had achieved. The address afforded instruction for the members of the Institute and instruction for the world: "*Urbi et Orbi*,"—*urbs* being that room, and *orbis* the morning newspapers of the next day. He had listened with very great interest to that portion of Mr. Street's address in which he had dealt with the suggested Ministry of Fine Arts for this country, and he had also listened with equal attention to the passing allusion to the subject made by Sir Frederick Leighton. He had often spoken of the subject before, and, coupling what had been said by Mr. Street with the words of caution which fell from the President of the Royal Academy, he thought he might say that a Ministry of the Fine Arts, if it would do enough, and not too much, would be an admirable addition to our public offices. He remembered that some few years ago it was very much the fashion in some quarters to advocate what was called "regularity" in the architecture of our public buildings and streets, and it was suggested that such regulation should be the care of a permanent official. Against such a proposal he most strongly protested. A permanent official entrusted with such duties would have the effect of stereotyping taste in building. He would be the suburban builder *in excelsis*. The proposal to have a permanent director of arts, in that sense, was one to be utterly and absolutely scouted. Who was to be the Minister of Arts? The departmental minister who sat in the House of Commons or House of Lords had his own mysterious master concealed behind him, in the shape of the permanent under-secretary of the department. Of course, if there was to be a Minister for Art there must be a permanent Under-Secretary for Art. By all means let there be a Minister for Art if he be an ideal minister, but, at the same time, let care be taken that the permanent under-secretary did not become the permanent overseer. The proposed Ministry of Arts should not be so powerful as to be able to override such bodies as the Royal Academy, the British Museum, and the Royal Institute of British Architects, and to make them serve as mere departmental *bureaux*. He did not say this with a view to throw "cold water" on the proposal, but merely to show the difficulties that beset the question. If the Institute, as the recognised mouthpiece of the profession of architecture, was true to its mission in every way, it would cease to be sneered at from the front benches of the House of Commons.

The motion having been put to the meeting,

Mr. Street, after expressing his thanks for the way in which his address had been received, said he was quite aware that there was a great deal more to be said on some of the subjects he had touched upon, and especially with reference to the question of a Ministry of the Arts.

MODERN EASTBOURNE.

The rapid progress which Eastbourne is at present making as one of the most popular seaside resorts in the south of England is a striking proof of what can be effected by public spirit and capital, and of how an almost-unoccupied and straggling series of hamlets can be converted into a handsome and well-laid-out town, with miles of streets, ornamented by noble terraces and princely mansions. In order fully to appreciate the transformation which Eastbourne has undergone within a comparatively short period, it is necessary to compare its present extent and population with what it was little more than twenty years since. The number of its inhabitants at that period was 5,700. Ten years later, that is, in 1871, its population had risen to 10,352, whilst according to the last census returns, only a few months since issued, it now has a population of 22,500, showing that during the decade between 1871 and the present year, the population has considerably more than doubled itself, the increase within that period being about 125 per cent. In 1857 the total number of houses was 400, whereas the Eastbourne Local Board have now on their books 5,000 as the number of houses within the district under their control, and a few weeks ago we were informed by Mr. Schmidt, the building surveyor, who courteously afforded us other information, that within the last six months he has passed the plans of 400 new houses, many of them detached family residences and other high-class structures, which are at present in course of erection. The present rateable value of the town affords another illustration of its rapid expansion. In 1845 its rateable value was 10,000*l*., whereas it is now, in the year 1881, upwards of 100,000*l*., the increase being thus tenfold within a period of thirty-six years.

There can be no doubt that the Duke of Devonshire, who owns the greater portion of Eastbourne,—estimated to cover an area (including the Parade) of nearly 6,000 acres,—has been the main cause of its remarkable development and expansion. An esplanade is, of course, regarded as an indispensable requirement at all seaside localities, and this feature Eastbourne already possesses on a scale which may at once be described as unique, whilst it is at present in course of extension, both in a south-west and in a north-east direction. It is estimated that in roadmaking, drainage, and the formation of the parade, the Duke has expended no less than 300,000*l*., and in extending the parade still further westward, he is now expending a further sum of 50,000*l*. This extension is from the point known as the Wish Tower to what may be termed the foot of Beachy Head, at Holywell, which now, with the village of Meads, forms a part of New Eastbourne. What is called the Marine Parade, in an easterly direction, is of the ordinary watering-place character, but the western section, named the Grand Parade, with which the Duke of Devonshire is specially identified as its constructor, is one of the most picturesque in the country. It is in terrace form, consisting of both an upper and a lower promenade, connected at intervals by flights of steps, the slopes between the upper and lower promenades being planted with flowers and shrubs, amongst which tamarisk is prominent. Another specially distinguishing characteristic of this portion of the Parade consists of large and commodious shelters erected at intervals along the promenade, together with a continuous range of forms and seats. From the point where the extension of the Parade commences to its terminus at the foot of the hill leading up to Beachy Head, there is continuous ascent, and the slopes between the upper and the lower promenades are of considerable depth. In order, therefore, to connect them, winding roadways down the slopes are being constructed, as well as steps. Messrs. Wallis & Wallis are the contractors for the extension. Running parallel with the Parade extension, the Duke has just completed the extension of the public road from the Wish Tower to Holywell and Meads, the road gradually rising until a high level is attained at Holywell, from which there is a commanding marine view. Several fine terraces of houses fronting the sea have just been erected between these points, whilst others are now in progress.

It is immediately opposite the terminus of this road and the parade extension that the large and handsome Convalescent Hospital and chapel, designed by Mr. Woodyer, of Guildford, is situated. The building, standing within its own pleasantly-laid-out grounds, was erected at a cost of 42,000*l*., accommodating upwards of 200 patients. In consequence of still further accommodation being required, a new wing has just been added, the contractors for the building being Messrs. Wheeler Brothers, of Reading. This new wing was opened on Thursday last, the 10th inst., when, with the sanction of the Bishop of Chichester, there was a special service in the chapel, the sermon being preached by the Rev. George Body.

The parade eastward has already been completed from the Wish Tower to the Anchor Hotel, and it is now being further extended in a north-easterly direction to the Great Redoubt, or eleven-gun battery. In connexion with this extension a strong sea-wall is in course of construction. The extension is 1,800 ft. in length, and its estimated cost is 34,000*l*. Mr. John Jackson is the contractor. The works are being carried out by the Local Board at the cost of the ratepayers. It will thus be seen that upwards of 80,000*l*. is at present being expended in parade works alone. The entire length of the parade from north-east to south-west, when these works are completed, will be nearly three miles.

A very comprehensive system of sewerage, from the designs of Mr. Shone, of Wrexham, has just been carried out, at a cost of 36,000*l*. Large ejector works near the Archway Tavern, complete the drainage of the town. The works

commence inland at Old Eastbourne, which is about one mile and a half from the sea in a north-westerly direction. The several sewers converge at the sea side, and have their outfall at Langney Point, situated about four miles from Eastbourne—a sufficient distance to preserve the bathing sites intact from sewage contamination. The outfall pipes are carried a long distance out seaward, so as to prevent the possibility of the sewage being washed back at high water to the shore opposite the town. Eastbourne is likewise fortunate as regards its water supply, which since the year 1859 has been chiefly in the hands of the Duke of Devonshire and a company of proprietors associated with him. In that year the duke bought up the rights of a small local company, and had new works constructed. In connexion with these works there are three spacious reservoirs. The largest of them is situated on high ground, 400 ft. above the sea level, and in the locality leading to Beachy Head. It is about the summit of a beautiful spot not inaptly named Paradise, immediately overlooking the Duke's mansion and grounds in the valley below, called Compton Place, and which is at present occupied by his brother-in-law, Mr. F. J. Howard. From this elevated spot there is a charming and commanding marine view on the south-east, together with an extensive view inland of the country for miles around, on the north-west and north-east sides, Pevensey Castle, Hastings, St. Leonard's, and the locality adjacent, being conspicuous in the more immediate distance. The capacity of this reservoir is equal to 2,000,000 gallons. The water is pumped up into this and the other reservoirs from deep wells passing through and filtered by the chalk, which is a guarantee for the excellence of its quality. It is thence supplied to the town on the gravitation principle. The rapid increase of the town renders an extension of the existing works necessary, and those works are now in course of construction. They consist of the sinking of another well, together with the erection of new buildings and pumping machinery in connexion. These are situated not far from the existing works, but on the opposite side of the railway, and about a quarter of a mile from the Eastbourne Station. The new well is being sunk to a considerable depth through the chalk, until it arrives at the greensand, whence an abundant supply of pure and excellent water is said to be obtained. Over the well an engine and boiler-house are in course of erection, the foundation-stone of which was formally laid about a fortnight ago by Miss Currey, daughter of the Duke of Devonshire's solicitor. The engine-house has a main frontage of 70 ft. in length and 65 feet in height, with an ornamental chimney-shaft carried to a height of 150 ft. There is also a further frontage of 70 ft., this portion of the buildings consisting of a low block, containing the boiler-house. The buildings are faced with stock bricks, having stone and red brick dressings and string courses. The cost of the works, including the engines and machinery, will be 15,000*l*. The architect is Mr. Henry Currey, of Norfolk-street, Strand.

As regards the numerous private residences and other buildings which are being erected in rapid succession, there is a distinctive speciality about them deserving notice. The long lines of structures on the parade facing the sea, and in the several streets and roads immediately adjoining, are all, as a rule, faced with Portland cement, and in their architectural features are altogether different from those in the new roads more inland which continue to be laid out. Amongst the more prominent buildings on the parade are the hotels, several of which are large and costly structures. These include the Grand Hotel, nearly opposite the Wish tower, towards the west end of the parade; the Burlington Hotel, a little further eastward, is likewise a large and handsome building. The two most striking buildings in the town, however, of this class, whether as regards their architectural features or capacity, are the Cavendish and the Queen's Hotels, the last named of which has only been completed within the last few months. The Cavendish, which has a lofty elevation with a central portion and two wings, is at present in course of enlargement and completion by the erection of the second wing. The architect is Mr. T. Knightley, and the contractor, Mr. James Peerlee, of Eastbourne. The Queen's, which is the most recently erected hotel in the town, is situated at the east end of the parade, a short distance westward of the great Redoubt, and has a range of frontages, containing six stories each. Including the ornamentally laid out grounds, which are partially devoted to lawn tennis, the hotel covers an area of more than an acre in extent. Internally it has accommodation for a very large number of visitors since the completion of the new wing a few months since. It has a spacious entrance-hall, 33 ft. square, from which, along a wide corridor, a number of noble apartments on the ground-floor are reached. These include the *table d'hôte* room, 70 ft. by 35 ft., in addition to a spacious bay, 24 ft. by 12 ft.; also a coffee-room, 47 ft. by 23 ft.; a drawing-room adjoining, 35 ft. by 17 ft. together with a reading and writing room, and a billiard-room. The first and second floors contain a large number of private sitting-rooms, and on the remaining floors there are ninety-six bedrooms. Mr. Henry Currey is the architect, and Messrs. Wallis & Wallis, of Eastbourne, are the builders. The cost of the hotel, exclusive of the furniture, which was supplied by Messrs. Maple, of Tottenham-court-road, was 40,000*l*.

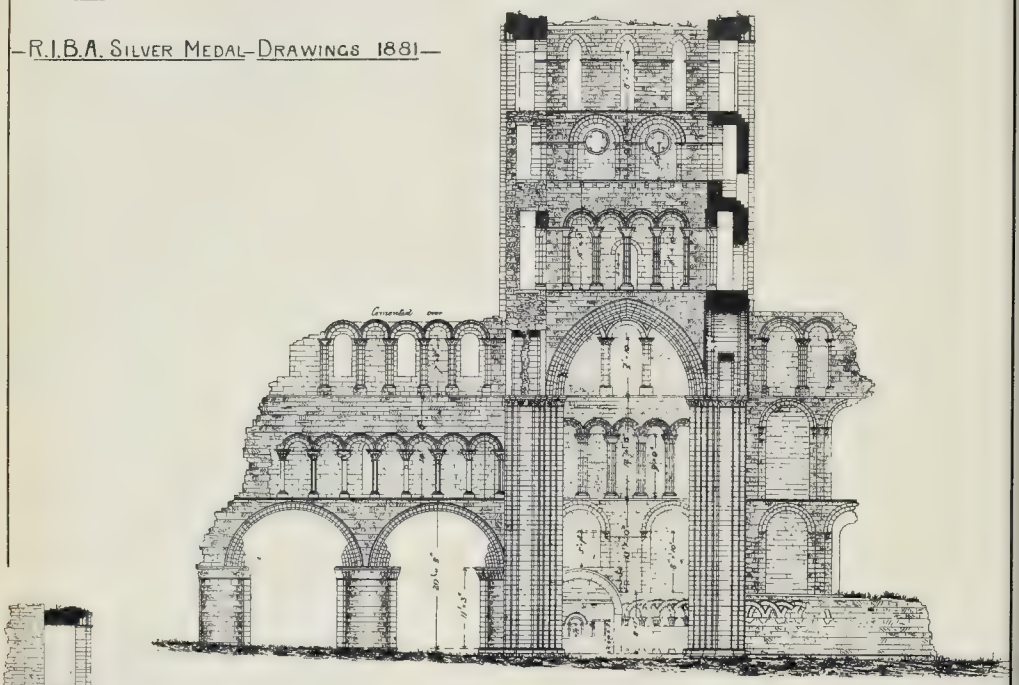
Amongst the public buildings and other attractions in the immediate neighbourhood of the parade, a public pleasure-ground on high ground around the old Martello-tower, named the Wish Tower, must be noticed. The site of this, which is between the carriage-road of the Grand Parade and the sea, has been ornamentally laid out, and is much frequented by visitors. The pier, which was lengthened a short time ago, and is now 1,000 ft. long, is a favourite promenade. In addition to the facilities for bathing on the shore by numerous well-appointed bathing-machines, an extensive and handsome block of buildings, forming salt-water swimming-baths for both sexes, have recently been erected on a site fronting one of the new streets, a short distance inland from the parade; and close adjoining, still further inland, is the Devonshire Park, an ornamental recreation-ground, twelve acres in extent. In the park there is a spacious pavilion, in which concerts and other entertainments are held. During the season there are performances in the park every morning and evening, by Jullien Adams's band, and a special feature is that the pavilion, as well as the grounds, is illuminated by the electric light. The land for both the baths and the park was presented by the Duke of Devonshire to the companies formed for the construction of the two establishments respectively.

The Eastbourne of the present day, which is manifestly destined yet to make more rapid strides, and ultimately to become one of the most important towns in Sussex, may be described as consisting of the localities comprising old Eastbourne, Southbourne, Sea Houses, and Meads. These hitherto disconnected and straggling congeries are fast being converted from a purely rural into a thickly-populated urban neighbourhood, forming a large and ornamentally-laid-out modern town and charming seaside resort, having all the advantages of marine views in combination with beautiful inland walks and scenery in almost every direction around. Under their Act of 1879 the Local Board's district extends to all the several districts above named, over which they have large powers in connexion with the laying out of streets and the erection of buildings. This Act gives them control over the materials and workmanship employed in every new building, likewise providing that no new building shall be occupied as a dwelling-house until the drainage has been completed, nor until the building has been certified by the building surveyor as fit for habitation. There are also other stringent provisions as to foundations and other matters, so that the sanitary condition of all new residences in this interesting locality ought to be well secured. In laying out the several new roads in various directions a noticeable feature is the preservation of full-grown trees, imparting to a large proportion of the roads the Boulevard character. This more especially applies to the hamlet of Meads at the north-west of the town, adjoining Compton Place, where large numbers of houses of the villa and mansion class are in course of erection, and which is not unlikely to become the Belgravia of Eastbourne. As we have already observed, the character externally of the new buildings in Meads and other roads inland materially differs from those on the parade. The materials of the former as a rule consist of red brick and flint, with gabled frontages and red tiled roofs.

From the extreme west end of the parade the carriage-drive is continued along the Meads-road shaded by a long avenue of elms and other full-grown trees, leading to South-street, in the direction of the railway station. It is at this point where the new Town-hall is about to be erected, designs for which have been prepared by Mr. E. W. Schmidt, building surveyor to the Local Board. The building is intended to be in the Classic style of architecture, and will be two stories in height. It will be faced with red brick, and will have stone dressings and columns, the ground-floor having Doric and the upper floor Corinthian columns. It will have a central tower, carried up to a height of 50 ft., with three stories, and in which will be the principal entrance. This will lead into a large hall, and stone staircase, which will give access to the upper floor. The building, amongst other apartments, will contain a large court-room, 75 ft. by 80 ft., with retiring-rooms for the magistrates; also a board-room, 40 ft. by 27 ft., for the meetings of the Local Board, together with the offices of the clerk to the board, the town surveyor, and building surveyor; also, committee-rooms, jury-room, inspectors', rate-collectors', and general clerks' offices. The total cost of the building is to be 14,000*l*. The site is at Stock's Bank, fronting South-street, which, under the board's Improvement Act, is at present being widened and re-constructed.

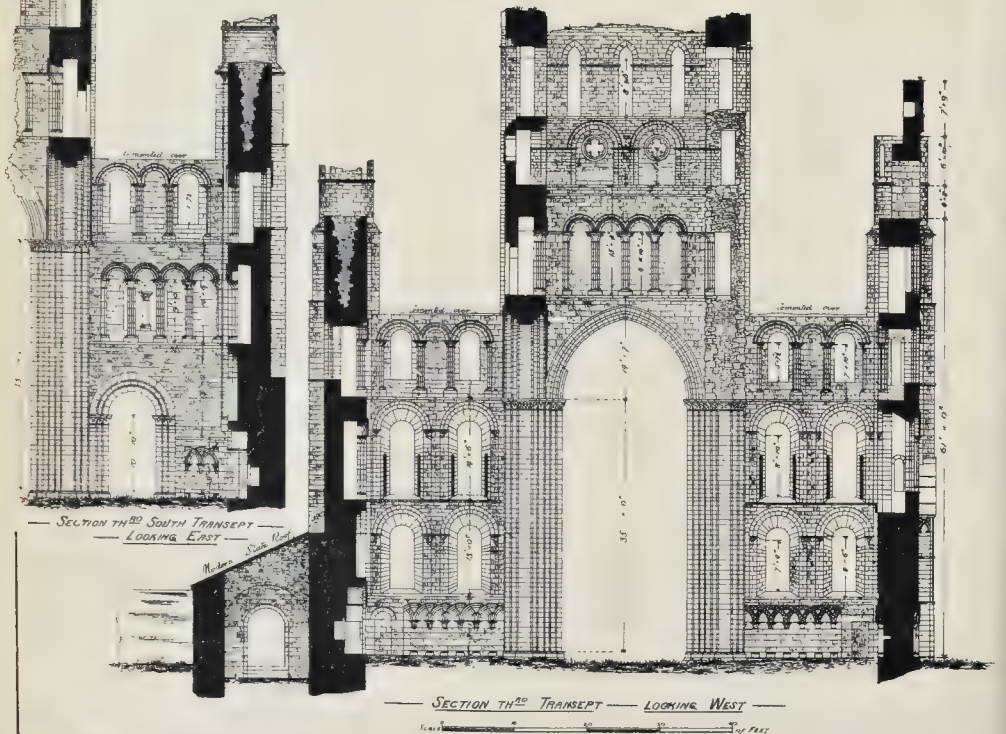
Eastbourne is noted for its schools and other institutions of an educational character, and amongst other buildings of this class which have recently been erected is the new college in Compton-place, an establishment covering a large area of ground, with accommodation for upwards of 100 students. Eastbourne College, another establishment of the same class, consisting of an extensive range of school buildings and dormitories, is situated in Blackwater-road, not far from Devonshire Park. A large building, containing library, reading-rooms, and lecture-rooms, has likewise been erected near the Queen's Hotel, under the auspices of the Mutual Improvement Society. Churches and chapels are erected in quick succession. On what is known as the Upperton Estate a new church, called St. Andrew's, has just been erected from the designs of Mr. Haddon, of Hereford, the contractors being Messrs. William & John Crow, also of Hereford. A new Baptist chapel, nearly opposite the site of the new Town Hall, was opened about a month since; whilst a large Presbyterian church a short distance from the Devonshire Park, is almost completed and ready for opening. In South-street new choir-schools and residences are being erected for the choir-boys of St. Saviour's Church, close adjoining. St. Saviour's, which was erected some few years ago, from the designs of Mr. G. E. Street, is the largest and most costly church in Eastbourne. It is Gothic in style, with a lofty tower and spire, and is elaborately decorated internally.

The accommodation at the railway station has been found to be altogether inadequate to the traffic to and from Eastbourne, and the station is at present being considerably enlarged. The extension will add two double lines, and arrival and departure platforms, each about 600 ft. in length. It is stated that the entire re-building of the present booking-offices, and the whole of the station buildings facing Terminus-road, is ultimately intended, and that there is a probability of these contemplated works being carried out in conjunction with the South Eastern Company, in connexion with a branch of the last-named company's line between Battle or Robertsbridge, and Eastbourne.



In closing this notice, we may state that, by the liberality of the Duke of Devonshire, a spacious building has just been erected at the summit of Beachy Head, close to the coast-guard-station, for the convenience of the numerous visitors who daily make the ascent to that elevated spot during the season, where tea, coffee, and other kinds of refreshment can be obtained, but no intoxicants.

MESSRS. AGNEW'S ART GALLERY, LIVERPOOL.



We give a sketch of part of the new gallery which has been erected for Messrs. Agnew, in Liverpool, from the designs of Messrs. Salomons & Ely, architects. The exterior is carried out entirely in red bricks from Maidenhead set in white putty, all cut and rubbed; the mouldings are cut on the spot and the carving is done in the brick. The interior is fitted up in American walnut and pitch pine; the cost was about 11,000*l*. Messrs. Haigh & Co., of Liverpool, were the contractors for the whole of the work.

KELSO ABBEY.

Kelso Abbey, which forms the subject of some of our illustrations, was founded on the 2nd of May, 1128, by King David I. of Scotland, and was dedicated to the Virgin Mary and St. John the Evangelist. It was inhabited by a reformed class of Benedictine monks, originally established at Tiron, in Picardy. King David's only son, Henry, the heir apparent to the throne, who died at Roxburgh about the middle of June, 1152, was buried within the walls of the building. James III. of Scotland was crowned here in the month of August, 1460, with great pomp and ceremony, more than 100 knights being created to commemorate the event. The monastery of Kelso is frequently mentioned in history as the place of meeting of the representatives of the kings of England and Scotland for the ratification of treaties and truces. The sacred building was twice burned, first during the contest that arose out of the rival claims of Bruce and Baliol for the Scottish crown; and in 1545, during the Earl of Hertford's invasion. It was never again rebuilt, but it was in all probability somewhat restored, as about twenty-one years later Queen Mary spent two days in Kelso, when she did no doubt take up her quarters at the Abbey. After the Reformation it was put into some sort of repair, and converted into a parish church, where the congregation continued to worship until the year 1772.

The ruin, as it stands now, is a fine specimen of Norman architecture. The form of the building was that of a Latin cross; the head of the cross, contrary to the general practice in ecclesiastical architecture, is turned towards the west, and the longest limb towards the east. The only parts which are still tolerably entire are the western end, which contains, among other features, a segment of a magnificent archway; the central tower, rising over the intersections of the cross, of which the north, south, and west sides remain; and the walls of the transept, with the northern entrance to this portion of the church. Of the eastern end, which seems to have consisted, when entire, of a choir and two side aisles, all that now remain is one of the walls which upheld the main roof, and separated the choir from the southern aisle. This wall rests upon two arches, with piers, and the superincumbent structure has within its thickness two tiers of galleries, one over the other, opening to the interior by a series of small round arches. In 1592 the lands and possessions of Kelso Abbey were conferred on Sir Robert Ker, of Cessford, whose representatives as Earls, and afterwards Dukes, of Roxburgh, have retained possession ever since.

A. P. Gunston.

THE NEW CORN EXCHANGE, SHEFFIELD.

This building, of which we give an illustration, has been in course of erection for about three years.

The new structure comprises a central hall for the use of the corn-factors, 150 ft. long and 75 ft. wide, and 35 ft. high. The roof, which is entirely of oak, is in five spans or sections, supported by stone pillars, having arched oak principals. This arrangement has been adopted to secure the steady north light so necessary for the corn-dealers, and, in addition to the sky-lights, there are five three-light windows in the eastern gables. There are four entrances to the hall, and the settling-rooms, lavatories, &c., are arranged on the eastern side of the hall. There will be space for 100 desks or movable stands on the floor of the hall.

The principal façade of the building, which occupies the site of the old Haymarket, is 225 ft. long, and the lateral elevations are each 135 ft. long.

A first-class commercial hotel, with ample accommodation, occupies the northern front. There are thirty-two bedrooms, spacious restaurant, billiard and smoking rooms, and private sitting-room. The offices are very complete, occupying the basement, with extensive cellarage.

Along the west and south fronts are spacious sale-shops, with mezzanine floors and basement, kitchen to each, the Dennett system of arched flooring being used throughout.

There is extensive cellarage under the central hall. The chamber-story is occupied as the Duke of Norfolk's estate offices, and there are also suites of offices to let.

The design, as shown in the illustration, is of the Tudor type, the materials being thin red bricks, with stone facings from a quarry on the estate, of a durable texture and warm colour.

All the roofs are covered with brindled Broseley tiles. In the centre of the west front is a gateway for the principal entrance, which is groined in stone, having a flight of ten steps to approach the hall. In the upper story is a fire-proof-room for all the muniments, plans, &c., of the estate.

It may be interesting to state that, the foundation being very unsatisfactory, it was necessary to underlay the whole with concrete, composed of five parts of broken stone and brick ballast to one part of ground Barrow lime, and the result is everything that can be desired.

The whole work was designed by Messrs. M. E. Hadfield & Son, and executed under their personal attendance, Messrs. Tomlinson & Sons being the contractors, and Mr. R. W. Payne the clerk of works.

The heating and ventilating arrangements are carried out by Mr. W. W. Phipson, C.E., and the carving throughout has been executed by Mr. McCulloch, of Kennington-road.

Messrs. Hardman & Co. have executed the wrought-iron gates and ornamental ironwork.

The cost of the building will be about 55,000*l.*

FRENCH AND FLEMISH GALLERY.

We can hardly say that the winter exhibition at this gallery, which opened last week, is of much interest, though, of course, it contains some good pictures. The work which is put forward as the prominent one, and which in regard to scale and elaboration is so, Brozig's "Une Fête chez Rubens," is disappointing. It shows the interior of the princely painter's house, a large room garnished with rich furniture and numerous paintings, and occupied by a number of guests, ladies and gentlemen, including portraits of various artists and other notabilities among the painter's contemporaries. Rubens stands in the centre of the groups, introducing two new arrivals to his wife, who sits near him. Among the group of ladies beside her is the reduced likeness of the face and headdress of the "Chapeau de Paille," coming out very prettily among the less refined faces of the more Dutch type. The painting is rich and full in colour, but impresses us too much like a contrived grouping on a stage; and there is a want of incident for so many figures: a number of the personages seem not to know exactly what to do with themselves, and to be sitting there just to fill up the scene. The men and women are grouped together, respectively, on opposite sides of the room, in a manner which increases the somewhat "stagey" effect of the whole.

There is nothing stagey about the work hung opposite, De Neuville's painting of French troops "Setting Fire to a barricaded House at Villersexel, January 9th, 1871." The painting has the same characteristics of spirited action, realism, and truth of detail, which have characterised other works of the same class by this admirable painter of battle scenes. De Neuville does not ignore the heroism of warfare; on the contrary, he is one of the finest illustrators of it, for he gives it us without tinsel; but he shows the sadder and less effective aspect of the game of war also with terrible truth. He is, whether intentionally or not, a kind of Erckmann-Chatrian among painters.

There are two landscapes by Herr Heffner (6, 24), brilliant in their effect of light and perspective, but a trifle hard. Mr. W. H. Bartlett's "Neighbours" (46) is a realistic and not very refined painting of two young artists working in a room whence they have a view of the feminine occupant of the opposite rooms watering the flowers in her window. There is nothing in any of the figures to interest us, but the precision of local colour and detail, and the clear atmospheric effect, call for much praise. A little interior by the same artist, "Kept in" (49), has similar qualities in even more marked extent, and is an admirable little work. Herr Schloesser's old man engaged in tying "a troublesome tie" is an admirable bit of humour. M. Laugée's group, "La Veuve" (139) has interest and pathos, far more than a larger picture, "Orphans" (95), which is hung in a place of honour at the top of the room, and bears the name of R. Wylie; the tone is agreeable, but the faces are absolutely without modelling, and seem all cast in one mould. There are other paintings that are below what we used to regard as the standard of this gallery, — much belo. wDuverger, Chevilliard, and other old favourites in the gallery, are represented, and Windmaier and Munthe among landscape-painters; and we must not omit Miss Hilda Montalba's "Sorting Crabs on the Lagoon, Venice" (107), pleasant not only for good drawing, but rich and fine tone. Looking about for rising talent, we will mention that Miss H. L. Corkran shows good advance in No. 125, "A Normandy Peasant Girl."

AN ANCIENT ATHENIAN CHURCH AND SARCOPHAGUS.

A German archæologist, writing from Athens on the 16th ult., reports the discovery there of numerous remains of one of the earliest Christian churches of that city, together with a sarcophagus containing the skeleton of an ancient bishop, Clematios. In laying the foundations of a house at the foot of the Lykabettos, there were found, at a depth of 0·65 mètre, the traces of the niche of an altar and of a building belonging to the oldest Christian period of Athens. Among the objects found the most interesting are:—

1. Two postaments, square-shaped, with the basis of a column of the Ionic style. It is of Pentelic marble, of good workmanship, of the oldest Christian period. The height of the postaments is 0·70 mètre, and diameter 0·55 mètre.

2. Two cornered capitals of columns, with pillars of Pentelic marble and fine reliefs of the Christian era. The length is 0·77 mètre, breadth 0·45, and height 0·32.

3. Two portions of small capitals, also of Pentelic marble, 0·22 mètre high, with a cross and small reliefs of the Christian style.

4. A four-cornered decretal column of Pentelic marble, 1·15 mètre high, 0·45 broad, and 0·15 thick. This contained an inscription, which unfortunately has been for the most part erased by some tool used in stone-work. Two lines only (in Greek characters) are legible and run as follows:—"*epsēphisato [he]x Areiou Pagou boulē.*" (The council of the Areopagus voted . . .) This column had evidently been brought from another part of Athens and employed with other materials in building a Christian church. The date of its erection, there is reason to believe, was during the reign of Constantine the Great. There are indications that the church was destroyed by fire either under Julian the Apostate (363 A.D.) or during the second invasion of the Goths under Alaric (396 A.D.).

From among the numerous pieces of marble, tiles, tablets, &c., here found, it is to be inferred that the edifice was of considerable size. It manifestly served as a common house of prayer, and stood on the churchyard and Christian burial-ground that existed at that spot in the first four centuries of the Christian era. This opinion is confirmed by the discovery of numerous Christian tombs there, and more particularly by the finding of a sarcophagus (on September 21st). This contained the remains of one of the first bishops of the city of Athens, although, until this discovery, his name was unknown. At a depth of 0·85 mètre the workmen, in digging, came upon a marble plate, which the house-proprietor had brought out and cleansed with great care. It was a white marble tablet, of good workmanship, with a smooth surface and an inscription. It was 2·30 mètres long, 1·06 wide, and 0·07 thick. About 0·04 mètre from the upper edge there are three Christian monograms inscribed on the tablet. The use of such abbreviations on Christian tombs was not customary till the period of the reign of the sons of Constantine the Great, 337 to 361 A.D. About 0·05 mètre below these three monograms stands a fourth, with the following clear inscription:—"*O en 'osiois episkopēsas Klēmatios*" (Clematios, the superintendent,—or bishop,—in sacred things). The letters of this inscription belong to the Roman-Christian period. They are precisely similar to those on a column erected in honour of the Roman Hipparchus Herculius at the expense of Plutarchus Nestorius, a Neo-Platonist who taught philosophy in Athens about the year 398 A.D. Unfortunately, the inscription just found contains no chronological mark. There is a little hole in the tablet, the object of which is not clear. After the tablet had been brought up by the workmen, they found beneath its original position a layer of stones or masonry of ancient date, to which the tablet had been attached by a thick layer of

mortar. All this having been removed, the hollow interior of the sarcophagus was come to where lay the skeleton of the former Athenian bishop. The length of the sarcophagus interior was 2·10 mètre, width 0·85, and depth 0·95. Of the four sides, one is cut out of the Lykabettos itself, while the other three are very strongly composed of tiles. Each tile is 0·40 mètre long, 0·30 wide, and 0·04 thick. The four sides were all covered with marble tablets, each 0·04 mètre thick. The sides were fastened together by bent nails, and nails were used to attach the sarcophagus proper to them. In this sarcophagus the excavators now found the remains of Bishop Clematios. His head was to the south, and his feet towards that part of the Lykabettos where the traces of the church altar had been found. The entire skeleton was covered with a layer of dust or clay 0·05 mètre thick. Only the lower portion of the skull was well preserved besides some of the teeth of the upper jaw. All the other bones were in a perfectly crumbling condition. It is strange that nothing else was found in the sarcophagus to denote that the deceased was a bishop; no ornament nor coin was there, such as those often found in the early Christian tombs opened in 1832. The bishop, however, appears to have been buried in his robes of office, as there were remains of colour on all the marble tablets. When Bishop Clematios lived is a question not easy to settle. But his date was probably soon after Bishop Pistos, of Athens, who attended the First Synod of Nicæa. Bishop Clematios flourished, therefore, either under the first successors of Constantine the Great, between 337 and 361 A.D., or a few years before the second irruption of the Goths in Athens. This conjecture as to the date is supported by a sarcophagus of an entirely similar character that was found a few years back in the catacombs at Rome, and which belongs to the year 355 A.D.

BUILDERS' BENEVOLENT INSTITUTION.

ANNUAL DINNER.

The thirty-fourth anniversary festival of this Institution took place (as briefly announced by us last week) on the 3rd inst. at the Freemasons' Tavern, Mr. George Burt, J.P. (of the firm of John Mowlem & Co., and ex-Sheriff of London and Middlesex), President, in the chair, supported by about 280 friends of the charity. The usual loyal and patriotic toasts having been disposed of (Major Brutton and Captain Bird responding for "The Army" and "Reserve Forces" respectively),

The Chairman, in proposing the toast of the evening, "Success to the Builders' Benevolent Institution," said the Institution was founded in 1847 chiefly by his very old friend the late Mr. Thomas Cozens,—all honour to his name. Its object, as they all knew, was to grant pensions to master builders and their widows, and others connected with the building trades. The number of pensioners who had been assisted by it, exclusive of those now on the list, was 129, and there were at present 23 men and 30 women in receipt of annuities at the hands of the Institution. The average age of the men in receipt of the benefits of the Institution was 70, and that of the women 72, and the amounts of the pensions granted were 39*l.* per annum for the men and 27*l.* per annum for the women. Widows of pensioners retained their husbands' pensions during life. The pensioners must have been in good circumstances to make them eligible, and of the age of not less than sixty years,—and there was one applicant at the present time for the benefits of the Institution whose age was eighty-four. The average time that pensioners remained on the list after election was from seven to eight years. It would, therefore, be seen that the pensions granted by the Institution did materially soften the last years of the lives of the old people, and that the charity was one which was of great service. The pensioners had been at one time in good circumstances, but causes perhaps not their own had led them to seek the comparatively small pittances given by the Builders' Benevolent Institution, the support of which was the real duty of the builders of London. He was sure it was not necessary that he should say much in appealing to the company to support the Institution to the utmost of their power, for he had already appealed to them in connexion with Mr. Godwin's generous offer, with a result that had been very gratifying, and he heartily thanked the very numerous friends of himself and the Institution for the way in which they had rallied round him and come to his support on that occasion. He sincerely trusted that as years rolled on the friends of the Institution would be able to gather together and invest such a sum of money as to render them less dependent on the appeal made on the occasion of the anniversary dinner. He felt that it was the duty of the master builders of London to endeavour to enable the Institution to attain that position as speedily as possible, so as to enable the work of the Institution to be efficiently supported from year to year independently of fluctuations in the amount of support given to the chairmen at its annual dinners. Many of those present would know some who had been seeking the benefits of the charity, and some of those to whom he was speaking might some day stand in need of its aid. Surely, then, they should all do their utmost to increase the amount of the invested funds of the Institution. So far as in him lay, he would do his utmost to achieve that object, and he was sure that he might count on the hearty support of all the friends of the Institution.

The toast was received with enthusiasm.

The secretary then read the lists of subscriptions, the total of the chairman's list alone amounting to 1,074*l.* 7*s.* This included 105*l.* given by himself, 105*l.* given by Mr. Godwin, and 827*l.* given in ten guinea donations, about 630*l.* being given in response to Mr. Godwin's offer to give 100 guineas provided twenty donors of ten guineas each could be found. The grand total of subscriptions and donations announced was 1,436*l.* 7*s.* 6*d.*, a sum not equalled on the occasion of any previous anniversary of the Institution.

Mr. F. J. Dove, in proposing "The Chairman," said that among the many services which Mr. Plucknett, their valued treasurer, had rendered to the Institution, not the least was his successful persuasion of Mr. Burt to become the President of the Institution. Mr. Burt had eloquently advocated the claims of the charity, and his zeal in its cause was shown by the magnificent list of subscriptions. It was not the first time that Mr. Burt had assisted them on the like occasion. A few years ago, when he was occupying the exalted position of Sheriff of London, he very kindly came to their assistance. His presidency would be memorable in the annals of the Institution.

The Chairman, in responding, said he thanked Mr. Dove for the flattering terms in which he had mentioned his name, and the company for the way in which they had received the toast; but he had to thank them for something still better, viz., for the warm response which he had met with in reference to his appeal in connexion with Mr. Godwin's kind offer. Mr. Godwin had started the ball towards a good subscription, and he (the chairman) had done his best to keep the ball rolling, and he had been nobly assisted in that work by many of the gentlemen whom he saw around him.

Mr. Barfield proposed "The Vice-Presidents and Trustees," coupled with the name of Mr. T. F. Rider, who, in responding, said he had to speak in the name of 150 gentleman, many of whom had done good service to the Institution, while many others were still doing it, or hoped to do it, good service.

The Chairman, in proposing the health of the Treasurer of the Institution, Mr. George Plucknett, J.P., said that gentleman had been associated with the charity from its very foundation, and everybody knew the great services which he had rendered it.

Mr. Plucknett, in responding, expressed his gratitude for the handsome way in which the Institution had been supported on that occasion, for by the help of the liberal donations and subscriptions which had been announced the committee would be able to carry on the work of the Institution without anxiety during the coming year. When, a year or two ago, the friends of the Institution were pleased to say that the stipends of the pensioners should be increased, so that they might have a sufficient income from the Institution without seeking the aid of other charities, the committee felt that they had undertaken a great responsibility by so large an increase of annual expenditure as was involved by the change, and they felt that if the change was to be a permanent one it would be necessary to largely increase the amount of subscriptions and donations. Hardly had that change been entered upon, however, when, thanks to the energy of Mr. Rider, the President of the Institution last year, increased subscriptions and donations flowed in, so that the committee were able not only to pay the increased amounts of the pensions, but to elect three additional pensioners. Before he resumed his seat he should like to say a few words more than had been said with reference to Mr. George Godwin's generous help. He did not believe that there was any man living who had rendered such powerful aid to the Institution as Mr. Godwin. In years gone by, when its founders were struggling to put the Institution on a permanent basis, Mr. Godwin rendered them every possible service by advocating the cause of the charity in the press. They used to look, as their annual meetings came round, to learn what Mr. Godwin had to say about them, and he never failed them in coming to their aid with words of encouragement, and with the powerful advocacy of the journal with which he was connected. The *Builder* had ever been foremost in aiding the Institution. When Mr. Godwin heard of the proposed increase in the amount of the pensions he did not allow many hours to pass before he wrote offering to give a donation of 100 guineas to the Institution provided twenty other friends would give donations of ten guineas each. The result had been, thanks to the energy of the President, that instead of there being twenty responses to the offer, there had been sixty. As treasurer of the Institution he (Mr. Plucknett) could not sufficiently express his sense of indebtedness to the friends of the Institution for the magnificent subscription list which had been announced.

The Chairman, in proposing "The Architects and Surveyors," said that the builders owed much to the gentlemen of both professions. It was perfectly true that they (the builders) often found themselves completely in the hands of the architects, but, as a rule, those gentlemen performed their duties most properly and fairly. With the toast was coupled the name of Mr. Franklin, who, in responding, said he considered himself by no means an architect, although he did claim to be a surveyor. It was his decided conviction that the two professions were, and should be kept, entirely distinct, and he believed that that was an opinion which would be ratified by all builders.

Mr. Chappell, in proposing "The Committee and Stewards," spoke of the assiduity with which the Committee of the Institution attended to their duties, and coupled with the toast the name of Mr. T. G. Smith, who, in responding, said that as some illustration of the way in which the committee performed their duties, he might mention that when, at the beginning of the year, Mr. Fourdrinier offered to get up a theatrical performance in aid of the funds of the Institution, the committee at once guaranteed all the necessary expenses, and the result was that the entertainment brought in more than 100*l.* to the funds of the Institution. More recently, when the offer which had been referred to came before them, eleven out of the required twenty donations of ten guineas each were promised by members of the committee.

Before leaving the chair, the President announced that he had received several kind letters from friends of the Institution wishing him success on that occasion. One of them was from Mr. W. R. Rogers, of the firm of Cubitt & Co., who stated that when he was President of the Institution some years ago, his firm offered 100 guineas to its funds provided nine other firms would give the like amount each. Now, Mr. Chappell had consented to be the President of the Institution next year, and if that gentleman could find nine firms who would give 900 guineas collectively, his (the Chairman's) firm would give the tenth hundred guineas.

Mr. Chappell said he accepted that challenge with pleasure, and would do his utmost to be able to claim the fulfilment of the President's promise. Personally, he might say that he should not be backward in doing his part.

Surveyor, &c., Loughborough.—A meeting of the Loughborough Local Board was held on the 3rd inst. to appoint a surveyor and waterworks manager. Out of 136 applications, reduced first to twenty-one and then to six, three had been invited to attend, viz., 1, Mr. Frank Baker, Assoc. M. Inst. C.E., Waterworks Office, Sheffield; 2, Mr. William Matthews, Assistant Borough Surveyor, Peterborough; 3, Mr. Alfred B. Brady, Surveyor to the Dockwell Union and Hunstanton Local Board. Eventually Mr. Baker was appointed. The salary is 200*l.* a year.

RE TEWKESBURY ABBEY.

A LETTER from the Secretary of the Society for the Protection of Ancient Buildings, published in the *Times* in the course of last week, calls attention to a subject of complaint in regard to which we can concur with the Society. This is in reference to a reported intention on the part of the Restoration Committee to take out the large west window of Tewkesbury Abbey, to replace it, we presume, with a modern building up of what it is supposed may have been there in the Norman period of the abbey. If it is true that there is such an intention, we say, without hesitation, that it is a foolish and unjustifiable scheme. It may be the more advisable that we should add an opinion, as we can at least give a moderate and reasonable one, without the exaggerated statements with which, as usual, the Society's agents do much to discredit their own recommendations and to prevent many reasonable people from accepting their authority. The Secretary states in his note prefacing the communication, that this is an ancient fabric which has "already received irremediable damage at the hands of the restorer." This may be regarded as true by those who think it is doing "irremediable damage" to a church to scrape the whitewash off the walls and repair the interior stonework. At the time when the interior work was half finished, we drew attention to the contrast of effect between the still white-washed state and forlorn appearance of the nave, and the way in which the cleaning and repair had brought out the effect of the choir and transepts, and advised any one who was affected by the fulminations of the Society against repairing and cleaning a building to look on this picture and on that,—on the unrestored nave and the restored choir,—and say which state best represented the true architectural effect of the building. The painting and gilding of the bosses of the vault were coarse and tawdry in effect, but that is not "irremediable." Subjoined to the Secretary's letter above referred to was a long statement from "a competent member" of the Society as to the west window and its history. It would have been better to have stated who the member was, and we could then have formed our own opinion as to his competency. He gives a description of the window, not forgetting the inscriptions on the two tablets inside, giving the names of the clergy and churchwardens, and the builder, under whose reign the window was put in, at the date, as stated on one of the tablets, of 1686. The "competent member" does not believe that this is the date of the window, but of its repair, and asserts that it is "a fine and interesting window" with the stonework in a perfect state of repair, and that, "the design of this window being a very good one, and its state of preservation quite perfect, there cannot be even the shadow of excuse for destroying it."

Whether the "competent member" is only biassed by the usual determination of the Society to find everything to be of remarkable interest which it is proposed to pull down, or whether he is merely unacquainted with the characteristics of really "fine" late Gothic work, we cannot say, of course. We believe the date of 1686 may be open to question as the real date of the window, but there is nothing to make such a date impossible. The window is a weakly-designed specimen of the decadence of Gothic architecture, with thin and badly-designed tracery, and such as in "the books" used to be generally classed as "Debased Gothic," and it is quite possible that such a window might have been put in, as an expiring effort of Gothic, as late as the date inscribed. No one who knew what fine Perpendicular work was would think of calling it a fine window, and any one who went out of the way to look at it in consequence of being told so, would consider that he had been taken in. We consider it necessary to state this, because we are not going to implicate ourselves in the ideas of the "competent member" in regard to Gothic architecture, and we wish to take every opportunity of warning the public against accepting exaggerated statements. But in spite of this, we entirely concur in the opinion that to take out the window would be an act of sheer folly. It is in a way "interesting" historically, as showing what sort of Gothic was put in by churchwardens towards the close of the seventeenth century. In spite of its bad detail, it looks fairly well at a little distance. It has been associated for nearly two centuries with the grand west end of the building, and has become assimilated by time with the tone of the rest of the exterior; and, above all, if the Restoration Committee take it out, what are they going to put in its place? Modern Norman, we presume, to "match" the large arch. Well, the present window, poor as it is intrinsically, is at least worth far more than any sham Norman can be. It represents part of the latter history of the church, and has a continuity architecturally with what preceded it, representing one of the latest attempts of a decaying or decayed style. To remove it for the sake of putting up modern imitation work in its place would be an absurdity, and we strongly protest against it, without thinking it necessary on that account to exaggerate the architectural beauty of the window. Nothing is to be gained by doing that, except impairing the force of the recommendation to let it remain. But it is an old feature which has grown into its place, and, at all events, nothing that is likely to be put in instead of it will equal it in interest. We hope the Restoration Committee will have the sense to let well alone.

OXFORD UNIVERSITY.

NEW BUILDINGS, ADDITIONS, AND ALTERATIONS.

THE building operations in connexion with the University of Oxford during the last twelve months have been less numerous and extensive than in past years, but the following summary, abridged from the *Oxford Times*, refers to some very important and interesting works:—

The New Examination Schools.—Since October 1880 considerable progress has been made towards the completion of this pile. The hoarding having been removed from the High-street front, the façade may now be seen in its entirety. The architect is Mr. T. G. Jackson; the builder is Mr. Estcourt, of Gloucester; and the carving is by Messrs. Farmer & Brindley, of London. The building throughout will be warmed and ventilated by the hot-water apparatus of Messrs. Haden & Son, of London and Trowbridge, under the superintendence of Mr. John Rogers. The same firm have also constructed a similar apparatus in the new High School for boys.

The New Wing at Magdalen.—A new quadrangle is in course of formation on the space between the existing front and Magdalen School. The foundations have been excavated and laid in, and the walls have at present reached a height of nearly 5 ft., the jambs of the windows and the various doorways being in position. Eventually it is intended to construct three sides of a square, the fourth side being occupied by structures already standing, but at present only half of the original design is in hand. This portion includes the whole of the frontage facing south, in a line with the school and Magdalen Bridge, and half of the west wing, to be erected at right angles to it. This part of the building will include thirty "sets," besides lecture-rooms and Fellows' chambers. The front elevation is Late Perpendicular in style, in order to harmonise with the front adjoining. At the south angle of the new façade will be erected a tower harmonising with that of the founder in the centre of the west side of the cloisters, which will rise to some 80 ft. At the base of this tower the chief entrance to the new quadrangle will be constructed, the archway and groining of the roof being in harmony with those in the founder's tower; and above, on the first and second stories, oriel windows. The front extends about 200 ft. from east to west, and the west wing will extend about 114 ft. northwards. At either extremity the oriels will extend to the second story, and in the west wing those facing the interior of the quadrangle will be of similar design. The architects are Messrs. G. F. Bodley and T. Garner, of London. The contract for the portion of the work at present in hand has been let to Messrs. Franklin & Son, builders, Deddington; and the clerk of the works is Mr. G. Fitzwilliam.

Somerville Hall.—A large addition, nearly or quite equal in size to the original building, is being made to this institution, situate in St. Giles's-road West. The extension consists of a new wing at the south-east corner of the old building, with which it will be connected by a corridor, and the foundations are now being laid. The new structure, which will be of Handborough stone and red brick, with red tiled roof, will be 56 ft. by 24 ft., and three stories in height. On each floor a corridor will extend the whole length of the north side of the building, and will give access to four sets of rooms. The building will thus give accommodation for twelve additional students. Mr. T. G. Jackson, of London, is the architect, and the builder is Mr. Selby, of Oxford.

The Reredos in the Cathedral.—This work, which was finished last Term, has attracted many visitors. It consists of a centre panel and two flying arches, in each of which is an accessory figure, flanked by side panels, each containing two statuettes. The centre piece represents the Crucifixion. The style of architecture employed is ornate Perpendicular, with rich adjuncts. The dull red of the stone is relieved by the golden background, and the ornaments picked out with green and gold on either side of the groined canopy. The structure itself is in Dumfries red sandstone, and the figures are in Cipolino marble. The canopies over all three panels are rich and effective, and the embossing perfect in its character. Over the side canopies are embossed shields, bearing figures connected with the crucifixion. Richly-embroidered wings, in green and gold tapestry, by Watson & Co., of London, are hung at either extremity on gilt rods, while the super-altar is covered with similar materials. The architects of the reredos are Messrs. Bodley & Garner, and the clerk of the works was Mr. G. Fitzwilliam. It may be stated that the cathedral authorities intend to erect a marble font in the south transept.

St. John's College.—Part of the new scheme for the extension of this college is now nearly completed. The entire plan embraces the construction of a new quadrangle and dining-hall to the north of the existing buildings, with a frontage to St. Giles's-street of 152 ft., a north wing extending 164 ft., and an east wing 156 ft. The new hall will be 88 ft. by 44 ft. Three old houses on the south side have recently been demolished for a fresh addition on that side, but neither the plans nor arrangements for this part of the improvements have been completed. The portion of the new quadrangle which is almost finished, consists of a residence for a porter on the south side of the entrance gateway, Fellows' rooms over the entrance, and twelve suites for undergraduates. The noticeable feature is the gateway, which forms the basement of the tower, and the tower itself. Over the archway is a decorated niche with canopy, which is destined to receive a statue of St. John the Baptist, in whose honour the college was founded. The oriel windows above are simple, but effective. The tower is 66 ft. high, and finished off with an embattled coping. The new entrance-gateway is low-pitched and stone-groined, with ornamental panels. At the junction of the groinings are the arms of the architect, Mr. Geo. Gilbert Scott, F.S.A., and of the University, and Herodias bearing the head of the Baptist, the escutcheon of the college. The pitch of the roof of this wing is 46 ft. from the ground, and the subordinate features of the frontage are elaborately executed gargoyles with grotesques carved on the weather courses. Throughout this portion the spandrels of the doorways are ornamented and carved. The chambers are spacious and well-lighted, a speciality having been introduced in the grates so as to provide either hot air or ventilation, as may be requisite. The walls of the building are of brick, faced with Taynton stone, supplied from the quarries of Messrs. Groves & Pittaway. The sills, weather-courses, &c., are in Clipsham stone, supplied by Mr. Medwell. The roofing is of Colley Weston slating, supplied and laid by Mr. W. Close. Messrs. Boyd, of Maddox-street, London, have been entrusted to fix the grates and tiles, and Messrs. Burt & Potts supply the casements. The staircases of the building are in solid oak with ornamented balustrades, the floor-joists and roof-joisting of fir. Messrs. J. R. Symm & Co., of Oxford, are the builders, and the completed contract was let for over 9,000*l.*, but this forms but a fraction of the estimated cost of the new quadrangle when complete. Mr. Thos. Burton is clerk of the works.

Brasenose College.—One of the most extensive collegiate alterations that have been recently undertaken is the new quadrangle. It is intended to construct a pile of buildings extending from the library to High-street. At present, however, only part of the scheme is to be completed. The portion at present in course of construction is to occupy the area of what used to be known as "Amsterdam." The space available by the demolition of old cottages is about 170 ft. by 80 ft., and the building to be erected will measure about 150 ft. from north to south, and about 46 ft. from east to west. The buildings will include basement, ground, first, and second

floors. There will be accommodation for about thirty students, and the plan includes two large lecture-rooms, besides laundresses' offices, conveniences for scouts, &c. At present the workmen are engaged digging the foundations, and, in order to get a reliable hold, excavations averaging 20 ft. in depth have been made. A solid bed of concrete, 6 ft. thick, will be laid in, over which there will be a solid stone bed very nearly to the present ground level. Mr. J. G. Jackson is the architect. The clerk of the works is Mr. Thomas Mockford.

Lincoln College.—A new wing is being added to this college in what is known as "the Grove." The site extends from the dining-hall eastward to the back of Brasenose College, and at right angles, northward, to Brasenose-lane, the area being 90 ft. by 30 ft. The foundations are already in, and when the new buildings are complete there will be accommodation for sixteen students. The new buildings stand on the site of an old block in which there were ten sets, and will consist of three stories and basement, with the usual offices. The architect is Mr. T. G. Jackson.

NEW FIRE BRIGADE STATIONS.

Several new station buildings for the use of the Metropolitan Fire Brigade are now in course of erection, or are about to be commenced. The report of the Fire Brigade Committee, submitted to the meeting of the Metropolitan Board of Works on the 1st inst., notified the receipt of a report from the Superintending Architect of the Board (Mr. Vulliamy), stating that Mr. Mott, the officer in his department who had the superintendence of the Fire Brigade buildings, was in a weak state of health, and that a medical certificate had been produced to the effect that he required a few months' leave of absence to enable him to recover his health. The Committee were able to say from their own experience that Mr. Mott was an excellent officer, and that his services were valuable to the Board. They recommended that two months' leave of absence be granted to him, and they hoped that at the end of that time he would be able to return to his duties in improved health. During Mr. Mott's absence, his place would be filled by Mr. R. Pearsall, who, although only employed temporarily, and in receipt of 3*l.* 13s. 6d. a week, was stated by the Architect to be a thoroughly competent man. The Architect had also reported to the Committee with respect to the work in hand and in prospect connected with the Fire Brigade buildings, and from his report it appeared that it would be necessary to employ more persons on the work to enable it to be proceeded with more quickly. There were three stations in course of erection,—at Shadwell, Theobald's-road, and Lower Norwood. The new station which the Board had ordered to be erected in Scotland-yard, and the drawings of which were now nearly completed, would, it was hoped, be begun at the end of this year or the beginning of the next; and the drawings of the additional buildings at head quarters were about to be proceeded with. There were also in hand the drawings of the proposed additions to the Holloway Station. The Board had, moreover, ordered the erection of two new stations, on ground already purchased for the purpose, one at Kentish-town and the other in the northern part of the parish of Kensington, and it was desirable that these should be proceeded with as early as possible. In addition to these works, there was in prospect the erection of new stations in Bishopsgate, Bethnal-green, Stoke Newington, Camden-town, Regent-street, and Baker-street, all of these being required, though some of them sooner than others. Then, again, additions and alterations were required at many of the existing stations to make them adequate to the increased necessities of the Brigade; and at all the stations repairs were called for from time to time to keep them in good condition. It would thus be seen that a considerable staff was required to deal with the large quantity of work which the erection and maintenance of the Fire Brigade buildings involved; and the number of persons now employed was really insufficient for the purpose. There were six, altogether: Mr. Mott, who arranged and superintended the whole; Mr. Pearsall, a competent architectural designer, of whom, as stated, the Architect speaks highly; Mr. Nixon, who assisted Mr. Mott in the survey and superintendence of the alterations, repairs, and general works, and whose assistance was stated to be most valuable, his salary being 4*l.* 4s. a week; Mr. Estall, clerk of works, at 4*l.* 4s. a week; Mr. Brakspear, a draughtsman, at 2*l.* 10s. a week; and Mr. Hart, a junior assistant for general purposes, at 1*l.* 10s. a week. Quite apart, therefore, from Mr. Mott's approaching temporary absence, it was requisite that more persons should be employed on the Fire Brigade work; and after full consideration, the committee felt compelled to ask the Board to authorise them to employ temporarily, and not in an established capacity, an additional clerk of works at 3*l.* a week, and two additional draughtsmen at 2*l.* 10s. a week each, their engagements to be determinable by a week's notice.

The report was adopted.

THE TOWN-HALL AT ECCLES, NEAR MANCHESTER.

The new town-hall which has recently been erected for the Local Board district of Eccles, Barton, and Patricroft, at Eccles (the seat of the manufacture of the famous Eccles cakes), near Manchester, was opened on Friday evening last (Nov. 4), by Mr. J. T. Hibbert, M.P., the Parliamentary secretary to the Local Government Board. The building, which occupies a commanding position in the main thoroughfare, Church-street, is in the Italian style of architecture; the exterior elevation is of stock bricks with stone dressings, and is surmounted by an ornamental clock-tower. Perhaps the most imposing feature in connexion with the hall is the large assembly-room, which is on the first floor, and is about 90 ft. by 40 ft., and capable of seating 1,000 people; there are also a fine orchestral platform and three ante-rooms, the room being intended to be used for public meetings, balls, and other gatherings.

On the ground-floor at the front are the board-room and general "rate, &c.," offices, and on either side of a long encaustic-tiled corridor are the offices of the surveyor, the sanitary inspector, the members' ante or retiring rooms, clerks' offices, and several other rooms. There are ten rooms in the basement, where there is a cooking-kitchen amply provided with the requisite cooking-apparatus, "Leamington ranges," &c., and living-apartments for the hall-keeper, storage-rooms, &c.

It was originally intended that the tower should be composed of wood, but Mr. Robert Hall, a member of the Board, offered to supply the tower with a clock if it were built of stone, which was accordingly done, and the result is, thanks to Mr. Hall's generosity, a very fine clock with bells, which strike the hours and chime the quarters. The total cost of the building has been about 4,600*l.*, in addition to which about 500*l.* has been expended in furnishing and fitting the interior. The architect was Mr. John Lowe, F.R.I.B.A., of Mansfield-chambers, St. Ann's-square, Manchester, and the builders were Messrs. T. Moore & Sons, of Eccles.

ST. PETER'S CHURCH, VERE-STREET, OXFORD-STREET.

This church, of which the Rev. Wm. Page-Roberts, M.A., is the present incumbent, has been closed for about three months, during which time it has been painted and decorated and reseated in oak, with new carved oak pulpit, lectern, &c., and was re-opened on Sunday, November 6th. The whole has been designed by, and the work carried out under the superintendence of, Mr. James K. Colling, architect. The execution of the oak work and carving was entrusted to Messrs. Cornish & Gaymer, of North Walsham, Norfolk; the decoration to Messrs. J. & J. King, of Norwich; and the glazing of the side windows to Messrs. Pepper & Co., of the Euston-road.

The east window has been filled in with stained glass designed by Mr. Burne Jones, and executed by Messrs. Morris & Co.

The organ has been removed from the west-end gallery and placed in the north-east angle of the church. This has been done, and considerable improvements have been made in the organ, by Messrs. Hill & Son, organ-builders. The church has been lighted by two sun-lights, which were put up by Messrs. Strode & Co.

The church externally is a plain brick structure, of very unpretending appearance, but internally it is divided into nave and aisles, having an enriched plaster ceiling, supported on Corinthian columns. The architect of the building was James Gibbs, the architect of St. Martin's-in-the-Fields, to which church St. Peter's bears a considerable resemblance, although upon a smaller scale.

The carving has been specially designed by the architect, with natural foliage conventionalised to accord with the character and style of the building. In doing so, the type of work which has been followed in a great measure has been the oak carving of Grinling Gibbons. It should be understood that Grinling Gibbons carved in two styles,—one out of the solid oak in low relief, much of which was very beautiful and delicate in style, as may be seen in the stall-work of St. Paul's Cathedral; the other was carved in lime-tree, and fixed upon an oak ground, executed with most extreme relief, as seen in the panels above the stalls of St. Paul's, and in the reredos of St. James's Church, Piccadilly. To obtain this latter character no attempt has been made in the carving designed by Mr. Colling for St. Peter's Church, but all has been scrupulously carved out of the solid oak.

The total cost of the additions, alterations, and decoration has been about 2,000*l.* The result appears to us very satisfactory.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

The annual meeting of this Association, for the opening of session 1881-1882, was held on Tuesday evening last, the 8th inst., in the Library at Queen's College.

The President, Mr. Jethro A. Cossins, occupied the chair, and there was a good attendance of members and visitors, including Messrs. J. G. Bland, H. F. Talbot, G. F. Hawkes, R. B. Morgan, J. L. Ball, J. P. Osborne, W. Henman, T. Jones, W. Wallis, J. William Tonks, W. H. Kendrick (of West Bromwich), H. H. McConnal, and F. E. F. Bailey (of Walsall), Fred. G. Hughes (honorary secretary), &c.

The annual report and the balance-sheet were read and approved.

The President then delivered an address, in which he dwelt chiefly on the subject of street-architecture. At the conclusion, a hearty vote of thanks was accorded to Mr. Cossins for his excellent address on the motion of Mr. McConnal. Messrs. Morgan, Tonks, and Henman spoke in support of the motion, and, after the President had replied, the meeting terminated.

EXETER ON THE "FIFTH."

The fiery festival was kept up at the "Ever Faithful" city with all the usual honours. At seven p.m. the annual procession started from the head of St. Sidwell's, preceded by bands of music. It consisted of several hundred citizens dressed in quaint costumes and armed with blazing torches. The scene, as the train proceeded down the venerable High-street, was wondrously picturesque. Not only was the thoroughfare thronged, but every open window above was filled with smiling and cheering faces. Coloured fires burnt at intervals illuminated the old gabled buildings and threw a weird light upon the proceedings. On passing the ancient Guildhall, the Mayor (Alderman Pring) was loudly cheered by the populace. This annual carnival has been opposed by several preceding mayors, but the present one,—who is a jolly brewer,—has countenanced, rather than otherwise, the traditionary gathering. Upon arriving in the cathedral yard, the bonfire was lighted with much ceremony for the 285th annual time, the brass band the while playing the "National Anthem." This fire is always built upon one spot,—an open space immediately facing the west front of the cathedral, and close by the adjacent church of St. Mary Major. It consisted of 1,200 ash-faggots, ten tons of old railway sleepers, six tons of roots of trees, and thirty tar-barrels. The old cathedral never looks so sublimely grand as it does on these occasions.

Cauer's Witch.—The fine marble statue, called "A Witch," by Carl Cauer, which excited almost as much admiration as any piece of sculpture in the German division at the last Universal Exhibition at Paris, has just been purchased by the Prussian Government. The work will form a permanent ornament of the National Gallery of Berlin.

PATENT RECORD.*

APPLICATIONS FOR LETTERS PATENT.

4,609. J. Court, London. Appliances for ventilating, heating, and cooling. Oct. 21, 1881.

4,620. H. T. Dawson, Chiswick. Cistern-valves. Oct. 21, 1881.

4,638. F. H. Smith, London. Ventilation, &c. Oct. 22, 1881.

4,648. H. J. Haddan, Kensington. Tiles. (Com. by A. Vuillaumé, Blanquefort, France). Oct. 24, 1881.

4,656. T. H. Rees, Lambeth. Glass tile borders. Oct. 25, 1881.

4,662. E. P. Alexander, London. Apparatus for heating baths and greenhouses, &c. (Com. by C. Martin, Paris.) Oct. 25, 1881.

4,665. H. J. Haddan, Kensington. Doors and windows. (Com. by Favier-Simonet, Tourcoing, France.) Oct. 25, 1881.

4,692. J. Benson and T. Wainwright, Southport. Apparatus for excluding draughts and dust in doors and windows. Oct. 27, 1881.

4,698. R. Brealey, Westminster. Chimney-caps. Oct. 27, 1881.

4,707. J. H. Miles, Southampton. Window-sashes. Oct. 27, 1881.

4,712. C. Ezard, Bradford. Ash-pans. Oct. 27, 1881.

NOTICES TO PROCEED

have been given by the following applicants, on the dates named.

October 25, 1881.

3,292. A. Sclanders, London. Appliances for fastening doors and instantaneously releasing the same. (Com. by J. P. Black, Nelson, New Zealand.) July 27, 1881.

October 28, 1881.

3,447. W. G. Macvitie, Sutton Coldfield. Attaching door-knobs to their spindles. Aug. 9, 1881.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending October 29, 1881.

1,101. M. E. Dearnaly, Mirfield. Bricks.

A T-shaped or dovetailed recess is formed in the brick, and iron binders are used in double walls which correspond to this recess to bind the walls together. March 14th, 1881. Price 1d.

1,184. J. A. Berly, Peckham. Pipe-joints.

A ring, made of an elastic or compressible material, such as indiarubber, lead, &c., is used for the joint. This ring, in section, is of U-shape, and is placed in the joint with the concave part turned towards the pressure of the liquids, fluids, gases, &c. In the female flange of the pipe is hollowed out a cavity in which the ring is placed, and the male flange has a fore part, the end of which presses against the joint ring. Numerous modifications and adaptations for different pipes are shown. (Com. by L. Langlois, Louvain, Belgium.) March 18th, 1881. Price 8d.

1,210. J. Bernard, London. Baths, &c.

The bath is formed of the usual shape, but with a double shell. The space between the two shells serves as an air-heating chamber, so that the bath may be used as a Roman or Turkish bath. The air may be heated by steam or other method. A rotary brush as a shampooer and other fittings of a like nature are also provided. March 19th, 1881. Price 6d.

1,217. W. L. Hunt, Westminster. Apparatus for measuring and registering the flow of liquids.

The tap or cock is fitted with a plug which has a central chamber of a determined size, and two holes in its circumference to open and close the communication. The plug is connected by a toothed segment and ratchet wheel, with an apparatus to register the number of times it is turned. (*Pro. Pro.*) March 19th, 1881. Price 2d.

1,249. P. O'Connor, Wavertree. Taps or cocks.

The taper hollow plug has an aperture leading from the large end to one side, and the barrel has two openings at the sides, one in a line with the side opening of the plug, and the other beneath the wider end of the plug. The plug is held in position by a washer. No leakage, therefore, is allowed. Several modifications are shown. March 22, 1881. Price 6d.

1,252. J. W. Lewis, Halifax. Raising and lowering window-sashes.

On the outer side of each sash is a groove, and in the frame a corresponding groove, with worm-threaded racks, arranged so as to be capable of being moved laterally therein into the opposite groove in the frame or casing. At the back of the grooves in the frame a pair of vertical shafts, each with a worm and pinion, are affixed, together with a horizontal shaft and double-faced bevel wheel, so arranged that this wheel can gear into either of the pinions. By rotating the handles of the horizontal shafts, two of the worms are revolved, and the two corresponding racks becoming geared into these worms, the sash in connexion with them is caused to ascend or descend. In the case of side windows, the handles may be connected by a link. March 22, 1881. Price 6d.

1,290. W. R. Comings, London. Bells, knockers, letter-plates, &c.

The bell is operated by clock mechanism, governed by an escapement. The spring is wound up by a lever connected with the bell-pull, and the reaction causes the bell-hammer to strike upon the bell. The bell-pull is carried through the door and letter-plate. All are placed together in the door. (*Pro. Pro.*) March 23rd, 1881. Price 2d.

1,293. J. Watson, Rotherham. Manufacture of kitchen ranges, &c.

The usual screws for securing the back and side plates together are dispensed with by casting on the edges of the plates hooks, which hold them firmly in position. (*Pro. Pro.*) March 23rd, 1881. Price 2d.

1,309. A. C. Henderson, London. Safety wicket and grating for street-doors.

A grating is let into the door from the inside, which is opened or closed by a second grating secured by a bolt beneath the grating in the aperture for the reception of letters. The lower panel of the door is movable, and turns on hinges for the reception of parcels, &c. The panel is secured by a bar which is formed in the shape of an axe for use if required. (Com. by J. M. A. Montclar, Paris.) March 24, 1881. Price 6d.

1,312. H. Massicks and W. Crooke, Millom. Hot-blast stoves.

An iron vertical cylinder, the top of which is conical and fitted with an air-valve, contains a series of concentric segmental passages, the walls of which are of brickwork. The gases to heat the stove are admitted from below to the centre of the stove, and caused to traverse all the passages alternately upwards and downwards before being carried off by the chimney. The air to be heated passes through in the opposite direction. March 24, 1881. Price 6d.

1,314. G. L. Shorland, Manchester. Ventilating apparatus.

An air-passage is formed from the bottom to the top of the building, and branches are led from each room to this shaft. The vitiated air is withdrawn through a passage in the ceiling, and suitable valves are used to prevent any down-draught. (*Pro. Pro.*) March 24, 1881. Price 2d.

1,338. S. Bee, Grantham. Apparatus for working the rollers of blinds, maps, &c.

A collar-nut is applied to the lower end of a spindle in such a manner that the nut communicates its rotary motion to the spindle, which carries a screw-worm geared into by corresponding appliances on the roller. (*Pro. Pro.*) March 25, 1881. Price 2d.

1,362. A. L. Tomkins, F. M. Courage, and F. A. Cracknall, London. Automatic regulation of heat in kilns.

A coil of mercury is connected with a receptacle covered with india-rubber. As the mercury rises or falls, the india-rubber, acting in connexion therewith, opens or shuts a valve which regulates the heat either by closing the air-channel or cutting off the gas. March 28, 1881. Price 4d.

1,380. W. E. Crowther, Manchester. Ornamental screens for fire-places.

The screen is composed of canes or other flexible reeds, which are arranged in an open ornamental pattern that will not interfere with the ventilation, but the screen at the same time can easily be bent or woven to the desired pattern or configuration. March 29, 1881. Price 2d.

* Compiled by Hart & Co., patent agents, 28, New Bridge-street, E.C.

ARCHITECTS' ACTIONS.

LANGSTON *v.* TRINITY COLLEGE, LONDON.

THIS was an action (Queen's Bench Division) for services rendered as an architect and surveyor. The defendants paid 21*l.* into court, which they said was sufficient to satisfy the plaintiff's claim.

The plaintiff, Mr. Alfred Langston, is an architect and surveyor, residing in Torrington-square, and the defendants are the authorities of Trinity College, London, which was established for the cultivation of church music and other purposes. The case for the plaintiff was that in January, 1876, he was employed by the Rev. Bonavia Hunt, the warden of the college, to prepare designs for the institution, and to look about for an eligible site. He accordingly prepared designs, which were accepted, and a perspective of the exterior of the proposed building was published in the College Calendar. Further, he entered into negotiations for a site, and selected and superintended the alteration and decoration of certain premises in Weymouth-street, which were temporarily occupied by the college. It was for remuneration for these services that the action was brought. The defendants admitted that the plaintiff was entitled to be paid for finding the premises in Weymouth-street and superintending the repairs and decorations there, and for this they paid 21*l.* into court. With respect to the design and the site, they said the plaintiff was employed subject only to his being paid for his services in the event of the design being carried out, and that, in fact, from want of the necessary funds, it was not carried out. It was agreed between the parties that if the plaintiff was entitled to recover under these heads, the sums should be 50*l.* for the design, and 10*l.* for services in connexion with the site, and the liability of the defendants for these sums was the only question in the case.

The jury found that the plaintiff was entitled to 60*l.* beyond the sum paid into court.

Verdict accordingly.

EVANS AND ANOTHER *v.* CARTE.

THIS case, which came before Lords Justices Baggallay and Brett in the Court of Appeal on the 9th inst., raised a question whether, if a plan for a building "goes off," the employer of the architect is liable to the surveyor employed by the architect to take out the quantities on the architect's plans.

The action arose out of the project of Mr. D'Oyley Carte, in 1880, of building the Savoy Theatre, and was tried before Mr. Justice Bowen and a common jury. The question left to the jury was whether Mr. Emden, the architect from whose drawings the quantities were taken, was acting under the authority of the defendant in giving instructions to the plaintiffs to reduce the quantities, which they had previously prepared, in order to get a reduced tender. The jury found that he was, and gave a verdict for the plaintiffs. A Divisional Court, consisting of three Judges, having discharged a rule *nisi* for a new trial, on the ground that the verdict was against the weight of evidence, the defendant appealed to this Court.

Their Lordships, without calling on the counsel for the plaintiffs, refused to interfere, and dismissed the appeal.

COMPENSATION CASES.

THE CORPORATION OF THE TRINITY HOUSE *v.* THE METROPOLITAN AND DISTRICT RAILWAY COMPANIES.

THIS was one of several heavy compensation cases arising out of the works lately taken in hand for the completion of the "Inner Circle" Railway. The case was tried on Saturday last before Mr. Under-Sheriff Burchell and a special jury.

The property in question is situate on the east side of Trinity-square, Tower-hill, and consists of several houses of which the claimants were the owners. Sir John Holker and Mr. Vaughan Williams appeared for the plaintiffs, and Mr. R. E. Webster, Q.C., and Mr. Graham, for the defendants.

Mr. T. Horsey (of the firm of Fuller, Horsey, Sons, & Co.), called by the counsel for the claimants, stated that the property consisted of 33, 34, 36, and 38, Trinity-square, No. 33 had a frontage of 16 ft. and an area of 993 ft., and was let on a lease at 90*l.* a year, expiring at Midsummer, 1894. He estimated it to be worth 150*l.* a year. He capitalised the rental on the 5 per cent. tables, making 2,430*l.* Nos. 34 and 36, on the opposite side of the mews, were houses with gardens; and as gardens were an anachronism in the City of London, he would let the sites as building land, and take 200 ft. from the roadway, which was wider than necessary. This would give 4,515 ft., but on 900 ft. buildings of only a ground-floor could be erected, as there were ancient lights to be preserved. He valued the 900 ft. at 1*s.* a foot, and 1,365 ft. at 2*s.* a foot. It was a very valuable site, easily accessible, and well lighted, and he capitalised it at twenty-four years and a half's purchase. He proposed to erect a warehouse containing 18,070 ft. of floor space, the rental value of which, at 1*s.* a foot, would be 900*l.* a year. The cost of the buildings would be, at 6*d.* a foot cube, 6,274*l.*, so that after paying 410*l.* a year ground-rent, the builder would still get 8 per cent. on his outlay. His valuation for these premises was 9,800*l.* No. 38 was a very substantial fine building, built by Cubitt in his best style, and occupied by Messrs. Morgan Brothers, wine merchants and shippers, and used to be the old Oporto House. It had an area of 2,293 ft., and was let on lease for 21 years, expiring at Christmas, 1884, at 150*l.* a year. This had also formerly a garden at the back, but it had been utilised for buildings and cellars by Messrs. Morgan, who had spent a considerable sum of money on the premises. At the expiration of the 3¾ years of the lease, the rental would be at least 300*l.* a year. He capitalised both rent and reversion on the 5 per cent. table, making 5,513*l.* The value of the easement of the road-way had to be calculated on the "rule of thumb." It contained 4,250 ft., which at 2*l.* a foot would be 8,500*l.* for the freehold; but as it was only an easement he put it at 1,000*l.* These four items together made 15,742*l.*, and he added 10 per cent. for compulsory sale, making 21,816*l.*

Mr. E. I'Anson, who was called as a witness on the same side, estimated the total value of the property at 19,897*l.*, or, with 10 per cent. for forced sale, 21,886*l.*

Mr. T. Chatfeild Clarke was also called for the claimants, and gave it as his opinion that the full value of the property, including 10 per cent. for forced sale, was 20,323*l.*

For the railway company, Mr. Alderman Ellis (now the Lord Mayor) was called. According to his view, the full value of the property was 11,823*l.*, which, with 10 per cent. for forced sale, amounted to 13,007*l.*

Mr. E. N. Clifton said the value of the property was 11,859*l.*, which, with 10 per cent. added, was 13,044*l.*

Mr. Edmund Farmer's total valuation was 13,266*l.*, being 13,060*l.* plus 10 per cent.

Mr. George Low valued the property at 11,755*l.*, or 12,930*l.* with the 10 per cent. added.

The jury gave a verdict for 14,659*l.*, including 500*l.* for the easement.

PUGH'S TRUSTEES *v.* THE METROPOLITAN AND METROPOLITAN DISTRICT RAILWAY COMPANIES.

THIS was a claim, in the Lord Mayor's Court, before the Recorder, Sir Thomas Chambers, Q.C., and a special jury, by Messrs. Edward Stuart Pugh and Charles Needs Wellon, trustees of the late Edward Pugh, against the defendant companies for compensation in respect of certain freehold property,—71, Great Tower-street, in the occupation of Mr. Godsell, wine merchant,—required by them under the compulsory powers of the Metropolitan and Metropolitan District Railways (City Lines and Extensions) Act, 1879.

Mr. Edward Clarke, Q.C., and Mr. Pollock were

counsel for the claimants; Mr. Bidder, Q.C., and another learned gentleman for the defendant companies.

The area of the land was agreed on both sides at 1,023 superficial feet.

In support of the claim, Mr. Bousfield (Messrs. Fox & Bousfield), Mr. Pryce (Messrs. Ellis & Co.), Mr. Buckland, and Mr. Vigers, surveyors, estimated the gross value, including a reversion under the will, to be about 13,000*l.*

On the part of the defendant companies, Mr. Alderman Ellis, Mr. Farmer (Debenham, Tewson, & Farmer), Mr. Whichcord, and Mr. Lowe, considered that something under 8,000*l.* was sufficient to satisfy the claimants.

The jury ultimately found a verdict for the claimants—Damages, 8,463*l.*

In the case of Middleton's Trustees against the same Company, and tried in the same Court, the property consisted of four houses in Seething-lane, five in Barking-lane, and three houses and a warehouse in Black Raven-court, City. Mr. M'Intyre, Q.C., M.P., and Mr. Gainsford Bruce were counsel for the claimants; Mr. Bidder, Q.C., and Mr. H. Sutton appeared for the Railway Companies. The valuations on behalf of the claimants were —Mr. C. Reilly, surveyor to the Drapers' Company, 36,828*l.*; Mr. E. l'Anson, Laurence Pountney-hill, 36,390*l.*; Mr. F. W. Porter, surveyor to the Clothworkers' Company, 34,683*l.*; Mr. E. Pryce (Ellis & Sons, auctioneers, Fenchurch-street), 36,828*l.*; and Mr. E. Fox (Fox & Bousfield, auctioneers), 33,325*l.* On behalf of the Railway Company the following estimates were given: —Mr. Alderman Ellis (Farebrother, Ellis, Clark, & Co., auctioneers), 17,050*l.*; Mr. J. Whichcord, architect and valuer, 16,955*l.*; Mr. Edmund Farmer (Debenham, Tewson, Farmer, & Bridgwater, auctioneers), 17,050*l.*; and Mr. E. N. Clifton, architect and surveyor, 16,057*l.*

The jury, after a brief deliberation, found a verdict for 23,143*l.*

DIAMONDS.

Sir,—I notice in the *Builder* of October 29th a statement as to the value of diamonds. Permit me to point out that the most valuable diamonds are not those which are entirely colourless, but those known to merchants as "blue-white." Of blue diamonds, the finest known is the "Hope," valued at 30,000*l.*, and which formed part of the collection of the late Henry Thomas Hope, esq., of Deepdene, and not Mr. Beresford Hope, as stated. This stone is in colour of a beautiful sapphire blue, and there are only three or four other diamonds known in Europe which can really be termed "blue."

The only known specimen of a *red* diamond is now in the hands of a great connoisseur residing in London. It weighs about three grains, and is valued at 800*l.*

The finest green diamond,—a pure emerald green,—is now the property of a West End merchant. It weighs about four grains. There is no other stone known at all approaching this for depth of colour. It is valued at 1,000*l.*

Diamonds that contain a slight tinge of colour are numerous, but have no special value.

Edwin W. Streeter.

*** We print Mr. Streeter's opinion, but against it we must set that of the learned authors of the book *dpropos* of which our remarks were made, who, in classifying diamonds, say, "*Diamants incolores*, très limpides, de la plus belle eau; ce sont les plus estimés, ceux qui donnent les pierres de haut prix."

IMPROVEMENT IN THE FIRING OF KILNS.

Sir,—Having read your article under the above heading, on page 541, I shall be obliged if you will allow me to point out, with reference to your remark, "In the best type of coal-fired brick-kiln hitherto constructed, a firing takes from forty-eight to sixty hours," that there is in use at the Harranden Brick and Tile Company's Hill Top Works, Harranden, a Cramp's patent brick-kiln, which consists of a series of six chambers, each capable of holding 10,000 bricks, and which is worked on the same principle as described by you. That is to say, as regards the utilisation of the heat, each chamber, containing 10,000 bricks, is burned in twelve hours, with a saving of 75 per cent. of fuel. These facts may be of interest to some of your readers.

For the Harranden Brick and Tile Co.,
Samuel Abbott.

The Fish Markets Question was revived at the meeting of the Metropolitan Board of Works on the 4th inst., when, by a much more decisive majority than at the previous meeting, the members voted against applying at present for Parliamentary powers to deal with the subject. On the previous day the Court of Common Council decided by a large majority to experimentally use the new Fruit and Vegetable Market (now nearly completed) as a market for railway-borne fish, subject to the sanction of Parliament.

WEST-END IMPROVEMENTS.

Sir,—I beg to offer for publication a suggestion as to West-end street improvements, which, both for convenience and ornament, is, I think, superior to the plan contemplated by the Metropolitan Board of Works, and which would probably not be more expensive. I propose to form a square between Regent-street, Great Windmill-street, and Piccadilly, and to continue the "Quadrant" from Windmill-street to the junction of Princes-street and King-street. I also propose to widen King-street, Crown-street, and Dudley-street, and remove the block of buildings at the junction of these streets. I would further propose to widen Wardour-street to the same width as Berners-street.

C. Roberts.

TESTING TRAPS.

Sir,—You will, of course, be cognisant that recently not a little discussion has taken place as to the value of the various closet traps, and that there are certain of them that I have advocated; also, that in furtherance of my ideas I have attended various experiments with a view of testing the actual value of each individual trap.

The result of these experiments I have duly reported, and as accurately as possible, but as some members of the trade seem to doubt (not improbably from some reason of their own) the accuracy of my reports, I beg now to inform them that on Saturday, November 19th, at three p.m., a committee of practical plumbers have arranged to meet and finally test the various traps. [See advertisement.] Any interested members of the trade can attend, and I trust that you will ventilate the matter as much as possible.

P. J. Davies.

Books.

The Imperial Dictionary of the English Language. By John Ogilvie, LL.D. New edition, greatly augmented. Edited by Charles Annandale, M.A. London: Blackie & Son. 1882.

The first volume just now issued of this new edition of a well-tried work is very satisfactory. The edition has been in preparation for above ten years, and may justly claim to be considered as substantially a new work. The augmentation which the vocabulary has undergone is so considerable that it will contain 130,000 separate entries.

As a literary dictionary it supplies a key to the written works in the language, by registering and explaining the various meanings which are or have been attached to words by writers both new and old.

The encyclopedic character of this dictionary adds greatly to its real usefulness as a book of reference, and, in conjunction with the numerous interesting quotations it contains, relieves it of the imputation common to dictionaries of being unattractive reading. In fact, it is nothing more than truth to say that, wherever it may be opened, the Imperial Dictionary presents something to interest and instruct,—some useful fact stated in concise terms,—some important maxim or sentiment in religion, morality, law, or civil policy; so that the charge usually preferred against English dictionaries, namely, that they furnish but dry sort of reading, will not apply to this dictionary.

The architectural terms, in common with others, are well illustrated. The work when completed will include 3,000 well-executed little woodcuts.

VARIORUM.

We have received a packet of serials from Messrs. Cassell, Petter, Galpin, & Co., all very good and cheap of their kind. The November number of the *Quiver* is the first of a new volume, and contains the commencement of a serial story, "Into a Larger Room," which begins very well. The *Quiver* is specially intended as a magazine for Sundays.——The *Family Magazine* is one of the best of its class at 7d., and may be safely recommended.——A popular issue, in one shilling parts, of "Picturesque Europe" has been commenced by the original publishers. It is a delightful work, and from first to last the same degree of excellence in the illustrations, on steel and wood, was maintained. The new issue will increase its popularity.——"Picturesque America," on the same lines, has reached its eighth number, and is richly illustrated.——"Cassell's Illustrated Almanac, 1882," for 6d., is a marvel of cheapness. The illustrations are excellent and numerous. —— "Gleanings from Popular Authors" will make an excellent half-hour book, and affords good subjects for readings. ——"Snow Time and Glow Time" is the title of "The Little Folks' Annual for 1882." It has plenty of good illustrations, and the letterpress is well calculated to please young people.—— The "Practical Dictionary of Mechanics," and "Cassell's Popular Educator," a revised edition, come also from the same enterprising firm.—— Never had the theatre so many frequenters in London as now, and never was there so much written of it, of a certain sort. The last addition to its literature is *The Play* (1, Kelso-place, Kensington), which gives weekly, for a penny, fair and sensible criticisms of new productions, and play-bills of all the theatres,—twenty-six. The number for November 3rd includes a touching poem, for recitation, 'titled "Drink," from the able pen of Mrs. Aylmer-Gowing.—— From the *Leisure Hour* office, 56, Paternoster-row, comes another pile of serials, all cheap, wholesome literature, with capital illustrations; the *Leisure Hour* itself, the *Sunday at Home*, and the *Cottager and Artisan*, a penny paper. The *Boy's Own Paper* and the *Girl's Own Paper*, from the same publishing office, are both well adapted to their purpose, and will be welcome anywhere amongst the young.——"Aunt Judy's Magazine" (Bogue) includes some charming writing and pretty illustrations. Our only objection is that some of the stories are a little over-sad. Why dash their bright spirits? Sorrow will come soon enough.——"Routledge's Christmas Number" is also intended for the young, and well fulfils its purpose. It includes eight full-page illustrations in colours.——In "Art and Letters, an Illustrated Monthly Magazine of Fine Art and Fiction," conducted by Mr. Comyns Carr (Remington & Co.), it is intended, if we understand rightly, to utilise some of the engravings given in the French journal *L'Art*. Under no other circumstances, probably, could so many excellent illustrations be given in the new venture at its present price. It promises to take a good place.——To remove from *L'Art* the more ephemeral portion of its usual contents, the proprietors have commenced the publication of a smaller journal, *Chronique de l'Art*, containing the art notes and current news heretofore printed in the former work, and which is sent gratuitously to its subscribers, while it can be bought separately by those who do not subscribe to *L'Art*. The number of serial publications in connexion with the fine arts is remarkable, especially if we look back to the bareness in this department of literature that existed when Mr. S. C. Hall first started the *Art Journal*, and the time it took to create a public for it. The good service done by this pioneer ought never to be forgotten, as it sometimes is.——*The Magazine of Art* (Cassell) for 1881, bound, forms a delightful book, whether for the eye or the understanding. It is impossible to open it at a page without finding something to interest. "The Homes of our Artists" makes a good feature in it. The two illustrated articles under this heading given in the present volume serve to show strikingly the splendour in which our distinguished countrymen, Sir Frederick Leighton and Mr. Millais, live and work. And, mind you, gentle youths, who are looking admiringly, perhaps a little enviously, on the magnificent apartments and costly surroundings here depicted, this is all the result, not of inheritance, not of mere luck, but of downright, resolute, and continuous hard work, developing original genius.

Miscellanea.

The Danger of Timber-covered Wells.—The danger to which the following refers is so little suspected, and yet, as is here proved, is so possible, that it deserves publicity. On the 2nd inst. as Vice-Chancellor Bristowe and Mr. Beckett (editor of the *Provincial Price Book*) were surveying an untenanted mansion in the neighbourhood of Crewe, an accident occurred which might have had more serious results. The Vice-Chancellor walked in the entrance-hall on a pump-well which had been covered with oak timbers, and looked perfectly safe, when the whole suddenly gave way under him, and he fell to the bottom. Fortunately, in falling, he obtained foothold on a cross-bearer some distance down the well, and, with Mr. Beckett's assistance, was able to sustain himself until further help could be obtained, when he was extricated from his dangerous position.

The Silicate Paint Company have received advice that their manufactures have been awarded the Gold Medal at the Adelaide Exhibition.

The Second Annual Food Exhibition, now open in the Agricultural Hall, contains much to interest everybody. There are a few matters of special interest to our readers. Messrs. Ashton & Green (Limited) exhibit a good collection of cooking-ranges, including the "Birmingham" and the "Phœnix Independent," but their chief novelty is their "Master" range (registered), which is a model of compactness, as will be seen when we state that the 36-in. size contains an oven 20 in. by 20 in. by 16 in., and a boiler to hold twenty-eight pints. It is a "close" range, and requires no setting. It needs but a small fire, and appears to be admirably adapted for use in blocks of artisans' dwellings and in the "back additions" of ordinary dwelling-houses. Messrs. Waygood & Co., besides some ingenious machinery for grocers' use, such as a gas-heated coffee-roaster and a mechanical sugar-chopper, show their patent self-sustaining lift, well suited for hotels, coffee taverns, factories, warehouses, &c. Their dinner-lifts are calculated to greatly facilitate the serving of food hot from the kitchen, and are deservedly coming largely into use. Messrs. Thos. Thomas & Sons, of Cardiff, exhibit their "automatic" self-sustaining lifts for various purposes. Of the great merits of these lifts we have spoken on previous occasions. Their "safety" hoisting crabs, cranes, and derrick winches, of which the handles cannot fly back, nor the load run down, are simple and ingenious. Turning the handles one way raises the load, turning them the reverse way lowers it. The load is always self-sustained, so that the handles may be left at any moment and will remain still. These appliances are eminently worthy of the attention of builders and others. Mr. E. S. Hindley, of Bourton, Dorset, exhibits horizontal and vertical engines and boilers, some of which supply the power for actuating the "Brush" electrical machines for lighting the hall. Messrs. F. Sage & Co. show by means of drawings what they can do in the way of shop fronts and fittings and show-cases. For excellence and variety of work of this kind this firm enjoys deservedly a high repute.

Middlesbrough. — Building operations in Middlesbrough, according to the *North-Eastern Daily Gazette*, have recommenced, — a very striking and hopeful indication of the change which has been steadily going on for some time. Mr. Almgill is erecting a small block of cottages in the Borough Field; Mr. Johnson has two houses on the way in Grange-road; a valuable block in Grange-road, which has been standing for years, has passed into new hands, and is now being completed; Mr. T. Imeson is erecting two spacious villas at the Albert Park, and is completing two others on the Linthorpe Estate; some progress is being made at Swatters Carr; foundations are being "dug out" in Union-street; and in three or four other instances land has been purchased or laid out with a view to its being utilised for workmen's dwellings. There are still empty houses in Middlesbrough, but the chief cause of this is that they have been allowed during the protracted depression in trade to fall into a state of dilapidation which renders them unfit for human habitation. Although it will take a long time to restore property in Middlesbrough to anything approaching its once reputed value, the contrast between the present and not very distant past, when there were some 3,000 empty houses there, is striking, and thus far satisfactory.

Smoke Abatement Exhibition.—At the meeting of the committee on Tuesday, at 44, Berners-street, it was announced that the Society of Arts had resolved to add, to the other prizes offered in connexion with this exhibition, a special medal to be given in the name of their Society, and Lord Alfred Churchill was nominated to act with the committee. It was reported by the hon. secretary (Mr. Wm. R. E. Coles) that the arrangements for completing the exhibition were being pushed on as fast as practicable, and that the applications for space were in excess of the amount at present available, and that fresh room would, if possible, be made for certain exhibits of special interest.

Houses in Bristol. — According to the returns of the rate-collectors, there are about 33,000 occupied houses in Bristol, and over 1,000 unoccupied.

Shutters.—Messrs. Salmon, Barnes, & Co., of Ulverston, have fitted up their patent iron balance-weight shutters to the new bank in Baker-street.

New Municipal Buildings at Launceston have been opened. The style of architecture selected by the joint architects (Messrs. Hine & Odgers, of Plymouth, and Mr. Otho B. Peter, of Launceston) is sixteenth-century Gothic. There is a central castellated tower, 15 ft. square and 60 ft. high, and a circular clock staircase at the south-west angle, leading to two rooms and a clock-chamber. From the tower a corridor on the left leads to the council-chamber. Its internal measurement is 20 ft. by 30 ft., and so far it is the largest room in the building. It has three three-light windows in the north wall, and one in the east wall. The former are filled with cathedral glass, and the latter, which is at the head of the chamber, is of stained glass, the subjects being the coats of arms and mottoes of past mayors of the borough. The centre piece is the Launceston borough arms, dated 1573, the date of the last charter. The carving has been done by Mr. Harry Hems, sculptor, of Exeter, in red Corsehill stone, from Dumfriesshire. It is surrounded by the arms of the most distinguished mayors. The window is by Messrs. Fouracre, of Plymouth. In addition to the council-chamber there are two committee-rooms, 14 ft. by 18 ft., a passage by the side entrance dividing them from the main room. Above these two committee-rooms is a large chamber, in which it is intended to fit up a local museum. There are also porters' rooms and lavatories. The walls are of local stone, from many different quarries. Mr. Congdon, of St. Stephens, was the builder. As soon as the funds can be obtained it is proposed to complete the buildings by erecting a large hall.

New Museum, Free Library, and School of Art, Stafford.—The new building erected by the Corporation of Stafford, from designs by Mr. J. B. McCallum, the borough surveyor, for the purposes of a museum, free library, and school of art, was formally opened on the 3rd inst. The building is situate in Eastgate-street, and adjoins the Borough Hall, being entered by the passage at the end of the hall, and having an internal communication with the corridor of the Assembly-room. It covers an area of about 225 square yards. The library and reading-room occupy the ground-floor, and the first-floor is taken up by the Wragge Museum, leaving the second floor for the art and science school. The dimensions of the rooms are 37 ft. by 37 ft. The frontage is composed of red brick, with ornamental designs in terra cotta, supplied from the Brereton works of Mr. Arthur Gee, of Stafford, the contractor. The work, which includes some scrolls and medallions in terra cotta, has been completed by Mr. A. Gee at a cost, exclusive of site, of 2,000*l*. The total cost was estimated at 3,000*l*., which is made chargeable upon the borough fund, the penny free library rate being only available for working expenses.

London and Middlesex Archæological Society.—The session of 1881-82 will commence on Monday, the 14th inst., when a paper will be read by Mr. Edwin Nash, F.R.I.B.A., entitled "Some Archæological Notes in Middlesex." The evening meetings will be continued as usual from November to May inclusive, and the following members have promised to read papers:—Mr. C. R. Rivington, "On the Registers of the Stationers' Company." Mr. H. B. Wheatley, F.S.A., "On the Site of the Adelphi." Communications are also expected from Alderman Hanson, F.S.A.; Mr. Wilfrid Cripps, F.S.A. (author of "Old English Plate"); and other members of the society. The "History of Monken Hadley," by the Rev. F. C. Cass, M.A., will be ready for issue almost immediately.

The late Mr. John Crawley.—We are glad to hear that the practice of the late Mr. John Crawley, of Bloomsbury-square, has been taken over by Mr. Joseph Stanislaus Hansom, F.R.I.B.A., of Alfred-place West, South Kensington, on terms of advantage to Mr. Crawley's family. Mr. Crawley was latterly engaged on the new Roman Catholic Church at Portsmouth, two churches at Brighton, and other important works. He had in progress also plans for a new cathedral at Hong Kong, which has been unavoidably delayed by his illness and death; but they are now being pushed on by Mr. Hansom.

"Victory over Sewer Gas." — We have received another letter from Mr. Cosmo Innes on this subject, but cannot find space for it. The matter is fully before our readers, and they can judge for themselves. A correspondent who writes admiringly of Mr. Mineard's system must accept the same reply.

The Building Exhibition, 1882.—This, the third Building Exhibition held at the Agricultural Hall, will be opened on March 20th, and remain open until the 1st of April. It will be under the same management as the previous exhibitions, and bids fair to continue the success already achieved. Applications for space should be sent to the Secretary and Manager, Mr. John Black, 161, Strand, without delay, for we are informed that more than three-fourths of the area of the hall have been already allotted to intending exhibitors.

Wilmington, Kent.—A new south aisle and heating-chamber have just been added to the parish church, and were opened on the 26th ult. Messrs. Naylar & Son, of Rochester, were the contractors; the architect being Mr. W. G. Bartleet, of New Broad-street. The total cost of the works has been about 1,600*l*.

Stoke.—The Stoke Town Council have resolved to purchase twenty-one acres of land in front of the infirmary for a cemetery, which the town will shortly require. The estimated outlay is rather under 5,000*l*., exclusive of chapels.

TENDERS

For stables and Coach-house, Jay's-mews, Kensington-gore. Mr. Basil Champneys, architect. Quantities supplied:—

Coles	£1,237	0	0
Higgs & Hill	1,234	0	0
Lascelles	1,208	0	0
Sawyer	1,253	0	0
Hobson	1,196	0	0
Adamson	1,187	0	0
Bywaters	1,183	0	0

For repairs and alterations to the Horse and Trumpeter public-house, Nottingham. Mr. Frederick Jackson, architect. Quantities supplied by the architect:—

G. Bell & Son, Nottingham	£1,060	0	0
Wood Brothers, Nottingham	1,059	0	0
William Bailey, Nottingham	997	0	0
Marriott & Wartnaby, Nottingham	830	0	0
Samuel Hind, Nottingham	803	0	0
Enoch Hind, Nottingham	772	10	0
Bradley & Barker, Nottingham	745	0	0
R. Middleton, Nottingham*	730	0	0

* accepted.

Accepted for plumber's, plasterer's, slater's, and iron-founder's work, Carlisle Grammar School. Messrs. Hetherington & Oliver, architects. Quantities by architects:—

W. Anderson, plumber	£879	10	0
T. Nanson, slater	435	0	0
Staufield & Son, ironfounders	432	10	3½
R. M. Ormerod, plasterer	397	0	0

For building two houses in North-street, Stepney, for Mr. Romain. Mr. C. A. Legg, architect:—

Elves	£425	0	0
Croft	4 0	0	0
Judd	397	0	0

For alterations, repairs, and additions to No. 10, Claremont-square, N., and for additional buildings in rear, for Dr. Abercrombie. Mr. A. J. Beesley, architect. Quantities supplied by Mr. Henry Nutt.

Allen (accepted).

Accepted for alterations and fitting-up of premises, 8, Russell-street, Leek, for the Leek Liberal Club. Messrs. William Sugden & Son, architects:—

T. Grace (Contract 1)	£189	10	0
J. & J. Matthews (Contract 2)	136	0	0
J. Heath (Contract 3)	97	0	0

For new branch bank buildings and manager's house at Leek, for the Manchester and Liverpool District Banking Company, Limited. Quantities supplied. Messrs. William Sugden & Son, architects:—

Samuel Warburton	£6,827	0	0
Richard Bradbury	6,774	0	0
John Wharton	6,772	0	0
Southern & Sons	6,660	0	0
H. & R. Inskip	6,485	0	0
J. Massey & Sons (accepted)	6,575	0	0

For the erection of stabling at Kilburn, for Mr. J. Griffiths. Mr. W. Graves, architect:—

Ward & Lamble (accepted).

For decorations and boundary walls to Yoroshi House, Woolwich, for Captain Skinner, R.A. Mr. W. Graves architect:—

Ward & Lamble (accepted).

For the erection of stabling and coach-house in the Edgware-road, Brondesbury, for Mr. J. Currom. Mr. W. Graves, architect:—

Ward & Lamble (accepted).

For the erection and completion of refreshment-bar and waiting-room adjoining the Staines railway-station yard, for Messrs. Charles Ashby & Co. Mr. E. Saunders, architect:—

Joseph Higgs, London (accepted).

For additions and alterations to the Nag's Head public-house, Sunningdale, Berks, for Messrs. Charles Ashby & Co. Mr. E. Saunders, architect:—

Joseph Higgs (accepted).

For alterations and repairs to the Bridge House Hotel, Frimley, Surrey, for Mr. T. F. Harris, Staines. Messrs. Low & Birch, architects:—

Joseph Higgs (accepted).

For the erection and completion of locomotive workshops, two blocks of workshops and one block of offices, for the Metropolitan Railway Company, at Neasden. Mr. J. Tomlinson, jun., architect. Quantities by Mr. A. R. Brede:—

W. J. Botterill	£31,342	0	0
F. Higgs	28,550	0	0
J. Kindell	27,489	0	0
W. Crockett	27,243	0	0

For six detached villa residences in the Lansdown-road, Ashburnham Estate, Bedford, for Messrs. Hawkins & Ashwell. Mr. H. H. Bridgman, architect. Quantities by Mr. F. Thomson:—

Thos. Spencer, Bedford (accepted)	£6,683 5 0

For a detached villa residence in The Oval, Ashburnham Estate, Bedford, for Messrs. Hawkins & Ashwell. Mr. H. H. Bridgman, architect:—

Thos. Spencer, Bedford (accepted)	£1,241 0 0

For pulling down and rebuilding the premises, No. 10, Finsbury-square, for the "United Kingdom Assurance Corporation, Limited." Mr. Frederick Hammond, architect. Quantities not supplied:—

Dove Brothers	£1,655 0 0
Prescott	1,250 0 0
H. L. & R. Roberts	1,083 0 0
J. H. Johnson (accepted)	2,197 0 0

For rebuilding Nos. 9 and 10, Tokenhouse-yard, Lothbury, City. Mr. R. E. Tyler, architect. Quantities by Mr. Barnett:—

Green	£8,389 0 0
Colls & Son	8,152 0 0
Clarke & Bracey	7,959 0 0
Wilson & Exton	7,787 0 0
Patrick & Son	7,785 0 0
McLachlan & Sons	7,678 0 0
Nightingale	7,584 0 0
Grover	7,547 0 0
Merritt & Ashby	7,547 0 0

For completion of two houses at Crouch-hill. Mr. Walter Stair, architect. Quantities by Mr. H. J. Kirk, surveyor:—

Gladwell	£973 0 0
Peck	840 5 0
Legers	840 0 0

For the erection of street portion of the new factory buildings on the premises of the Old College Ironworks, St. Alban's, for Messrs. John Freshwater & Company (Limited). Mr. Bertram A. Raves, architect, Welwyn Quantities by the architect:—

J. & W. Savage, St. Alban's	£732 0 0
C. Miskin, St. Alban's	680 0 0
W. Carlin, St. Alban's	666 10 0
J. Mead, St. Alban's	657 0 0
G. Capper, St. Alban's (accepted)	570 0 0

For alterations to shop at Canning-town. Mr. Walter Stair, architect:—

McLean	£1,510 0 0
Cawthorne	1,450 0 0
Hall	1,310 0 0
Gladwell	1,200 0 0
Clark	1,170 0 0

For engineering works in connexion with the laundry and bath-house, &c. at the Kensington and Chelsea District School, Banstead, for the Managers. Messrs. A. & C. Harston, architects:—

Benham	£1,265 0 0
Clements	1,250 0 0
May	1,080 0 0
Bradford & Co., High Holborn*	994 10 0

* Accepted.

For the erection of a "Mission House" at St. Leonard's-road, Bromley, Middlesex, for Miss Emily Currie. Messrs. A. & C. Harston, architects. Quantities supplied:—

Smith	£900 0 0
Atherton & Latta	745 0 0
Walker	738 0 0
Holland	723 0 0
Carpenter & Poole, Pentonville	697 0 0
Ditto, reduced to and accepted at	653 0 0

For laying house connexions from the main sewers for the parish of Chiswick for twelve months:—
Wilkes & Company, London (accepted).

All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication.

We are compelled to decline pointing out books and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under ..... 4s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

Terms for series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under ..... 2s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

REPLIES TO ADVERTISEMENTS,

Addressed Box —, Office of "The Builder,"

Cannot be forwarded, but must in all cases be called for, and the Office Receipt produced.

THE CHARGE FOR A BOX IS AS UNDER:—

For "Situations Wanted" Advertisements ..... 3d. per Week.
For all other Advertisements ..... 6d. per Week

PREPAYMENT IS ABSOLUTELY NECESSARY.

*** Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, King-street, Covent-garden, W.C. to
DOUGLAS FOURDRINIER, Publisher,
Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied *direct* from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum, *prepaid*. Remittances payable to DOUGLAS FOURDRINIER, Publisher, 46, Catherine-street, W.C.

The New Etruscan Room in the British Museum.

In our recent notice of the principal objects of interest in the new Egyptian Rooms of the British Museum a subsequent account of the contents of the new room which is devoted to the display of Etruscan fictilia and sculptures was promised; this promise it is proposed to fulfil on the present occasion. The removal of the Palæontological Collections under the charge of Professor Owen, C.B., and Dr. H. Woodward, F.R.S., from the north-west corner of the upper floor at Bloomsbury gave an opportunity for exhibiting this fine series of Etruscan relics, of which Professor C. T. Newton, C.B., keeper of the Greek and Roman Antiquities, was not slow to take advantage. These Etruscan relics, which have been gradually acquired by the trustees, have never before been shown to the general public in any order of instructive arrangement. Indeed, almost all of them have been stowed away, for the last decade or longer, in the vaults of the basement floor, where they were difficult of access to the mere sight-seer, and equally difficult of examination by the critical student or archæologist. These circumstances, however, have now passed away. The Museum is gradually throwing off the feeling of overfulness which was once so universal in it, and a very short space of time has elapsed since the transference of the Natural History collections to that branch of the British Museum which, although still subject to the control of the Principal Librarian, is located at South Kensington, before the shifting of the unrivalled collection of Etruscan art remains has been made from the dark recesses and vaulted cellars of the British Museum to a new and admirably suitable position, where they will enjoy the advantages of being better lighted, more instructively grouped together, and more readily inspected by the ever-increasing number of persons who are rapidly becoming aware that the only true and profitable way of studying ancient art is to make a personal examination of the actual remains.

The relics which Etruscan sepulchres have richly and abundantly yielded to the scientific excavator are, in point of material, analogous to those of other sites and of other European nations. Glass, supposed to be of Phœnician origin, has been found in the tombs; gold objects, principally objects of personal ornament, beautifully worked in forms and patterns which defy even the most skilful of modern goldsmiths to imitate or reproduce them; and bronze figures and vases which manifest a highly-cultivated acquaintance with the manifold arts of the metal-worker, have been discovered in considerable quantities on the sites of ancient Etrurian cities and cemeteries. Of these three sub-divisions of Etruscan remains many specimens of especial beauty and value are in the collections of the British Museum. But they are displayed in the rooms devoted to the exhibition of similar materials from other archæological sources; hence they must be sought for in the Glass, the Gold, and the Bronze Rooms in other parts of the upper floor.

The New Etruscan Room, to a notice of which the present article is designed, is destined to an exhibition of the pottery and stone remains; and putting aside for the moment any consideration of other materials, in these two alone true and native Etruscan art, both in style and feeling, may be as well studied as it is thereby excellently illustrated. Commencing with the terra-cottas and fictilia, the first few cases at the left-hand corner farthest away from the doorway which leads from the new Egyptian Room to this are filled with specimens of vases and other miscellaneous specimens of pottery. Dr. Birch, one of our best authorities on the subject, divides the vases into four varieties: 1, brown ware; 2, black ware; 3, red ware; and, 4, yellow ware. The brown wares are apparently the oldest, their colour is a greyish brown, probably from having been imperfectly baked; sometimes, however, they are red in the centre. Some vases of this class, the fabric of which is exceedingly coarse, and which are ornamented with rude decorations, consisting of punctured or incised lines, spirals, raised zigzags, bosses, and projecting ornaments, applied after the body of the vase was made, resemble in their character the Teutonic vases which have been found on the banks of the Rhine, and certain Celtic examples that occur in France and Britain, from which they are often scarcely to be distinguished. They consist of jugs, *oinochoai*, small vases with two handles, and wide cups like the *kyathos*. In the rudeness of their shapes and peculiar treatment, they seem to be imitations of vases carved out of wood, such as we know the *kissibion* to have been. The most remarkable and interesting of this class are those found under the volcanic tufo, near the Alban lakes, which are in the shape of a tugurium or cottage, and must have contained the ashes of early inhabitants of Latium. There is one of these latter placed among the vases; another one, of somewhat larger dimensions, presented by Mr. W. R. Hamilton, found at Monte Albano in 1817, is placed under the windows on the right hand near the door. This is filled with the ashes of the dead, which were introduced by a little door, afterwards secured by a cord passing through two rings at its sides and tied round the vessel. The cover or roof is vaulted and apparently intended to represent the beams of a house or cottage. The exterior has been ornamented with a Mæander in white paint, traces of which still remain. They were placed within a large two-handled vase, which protected them from any superincumbent mass.

Close to these are specimens of the black ware with lustrous, jet-like polish, made, according to some authorities, of black bituminous earth found in the Etruscan territory, or, according to others, of yellow clay, darkened by casting the smoke of the furnace on it. It was baked in kilns at a low temperature. An *oinochoe* of this ware, and a vase with moulded figures on it, from Vulci, in this collection, have been figured by Dr. Birch in his "History of Ancient Pottery." Among other objects a male and a female mask will attract the visitor in this class of ware. Near these are those of a later period, when a finer material was employed, and the shapes and details of the ornamentation were chiefly imitated or adopted from contemporary works in bronze. In this style the ornament frequently consists of a frieze, or band, with representations of men, animals, and monsters. In this case are also three specimens of red Etruscan ware, on one of which is a frieze, with two draped figures reclining on a couch, beneath which are two birds. At the head of the couch stands a naked male figure, playing on the double flute at the foot are two vases and a branch. Towards them another similar figure is advancing, holding an instrument thought by some to be a strainer. Behind this group is a female stretched at full length on a couch, with a low table at the side, and another male figure, also undraped, advances towards the foot of the couch. This subject is repeated seven times, and appears to have been impressed by rolling a cylinder with subjects in intaglio along the body of the vase. Of the third or red ware are several examples. Some of them are flat circular dishes of fine paste, the broad and flat lips of which have similar friezes impressed in bas-relief with a rolling cylinder. These vases, of which there are three in the Museum cases, are very old, according to a very good authority, probably B.C. 700. They are generally found in the older Etruscan cemeteries, in the tunnelled tombs of Cervetri, or Caere Vetus, or at Tarquinii, and on the site of Veii. Of the pale yellow ware of fine quality, but imperfectly fired, are certain *lekythoi* and perfume-vases, sometimes found in the more ancient sepulchres, but the general mass of the pale ware appears referable to a late period.

Of Etruscan fictile vessels a large number has been collected, and there is scarcely a museum or a tolerably large private collection of antiquities without some specimens. Bricks and tiles were, probably, rarely employed; some, however, are extant with inscriptions painted or engraved upon them; and one writer of authority considers that tiles were used to close the recesses in sepulchral chambers, within which

were placed the small sarcophagi holding the ashes of the dead. The sepulchres of Chiusi, the ancient Clusium or Camars, have contributed some of these. There are some, also, with Latin and Etruscan bilingual inscriptions as late in point of date as the Republic or the Empire. Some pottery has been found under strata of peperino of considerable age.

Near the vases is a table-case of antefixal ornaments in terra-cotta of the yellow or light reddish-yellow class. These are mostly from Capua, and form the ornaments of roof tiles. They are impressed in bold relief with female heads, masks, harpies, gorgonic heads, a draped figure holding two lions, and a figure on a horse with a goose below on the ground. These, in many cases, preserve traces of colouring laid on rudely. On the top of this case is placed a canopic figure in the form of a cinerary urn, with two human arms for the handles, and a cover in the form of a human face or iconic head. Close by is a seated figure in terra-cotta, probably also of sepulchral or cinerary employment; and on the other side of the cast of a capital of foliated design, called, from its subject, the "Paris and Helen" capital, from the central support of a large tomb, another cinerary figure, with holes pierced in the head to allow of the escape of steam in the process of baking, or of effluvia from the ashes of the dead. This latter figure is seated, so to speak, for it has no legs or feet, in a large curule chair with curved and spreading back. On the right-hand side of the doorway, between the windows is a somewhat similar figure of yellowish-red clay, seated in a hollow box-like plinth. It has large earrings, and the dress, or toga, is deeply scratched with lines crossing like network about 1 in. apart, in a fretty or lozengy pattern. In the centre of the row of windows on the right-hand side of the room is a large vase of considerable age with a reeded body, widened lip, and narrow base, having on the shoulder a frieze of the peculiar style already described, in which is depicted a chariot scene.

The Etruscans enjoyed a reputation for their works in clay; but few statues of any importance have come down to us, yet the art of modelling in clay preceded that of working in metals, an art in which also the Etruscans particularly excelled, especially in the mechanical treatment. The most remarkable Etruscan terra-cotta group for its size and execution known, is that of a male and female figure reposing on a couch, of the same style of art as the early bronzes and wall-paintings of the sepulchres of Italy. The figures are of life-size, of slender proportions, with smiling features, the drapery flat and formal. It is made of a clay mixed with volcanic sand, resembling the red ware, and is decorated with colour. It comes from Cervetri, a site of prolific yield to the archæologist, which has not only contributed this group to the Louvre, but a group in many respects very similar to it, which was acquired from Signor Castellani by the Trustees of the British Museum, and now occupies a central position in the new room. Much has been written of this remarkable terra-cotta group placed upon the lid of a sarcophagus, the body of which is ornamented, after the late Etruscan style, with a frieze or band replenished with battle and banqueting scenes. It will be remembered that the Rev. Isaac Taylor, about the time of its acquisition, declared in the *Athenæum* his belief, founded on philological reasons in connexion with the inscription which it contains, that it was not a genuine object of antiquity; and Mr. Dennis, one of the greatest authorities on Etruscan monuments, who has given, in his newe dition of "The Cities and Cemeteries of Etruria," vol. i., p. 279, a graphic description of the Louvre sarcophagus mentioned above, speaking farther on of the yet more primitive character and peculiarly indigenous art of the British Museum terra-cotta sarcophagus, declares that Italian antiquaries generally doubt its genuineness. On the other hand, the inscription is observed by Mr. Newton to be in very early Greek characters rather than Etruscan, yet, like the latter, it is written from right to left. The room contains several other terra-cotta sarcophagi, among others two large ones from a tomb at Vulci. The lower part, which held the body, is in shape of a rectangular box or trough. On the covers are recumbent Etruscan females, modelled at full length. One of these has both its cover and chest divided into two portions, a fact probably to be accounted for in the fact that masses of too large a size were apt to fail in the process of baking.

We may aptly close the notice of the Etruscan terra-cotta, by Mr. Newton's description of the remarkable sarcophagus which occupies so prominent a position in a room dedicated to the ancient art of Etruria. He says, "This Etruscan sarcophagus consists of a coffin, richly decorated all round, the four corners of which rest each on a pedestal ornamented with the bust of a siren or harpy. On the cover of the coffin are a male and female figure reclining on a mattress. The male figure is naked, and his meagre and emaciated condition seems caused by age and sickness, though perhaps much of the peculiarity of the type may be due to the want of skill in the artist in the representation of nude forms. The female figure wears a close-fitting *chiton*, which does not reach to the feet. Her hair falls in long tresses over her bosom, and is gathered into a thick queue behind. Round her neck is a necklace with pendants, resembling some very ancient ornaments in silver and amber found at Palestrina, and now in the Castellani collection of jewels. Her right hand is raised as if she held out something, which the male figure advances his right hand to receive. His left elbow rests on two flat cushions, on which a painted Mæander is still visible. The style of these figures is archaic, the treatment throughout very naturalistic, in which a curious striving after truth in anatomical details gives animation to the group, in spite of extreme ungainliness of form, and ungraceful composition. The groups seem to have been made in parts, filled in after passage through the furnace. The relief on the front of the coffin represents a battle between two warriors, each attended by one male and two female figures. At either end of the scene is a winged figure; these probably represent the souls of the two warriors. On the opposite side of the coffin is represented a banquet, at which a male and female figure recline. At one end are two warriors, each of whom appears to be taking leave of two female relations. At the other end are two pairs of females, seated in chairs, in a mourning attitude. It is to be presumed that the four scenes thus represented on the sides of the coffin have relation to one another, and that the four subjects represented are the leave-taking of two warriors before going to single combat; the death of one of them; the mourning for that death; and the funeral feast, or possibly the reception of the slain warrior in the realms of bliss. But the particular single combat represented has not yet been identified. It should be noticed that in the single combat a lion is represented fastening on the leg of the falling warrior. Above the battle-scene is an Etruscan inscription painted in two lines, one of which is along the edge of the mattress, the other immediately below. The letters are identical with the earliest forms of the Greek. The inscription is very similar to that on a gold fibula found at Chiusi, but its interpretation is not yet determined. In the Louvre is a terra-cotta sarcophagus found at Cervetri, and formerly in the Campana Collection, on which are two relief figures, very similar in type and composition to these, but showing more sense of beauty, and more artistic skill in their design and execution. These two sarcophagi may be reckoned amongst the earliest known specimens of the fictile art of Etruria. There is no positive evidence as to their age, but they can hardly be later than B.C. 500." Dennis, however, considers the Museum sarcophagus to be earlier than that in the Louvre.

The stone relics, which form by far the largest proportion of remains in the Etruscan Room, may be divided into three classes: 1, the statues; 2, *cistæ*; 3, sarcophagi. Of the first there are only two examples in the British Museum. One is a full-sized male figure, draped and seated in a chair. The body is divided horizontally, and hollowed out, in all probability to receive the mortal remains of him whose portraiture it claims to represent. This comes from Chiusi, and is of considerable age. The other is a stone figure of a female, draped, holding a long-horned bird of peculiar shape in the left hand. The stone seems to be a very old kind of alabaster, and has been thickly gilded. It comes from the Polledrara tomb at Vulci, and has been described at length in Micali's "Monumenti Inediti." Of the second class, that of the *cistæ*, there are four remarkable examples, placed on the left-hand side of the room in the floor-space in front of the glass cases. The one nearest to the entrance-door has an elegant moulding as seen in profile. It bears four separate scenes on its sides in low relief. The subjects are,—funeral rites; music; a banquet or sepulchral feast, where a dog and a casket have been introduced by the artist under the couch of the guests; persons lamenting with uplifted hands; and a female figure on a bier attended by four mourners. The second *cista* has also four scenes in the same style of relief. Here occur the player on the double pipe or flute, a player on the lyre, a music band, and a group of mourners with hands upraised and finger stretched out in that peculiar attitude of wonder and alarm which may be noticed in some of the earliest illustrated manuscripts. The profile of the moulding here also is worthy of notice by the professional architect for its delicate simplicity and harmonious balance of proportion. The third *cista*, which has likewise an interesting moulding in plan or outline, shows us a group in which there is a dog and a vase under the banqueting-table, geese under another table, and a party of huntsmen equipped with a kind of pastoral crook. The fourth and last of these objects near the table-case of Capuan antefixal ornaments comes, like the others, from Chiusi. Its subjects are,—a banquet with a dog and a goose on the floor; two warriors leading their horses; a group of hunters armed with the crook and the spear, and attended by a man carrying the game slung on a yoke or pole over his shoulders; and a band of warriors whose armour consists of spears or javelins, the round shield, and the helmet with a long crested ridge reaching far down the shoulders of the wearer. Behind this *cista*, and at the left side of the gilded female figure holding the mystic bird, is a small sarcophagus or cist, of an intermediate type between the *cista* already mentioned and the sarcophagi proper, which we are about to describe. On the lid is a female figure laid out in death upon a funereal couch. The hair of the figure is disposed in six ample plaits upon her breast; the drapery is curiously archaic, and the mattress on which the body rests has a kind of double pillow at the head, and an undulating or wavelike bed. On the frieze below are two lions attacking a bull and two reclining Satyrs. The feet of the couch have a strange kind of antefixal ornament. This remarkable object comes from Caere.

The stone sarcophagi form the great bulk of the Etruscan Collection in the British Museum. In all there are about fifty of these relics. They are of all sizes, from 1 ft. long, and about the same in height, to about 7 ft. long and 6 ft. in height. The material of which they are composed is of various kinds; the dull greenish tufo, a whitish calcareous rock, and a yellowish, lustrous kind, somewhat resembling a marmoreal alabaster, being the favourite vehicles employed by the sculptors of these conventional cippi. A large proportion of them have upon the lid a recumbent figure, generally more or less iconic, propped up upon the left elbow, holding in the right hand a concave sacrificial patera, with a central boss, and wearing round the neck a chaplet of flowers, or of a kind of woollen material. This form is probably figurative of the deceased reclining on the festive couch, as described by Dennis, vol. i., p. 394. A few figures wore finger-rings, and one has a mirror in the hand. Among the subjects of the small urns, sarcophagi, or cippi, which are arranged in glass cases around the wall of the room, are many of Greek origin. They are well carved, as a rule, in bold and salient relief. Here we may see two Centaurs carrying off Lapithæ women; Paris and his companions carrying off Helena and the treasures of Menelaos; Ulysses and his companions passing the Sirens; Orestes and Pylades putting Klytemnestra and Ægisthos to death; Achilles slaying Troilus; the tragic death of Eteokles and Polyneikes, as tragically related in the "Septem contra Thebas"; the death of Hippolytus, his horse being terrified by a bull sent against him by the order of Poseidon; and another similar subject into which is introduced the figure of Artemis holding a torch. In others are:—Achilles slaying Penthesilea in her chariot; Telephos threatening to kill the infant Orestes in the presence of Klytemnestra, and Agamemnon with three Greek warriors; and four examples of the combat of two Greek warriors, probably Eteokles and Polyneikes, in the presence of a winged female figure holding a torch, and perhaps intended to represent Thanatos, or Death. Warriors, bouquets, floral ornaments, and animals' heads are also found on the smaller and less pretentious of these carvings.

It now remains only to speak of the larger

sarcophagi arranged under the windows on the right-hand side of the room. As we enter the room, the first is the stone cover of a sarcophagus of which the lower part or cist is wanting. On it is a recumbent female figure in relief, holding a *thyrsos* or branch, and a *kantharos* or vase. At her side is a deer. This comes from the early tomb called the "Grotta del Triclinio" or "Grotta Marzi," as it is also called, at Corneto or Tarquinii, discovered in 1830 by Marzi and Fossati, and of which Dennis, i. 318, gives a detailed notice. Next in order is a well-carved sarcophagus, with a recumbent effigy on the lid. On the front of the box is a winged male figure leading a *biga* or two-horsed chariot, attended by three lictors with their fasces and a trumpeter. This was brought from Toscanella, and the inscription forms the subject of especial lucubrations by Fabretti and Corssen. Close to this is another slab with a recumbent figure at full length holding a *kantharos*; and near to it a fine and spacious sarcophagus, without the lid, carved on both sides with scenes from the "Iliupersis," or taking of Troy. This was found in the "Tomb of the Chariots" at Corneto or Tarquinii, and is described at length by Campanari in his "Etruscan and Greek Antiquities." In proximity to this is another sarcophagus, with the usual recumbent figure on the lid, having on the front a Gorgon or Medusa's head between two marine monsters, ridden by youths. By the side of this are casts of two small lions, of rude workmanship, and probably of very great antiquity. At the north-west corner of the room is another sarcophagus, with the usual effigy leaning on the left elbow, and supported by a wedge-shaped pillow upon the lid. The front of the coffin in this case is ornamented with a head, perhaps of Medusa or a Gorgon, between two dolphins of primitive design. In front of the lions, and opposite the table-case of terra cotta antefixal ornaments, one of the most interesting sarcophagi is placed. This comes from the tomb known as the "Grotta dipinta" of Bomarzo, about twelve miles east of Viterbo, where extensive excavations have been made. In many respects this sarcophagus is unique. It seems from the sloping roof, joint-tiles, and antefixæ to have represented a house or temple, yet nothing like a door is shown. The lid has a winged sphinx at each end of the ridge of the roof, and in the middle are a pair of serpents curiously knotted together like ropes; and it appears highly probable, as Dennis asserts, from this and the other adornments of the sarcophagus, as well as from a serpent jar painted on the wall of the tomb itself, that this was the sepulchre of some augur or aruspex skilled in the mysteries of the Etruscan disciplina" and in interpreting the will of the gods. His name, inscribed on the sarcophagus, was "Vel Urinates," a family name met with at Castel d'Asso, on a rock tomb, and at Volterra, Chiusi, and Perugia, among Etruscan antiquities. The antefixæ of this sarcophagus are female heads, probably larvæ, like those on the black-ware of Chiusi and Sarteano. At each end of the sculpture are griffins, or beasts of prey, devouring antelopes, and on the sides, at each angle, is a figure, also in relief, one side representing Charon or Mantus, with a hammer and crested snake in his hands, balanced by Lasa, or Fate, with a scroll; the other the goddess Nortia, with a hammer and a nail, balanced by a warrior, with sword and shield. The whole was originally covered with stucco and coloured, and traces of red, black, and blue may still be detected. Near this is a sarcophagus, with the conventional recumbent figure, an incuse inscription, and two marine creatures on the front panel, from Toscanella. A smaller temple-shaped cist or sarcophagus, with sloping imbricated roof, and carved feet, is placed behind the cists on the left of the doorway, and may be compared in some parts of its form with the remarkable coffin of Vel Urinates, the soothsayer of Bomarzo.

Over the wall-cases are a series of painted facsimiles, by Signor Campanari, of the walls of an Etruscan tomb at Tarquinii, decorated with a double frieze. In the lower are represented dances and entertainments, and in the upper athletic games, as leaping, running, chariot-racing, hurling the discus, boxing, and the armed course. Above is a large vase and persons at an entertainment. The sides of the entrance to this tomb, decorated with two panthers, are also shown. Such are the principal objects of this marvellous collection of antiquities. The educational arrangement and artistic display reflect great credit on the keeper of the department to which they belong, and although, undoubtedly, the exhibition would be enhanced by the addition of bronze and gold Etruscan relics, yet, as the collection at present stands, there is considerable profit to be gained by those who study these antiquities aright; for, like most other monuments, they are eloquent, though silent, and speak readily enough to those who can understand them.

SOME POINTS IN THE INSTITUTE ADDRESS.

The opening meeting at the Institute last week was crowded to the doors, showing that so far at least the new President commands the support of a large number of members, as we should have expected. Those who may have come partly out of a wish to hear what new views, if any, on the subject of architecture might be put forth by a president whose general professional tendencies are so different from those of his recent predecessors in office, or who expected a very marked "new departure" in regard to the ideas to be entertained as to the object and influence of the Institute of Architects, would not have felt their expectations fully realised. Mr. Street, indeed, seemed specially desirous to show that he, though professedly an "art-architect," could take as practical a view of matters as any of his recent predecessors, and his address, chiefly concerned in indicating in what direction lay the lines of usefulness of the Institute, was marked by the absence of observations specially relating to architectural design or architectural art in its pure form.

This turn of the address is noticeable because the President in the first paragraph observed that he considered that the scientific side of architecture had received disproportionate attention lately in comparison with the artistic side. Our own judgment would be, in the Scriptural phrase, "These things ought ye to have done, and not to leave the other undone." The scientific side of architecture is of such great importance, being, in fact, the basis of the whole and that without which architecture can hardly be said to be fulfilling its mission at all, that it would take very strong evidence to make us think that we had reached a point at which little more attention to it was necessary. A great deal of practical work has been done at the Institute during the last session, and we pointed out, in a few words the other day in regard to the new volume of the Transactions, that here was at least an answer to the charge often recklessly made by newspaper writers and their readers, that the architects of the day were not giving attention to practical questions. But we fear it is too soon yet to say of English architects that as a body they are honourably distinguished for the way in which they deal with new forms of construction, drainage, and water-supply, &c. Some architects of the day have distinguished themselves among their fellows by special attention to these subjects, but the distinction is not one at present very difficult, relatively speaking, to acquire. The phrase "English comfort," quoted by Mr. Street, refers in the main to characteristics in regard to our habits of living and of furnishing our houses which do not come quite under the same category as questions of drainage and ventilation, and are the result of influences other than those of the architect. A great many people still consider it "English comfort" to have a large dinner-party in a room without the slightest provision for ventilation, and in a great many, we rather fear a majority of cases, the architect says and does nothing to induce them to be less easily contented. In the matter of drainage we are probably more advanced (where our best theory and practice have been applied) than any other European nation. In many other matters connected with house comfort we might probably have many hints to take from other nations, the French and Americans especially. In the exhibition of sanitary appliances during the medical congress we could not but notice how almost entirely insular was the exhibition in character, and how many things might have been shown there which are at present only known to us in French treatises on "Chauffage et Ventilation," and other cognate subjects. In relation to this we may be allowed to observe that the special intention in the founding of a new endowment for professional study by the editor of this journal, which was incidentally referred to in another part of the address, does not seem to have been quite fully apprehended. The position, it may be once more explained, is this; there are several endowments in the Institute for encouraging young architects and students to study, sketch, and measure ancient buildings abroad and at home, but abroad chiefly: there is one (the Grissell medal), specially intended to promote the study of construction. But there was no special inducement to students to study the *modern* buildings of other countries in their practical aspect, thus to see what could be learned from them and to keep our own country up to the mark in planning and construction and other practical details. This, it will be admitted, is as important in its way, and as much within the proper scope of the work of an educational institution (which the Institute is, to some extent), as the promotion of sketching tours in which the sentiment of ancient architecture, rather than the requirements of modern architecture, is the object.

In the stand which Mr. Street made in favour of solid and substantial building, and its great importance even when there is not a question of anything higher in the scale of architecture than mere substantiality, we, of course, quite agree. Whether the prevalent jerry-building of the speculating builder is really at all to be traced to the bad example of flimsy building under architectural rule, we should be disposed to question. The worst building executed under an architect is better than the speculating builder's average work; and a great many of the speculating builder's pet "vanities," such as exuberant plaster cornices and plaster arches, are derived much more from the traditions of a generation or two back than from the present. We imagine the public are the most to blame for the fact that the speculating builder in these days flourishes like a green bay-tree. Population is increasing fast, and the lower middle class public want dwellings very fast, and are either ignorant or careless as to their construction, and hence the natural results of these favourable circumstances for unprincipled and grasping builders.

There were two other points in the address which really belong to the same subject, viz.: the degree of influence which the Institute might reasonably expect to exercise in controlling and directing matters of public taste in regard to the architectural treatment of London, and the laying out of streets and sites. In regard to this, reference was first made to the part which the Institute of Architects had been invited to take in passing judgment on the designs of buildings to be erected in Northumberland-avenue. We consider the architectural profession may think it a matter for congratulation, in one sense, that such an arrangement was made law. It at once showed a growing feeling of the importance of having good architecture in a new thoroughfare, and of respect for the architectural profession in inviting their representative body to occupy the position of arbiters in the case. Nevertheless, we cannot but agree with Mr. Street that the position is an awkward and doubtful one. To ask the Council of the Institute, or, indeed, any architect or body of architects, to sit in judgment on designs and pronounce that they are or are not good enough for the occasion, is to place him or them in a very uncomfortable dilemma. Either they must be very critical and exacting, and hence lie under the imputation of being ungenerous towards those whose plans are submitted to them, or they must pass whatever is not glaringly bad, even if quite beneath the standard of taste of the majority among them, with the almost certain result of being saddled with a kind of responsibility for what is erected under their supposed sanction, and of having the new street or new buildings pointed out as exhibiting the taste of the Institute of Architects. But upon the question of mere prevention or regulation of public works which might be disfigurements to important points in what may be called city scenery, there certainly might be some good to be done by the Institute, if it were allowed the opportunity. Mr. Street's references to the additions to the Post-office, as well as to various railway bridges and stations, among other things, were sufficiently to the point. The disfigurement of the Thames by the dreadfully ugly viaduct over the river at Blackfriars is a thing that might have been prevented, on such grounds, but we know not how any case would have been made out against the adjoining bridge for ordinary traffic, which is in one sense the most objectionable of the two, as it is a pretentious and sham piece of work, whereas the viaduct is at least genuine in its ugliness. But

if any constituted body or any individual had made a stand against the erection of the Blackfriars roadway bridge on account of its vulgarity of design, he would have been met with the answer, "Here are columns and capitals and a balustrade, things which give the bridge that architectural appearance which you desire. You say they are in bad taste; we do not see it, and we challenge you to prove it"; and then there would have been the old dispute "*de gustibus*." On such a head there may be perfectly reasonable and maintainable judgments passed, which, nevertheless, it would be exceedingly difficult to put into any form which would afford a good ground for legal or official action. The difficulty will never be really got over in that way. But the advice of the Institute might certainly be of value in the determination of such questions as sites for important buildings, and the proper consideration, before it was too late, of the manner in which this or that proposed treatment of the site would affect the general *coup d'œil* and the relation of the new buildings to existing structures. But, after all, the necessity for this would lie chiefly in the fact that our Government and some of our large public bodies are too often in the habit of employing official advice only, and hence are led to under-rate or altogether ignore questions of architectural effect. If they employed an architect of high standing and ability, and went by his judgment, the result would be the same as if they employed the Council of the Institute as a kind of honorary consulting architects, or perhaps it would be more satisfactory, for the latter proceeding, after all, seems like a method of getting architectural advice *gratis*.

The idea of the appointment of a permanent Minister of Fine Arts, which has often been mooted in these columns, is naturally suggested in connexion with the subject of the control of the architectural treatment of London; but any one recommending such an appointment must be very careful to consider, first, exactly what he means by it,—what he intends the functions of such a minister to be. Mr. Street's reference to the subject evidently filled Sir F. Leighton's mind with anxiety, and he uttered some warning words about it in his speech proposing a vote of thanks for the address; and most certainly the appointment of any minister on the part of the State who was to act as a kind of arbiter of taste would be not only an evil to art, but an absurdity. What we have more than once proposed, and what, perhaps, Mr. Street intended, was that the office of First Commissioner of Works should be extended in its scope, and made independent of political changes, with which its objects have naturally no connexion whatever. Such a functionary might, if a judicious appointment were made, be of the highest use as a central controller of all works connected with public improvement and the promotion of the arts, without by any means necessarily interfering in matters that were really questions of taste, further than by a veto upon projects which, on due weight of evidence, seemed manifestly injurious to the interests of art progress, or to the beauty or convenience of the metropolis. Such a project, for instance, as the much-needed and often-asked-for museum of casts, also referred to in the Presidential address, would come under the management of the permanent Commissioner, and be his to initiate, perhaps, and to keep up. One great and clear gain would be the avoidance of the change of plans owing to a political crisis, when First Commissioner A. has to leave a scheme which he has just matured in the hands of his successor, B., who may have entirely different ideas,—perhaps entirely mistaken ones,—and undo all his predecessor's work, an absurd condition of things in regard to matters which have nothing whatever to do with politics.

Upon the question of the amalgamation, on some footing or other, of the Institute and the Architectural Association, we do not care to comment, regarding it as a matter for the two bodies themselves to make up their minds about, beyond saying that we can quite understand the members of the Association feeling that they do not care to give over to the nominal credit of the older society a system of architectural education which they have themselves worked out independently. Whether by enrolling under the Institute they would obtain any compensating advantages is a point for them to consider.

There is one other important,—very important,—subject touched upon by Mr. Street, upon which we would gladly have heard a little more from him. This is the demolition of the City churches. That we cordially go with him in lamenting in advance the grievous loss to the City of London if any large proportion of these remarkable and characteristic buildings were removed, as is threatened, no one, we are sure, will doubt. The moan over the fate of some and possible fate of others, has, however, been made often; we should have been glad if Mr. Street had gone further and given us some suggestion as to what to do with the churches so as to turn them to some account, instead of leaving in favour of the demolitionists the weighty argument, "These buildings are of no further use, and are taking up space which is urgently needed." We are by no means disposed to back this merely utilitarian view, but it must be taken account of and appeased, if possible; otherwise it will have its way sooner or later, and it is impossible to oppose it indefinitely. The question is one apart, practically, from considerations of orthodoxy in regard to church worship; because, let all the community be as orthodox as you please, the members who would otherwise go to the churches live out of the reach of them now; and many even of the absurdly small congregations who do *not* fill them, come from a long distance for the special purpose apparently of making a congregation. If Mr. Street, besides expressing his regret at the demolition of these often beautiful buildings, had gone a step further and suggested any means whereby they could be better utilised, so as to abolish the present practical arguments in favour of their removal, he would have done something for their preservation. We may suggest for a discussion at one of the meetings, "What is to be done with the City churches?"

SCARBOROUGH.

The first historic mention of Scarborough is in a Saga, the story of which is strangely unlike that of the town now: for the fierce Norse King Harold "lay to at Skardaborger," fought with the burghers, set fire to the town, and "slew many people" before he went to his fate at Stamford Bridge. But to the gazer from the ruined Castle or Mount down on the gay town, there is no more resemblance to that spoken of by the Saga Phillips quotes in his "Yorkshire," than there is to the town Leland saw partly walled with stone, partly with earth and mud. There is no more varied sight than that of Scarborough in its season; and possibly of all our watering-places it is the one that exhibits most fully all the phases of British life and character. It is incontestably the queen of the Northern watering-places; it has of recent years shown a spirit in catering for the wants of its visitors that none others have attempted; and it is to this that there is attributable the increased popularity of this ancient health-resort. It has a wide area to draw upon; the great towns of the greatest county yield it a continuous flow of visitors, and some of those near it give it a residential population, spending freely the earnings of the manufactories in the smoky valleys. Its ancient port is also the resort of another class, and in their season the fishing-boats cluster thickly, tier on tier, in the little harbours, and form a distinctive feature of the seascape. From its configuration, the peculiarities of life in Scarborough approach near together, and from that centre of fashionable life, the Grand Hotel, a stone might almost be thrown into the throng that gathers round the returning fisher-boats.

Look from the yard of the castle which for seven centuries has dominated over Scarborough. In late autumn there are few more varied scenes than it shows, especially in the gloaming, or on the afternoon of that day that is tautologically said to "come betwixt the Saturday and Monday." The town on a rock has expanded north and south. Look to the north from that gray castle, with its walls enclosing only the green fields now. The streets on the northern portion are comparatively quiet, and many an invalid has lingered there to inhale the sea breezes. The promenade pier stretches its 1,000 ft. seawards, and the coast ruggedly ranges its cliffs and sands along by the well-known woods of Scalby, and on towards that little wyke where Robin Hood's Bay keeps green the memory of the bold outlaw, and preserves in the romantic little village a hardy race of prosperous fisher-folk and of other sea dependents, whose dwellings, ranged unevenly on the cliff side, form one of the quaintest pictures that the Yorkshire coast presents. But it is to the south that the view from the castle cliff shows Scarborough at its best.

Down below, on the side of the harbour, are crowded, uneven streets of ruddy-tiled houses, whose irregular heights and liberal-minded gables tell of the builders of old. In the harbour, at low tide, there is a huddled mass of cobles, fishing-smacks, and steamboats, brown sails lying idly on the decks of the former, and purple nets littering the holds, whilst the gazer can readily discern the mystical letters that tell to the initiated the port the boat hails from. On that margin of the shore close to the West Pier fishermen abound, the "guernsey" being frequent, and the rough pilot-cloth seen frequently along the Foreshore-road. But before the close of this, fashionable Scarborough has put in its claim.

That stretch of road and cliff from the public baths, by the "tramway" and the Grand Hotel, to the Spa grounds is, in its season, one of the fashionable resorts not alone of a county, but almost of a country. Sea and shore, hotel and cliff, grounds dotted with trees, valleys, bridges, and an esplanade crowned with villas and dwellings, and based on a terraced mass of verdure, form, when peopled with the gay frequenters, a splendid sight. At night it gathers its charms into the Spa grounds, or the dimmer recesses of the Aquarium. Seat yourself in one of those chairs that are ranged in rows near the band-stand; listen to the strains that float therefrom, and the deep low bass that the sea continually gives out before you; or look from one of the upper terraces down on the scene, lighted by its row of electric lights, that make the more regular gas-lamps yellow at the time of their intermittent show, and in that crowd and that spectacle you have one that the east coast of England cannot parallel from its farthest north to long past Lincolnshire. The long procession moves to and fro in couples and groups, showing all the vagaries of feminine fashion, from the creamiest of oatmeal cloth to the darkest hue of velvet. In the grand hall, in the fine little theatre, in the dining-rooms, you may find hundreds congregated, whilst despite these attractions, the click of the billiard-balls is frequent above, and on the upper terraces there are the countless couples who take "no note of time" in the leafy promenades till the distant bells proclaim it with heavy tongue. Here gather portly aldermen from distant towns, in autumn evenings, to discuss provincial politics, business in cotton or cloths or iron; here their helpmates face the sea breezes, and gossip, and dawdle over novels that are glanced at, not read, whilst the ever-shifting scene varies as the groups pass and repass, as the pieces are changed by the band, as the waves show on the sand under the mellow moonlight that "Brush's system" flings from its tall lamps. Here the invalid finds momentary rest; here the young and the gay meet, form acquaintance and deepen it in the successive visits, till the walk from the promenade to the terraces seems a frequent step to that sequel which has its opening scene at the altar.

It is largely owing to its success that Scarborough succeeds. To those natural attractions that it has,—in situation, where the breeze blows landward from over the wold, and seawards across leagues of German ocean foam,—and in configuration of hills and dale, with its two bays, the Castle Cliff dividing the fashionable from the quiet resort of the health-seeker,—to these attractions great additions have been made, and that especially of recent years. It is a year only since the Spa, with its stately adjuncts, was re-opened; its Aquarium is young, but boasts of its size; and, wise in its generation, the town has taken care to provide itself with hotels in all degrees of magnificence. There are few that, alike in situation and surroundings, in appearance and cost, can surpass that Grand Hotel that projects its tall stories high from the cliffs, whilst others only less costly and magnificent on the cliff claim their share of that sea view and those breezes that are dear to the visitors. So Scarborough, with its prolonged season, is always charming, except on the days when the excursion trains disgorge the hordes who for a few hours have to see the "lions," and to attend to the wants of creature-loving people from large towns of the shires of York and Lancaster. Spring buds out the beauties of wood and pleasure garden around it; summer commences that gay life that is prolonged until the period of the Indian summer even is past;

and even in winter, when the storm-wind descends, and the rude ocean beats at the promenade walls and batters the craft in the harbour, Scarborough in its idleness and rest has its touch of romance that beautifies it.

DRAWINGS BY THE LATE SAMUEL PALMER.

A FINE collection of the drawings, with a few etchings, of this remarkable artist, is now being exhibited at the rooms of the Fine Art Society in Bond-street. Palmer had, it seems, arranged for this collective exhibition during his lifetime, and accordingly the Society of Water Colours, who had intended to collect some of his works in the gallery which they have so often adorned, at one of their Annual Exhibitions, gave up the idea in order not to interfere with this collective exhibition.

Samuel Palmer, who died in May last at the age of seventy-six, practising his art almost to the last, was an artist of peculiar and special powers, and with a very marked line of his own. His most characteristic work belonged to a stage of artistic feeling in regard to landscape which has dropped out of general favour and popularity of late years, and many habitual frequenters of the Society of Water Colours' Exhibition recently, we have found, hardly knew Palmer's name or his style, and his drawings were often passed over as something odd and old-fashioned. His work has, however, always enjoyed the appreciation of a number of the best of his brother artists, and he is at present also the object of the incense of the ring of æsthetic critics, to whom the fact that he was a friend of Blake would be almost enough to secure his apotheosis. We observe that the catalogue is prefaced by some somewhat tawdry sentimentalising. Palmer, however, was worth something better than to be made the object of this kind of adulation. A large proportion of his finest works belong, it must be confessed, to a conventional and unreal school of landscape art; he was one of those painters for whom nature is not good enough, and who made ideal effects of his own, such as are hardly to be found in real landscape. We think that such art is not so true nor so lasting a thing as that which is directly based on nature; but there is a place for it, and Palmer carried it out in a very grand manner. We have several times pointed out how remarkably, in some of the very small and powerfully-coloured landscapes which he used to send to the Water Colour Society's exhibitions, he had exhibited the effect of grand and monumental painting on a small, sometimes almost a minute, scale; and also how he overstepped the bounds and became violent and exaggerated in effect when he tried the same thing on a larger scale in the pictures on subjects from "L'Allegro," his last exhibited works at the Water-Colour Gallery in Pall Mall East. These drawings hang at the top of the room in Bond-street, and, of course, are praised up to the skies in the introduction to the catalogue; but most persons who can discriminate irrespective of fashion will regard them as unfortunate results of pushing a favourite effect too far.

A large number of Palmer's works, however (and some of the finest of them find place in this collection), are of lasting interest as very fine landscape poems and remarkable examples of very powerful handling and a peculiar feeling for rich and glowing effects of light and colour. In looking at such works as, among others, "Twilight" (7), "The Herdsman" (10), "A Golden City" (13), "The Traveller" (52), we are in a land of enchanted ground where the lights are more golden and the shadows more rich in purple than nature spreads them over the scene; they are usually Classic landscapes, somewhat recalling Turner in composition, but quite different in the solidity and opaqueness with which they are painted. They are not the least like ordinary water-colours; the colour is laid on in thick and powerful masses, and to some extent, in its very peculiar texture and manipulations, recals the strange effect of his friend Blake's water-colour drawings, or what pass for such (for no one knows precisely what they are). Palmer's massive way of painting, or almost building up a landscape, is shown to great advantage in some of his cloud-scenery; as, for instance, in the fine and powerful little work, called "The Bright Cloud" (6). Some of his finest works are in illustration of Milton, with whose poetry his landscape has a good deal of affinity, and it must be remembered that Milton's descriptions of landscape are somewhat artificial and unreal. "The Curfew" and "Towered Cities please us then" are two very fine examples. Palmer would have been the very artist to have realised the sombre and rich landscapes of Spenser's "Fairy Queen," and we cannot but wish he had undertaken to illustrate some of that poet's haunted scenery. One of the latest schemes of Palmer's life was a metrical translation of the Eclogues of Virgil, with his own illustrations; this was projected and ten etchings made for it, but the work was never completed or published. Was the "Early Ploughman" one of these? It reminds us of Virgil, but rather of the Georgics than the Eclogues.

There is, however, another interest in this exhibition of Palmer's works, as it shows us that his choice of a highly-wrought and unreal landscape was not owing to any incapability of representing the freshness of nature as she really is. He seems to have had two styles, one at hand when he sketched from nature, which is entirely different in tone and colour from his "poetic" works, and shows the greatest freedom and boldness, and the other which his best-known works illustrate. Of his naturalistic or sketching style there are some very fine examples, such as "The Aged Oak" (12), which would hardly be taken for the work of the same hand or mind as many of the other drawings. The excellences of this style of drawing, however, are such as are found equally in such painters as David Cox and others; the excellences of Palmer's poetic landscape style are entirely his own, and hence they are the more interesting because the more individual and original works. They are not like nature, but they are beautiful works to dream and indulge the fancy over, and we want art which will help us to do that, as well as the art which interprets nature.

PROFESSIONAL TOPICS AT THE ARCHITECTURAL ASSOCIATION.

MR. ASTON WEBB, president of the Architectural Association, in the course of his address at the first ordinary general meeting of the session, delivered on Friday, the 11th inst., after reviewing the work of the Association in detail, said,—

I am afraid I have wearied many by reiterating details you already knew well; but I have thought it part of my duty on this, the only occasion I have, to bring before those who have recently joined us the various branches of work in which we are engaged; and possibly also to our older members, who come here less often than they did, it may not be without interest. One thing, I believe, is generally admitted, that there is a want in the profession which we are endeavouring, not altogether unsuccessfully, to supply. We carry on our work here, as we hope, in support of the Institute,—each having its distinct work,—the Institute, as our representative professional society before the world; the Association as the educational society to assist men to prepare for their profession. The importance or the responsibility of our work can hardly be over-estimated. Wellington believed most of the battles of the world were won at our public schools, and so, probably, the foundation of many a great reputation will be laid here. Last Monday, Professor Street, in his opening address at the Institute, very kindly alluded to us, and expressed a decided opinion that "some means might and ought to be devised for enabling that active body [referring to the Architectural Association] to join us," and farther, "he does not hesitate to say that the Institute suffers much and seriously by the practical abstinence of young men from its meetings its society, and its work," and he attributed this abstinence to the Association. Such an opinion, coming from such a source, must carry great weight with it. I hope that some present may give us their views on the subject, for there are many here whose opinion will, from their long and intimate connexion with the Association, carry more weight than mine could do. Nevertheless, I feel that it is my duty to say a few words on a proposition so kindly broached (though not by any means for the first time) by Mr. Street. Gentlemen, I cannot think that any one is hindered from joining the Institute or its work by this Association; rather, as it appears to me, we are a sort of forcing-house from which members blossom out into the Institute. Mr. Street thinks "some means might, be devised whereby our junior members might, under their own government, be training themselves until they gradually fall into their places amongst us"; but this, I claim, is precisely what the Association does. I find that 54 of our members are now Fellows, and 170 are Associates, and that six are members of the council. I venture to think the members of this Association do take a part in the affairs of the Institute whenever they can be of use. That they should speak much at the meetings is hardly to be expected, or perhaps desired, but even during last session they on one or two important occasions took a somewhat prominent part in its affairs, and the training received here at our ordinary meetings appears to me admirably adapted to prepare men to take a part subsequently in the more august proceedings of the "upper house." Should any scheme be submitted to us in furtherance of the views expressed by Professor Street, it would receive, of course, our careful attention; but the system on which our work here has been gradually built up has succeeded so well, and the prosperity of the Institute has also so largely increased at the same time, that I, for one, cannot but think that we support the Institute more in our independent position than by any other means, and that the system so carefully worked up is of great use and will be still more so by preparing our students for membership of that body. Having now touched on most of the branches of the Association and its work, the more general question arises as to how these opportunities can be best utilised by a student entering our profession. One is constantly being asked what course to recommend, and this has led me to think it over a little, and possibly the opinion I have come to may be of some use to those who still have a future. I do think, as I said the other evening, that there are now in our profession ample means for the thorough education of an architect, but that, owing to their present disjointed condition, comparatively little advantage is derived from them to what might be the case, and that it is as true now as years ago when this subject first came prominently before us, that the education of an architect is of a most haphazard and incomplete kind, altogether inadequate and unfit to prepare a man for the intricate and ever-increasing problems and duties of our profession. We seem to require some central authority or college under which these various opportunities could be made of full value to architects. For instance, at present all the subsidiary means of education beyond those of a practical kind supplied in the architect's office are to be had only of an evening, when a pupil, if he has worked hard all day, cannot bring a fresh intellect to bear on the various equally important subjects brought before him, and as the theoretical parts of his education cannot in the circumstances of the case be together in the office, they are either neglected or picked up in the evening. What appears to me to be wanted is a college or school where a student could spend one or two years in systematic and theoretical education before entering an architect's office.

But to take the means as they exist. The Institute has founded a compulsory examination, but professedly takes no part in the preparation of students for it, and the work of this Association therefore becomes more defined, and it is to it that the student must first look for instruction. My own impression is that one fault often made at the commencement is that boys leave school too soon, and are articled at sixteen or seventeen, just as they are commencing to learn the higher branches of education, and that they regret, as they get into practice afterwards, they were not allowed to remain a year or two longer to acquire information they are never able afterwards to obtain.

But suppose our student to be articled to a great London architect, where he has every opportunity of seeing that a great amount of work is being done, but not, perhaps, much as to how it is done,—or he may be in a small office, where he sees both the work in execution and how it is done. Both have their advantages, and neither are sufficient in themselves. He should, I think, follow some such course as this:—The first year he should attend our Elementary Class of Design, and read at home such books as he is recommended and can obtain; the second year he should join the Class of Design and also of Construction, and endeavour to get a prize at one of them; during his holiday he should spend part of the time in sketching, and publish some of his sketches in the Sketch

Book; the third year he might, with advantage, attend the lectures at University or King's Colleges, in addition to attending either the Class of Design or Construction here, and he might also compete for the Association medal or measured drawings prize. The fourth year he should become a student at the Academy, and join the Colour or the Advanced Construction Class, and compete for the Association travelling studentship. The fifth year he should work at the Academy and one of our classes, probably as one of its officers, and compete for the Pugin studentship or the Soane medallion; after this he should, if possible, take a trip abroad, and on his return compete for one of the great prizes offered at the Academy, while at the same time he has gone into another office, to seek further experience, or commenced practice in a small way on his own account. This is an incomplete sketch of an architect's opportunities, and the curriculum must, of course, vary according to circumstances; but if students laid down for themselves some such order of study, and worked to it from the commencement, they would find the various opportunities more useful to them than they are at present. This question of education is not only for the individual good, but it affects the profession generally; each member of it, by his acquirements, or lack of them, and by his executed works, most distinctly raises or lowers his profession in the eyes of the public, and, therefore, increases or diminishes its influence with them; and every building erected by an architect which is inconvenient for its purposes, unstable, or ill-designed, inflicts a direct injury not only on himself, but also on the profession to which he belongs. In aiding, therefore, as far as we can, the cause of architectural education, we are aiding also the influence of our profession in the world of art generally, and, therefore it is, as I venture to think, that this Association is so well supported by the profession generally. The one objection that used to be often raised against us here, but which is perhaps not so often heard now, is that we are too apt to become a mutual admiration society. I am not concerned to deny this; but if it is the case with 800 members, it must be on a very extended scale; and as long as the mutual admiration is extended to each other, and not to ourselves, I see no harm in it: perhaps even a little more of it in the profession generally would not be thrown away.

One of the questions that must affect us at the present time is as to how far the archæological side of our art has too much overengrossed us, and as to how far it should form a portion of our architectural education. That it must, and always must, form a part, is obvious; it is like grammar to a language, without which knowledge design is impossible, for originality of design never yet came from ignorance of what had gone before. I once heard of an instance where an architect was engaged on an important building of a special class, and he called in a draughtsman to assist him in it, and said, "Now, I want you to design this on such and such lines, but I don't want you to see any building of the sort before you make your drawings, as I want something perfectly original." The result was a failure. Archæology is, therefore, a *sine quâ non* to a student; but I think it can be carried too far, and directly we begin to make mere notes of detail for the purpose of "working them in," we leave our position of designer for that of copyist. The great movement for the restoration of our churches led to much of this archæology, and possibly the fascination of it is apt to lead us too far, and to check the originality which all seem to feel and are yet unable to produce; and I think we may see some of the result of it in the lack of enthusiasm there appears to be in the architectural world just at present. We seem to have no principles at the moment which are thought worth fighting for, and the principal questions before us in any form seem to make only a ripple, which will soon die away, and are nearly all of a negative character. These are some of them:—"We ought not to restore any more churches;" "we ought not to take out our own quantities;" "we ought not to go into competitions;" and the *British Quarterly* has laboured to prove "we ought not to have too much work to do." The Architectural Conference discussed two of these points over again at their last meeting, though they had done so before, apparently in default of any others occurring to them; but none of them can be said to be questions likely to stir up much enthusiasm one way or the other. The Anti-Restoration Society (to call it by a shorter name) was only started when restoration was drawing to a close, and therefore is not likely to exercise much influence. Opinions as to the taking out of quantities seem very equally balanced; those who do so see no harm in it; those who do not, think it better to leave them alone.

The competition question seems fairly laid to rest by an almost unanimous expression of opinion in favour of the appointment of a referee, and it appears to be an excellent arrangement (especially for the referee); and, for myself, I should be very sorry to see the competition system any further restricted. As to the *British Quarterly*'s complaint that pluralism is the crying evil, it certainly is not the special grievance, amongst architects generally, that they have too much to do, and the few that have are likely to continue to have while they retain the confidence of their clients.

It appears to me that what we require in addition to a thorough knowledge of previous styles and buildings, is a more careful study of the best buildings of our own day, for there are, undoubtedly, some built every year of which we, and those who come after us, may be justly proud. Attempts to master the principles on which these are designed, and to develope our work carefully and thoughtfully for ourselves from them, seems to me to be the course which promises the best results; and to avail ourselves of all modern improvements and inventions as they are brought forward. We, as architects, should also be men of the world, observant of the habits and requirements of the present day, and ever thinking how best we can adapt our buildings to them; the churches should show by their planning the gradual change of ritual, and the plan should be adapted to the peculiar requirements of large and small congregations of the present day. Our middle-class private schools and Sunday schools afford a large field for improvement and ingenuity in planning. The adaptation of the latest sanitary improvements to the architectural treatment of our houses is another subject yet to be satisfactorily dealt with (and Mr. Ingress Bell has chosen a most interesting subject to read us a paper on, viz., "Ideal Dwellings"). These are some of the great questions which we, as architects, must have to deal with, and be prepared to advise upon. The designing of furniture, carpets, &c., watercolour sketching, and such like, are very enticing (as I know, having dabbled a little in such like myself); but architecture is a bigger thing than these, and demands, in order to produce really great buildings, all the resources we can command; it is also an ennobling work, and worth all the efforts we can make to master it.

Have an ideal and work up to it, and the higher the ideal we fix for ourselves the better will be our work, falling, as it always must, far short of our ideal. There is no room for sentimentalism in our art, for we soon find ourselves pulled up sharp in the stern matter-of-fact requirements which are involved in whatever we are called upon to design. But it is an art of great opportunities; no matter how small or insignificant the work may be apparently, if we design with care it must be interesting to others as well as to ourselves. After all, it is the individual thought and care displayed by the designer of any building, great or small, which gives interest to it apart from style. The architect of the Jews' House at Lincoln probably never thought that his "little job" half way up the hill would be examined, criticised, and measured up countless times nearly 800 years afterwards. And there is no one in this room but will probably have a commission entrusted to him to that extent before he has been a year in practice; and if he takes all the pains and uses all the power he has in him,—spends, as one says, his life-blood on his work,—*he* can make it interesting also, and the interest will endure as long as his work does, and we, of all artists, should do work to endure.

Speaking of individuality, I will quote, in conclusion, one passage of Thomas Carlyle's, spoken to mankind, but applicable to us:—"Produce! produce! were it but the pitifullest infinitesimal fraction of a product, produce it, in God's name! 'T is the utmost thou hast in thee; out with it, then. Up, up! Whatsoever thy hand findeth to do, do it with all thy might. Work while it is called to-day, for the night cometh wherein no man can work."

We defer our report of the discussion that ensued until next week.

NOTES FROM THE WEST.

A good deal of interest has been excited, not only in Bristol, but in scientific circles elsewhere, by the suggestion of Mr. Wm. Smith to the Bristol Town Council, that the tidal force of the Avon might be in some way utilised. Mr. Smith proposed that the Sanitary Committee take the matter in hand, and, aided by engineering skill, should see in what way the power now running to waste could be used, but the Corporation did not see fit to adopt his idea. The subject has not, however, been lost sight of, and Mr. Smith has laid it before several eminent electricians at the International Exhibition at Paris, besides consulting local scientists. Sir Charles Bright, one of the British commissioners at the exhibition, has, in a letter, expressed an opinion that the utilisation of the tidal power of the Avon is beyond all doubt practicable, whether for the electrical illumination of the city, or otherwise. The idea of making use of the tide has nothing new about it, but with Faure's batteries the practical possibilities of the situation are placed in a different position, and it has been estimated that only one-sixth the amount of energy available would be required for the complete lighting of Bristol. Whether the rise and fall of the tide could be made use of without interfering with the present navigation) and as the tide runs several miles beyond the point to which vessels come up, there would seem little difficulty about this), and whether such a utilisation of natural energy would be feasible with the river wholly or partially dockised (both of which schemes have many advocates) has, of course, to be shown. Sir Charles Bright will probably run down to Bristol to make inquiries on the subject.

The parish church of St. Thomas, Wickwar, which has for sixteen months been undergoing thorough renovation, has just been re-opened. So misty are the records of its origin that some have it St. Thomas is the patron saint, and others that it is dedicated to the Holy Trinity. The place has so often been repaired that very little of the original structure remains. The Virgin Chapel at the end of the north aisle is the oldest part, and in the east of the chapel a piscina was discovered beneath the plaster during the alterations, and has been preserved. The church is in the Early English style, and has a lofty western tower. The renovation has been very complete, and has been under the direction of Mr. W. L. Bernard, architect, of Bristol, carried out by Mr. J. Roach (Charfield) and Mr. Lewis Lowell (Wickwar). Several of the walls have been entirely rebuilt, and massive columns separating the nave from the aisles have been replaced by lighter ones. The arcade has been lengthened by the addition of an arch, and the internal arrangements are nearly all new. A vestry-hall has also been built on the north side of the chancel and the tower repaired.

It is proposed to spend 2,000*l.* in the restoration of St. Saviour's Church, Larkhall, Bath. The plans of Mr. C. E. Davies, which have been approved, provide for the extension of chancel 22 ft., the reseating of the body of the church so as to give more sittings, the enlargement of the vestry, the removal of the west gallery, &c.

A new church was opened at Penarth a few days ago. The parish church is in such an elevated, exposed position, overlooking the Bristol Channel, that it is in bad weather almost inaccessible. The new church is at the foot of the hill near the railway station. The designs were inexpensive, and the cost was about 700*l.*

The Evangelical Mission at New Swindon have opened a central hall in that district. The cost was 1,200*l.*

Whiteshill Church, Stroud, has been re-opened after extensive alterations, including the addition of a transept, vestry, and organ-chamber. The church will now seat 478 people. A portion of the north and south aisles has been taken down and an archway erected; a wooden gallery or vestry beneath at the west end of the church has been abolished. The cost has been 800*l.*

A stained-glass window, the gift of her Majesty the Queen, has been unveiled at St. Mary's, Bury St. Edmunds.

A new church has been opened at Cwm. It will accommodate 200 persons, is in the Gothic style, and is erected of blue Pennant stone with random courses and buff brick dressings. The cost was 1,300*l.*

The tender of Mr. E. Morgan, of Tredegar, for

1,295*l.*, has been accepted for enlarging the Newbridge Board Schools.

It is proposed to spend 5,000*l.* in building new borough offices, police-station, &c., at Lower Grangetown, Cardiff.

At Maesteg, a market-place, with town-hall over it, has been completed. The hall will seat 1,300 people. Mr. Harris, of Cardiff, was architect, and Mr. Geo. Thomas, Newport, Pem., the contractor.

The foundation-stone of a small church has been laid at Briton Ferry by the Countess of Jersey.

The preliminary heading driven beneath the Severn by the Great Western Railway having been completed, the work of constructing the tunnel itself now engages attention, and will probably for the next two years afford employment for a very large number of men. The importance of the work can hardly be overestimated, and a brief glance at the progress of the undertaking may prove interesting. The idea of a submarine railway to connect the South Wales lines with Bristol and the West, originated nearly twenty years ago, with Mr. Charles Richardson, who noticed that the geological formation of the ground, visible at low-water mark, was not at all unfavourable for such a work, its compactness giving promise of considerable stability from the inroads of the sea to a channel cut beneath it. The work, however, was manifestly of a very different character from the Thames Tunnel, in which that gentleman was engaged, though that was by no means a small undertaking. On the east side of the Severn are the "English stones," as they are termed, extending a mile and a half across and standing above low water; and, corresponding to these on the Welsh side, is the "Lady Bench." Between the two run the "shoots," a deep, narrow passage, which carries all the water at low tide. The elevation of these half-tide rocks on each shore is due to their superior hardness, other portions of the river's bed having been worn away, so that tolerably deep water is found except at this point. The idea of Mr. Richardson was not seen in any practical form till nearly ten years afterwards; and an Act of Parliament having given the necessary authority to the Great Western Railway Company in March, 1873, the actual work was begun. The heading, which occupied close upon seven years to complete, was two miles and a half long. It was 6 ft. to 7 ft. in diameter, and was driven on the Welsh side from a shaft 180 ft. deep, about 11,000 ft., and tolerably level. The "shoots" were thus passed at a considerable depth. Working from the English shore, it was unnecessary to run so deep. The shaft, therefore, was 90 ft. in depth, and the heading ran from it at a descent of 1 ft. in 100 ft. to meet the deeper excavation from the other coast. From the Welsh side the drills had to bore through sandstone, coal shale, and Pennant, and from the Gloucester side the material consisted principally of marl. One of the most serious hindrances to the undertaking was the influx of a land spring to the Welsh heading, which entirely flooded that part, and necessitated the use of powerful and expensive pumping machinery before the water could be got rid of. The heading, which has been so satisfactorily finished, will be used for draining the tunnel, and, as will be seen from the description first given, the water will drain,—roughly speaking,—to the centre, and will have to be pumped out. The tunnel will necessarily be much longer than the heading, and the total length of the working will approach five miles; part of it, however, will consist of a deep cutting. It is being constructed of a width of 25 ft., and a proportionate height, and is being arched over in a substantial manner with brickwork. The tunnel will follow the course of the heading from the new passage side till "the shoots" are passed, and will then gradually ascend. About 1,000 ft. of brickwork have been completed on the Gloucestershire side, and care will be taken to arch in the more suspicious portions of the roof first, so as to prevent possibility of accident. The contractor for the work is Mr. T. A. Walker, and prior to Sir John Hawkshaw's services being enlisted in the undertaking, the engineering department was under the care of Mr. C. Richardson, assisted by Mr. A. W. Gooch and Mr. J. J. Geach. Mr. Luke is resident engineer.

A census of persons attending divine worship in Bristol on October 30th, taken by the *Western Daily Press*, shows that no fewer than 209 places are used for religious services, nearly all being permanent churches and chapels. The morning attendance was 51,689, and the evening 64,459, the population being 206,000. "The city of churches," therefore, as far as attendance goes, compares very favourably with Liverpool, where a similar census was taken.

The new dock at Swansea (opened as already mentioned in the *Builder*, by the Prince of Wales) nearly doubles the accommodation of the port. It has a length of 2,320 ft., and a breadth varying from 500 ft. to 340 ft. The walls, therefore, enclose about 23 acres of water of a depth of 36 ft. The outer sill of the dock will have on it at ordinary spring tides 32 ft. of water. Mr. James Abernethy, president of the Institution of Civil Engineers, designed the work, which cost 300,000*l.*

During alterations in Maryleport-street, a quaint old narrow street in the centre of Bristol, a fine freestone mantelpiece, ornately sculptured, was exhumed from a thick coating of mortar, beneath which its existence was unknown. It has several features of archæological interest about it, and bears a shield charged with the arms of George Harrington, mayor of Bristol in 1617.

GOVERNMENT INSPECTION OF ARCHITECTURAL PLANS IN PRUSSIA.

The Prussian Minister of Public Works has issued a statement indicating the classes of architectural undertakings the plans of which are in future to be submitted to the examination of the Royal Academy of Architecture. The classification is intended to show in which cases this submission is to be obligatory, and in which it is only to be so in the event of the cost exceeding 750,000 marks (37,500*l.*).

In the former category are Parliamentary buildings and edifices connected with the different Government departments; churches intended for more than 1,500 worshippers at one time; museums and galleries of all kinds; State libraries; theatres where the whole or part of the expense is borne by the State; collegiate buildings of universities, technical high schools, military academies, and schools of artillery and engineering; medical institutions and other similar edifices; alterations in the aforesaid buildings, or in any such as possess historic or artistic value; the arrangement of open places, and the erection of monuments; the execution or extension of ship canals, the building of harbours, wharfs, and docks; the systematic regulation of rivers, and works for making them navigable.

In the second division are included buildings for provincial Government offices, for the archives and tax departments of the State, and such Government works as are not included in the preceding category; buildings for judicial purposes, for the postal and Government printing departments, as well as for the telegraph service; general offices of railway companies; educational buildings not included in the other class; astronomical observatories; gymnasia; schools of commerce, art, and navigation; benevolent institutions, prisons, hospitals, and kindred edifices; lighthouses, signal towers, coast fortifications, &c.; the drainage of lakes, the erection of dikes; bridges over arms of the sea or large rivers; sluices, aqueducts, viaducts, and the draining of cities; also important railway stations, particularly such as have an influence on the building plans of large cities.

Increase of Kensington.—At the ordinary meeting of the Kensington Vestry last week, a memorial addressed to the Home Secretary was read, praying for the introduction of a Bill into Parliament for powers to appoint an additional member at the Metropolitan Board of Works for each of the parishes of Kensington, Paddington, and Wandsworth. With respect to the claims of Kensington, it appeared that the vestry was represented by one member only. In 1851 the number of inhabited houses in the parish was 6,166; population, 44,046; and rateable annual value, 228,500*l.* In 1881 the number of inhabited houses had increased to 20,103; population, 162,924; and rateable annual value, 1,648,187*l.* The parish was larger than any of the six parishes returning two members, excepting St. George's, Hanover-square. The vestry resolved to affix their seal to the memorial, and also to one addressed to the Metropolitan Board of Works.

THE EXHIBITION AT PORTO ALEGRE.

The project of a German-Brazilian exhibition at Porto Alegre (the capital of the South Brazilian province of Rio Grande do Sul) originated with the Berlin Association for Commercial Geography. The support from both countries is only partial, as far as the industrial element is concerned. The Brazilian Government has advanced 2,700*l.*, and also 1,000*l.* for gold, silver, and bronze medals. The duration of the exhibition is arranged to be from the 1st of October to the 1st of January. The site is near the Varsia, an extensive exercise-ground. The building was commenced last February under the inspection of Mr. Ahrons, and is mostly constructed of wood. Its five towers, one in the middle and one at each corner, together with the combination of brown, blue, pink, and white paint, are said to remind the observer in some degree of the general character of Swiss châlet architecture. The same colours predominate in the interior of the building. The pillars are of wood, and are joined to graceful arches; the roof is of galvanised iron. The main building is 65 yards in length and 33 yards in width. The whole disposable room, including the galleries, is about 2,100 square yards. The roof is at the sides 6¼ yards from the flooring, and at the loftiest point of the building is at a height of 9¾ yards. The cost of the edifice (about 3,600*l.*) is considered relatively low by the special correspondent of the *Kölnische Zeitung*. The gardens of the exhibition are described as being in an unfinished condition. The lighting of the main building is said to be excellently arranged. Light from above is admitted in three places, and no less than fifty-two windows altogether are in the building.

The wood used in the construction is just as it is delivered by the local saw-mills. A description of wood, called Madera de Lei, having a singular power of resistance to rotting, has been used for the underground portions of the work. Pine and cedar are said to be employed in the structure itself.

GERMAN EXHIBITIONS IN 1881.

Of the four exhibitions which were held in various parts of Germany during the past summer, it is known that in two cases at least the financial results are very unsatisfactory. The great Patent and Pattern Protection Exhibition at Frankfort-on-the-Maine closes with a loss of 800,000 marks, or 40,000*l.* In this case the guarantors will have to be called upon to pay up the amount they guaranteed in full. The Halle Exhibition of Industry was also a failure, but the deficit is far less serious than at Frankfort, amounting only to about 5,000*l.* This, too, will have to be made up by the guarantors. The Stuttgart and Breslau Exhibitions of Industry and Art were less unfortunate, but none of the German Exhibitions of the past summer can show the financial success of the Düsseldorf Exhibition of the previous year, which yielded a very handsome surplus.

MARKET HARBOROUGH SEWERAGE.

The plans for the main sewerage of Market Harborough and the adjoining parishes of Great Bowden and Little Bowden, in the counties of Leicester and Northampton, these parishes forming a united district under one Local Board, having been approved by the Local Government Board, a contract, amounting to 11,950*l.*, has been entered into with Mr. G. Stevenson, of Eckington, near Chesterfield, for carrying the plans into effect. The works are now being executed under the direction of Mr. J. B. Everard, of Leicester, the consulting engineer, with Mr. E. G. Mawbey, the surveyor to the Board, acting as resident engineer and clerk of works.

NEW IRON FOOT-BRIDGE AT STAMFORD.

A new wrought-iron foot-bridge of 90 ft. span has lately been erected by the Corporation of Stamford over the river Welland, to replace one destroyed by the great flood of July, 1880. The total cost, including entirely new abutments and approaches, is between 700*l.* and 800*l.* The work has been executed from the designs and under the superintendence of Mr. J. B. Everard, C.E., of Leicester; the contractors being, for the builder's work, Mr. C. Hinson, of Stamford, and for the ironwork, Messrs. Dawson & Nunneley, of Hunslet, near Leeds. Mr. T. J. Ward, of Stamford, has filled the post of clerk of works

WORKS OF RESTORATION IN FRANCE.

During a recent tour in the northern and southern provinces of France, I was much interested in examining the works of restoration now in progress, and those more recently completed; for most of the churches and buildings classed as "Monuments Historiques" have now been taken in hand by the Government, and large grants given towards the cost of their restoration. At one time complaints were made by archæologists that the French architects were not sufficiently "conservative" in their restorations to suit our ideas of the word "restoration," and that good stonework was condemned, and replaced by new, simply because some corner was chipped off, or such like small injury sustained; and there was, I think, no doubt that much harm was done at one time in this way in France, as, indeed, it was in England; but from recent examination of some of the more important restorations now going on at Rheims, Chartres, Limoges, Clermont, and other places, it is evident that more care is now taken while doing the work in the most thorough manner, to do it with as little interference as possible with the ancient work. The completed restoration of the interiors of Notre Dame at Chalons and the cathedral at Valence are examples of work thoroughly and also well done; while the interior restoration of Perigueux Cathedral, completed some years ago, is an example of work thoroughly, but not well done. In the first two cases the old stonework is carefully cleaned, pointed, and repaired; in the other it is scraped all over and renewed to such an extent that it looks as if just built. The system adopted at Perigueux was but too common at that time; but the more conservative spirit seems to prevail in the restoration of the important buildings now being carried out, and which I had an opportunity of visiting, amongst which are the cathedrals of Rheims, Chartres, Laon, Clermont-Ferrand, Limoges, Nîmes, &c. My notes commenced with the more important of them all, viz.:—

Rheims Cathedral.

The modern works of restoration, though now being very actively pushed forward, were begun as long ago as 1809, and even before then the chapter had been obliged at different times to spend large sums on reparation, sometimes to the extent of 25,000 francs annually. The works in 1809 and onwards were carried out under M. Dubut, architect, and then under M. Rondelet, and at that time the restoration of the north transept and the flying buttresses of the apse, "dont plusieurs étaient dégradés," were carried out. The troubled times of the year 1814 stopped the works at this point, and little was done till 1877, when the French Government granted the sum of 80,000*l.* for the works of restoration, since which time very much has been done, and those who knew it of old times are naturally anxious as to what the result of the expenditure will be; for, to ordinary observers, there was nothing, at all events on the exterior, which appeared to call for very much repair. It, however, seems from the architect's elaborate report, that some parts were in quite a dangerous condition, especially the flying buttresses, the great niches of the buttresses and their spires, and the parapets of the nave and much of the facing. The first works undertaken were, therefore, the repairs of these worst parts; they, of course, involved the construction of very elaborate and skilful scaffolding for the entire height externally, the stained glass of the clearstory being carefully covered up and boarded over where they are actually at work, producing a most singular and gloomy effect internally. Many of the westernmost bays are now completed, and the scaffolding removed, and one is much pleased not to be struck with such a sense of newness as might be anticipated. Much care seems to have been taken to preserve old work where sound, the mass of the wall and buttresses, therefore, fairly well retains its ancient tone of colour; but it is in the buttress-niches and their spires that new work makes itself specially evident. And here there is rather more done than some of us would consider quite justifiable; however, very many of the old stones of the canopies, capitals, &c., of the niches and carved bosses and gurgoyles are preserved on the pavement between the buttresses with permanent and picturesque small pent-house roofs constructed over them under the aisle-windows, resting on corbels let into the wall. Though this arrangement has a rather museum-like appearance, it enables one to test the accuracy and care which has been bestowed on the new work. I noticed many old moulded and carved stones marked and cut out for the insertion of new pieces, and that the great angels in the niches have, in many cases, had their ancient outspread wings refixed, the old fixing having been very bad; but I did not notice that any of the figures themselves were renewed.

The nave parapet and its pinnacles seem to have been in a very bad state, as they are almost entirely new. This ancient parapet was later than the clearstory wall, and certainly appeared to be no improvement to the earlier work; this defect is now more apparant through the almost white tone of the new stone. This stone seems to be of the same description as the old, and is a very hard limestone full of fossils.

The glorious west front, save for some new stones to the lower part of the tower-buttresses, is untouched, and long may it remain so. The area in front is still full of blocks of stone; but one misses the ancient stone lamp-posts, one of which I saw prostrate on the ground! It is to be hoped they will be re-erected.

Those who have examined the great side buttresses of the towers will remember the curious way in which Robert de Coucy or his successor altered the design (being obliged to reduce its cost) by making the projections of the buttresses less, just above the cornice of the aisles. It will be noticed that on the top slope of this cornice there were left curious square blocks, which Viollet-le-Duc writes, were described by Villars de Honnecourt thus:—"Les carniaux réservés sur la pente des larmiers pour permettre aux ouvriers de circuler autour des contreforts à l'extérieur." Viollet-le-Duc does not altogether accept this suggestion, but he does not explain why the blocks were so left. The problem is a very interesting one to attempt to solve when carefully examining the cathedral; it is, therefore, to be regretted that these old stones on the south buttresses are removed and new stones with similar square blocks inserted. But, on the buttresses of the north tower these blocks are not square, but are formed into small mouldings dying into the slope of the cornice, possibly indicating that the architect meant either to panel the face of the next stage of the buttresses, in continuation of the design of his intended aisle parapet, or that he meant to carry his parapet round the buttress, and by setting back all its faces to leave a clear passage round it, as was done at Limoges and Clermont. Whether the southern stones now removed were thus moulded or left square, I do not know, but if these northern stones are removed, the solution of this interesting problem will be impossible, as nothing can be inferred or proved from modern copies, however carefully executed.

In the interior, nothing is done, still the capitals look like butter (!), and there are in the niches and behind the triforium arcades, the hateful colour wash of greyish-blue. The cathedral would gain immensely by the removal of all this colour; but it is to be hoped that it will not have its stone joints pointed with the usual black mortar. The present altar, the screens, and all the fittings, are in the worst taste, and poor and mean in character, and ought to be entirely renewed, and, if possible, as they were before. In the Archbishop's Palace there is preserved a careful drawing of the very magnificent Flamboyant *jubé* erected in 1420, with its pair of circular open-work staircases. This was removed in order to gain a more spacious effect! I hope it may be possible that *this* splendid work of art may, at all events, be reproduced.

It is to be wished that it were possible to reproduce from authority the ancient fittings with the stone inclosures to the choir, probably in the style of the *jubé*, and in the style of those at Chartres; and also the ancient stone screens which shut off the apsidal chapels, and, above all, the magnificent ancient altar, which stood under the crossing, on the rich mosaic pavement brought there in 1791 from the destroyed abbey church of St. Nicaise. Most of the beautiful fittings were destroyed and replaced by wretched modern fittings in 1747 by M. Godinot, a canon of the cathedral. The removal of the mosaic maze on the nave-floor in 1779 is due to another canon, "qui était choqué des courses des enfans, et des étrangers qui s'amusaient quelquefois à parcourir pied à pied toutes les sinuosités et les contours de ce labyrinthe"!

Chartres Cathedral.

The works of restoration have been long in hand here, and up to the present time the exterior only has been dealt with, and that chiefly on the south side. The nave, with its aisles and buttresses, has been carefully repaired, and though there is a good deal of new stone, it seems to be introduced not more than was, perhaps, necessary. The south transept has been completed on its west and south-west fronts quite recently, and the scaffolding removed. Here much pains seem taken to replace only decayed work. This is especially to be noticed in the shafted buttresses, where a few stones here and there are put in, instead of renewing the whole length of the shafts. The great rose-window externally is entirely new, but it seems that the old stonework was in a most ruinous state, and only kept together by its iron bars. They seem to have taken the opportunity of the removal of this window to clean its old stained glass, for it has a more brilliant and transparent effect than I remember noticing on former visits. I do not, however, think the south clearstory or south aisle glass has been touched, as the stonework was in so good a state that it was not necessary to disturb the glass. The east side of this transept, the south-east tower, and the south choir aisle, are now hidden behind a mass of scaffolding; the windows are boarded up, and the works are just started. The south porch is left alone: though structurally like the northern porch, it really is in need of repair; but yet one would be sorry to see anything done, even though the great wooden props must still stand there. Some new finials are, however, being put on its pinnacles, but this seems the extent of what is to be done.

The interior greatly needs fittings worthy of the building, and the cleaning off of the thick coats of yellow wash and imitation porphyry (!) with which it is encrusted, and, above all, the removal of the horrible Classic casing of the choir arches and their piers. These abominations were executed in 1772 by the architect of the Duc d'Orleans, and at the same time the authorities barbarously destroyed the magnificent *jubé*, which is said to have been the original one, dating about the year 1030, and which, of course, must have been reconstructed in the new choir. It had seven arches, carried on monolith columns, and was ornamented with bas-reliefs, and had two staircases on each side, with "watch-lofts" for the guardians of the church. The present altar, erected 1773, involved the destruction of the ancient one of 1520, which is thus described:—"Environée de chaque côté de colonnes en cuivre surmontées d'anges de la même matière et couronnée d'une figure de la Sainte Vierge, en argent, monument dont comme de tant d'autres objets sacrifiés à la manie et la mode du jour, nous ne cesserons de déplorer la perte si importante à l'histoire de l'art dans le moyen age." When one reads how magnificent an effect the interior formerly presented, its present neglected and squalid state is the more to be regretted.

Most visitors to Chartres will remember the beautiful Early Gothic house on the south side of the Place of the cathedral, with its beautiful two-light windows in the first floor. This house has been restored (?) in the most grievous fashion, and its interest and beauty are gone for ever.

At Laon Cathedral the works are nearly completed, though the western end and the porch are still partially covered with scaffolding. It strikes one here that the work is almost entirely new, but whether that was necessary is doubtful. It is true the church was built very rapidly, and that there were partial failures in consequence, but the material used for the building generally is in such singularly good condition, that it is puzzling to account for the complete disappearance of the ancient west porch, and the parts adjoining it.

Valence Cathedral has been partially restored, and has a very beautiful modern Romanesque west tower, possibly to a great extent a reproduction of ancient work; the lower story, forming an open porch, is remarkably fine in its proportions and details. A portion of the west end of the nave and aisles has been rebuilt, and here a fatal mistake is made. The architect did not seem to appreciate how much the effect of the design depended on the manner of its construction, and he has used courses of ashlar and dressings of great height, instead of following the old thin courses and small dressings of the

ancient work: the result is deplorable. There is at Valence, as in so many French restorations, too much use made of black mortar in re-pointing the interior stonework: the result produced is one never intended by the designer, and there being no need to draw attention to the irregular sizes to which the stones are worked. For instance, at Valence the slender apsidal pillars are some of them carried up in numerous stones, only 10 in. or 1 ft. in height; others are in two or three stones only in the total height, but the architect never meant this to be pointed out in the emphatic manner in which the black pointing does it.

At Avignon, little or nothing is done to the cathedral in the way of restoration, but some unimportant works are going on at the Papal Palace, which will some day or other be disused as a barrack, and become a museum. At present much remains to be done. The magnificent Salle de Garde is so divided by floors and partitions that one has to go into very many rooms to get an idea of its magnificent dimensions. The interesting painted chapels open off barrack dormitories, but fortunately are kept locked; the frescoes are, however, terribly mutilated, and many of the heads of the figures have been cut out and removed to be framed and sold!

However, on the north side of the palace is a magnificent hall of early fourteenth-century date, under restoration; its great pointed barrel-vault is being for the most part reconstructed; the walls are supported by very massive buttresses, between which are thrown great pointed arches, leaving a space vertically next the wall for the purposes of defence; these arches are being rebuilt, and the old Roman system of carrying the centering is adopted by supporting it on a projecting course of stone of the arch itself, just above the horizontal courses which form its springing. At the Pont du Gard these projecting courses in the arches are left, but at Avignon they will be cut to the form of the arch when the centres are taken down.

The ancient city walls and towers, which still exist all round, are now almost entirely cleared of the houses built outside and against them, and are being restored, and their battlements and corbelling renewed where they had been destroyed. A boulevard is formed around the city, at the foot of these ancient walls, with most admirable effect.

Nimes.

The Cathedral of St. Castor is being almost entirely rebuilt excepting its very interesting Romanesque west front; the whole building was of that date, but had sustained such injury during the religious wars of the sixteenth and seventeenth centuries, and had been so modernised that it had become an utter wreck. The church is so entirely built round, with houses against its walls, that nothing but the west end is visible, and there are no open windows on its ground floor. In the fifteenth century, pointed groining was erected on the earlier walls of the nave, of fair detail and proportions; this groining has been very cleverly supported and retained in its place during the rebuilding of the walls under. The church has been reconstructed in its ancient Romanesque style; with a bold arcade, and triforium, consisting of four or five small semicircular arched openings, with a round-headed clearstory window over; the same design runs through the choir, which is not yet built to its full height. Most of the old aisle walls are retained, as they support the houses adjoining them; the eastern ambulatory walls are, however, new. There is in the choir a curious example of modern construction! The marble pillars of the triforium are very small in diameter, and the architect has feared to bring the weight of the clearstory upon them; he has, therefore, introduced a double cast-iron girder over them from pier to pier, to carry the superincumbent weight. The clearstory is built; but the triforium arcading, which apparently carries it, has yet to be filled in under the girders (see rough sketch). The groining of the choir will be on the old Romanesque lines; it is not yet constructed, but I examined the drawing (set out on the wall!) showing its design. This rebuilding is a most important work, and seems to be carried out with the greatest activity, and promises to be very successful. It used, indeed, to be a reproach to Nimes that its cathedral was so ill cared for, when it had three great modern churches on a still larger scale. As regards these churches, two are very pretentious and costly, and utterly uninteresting; but another, dedicated to St. Paul, built in 1850 by M. Questal in the Romanesque style, is worthy of the highest praise for its refined architecture and for its magnificent paintings by Flandrin.

Lyons,—St. Martin d'Ainay.

The Church of St. Martin d'Ainay was the most remarkable church in Lyons by reason not only of its great antiquity, but also for its beautiful proportions; the earliest portions date from the ninth century, and there are used in its construction granite columns of great size taken from some Pagan building. The style is the Early Romanesque of the district, and of beautiful detail; the western tower is Carlovingian, of admirable design. Its plan consists of nave and shallow transepts, and choir, with an octagonal domed lantern over the crossing; the aisles are narrow, and end in apsidal chapels east of the transept. The restoration and enlargement of this church is much to be deplored; the architect has entirely ruined its proportions externally and internally; he has added great aisles on each side (see plan), cutting through the ancient aisle walls. This extra width, of course, would have darkened the church (the nave having a barrel-vault without a clearstory), so he raised the old aisle walls and added a clearstory to them, and continued up the wall pilasters considerably above the level where the cross arches sprang. These heightened aisles were then continued on to the west front, with new doorways, the effect being to dwarf and ruin the proportions of the old tower. The eastern chapels, fortunately, are not raised, and here the charming relative proportions of choir, lantern, and aisles can be seen and enjoyed. The modern aisles have semicircular-headed windows, &c., imitating the tower, and they are carried out in a costly and most substantial manner; but such a church should never have been enlarged, and no architect should have attempted it: success was not possible, as the old building was quite perfect in its proportions.

Limoges and Clermont-Ferrand Cathedrals.

The new works at the cathedrals of Limoges and Clermont-Ferrand are of peculiar interest and importance, for both are now being completed after the suspension of building operations for four centuries. Both cathedrals are on the site of Romanesque buildings, and both were commenced to be rebuilt in the Northern-Gothic style in the thirteenth century, and (as Viollet-le-Duc points out) on the same general plan, and most probably under the same architect's directions. In each case the choir (and at Clermont three bays of the nave) were completed in the Middle Pointed style. At Limoges the transept and two bays of the nave were proceeded with and completed, and the lower portions of two more were commenced, in the fifteenth century; while, at the same time at Clermont, a portion of another bay of the south aisle was erected. The works then were stayed at each church, leaving standing portions at the west end and the towers of the Romanesque churches.

The works now in hand follow more or less the ancient lines. Viollet-le-Duc gives plans of each, showing exactly what was originally carried out, and he indicates further the supposed original intention of the architect. I was much interested in examining the new works and comparing them with these plans, and I find some important variations from them; while, however, on the whole, they represent fairly well the new work done.

At Limoges the three western bays are in course of erection, including the aisles and chapels, and these seem to be faithful reproductions of the ancient work; but, on reference to page 374 of the "Dictionnaire," it will be noticed that Viollet-le-Duc shows on his plan one bay of the nave and aisles of the Romanesque church as existing; and in a foot-note he explains it thus:—"On a laissé subsister un débris le l'ancienne nef romaine et les soubassements de la tour de XIe siècle, renforcés et surélevés au XIIIe et au XIVe siècle"; but this bay of the nave, unfortunately, has been entirely pulled down, and a porch has been designed by the architect (as indicated in my plan) between the nave and the tower. He has arranged this with a view to get over the difference of the centre lines of the tower and the nave, and when viewed internally the result is fairly successful and picturesque. The porch is vaulted at the same height as the aisles, but it is not yet sufficiently advanced to enable one to see how the upper part will be treated, and whether or not it will be made an organ-gallery by continuing the triforium and clearstory up to the tower, and so give the same number of bays as at Clermont, which the original architect probably intended to do. The external effect of this porch is, however, most inharmonious, and has singularly ugly doorways, with square lintel-heads, carrying the upper part of a four-light window, giving the effect of the window having been cut down to form the doorway, and its tracery supported by a girder! These doorways are a most serious blot on the work; but, in other cases, the ancient details, and even the heights of the courses, are scrupulously adhered to.

The progress of the works has been rather slow since the recommencement. The first and second bays (on each side) next to the old work are built as high as the cill of the clearstory; and the next bay and the west wall as high as the string under the triforium. The aisles are vaulted, and the windows formed, but are yet without tracery or mullions. A light-coloured granite is used, like the ancient material, which has now weathered to a dark brown tint. Very little scaffolding is being used, much of the work being fixed by men standing on the walls themselves. While there is so much to praise in the new works, one regrets the destruction of the Romanesque fragment, and the substitution for it of the not particularly successful porch.

There is a point in Viollet-le-Duc's plan to which I will just draw attention. He does not show on it the singular thickening and strengthening of the walls of the Romanesque belfry referred to in this footnote, so I have indicated this in my plan. The original porch and bell-tower was on the usual Romanesque Auvergne type, and had thin walls, with openings, and four central columns, resembling the belfries at Le Puy-en-Velay and at S. Benoit-sur-Loire. It was, however, incapable of supporting the great tower which was erected over it in the fourteenth century. The architect of that day, therefore, built up the centre, and thickened the external walls, so as to get a solid mass on which to start his tower safely: the result is singularly heavy and ugly, and hopelessly ruins the western view, and gives but a narrow and tortuous entrance to the church.

And now as regards the works at Clermont. They are very much more advanced; the new portion of the nave, aisles, and chapels are completed, and are opened into the ancient church. Here the old details have also been carefully followed in all respects, and the result is most satisfactory, giving its due effect and proportions to the very beautiful original design. The apse, and its surrounding chapels, of this cathedral, with the magnificent stained glass, combined with the dark tone of the lava of which the whole is built, are to my mind almost unequalled in beauty, except, perhaps, by the glorious apse of Barcelona Cathedral.

But with regard to the west end, there seem variations from M. Viollet-le-Duc's plan (they are executed as shown in my plan), but the western towers are puzzling. He speaks of the ancient Romanesque west end and towers thus: "On voit encore les restes de la façade du XIe siècle"; and he goes on to say in a foot-note,—"Deux tours qui subsistaient encore sur cette façade, mais qui avaient été dénaturées depuis longtemps, ont dû être démolies parce qu'elles menaçaient de s'écrouler." This front was pulled down in 1855, and a new front and towers erected in the thirteenth-century style designed by M. Mallay, as shown on the plan given by Viollet-le-Duc. The spires are now being commenced, and the effect on the whole promises to be very good; but unfortunately the lower story of the towers, both inside and outside, are exceedingly poor in detail and effect. The space is cut up into passages and steps, and is very different in effect to the lower stories of the Cologne towers, the plan of which is here imitated on a small scale. One much regrets that the ancient Romanesque towers were not strengthened and restored.

The new works are all carried out in lava, but of a somewhat lighter tone than used in the old work. It is a material of great strength, and wears remarkably well. The ancient work is, therefore, in an almost perfect state. Its whole construction is exceedingly slight, yet the wonderful skill and knowledge of proportion shown in its design is most remarkable.

The Roman Antiquities of Orange, Arles, and Nimes.

The restoration of Roman remains is ques-

tionable from an historical and artistic point of view, and really only to be defended, when it is adopted as a measure of precaution for the purpose of preserving these buildings for posterity to study, and I was, therefore, glad to find that (excepting, perhaps, some rather superfluous new work in the amphitheatre at Nimes) the works of restoration have been, and are now, carried out in a most judicious and careful manner. At Orange the very beautiful triumphal arch was taken in hand some years ago; it had been built into a palace of the Princes of Orange, but this building has now entirely disappeared, and the arch stands in a clear open space across the main north road to Valence; the southern face and its engaged columns, including portions of the pier of the small side archway have been rebuilt, and blocks of stone inserted where the old stone had been cut away; the mouldings are wisely carried on in the new work so as not to needlessly break the ancient lines and profiles, but no carving or enrichments of mouldings are executed, so the new work preserves the old from further decay, and in no way professes to imitate it, while at the same time it gives additional value to the ancient work by enabling its proportions and design to be fully appreciated.

The top of the great wall, which forms the "scena" of the Theatre of Orange, is now being repaired. The whole had much bulged in its length, and had lost most of its coping, and portions of the upper courses, especially on the slopes of the wing walls; these are being rebuilt and a new coping put on, copied from the old, portions of which are suffered to remain *in situ*, so that the accuracy of the restoration is guaranteed. Nothing else is to be done, and the great wall, with its interesting doorways, recesses, and niches, is left untouched.

At Arles the amphitheatre has not had much done to it beyond repairs to the ancient steps, and the replacing of some of the outer piers and arches,—this last, possibly, from necessity; for I saw an old print showing the interior filled with houses, which were also built up and into the recesses of the arches. The three great towers raised on the upper series of arches, when the whole was one vast fortification in the eighth or ninth century, are carefully preserved and repaired; of course, they are incongruous, as was the old Venetian tower on the Acropolis at Athens, lately pulled down, but they are part of its history, and are as such valuable; the details of their windows, &c., are, moreover, very good.

The theatre of Arles is being gradually brought to view by pulling down the houses which formerly covered nearly all its area; most of it is now exposed, and on the foundations and remains of the piers there is in course of construction the outer semicircle of open arches, copied from some old ones which exist; these will form a bounding line to the ruins, and in no way interfere with its great archæological and architectural interest.

It is at the great amphitheatre of Nimes that the most important restorations and additions have been carried out. It underwent the same vicissitudes as that at Arles, and like the Colosseum at Rome it was converted into a fortress by the Visigoths, and was in 1100 held by Knights called "*Milites castri arenarum*," who constructed their houses within it; but at the end of the fourteenth century the knights having left, the people took possession of it, and its area gradually got completely filled up with mean houses. In the early years of this century the restoration was begun by clearing out the area and pulling down all the houses built up to the exterior, and up to the last few years the works have been continued. As at Arles the towers and alterations of the Visigoths are not disturbed, and the arena has been lowered to its ancient level, showing the marble-faced podium. The lower division of four rows of seats was found nearly perfect, and also six rows out of the ten of the second division; but the twenty rows of the third and fourth divisions were almost totally destroyed, with the arched passages and "vormitoria" under them; small portions of these have been re-constructed (without interfering with the general effect), with a view to explain the original design of the building. Some persons may say that this is going too far, but I can say that it adds vastly to one's interest when endeavouring to understand this magnificent building. Portions of the exterior have been restored and re-faced, and here there is, I think, more work done than was necessary for strict "conservation"; moreover, the detail is very poor, and the new white stone brings it out in rather painful prominence.

A most interesting and learned history and description of the building has been written by the late M. Auguste Pelet, of Nimes (and published in 1866); he so thoroughly enters into the question of what a "restoration" should and should not mean that I will venture to quote some remarks of his on the subject:—"Malheureusement on s'est un peu trop éloigné du but qu'on s'était d'abord proposé dans les réparations projétées; on voulait seulement conserver et l'on a crée. On aurait dû traiter ce colosse avec tous les égards dûs à son antique origine; il fallait guérir ses blessures et respecter ses cicatrices, dont chacune était une page de notre histoire. Nous n'aurions pas, il est vrai, une galérie toute neuve, des pilastres à vises arêtes, des moulures ciselées avec soin, des chapes éblouissantes de blancheur pour garantir des constructions modernes, des murs qui dénaturent le monument; mais en revanche, les tours des Visigoths existeraient encore, l'on verrait des arceaux croulant en apparence, mais solides, des arêtes écornées par le temps ou les Vandales, des fragments de voûtes noircis ou couverts de mousse, et cette belle ruine n'aurait rien perdu de son caractère, de son éloquence, et de sa poésie." R. Herbert Carpenter.

NEW PREMISES FOR MESSRS. J. FIELDUS, SON, & CO., QUEEN'S ROAD, BRIGHTON.

These premises have been erected for Messrs. Fieldus & Co., from the designs and under the superintendence of Messrs. Lainson & Son, architects.

The frontage to the Queen's-road is 41 ft. 6 in., with a depth of 150 ft. The total floor-space is 26,000 superficial feet, and the cubical contents about 500,000 ft. The style is that of the French Renaissance. The main walling is of red brick; the dressings partly of Aberdeen granite, but mainly of terra cotta from the Tamar Terra-Cotta Company. Wood and glass form conspicuous features in the design.

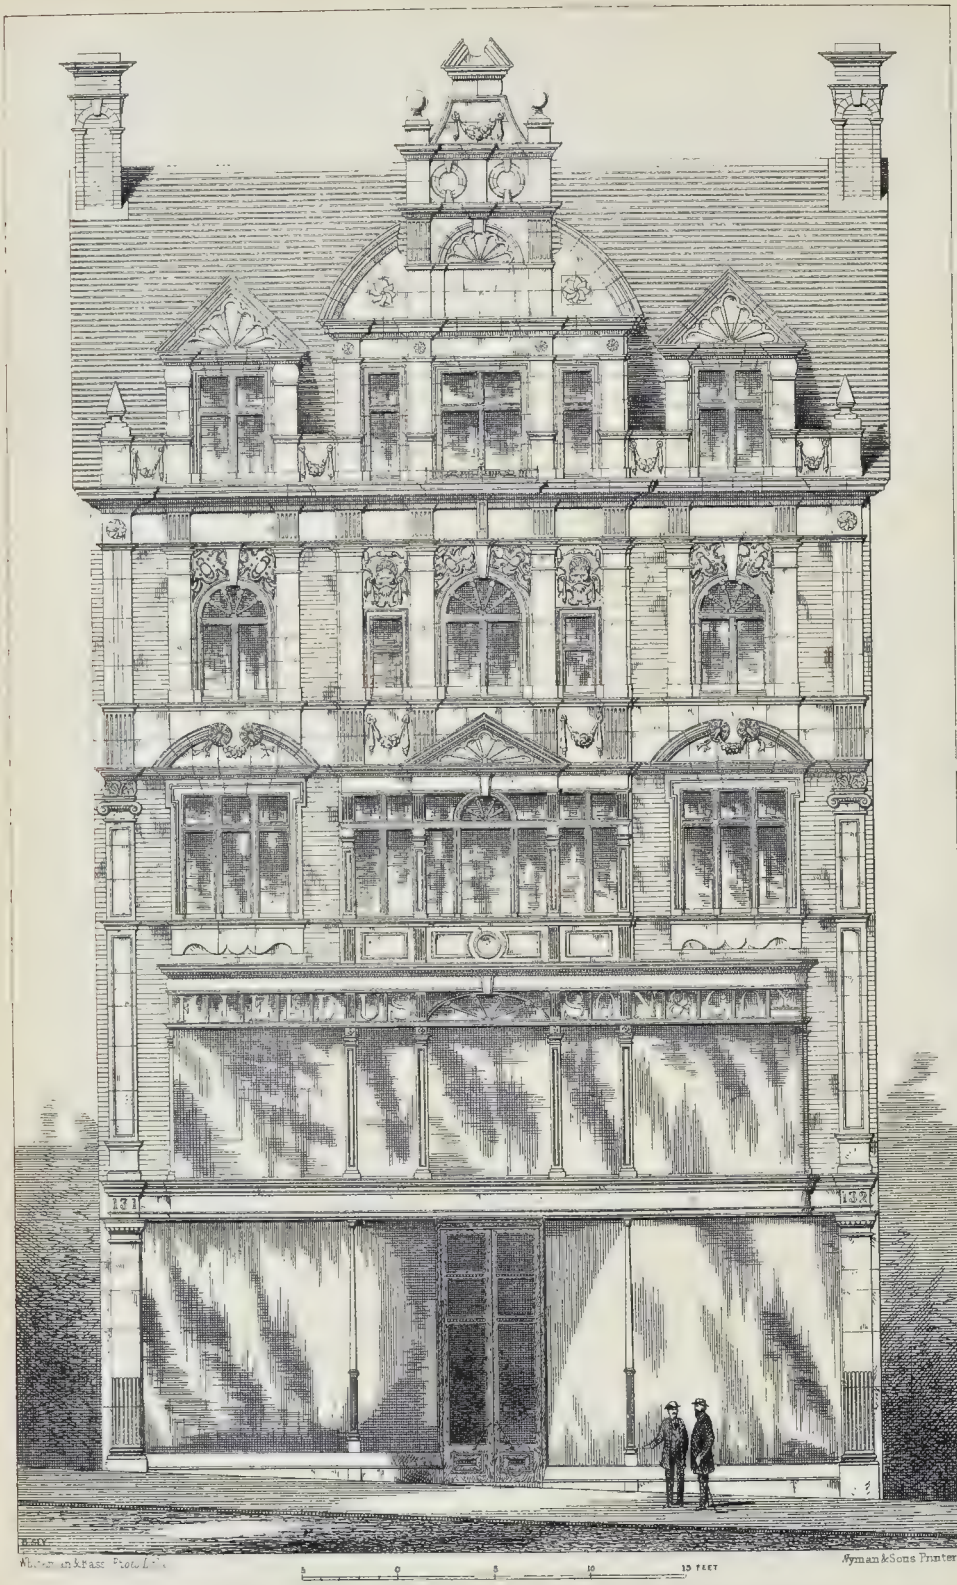
CHAPEL OF THE CONSTABLE IN BURGOS CATHEDRAL.

Burgos is a proud, a royal, city; she is an epic dating from the most brilliant time of Spain, and still preserves in her ruins a trait of nobility and grandeur which time has been unable to efface. The architecture of Burgos has less of the Eastern character than Toledo or Cordova, and the city remained a shorter time in the hands of the Moors; she was, on the contrary, the stronghold of the Gothic kings, the city of the sainted Ferdinand, of the proud Alfonso, the home of the incomparable Cid. Everything which Burgos possesses of beautiful buildings is overshadowed and eclipsed by the majesty of the cathedral. This dates from the thirteenth century, from the time of Ferdinand, and was erected on the site formerly occupied by the king's palace. The outcrop of pinnacles, which in Milan Cathedral appears almost overdone, as an excess of Southern fancy, has here been restricted within bounds; what in Northern cathedrals might look abstract and naked is here still the pure expression of original ideas, of that powerful devotion which turned kings into Crusaders and made artists the anointed of the Lord. The principal portal, which must have been originally very rich in execution, is partly destroyed and clumsily restored; the rose-window, however, and the double windows over it, are of considerable beauty; and the two principal towers, of a height of 300 ft., have withstood the ravages of time very well, notwithstanding their open work and extremely fragile carving. The octagon tower over the cross into which the cupola of the cathedral rises is surrounded again by turrets rising from the roof, and over the side portals a bundle of eight slender openwork turrets. The tower of the chapel which joins immediately on to the choir of the cathedral has a very similar effect, and altogether the total impression produced is very striking. The interior of Burgos Cathedral corresponds in a high degree with its exterior. The light comes in through stained-glass windows, and produces now and then magical effects of colour. The ornamentation of the interior presents the best which sculpture and painting of the epoch could provide; celebrated names are represented, and every succeeding century added treasures to those already deposited.

Numerous chapels surround the nave of the church, of which the most splendid, if not the most to be admired, is the "Capilla del Condestabel," in the late style of the fifteenth century. It is behind the high altar, and contains the graves of the Velasco family, and especially that of the founder of the chapel, the Constable of Castile, and of his wife, in marble. The sculptures of the chapel, which are ascribed to Juan de Borgogne, represent the Crucifixion, the Resurrection, and the Ascension. By the side of the statues lies a large block of jasper. Coats-of-arms and supporters adorn the walls of the chapel, which is shut off by a heavy iron railing, over which stands the equestrian statue of the Apostle James, a work of Cristobal de Andino, a native of Burgos.

BOGNOR ROMAN CATHOLIC CHURCH AND MONASTERY.

A new mission has been started at Bognor by the Servite Monks, or "Servants of Mary," from their head house in England, St. Mary's Priory, in the Fulham-road, West Brompton, and the first stone was laid on the 26th of October, by the Rev. Canon Butt, of Arundel, who officiated in the place of Cardinal Manning, unavoidably prevented from attending at the last moment. A large gathering of friends came from London and parts near to Bognor.



The part of the church now building consists of five bays. A peculiarity of the church is that there are no aisles, but recesses used for chapels, confessionals, and a baptistery are substituted. The nave (till extension) will be 76 ft. long and 38 ft. span. The material used is brick with Westwood ground stone dressings, from the quarries of Messrs. Randell & Saunders at Corsham. The style is Early English, of simple but bold treatment. The façade we need not refer to, as it will be seen in our view this week. It will be necessary, however, to explain that windows are not shown in the gables of the side chapels, as, this being the limit of the ground, they would be liable to be blocked out by adjacent buildings at some future time. In the recesses from the outside, however, light is obtained by treble lancet lights in the nave, and double lancets in the chapels.

The monastery is to contain, in the basement, kitchen, scullery, three store-rooms, larder, wine-cellar, lay brothers' rooms, and other accessories. The ground-floor will have two reception rooms, outside the cloister enclosure, of which one side only is to be built at present. Inside the enclosure will be the refectory, 26 ft. 6 in. by 17 ft. 9 in., and 12 ft. 6 in. high. On the two upper floors are to be a community room and thirteen cells.

Both the church and monastery are capable of considerable increase, ample ground having been procured, shaped letter T, 345 ft. across the arms, 125 ft. at the foot, which the new buildings are to occupy, and 222 ft. high. There are frontages to four roads.

The architect is Mr. Joseph Stanislaus Hansom, of South Kensington, and the builder Mr. George Huey, of Parkstone, Dorset. 6,000*l.* are to be spent on this the first instalment of the buildings, which are to be completed by September, 1882.

Strikes in France.—As the carpenters' strike continues in Paris, the masters are obtaining hands from abroad. The *Standard* says,—"On Thursday no fewer than 900 men arrived from Belgium, 250 from Switzerland, 200 from England, and 200 from Italy, who at once found work. On Friday a further detachment of 300 reached Paris from Brussels, Antwerp, and Liège; some 200 are expected before the close of the week from Switzerland, and an equal number from the north of Spain. Thus a total of some 2,000 foreign carpenters will next week be earning their bread in the French capital. Under these circumstances it is to be feared that the native workmen will have reason bitterly to repent the step they have taken. In view of the number of strikes now existing in various trades, the French Academy of Moral and Political Science has offered a prize of 5,000 francs for the best essay on "The Effects of Coalitions and Strikes." Competitors are directed to trace the movement in the rates of wages in trades from which strikes have been absent, and in those in which they are of frequent occurrence."

PLANS OF EDIFICES ILLUSTRATING "RESTORATION WORKS IN FRANCE."

THE PRESIDENT'S ADDRESS AT THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.*

The losses which we have sustained during the year will be duly chronicled in our Transactions, and a few words will suffice in addition to what is doing upon some of the names whose absence from our ranks we deplore. The death of William Burges took from us, unexpectedly and in his full vigour, one whose belief in his art, whose devotion to its study, whose enthusiasm for his work, have rarely been excelled. A student from first to last, an artist whose hand was always seen in every detail of his work, his example is one to be held up always for our admiration and emulation. He knew that unless an architect's work is good and thorough it has no enduring life. He knew that this lesson required to be taught us more than any other, and he made it the business of his life to teach it, and I honour him the more that he gave to others what he had with infinite pains learnt. It was one of his greatest pleasures always to discuss, in public or in private, old modes of procedure, of manufacture, of design. There was nothing selfish in his acquisition of architectural or archæological information. He was as ready to communicate as he was to acquire, and many of his published papers are replete with learning and information. The study of Early French Pointed architecture had evidently produced a very strong and lasting effect upon him as an artist. He revelled in the somewhat rude and ponderous version of it which he affected, and it was in the sculpture and the decoration with which he rejoiced to overlay his work that he allowed his quaint and exuberant fancy to have full play. There was so much originality in what Burges did that his work was certain to be criticised. It was warmly admired and as warmly opposed, and he would have been the last man to wish it otherwise. In one thing at least all were agreed, and this was that his death was a real loss to our art. The Royal Academy had at last recognised his undoubted claims, and, unfortunately it still remained for this Institute to follow with a testimony in the shape of the gold medal, the bestowal of which, I am sure, could not have been much longer postponed. In Frederic Ouvry we have lost an adviser, who was not only always ready to give us his valuable counsel whenever we asked for it, but we had the satisfaction of seeing combined in him the able solicitor and the accomplished antiquary. For the greater part of his life he had been an active member of the Society of Antiquaries, of which he was for many years treasurer, then vice-president, and finally president, after the death of Lord Stanhope. Among foreign architects whose deaths we have to deplore are some of great mark. Hector Lefuel, member of the Institute of France, was well known by his works to many of us. The names of Davioud and of Mariette Pasha must not be forgotten. Both of these did great work in different directions, and will long be remembered among us, the former especially by what certainly was a bold flight of genius,—the Trocadéro building,—and the latter by his good work among the monuments of Egypt. Time will not allow of my mentioning other less well-known names, or those of men whose life was less intimately bound up with our own work here.

The architectural publications of the year do not appear to be numerous. I cannot say how much I regret this. Nothing in my opinion tends more to raise our art than some attention among us to these literary illustrations of architectural history and style in which so many architects have in past times distinguished themselves. We have examples in the case of some of our oldest members which may well be commended to the notice of their juniors. Nothing, let me assure them, so certainly gives young men their first footing on the ladder which leads to fame and success. Our old librarian, Mr. Dollman, has shown us how valuable a work it is possible to produce in his monograph of St. Mary Overie's Church, as to which I have already had great pleasure in expressing my opinion here. The Society of Dilettanti has published another part of the antiquities of Ionia, in which, seeing that Mr. Newton, Mr. Watkiss Lloyd, Mr. Fergusson, and Mr. Pullan, have combined their forces, we need not doubt the result. The magnificent Government work, the "Monumentos Arquitectonicos de España" is still going on, and we are looking forward to the early publication of Herr Richter's promised edition of Leonardo's "Trattato della Pittura," a work which will have almost as much attraction for architects as for painters, for among the many hitherto unpublished drawings which will be contained in it, many, I understand, are architectural designs. No great public works have, I think, been completed during the year. At Vienna, at Brussels, and in Paris, great works are approaching completion, all of them undertaken in a spirit of lavish expenditure, which is somewhat surprising to us in this country. The cathedral at Cologne has been completed,—the most gigantic work of modern times,—in presence of which all unkind criticism ought to be hushed in admiration of the grandeur of the idea. The so-called "restoration" of St. Mark's, Venice, has I hope, for a time, been arrested,—whether permanently or not it is impossible to say. Only too frequently works are done for which the necessity, if it exists, cannot but be deplored. Such a case is that of Coutances Cathedral, where the north-west steeple has been made to look as it might have done, when first built, by the obliteration of every mark of age. I most sincerely trust that this may not be the forerunner of an entire scraping of the whole of this magnificent church. The question of the restoration of ancient buildings is one which is constantly coming up for consideration, and I am constrained to say, that unless the very greatest care and judgment, and the utmost reverence for every relic, actuate the restorer, restoration is not only a serious risk, but an unmitigated evil. There is the risk of doing too much and of obliterating every sign of antiquity. Such works in our own country as the redecoration of the Chapter-house at Salisbury; or in Germany, such works as the decoration of the castle at Meissen, and the far more interesting castle on the Wartburg near Eisenach; or in France, such as the re-decoration of the interior of the Sainte Chapelle, fill me, I confess, with distress. No one wishes more than I do to see our painters at work upon our walls; but I do not wish to see their works obliterating, as they do at the Wartburg, every mark of antiquity inside the building. Our new walls and buildings are numerous enough for all that they can do; and in the repair of old work, it is the repair, strictly speaking, that is the one thing needful, and beyond which it is undesirable to go. And even this ought never to be treated as proper work for any but the most skilled hands.

For the coming year I hope that subjects will be found, both for discussion and for illustration, at our meetings, which may enable us to leave at least as good a record as heretofore. I cannot but think that it is not creditable that our committee should have so much difficulty in persuading members to read papers. If you look through the past volumes of our Transactions, and then at the best known names in our lists, you will find, I fear, that many who must have matter well worth communicating, have never yet troubled themselves to make a single communication to the Institute. It ought not to be possible for me to say this.

Various matters of considerable practical interest will come before you this Session. The proposed repetition of the Electrical Exhibition is one which will be full of interest to those who have not made it their business to visit Paris during the exhibition there. And hardly second to this in its interest for architects is the Smoke Prevention Exhibition, which is to take place this month and next at South Kensington. There is small encouragement in London to use the best materials for building, if they are to be defiled as soon as built by the foul atmosphere which we create for ourselves; and our utmost endeavours ought to be given to the cause both of clean lighting and clean warming, if we have any care whatever for the permanent effect of our buildings, both internally and externally. Among other subjects which I hope your Council will see their way to bring before you, are suggestions for the consolidation of the Building Acts for the whole country in one uniform Act; and the preparation of such a statement on the subject of the law of light and easements as may help to form the basis of an Act of Parliament to do away with the present uncertainty and variety of opinion and practice; and the Council will no doubt feel it necessary to bring before you some amendment on the present mode of electing to the highest office in our body.

Her Majesty's Gold Medal was given last year to Mr. J. L. Pearson, and this year to Mr. Godwin. Next year, according to the established custom, it will be given to a foreigner. On these occasions, when foreigners are elected, it is generally of necessity given to one who has no connexion with this Institute, and I do not hesitate to say that if we saw fit when the man exists in our own profession, but outside our own ranks, we should both better obey the Queen's intention and gain more credit than if we insist upon regarding membership of this Institute as a preliminary condition for British membership, which is what hitherto, I believe, we have practically done.

The most serious matter before us for next year is the first Obligatory Examination for admission to the privilege of membership. It would be strange, indeed, if in a land of freedom such as ours there had been but one opinion as to the wisdom of the proposal, but it would be almost equally strange if, in a land of order such as ours fortunately is also, the examinations were not carried out with due zeal and thoroughness by your executive. Some of us may think old times were not so very bad, and that want of some small preliminary technical culture and education did not prevent many of our British architects from being really great men. But these are not the sort of men who will be affected by our examination, the object of which is rather to raise the general standard of education, and so to keep out of the Institute those who are wholly incompetent, than any vain hope of suddenly creating an unlimited supply of admirable artists. We must not raise our expectations too high, or we shall certainly be disappointed. At the same time I feel very decidedly that it is the duty of the Institute to take care that the examination is a *bonâ fide* one, involving careful preparation on the part of the candidates, and a real acquaintance with at least the groundwork of an artistic and a professional knowledge. It is obvious that there will be no difficulty in testing satisfactorily the ability of those who come to be examined in many of those branches of our work in which every one who intends to act as an architect ought to be well grounded. The power of drawing accurately and intelligibly plans for buildings which will stand when built, is a *sine quâ non*; and there is much work of this sort as to which we shall have no difficulty in framing sufficient tests. The far more real difficulty is in an examination into the capacity of candidates as artists; and here I feel that it will not be desirable to make the test very difficult, for I know well under what difficulties students often labour. As a visitor and teacher for some years in the schools of the Royal Academy, where probably owing to the examination at admission the ability of the students is above the average, I have to see with constant regret a singular want of acquaintance with the first principles of architectural design, and with the rudiments of architectural detail, which mark the work of many students. But I hope all here will agree with me that it would be a fatal mistake to make the artistic part of our Obligatory Examination so very easy and rudimentary as to allow of even the most ignorant of our candidates scraping through. The examination once instituted must be a real one, in the sense of meaning that the candidate has at least reached some fixed standard,—even if a rather low one,—of efficiency all round. My own opinion is that such a standard should, as far as possible, be so settled at first as to remain permanently the same. We are not likely, so far as I can judge, to have a better prepared class five years hence than we have now. All the necessary means of education exist now, and have long existed. The system of pupilage, which enables men to learn exactly how those who have succeeded in making their mark are in the habit of working, is no doubt the strong point of our English system; and this can be supplemented by work in London under the professors at King's College and University College, and both in London and the provinces under the Government teachers. Then there is the Architectural School of the Royal Academy, presided over by an active member of our Institute, and where the students have the advantage,—as from the crowded state of the school there can be no doubt they feel it,—of the personal teaching and direction of most of the architect members of the Academy in succession. Finally, there are the inducements held out, both here and at the Royal Academy, to the more able and earnest art-students, in the shape of prizes more or less attractive, and only to be gained by those who

* Continued from p. 598, *ante*.

have achieved considerable artistic excellence. No one can fail to be struck with the high average of the work which is done in competition for the medals and prizes which we annually distribute; whilst at the Academy, though the excellence of the competition has been for many years very remarkable, I am sanguine that the alterations which have just been made in our laws, with, among other things, the provision of a travelling studentship of 200*l.* attached to the Architectural Gold Medal, will produce an even better effect. The further new provision of a travelling studentship for travel in the United Kingdom is valuable as showing that the existence of native art worthy of study is at last recognised by the Royal Academy, treading in the footsteps of our own Pugin Travelling Studentship, of which, as we know, the results have been so eminently satisfactory. We shall all be agreed in allowing that such successes as the gaining of these artistic prizes in competition, either here or in the Royal Academy, will count as somewhat more than any artistic examination which we can conduct in a few hours here; and in the same way that when a graduate of one of our universities presents himself for examination, what he has already had to do for his degree will not require any sort of repetition at our hands. The Institute having taken this examination in hand, we must all do our best to ensure its success, and in one respect many of us can do more perhaps than we do. It is the master who does bad or inferior work who ruins the prospects of those whose education he has undertaken, and the better the master's work the better will be the prospect of those who have been trained to look up to him. I think I may dare to say in reference to our English School of Architecture that it has in some respects made marked progress within the recollection of most of us. No school, I believe, has advanced more in draughtsmanship, whilst the study of ancient examples at the fountain-head has become universal among all those who have any enthusiasm or ambition. The individuality of the artist, which is the special mark of English art, is stamped as strongly on our architecture as it is upon the sister art of painting, and I trust that we here shall always steer clear of any attempt to follow foreign systems in this respect. I heard only a short time ago the lively expressions of regret of a great German authority, that their Governmental system of teaching deprived them of the enviable independence and originality which struck him so much in our English system of architectural trainiog.

Let me now say a few words to those who at present do not see their way to joining the ranks of this Institute. They are of two classes,—the old and the young; of the former, it would be idle to shut our eyes to the fact that some very eminent names do not appear in the list of our members. Whatever the cause of their absence, I cannot say how much I regret it, and how heartily I wish it were possible to induce some, if not all, of them to give up their self-imposed isolation. I know that we see it asserted from time to time that this Institute concerns itself with nothing but questions of professional practice, professional etiquette, professional payments,—that its whole concern is with the professional as opposed to the artistic side of our necessarily two-sided life. Well, gentlemen, I can only say that from first to last I have spent a good deal of time at your meetings and at your council-table, and my experience is not quite so dreary as those statements would, if they were justified by facts, make it. But those who think that less than the right amount of interest and time is given to artistic questions should, by joining us, strengthen the hands of those,—among whom they may count me,—who more or less agree with them. No one is more loyal than I am in every respect to that Academy of the Fine Arts to which it is my fortune to belong. Were this Institute in the least degree hostile to it, I certainly should not have the honour of occupying this chair. But I hold that it is impossible for an instant to contend that all the artists in our profession are to rest quiescent outside because some half-dozen seats in that body are reserved for a few fortunate architects. It was a wise and noble act, when the Royal Academy was founded, to make its constitution what it was and to combine within its ranks representatives of all the arts. But our art requires much more than this, and I for one feel that we cannot too much interest ourselves in the work of this Institute, in order, above all things, that the position of our art as an art may more and more be recognised.

One of the aims of this Institute is to regulate,—as far as it tries to do so, and that is not very far,—professional practice by discipline, which, being suited for gentlemen, is suited for artists; and those who do not belong to us do most undoubtedly, whether they like it or allow it or not, reap advantages from our existence by their side. If the Institute were even remotely like a trade-union, then no appeal should come from me to these outside brethren. But knowing what its worth is, I do not choose to lose this opportunity of appealing to them to join us.

The younger class is very differently situated. That active body, the Architectural Association, is, in so many respects, working in a groove which runs parallel to our own, that I can never avoid feeling that some means might and ought to be devised for enabling its members to join us. I feel that there is so much that is admirable in their self-constituted system of education, in the energy with which they pursue their work, and in the high excellence of very much of it, that I rather grudge their securing all the energy of the young for an Institution with which we have nought to do. Surely some plan might be devised by which our juniors might, under their own government, be training themselves until they gradually fall into their places among us, instead of, as now, finding themselves obliged to belong to both Institutions where one should suffice. The young men ask for self-government; but I, who am no longer a young man, do not hesitate to say that this Institute suffers much and seriously by their practical abstinence from our meetings, our society, and our work. And if it were possible,—and it does not seem to me to be impossible,—I should, above all things, like to see their connexion with us established, together with full liberty of self-government as to all those educational arrangements which they at present appear to manage so admirably and to prize so much. I believe that few of us grow much better artists as we grow older. A man's best work is generally done between the age of twenty and forty, and we should all gain very much if our younger friends would occasionally read papers and join in discussions with us older men. What chance there may be of doing anything in this direction I know not; but nothing would give me more pleasure, during my time of office, than having to assist in any such fusion of the two bodies as may be found practicable.

There is again another class which might be more largely represented here, and this is the class of provincial architects. Some of our most distinguished members practise in the provinces, but the number of these who belong to us, compared to the total number of those who are really practising as architects in the country, is very small. I am well aware that the number of architects who could join us must be largely discounted; for among those whose names appear in directories are many who are architects only in name. But making every abatement in this way, I cannot but regret that no scheme has yet been successfully launched for creating local associations in connexion with this Institute, whose members should be bound by exactly the same by-laws, and who, either in towns or districts, should have the right of electing annually their own representative to sit on our council. It may be objected that if all my suggestions were feasible and were acted on, there would be no one left outside our ranks, and we should then inevitably attempt to make ourselves a close corporation. I do not fear this, or I should not make such proposals. The British public, depend upon it, will take good care that it can retain its liberty to employ whatever architect in its wisdom it prefers; and the occasional incursion upon us of an amateur, or of a sculptor or painter, seems to me to be likely to do much more good than harm to us and to our art.

I fear, gentlemen, that I am trespassing upon your kindness and patience; but I shall detain you now but a very short time, whilst I endeavour to gather up the suggestions which I have already made as to the work which lies before us, to be done somehow or other if this Institute is to do its duty by our art and by the world.

We have gone on far too long enduring the existence of bad building on all sides, shutting our eyes to it and declaring it to be none of ours and that we can accept none of the responsibility for it. Believe me, we are deluding ourselves. If the architects are now more numerous, more united, and so much more powerful than ever they were before, to what purpose is their power if it cannot persuade those who build so badly to build better? The fault, I fear, is with us. We hear architects of position plume themselves on being "practical" men; we see them indulge in so-called practical discussions, whilst they earnestly deplore the over-great attention which others would fain see bestowed on what they call merely artistic questions. So much is said about practice and practical matters that by degrees they cease to realise that the business they are pursuing ought primarily to be regarded as an art pure and simple, and thus looking first of all at the lower side of their art, they end by ignoring wholly the higher side. Do not mistake me. In our art the best artist is the most practical man. There is the highest art in the best disposition of a ground plan. There is equal art in the best construction applied to a scientifically-devised plan, and in the same way there is the highest art in so disposing the plan that the arrangement shall be convenient for the purpose and yet admit of well-balanced masses in the elevation, and well-arranged outlines and skylines. Beauty of detail is inferior in artistic importance to these qualities, but essential, of course, to a perfect work. I plead that, if we all in due order took this really practical view of the requirements of our art, all our buildings would begin by being well planned, would next be well and soundly built, with elevations meant to bear inspection wherever seen. There would be no sham fronts or false use of materials or deceits as to construction; and if our 900 architect members were all building in this way, depend upon it the day would not be far distant when good building would be so much the fashion, that the builder unassisted by an architect would not care to do such vile work as now he almost always aims at and succeeds in doing. The conclusion to which I have come after many years' experience is that the well and honestly-constructed building never excites contempt. We may regret that it has no style, but if it have the qualities just named it may be said to have the first elements of style in itself, and can dispense with anything adventitious. That fashions in art come and go, most of us have already seen evidence; but really good work is never out of fashion, whatever its style. One revolution we have seen accomplished under our very eyes. We have lived in the days of compo, we are now living in the age of brick. We have seen the world outside us converted from the use of a bad and mean material to that of a good and honest one; and I am sanguine enough to believe in the possibility of such a change in other respects as may make all building throughout England more tolerable because more honest and less vulgar than it now is. If I did not think this a matter which ought to be taken to heart by every one of us, I should not venture so frankly to state my strong opinions. I hope that I shall not find myself without very general support, and that in due time our own consistent determination never to build anything which is not solidly and well constructed with the best art we can bestow, will not only make men honour us for our work but anxious above all things consciously or unconsciously to build and work in the same way. Certain it is that, when we have accomplished this, we shall have just reached the point which every good school of architecture throughout the world seems to have reached long before its best period.

COMPETITIONS.

Fulham Infirmary.—Some of the Board, it is said in the neighbourhood, do not quite agree with the referee's selection:—1, "Experience," in circle; 2, "Simplicity"; 3, "M. D."; and propose to visit various infirmaries themselves, previously to the meeting which is to be held on the 22nd to consider thematter.

Proposed Markets, Kendal.—Mr. Eli Cox, architect, Kendal, was last week awarded the first premium in this competition.

The New Corn Exchange, Sheffield.—In addition to particulars given, we are asked to state that the large fire-resisting door for the muniment-room of his Grace the Duke of Norfolk, in this building, was supplied by Messrs. Chubb & Son.

CLEARING THE STREETS AND MANNING THE NAVY.

ENERGETIC men amongst the Middlesex Magistrates have been long urging the pressing necessity of measures to maintain the efficiency of the Royal and Mercantile Navy. It has been argued in the course of the discussion, for example, that to keep it up in a prepared and efficient state, and to avoid in a moment of emergency the having to man our merchant-ships with the refuse of seaport towns, or with foreign hirelings, depôts of trained and educated seamen are an absolute necessity. Captain Bedford Pim urged energetically, amongst other matter, in his "Training-Schools and Ships Bill" brought before Parliament in 1875-6-7-8 consecutively, the want of more inland and training schools than we at this moment possess.

The great question is, from what material are the training schools to be formed? and the answer seems ready to hand,—from children who have earned a right, from their father's services in various parts of the globe, to receive a free and liberal education; from good and honest boys desirous to enter the service from love of it; and from the thousands of waifs and strays that are growing up uncared for in our midst, and who threaten to become a very dangerous element of the community.

The great torrent of pauperism which is in far too large a proportion to the population of this realm, and more especially to that of London, ought to occupy the earnest attention of statesmen to stem and guide, if they cannot absolutely govern it,—men must live,—and if they cannot by fair, they will by foul, means. The object to be aimed at is to try and purify this stream of human life at its very source, ere it filters through our empire; to provide honest labour and useful professions for the thousands of unemployed hands, to fill our ranks with gallant soldiers and man our Navy with daring and trained seamen,—men who do not go to sea as a last plank against starvation, and who are as ignorant of the real "carpentry" of the profession as a school-girl, but those who adopt it from an honest love and pride in it.

But love and pride in a profession do not come in a moment with lightning flash. They must be nurtured, encouraged, and fostered in a boy. There are many intervening stages of drudgery and hard work ere the workman becomes worthy of his hire, and training-schools are beyond question the best means towards meeting this want; but in view of our vast unemployed juvenile population, more are required still. To-day it is of Feltham we would more especially speak, and point out how admirably, in respect of the *third class* of boys we have mentioned, the system of training-schools answers.

To trace step by step the cause from which the happy results there have sprung, is most interesting. The attention of the magistrates of the county of Middlesex was drawn, in 1850, to the crowded state of the prisons, and the shameful injustice of children of still tender years being incarcerated promiscuously for some trifling offence,—for which the horrible social miasma in which they had been reared had rendered them, if not legally, at least *morally irresponsible*,—being shut up with prisoners of the worst description, even sleeping side by side with them, thus inuring them to the lowest and most degraded view of human nature. These gentlemen having then succeeded in re-organising the prisons and classifying the prisoners, drew the interest and the attention of the public at large towards the establishment of County Industrial Schools for the reception of juvenile offenders. At first alone in their opinion, later on they had the public with them; and Mr. Antrobus (whose telling articles on the subject of the juvenile lower classes of London, written in the *Navy*, are as much to the point now as when published) brought forward, in conjunction with other earnest and philanthropic men, a motion at the Court of Quarter Sessions for the county of Middlesex in 1853, that a special committee should be appointed to consider the propriety of applying to Parliament for an Act to erect and maintain one or more County Industrial Schools for the reception and care of the juvenile offenders of the county of Middlesex, with power to communicate with her Majesty's Secretary of State for the Home Department. This motion was carried unanimously, forty-six magistrates being present; and in 1854 the Legislature passed the Middlesex Act, and at Feltham was established what has become one of the best managed and best organised schools in the kingdom. To the Middlesex magistrates, therefore, led by Mr. Antrobus, is due the honour of establishing the first,—and alas! as yet the only,—County Industrial School in the kingdom. Since 1854, 4,000 boys have been admitted within its walls.

How often has the question been asked,—"Why are British sailors so often deficient in the thrift, the sobriety, the discipline, the self-control, which education is intended to provide?" Because they have been under no parental (or the worst of parental) control; because they have lived in a contaminated atmosphere without a benevolent guide, subject to no control, subject to no good example; so they find discipline and order irksome, and are deficient in sobriety.

It is, then, the early education of the boy,—the removing him from injurious influences; the subjecting him to kindly but strict discipline, that must remedy this; and schools such as Feltham, or on the model of Feltham, seem to be the best calculated to do this. The establishment at Feltham consists of an area of ninety acres; the school was designed by Messrs. Banks & Barry, not for show or ornament, but for accommodation, cleanliness, and comfort. There are farms, dairies, workshops, and a full-rigged brig, homes for the subordinate masters, &c. Here, as Captain Brookes, R.M., the director, observes, they have discipline, order (kindly, if strict), and constant supervision; and they are taught every useful trade and occupation,—farm-work, the grooming of horses, gardening (and some of their vegetable produce might put trained gardeners to the blush), carpentry, bricklayers' work, every sort of agricultural work that will fit them for home labour or for emigration; they are taught instrumental music by qualified men who have been in regimental bands, and they can thus enter the army as band-boys. There is a vessel on the lines of a ten-gun brig, fitted up and rigged on the grounds, and seamen are engaged to teach the boys all the details necessary for following a sea-life; and, although an Industrial School, it was absolutely necessary that strict discipline should be maintained, so that, from the first, it became a semi-military and naval establishment.

Boats are provided on the river at Staines for the instruction of the boys in rowing and managing the same, and every boy before entering the boats is taught to swim.

It will be seen by the reports of the committee that 88 per cent. of the boys turn out well; and when Mr. Antrobus last distributed the prizes, he adverted with pardonable pride to many a gallant deed performed on land and sea by Feltham boys, whose names had even swelled the list of heroes, and had been recorded in despatches.

The establishment at Feltham differs from other institutions in that all boys in it need not have been juvenile offenders and committed for some petty offence. Instead of returning to a life of pauperism or crime, they are taken in hand, rescued, sheltered, fostered, and from apparently somewhat unpromising materials, good men and true are moulded, who look back in after years to the "old place," as they call it, with affection, and attribute their success in life to their training there.

We would pause for a moment and mention that on the day we assisted at Feltham, Sir Astley Cooper Key, First Naval Lord of the Admiralty, was distributing prizes to the successful candidates at the Royal Naval School at Greenwich. The Admiral reminded them that the boys who came there came not for their own merits, but for the services rendered by their fathers in every part of the globe. These boys start, then, on their career with a "fair wind and flowing tide," good antecedents and honourable lives to emulate and act up to. But how many other poor little fellows owe their first step in wrong-doing more to their evil surroundings than to themselves?

Nurtured in back alleys, in pestilential slums, surrounded by social plague spots, by the ever-festering sores of dirt, disease, and moral corruption, lying like Lazarus at the gate of Dives, appealing to be healed, living in that "inner life" of London, that world within a world (so ably depicted in those remarkable little books, entitled "London Shadows," "Town Swamps," &c., not unknown to readers of the *Builder*), these boys would have grown up worse than useless members of the community, a drain on the State, or would have helped to fill our prisons with hardened and despairing criminals, were it not for the exertions of men who make these noble institutions the work of a lifetime,—crucibles in which the gold is separated from the baser metal. Here in this pure and healthy atmosphere their little stinted frames develop into fine physical proportions, and the mind expands in the same healthy ratio as the body. Here, like bees in a hive, in this well-arranged little colony, they work together as one harmonious whole.

The swimming-baths at Feltham might be the envy of any gentleman's school in England; and under the vigilant yet kindly rule of the Governor, Captain Brookes, of their genial chaplain, Mr. Newton, and the excellent body of men who instruct them, they learn to love their happy and useful home. No boundary-walls are needed, for the case of a boy with a great "R" against his name has never been known!

The prize day itself began with a very interesting ceremony,—the confirmation of the boys by Bishop Claughton,—their dinner,—inspection on parade and inspection of the training-ship followed; and a prettier sight than the "making" and "shortening sail" on board the ship by these little blue-jackets, could hardly have been seen. Later on, when formed into a compact mass in the new gymnasium built by themselves, the young drum-major's staff being planted in front of them, and on which were inscribed the names of those who had won the yearly prize for good conduct, one by one the successful candidates received various valuable prizes from Mr. Antrobus and the gentlemen of the committee. Well might Captain Brookes exclaim as he gazed downwards on the sea of young upturned faces,—

"If you seek a monument, look around."

In the organisation of such a school as Feltham, the question how to provide men for the sister services seems partly answered. One of the clauses of Captain Bedford Pim's Bill was to establish more inland and county training-schools,—in fact, one in each county,—and to provide there the teaching of the rudiments of nautical matters, which can be learned as well on land as on sea, for boys who had committed *no* offence, and, thus to extend the benefits of this valuable system. We should thus be ready at any moment to meet cases of emergency whether in time of peace or of war, and to prevent our merchant-ships from being manned at the last moment of starting with the off-scourings of the port, or a large mixture of foreign seamen. We are told that half the crews of our mercantile ships are composed of Lascars, Russians, Germans, Greeks, and other foreigners, often incapable of working together or understanding an order given them.

In this age, when anything from a siege to a murder is forgotten in nine days, the loss of the *London* is probably forgotten also, but the words of one of the survivors point to the moral:—

"Work was always ahead, sailors continually at work; yet the ship was never 'snugged,' the crew had not got used to the ship: and another difficulty, many were foreigners and did not understand English. Mr. Angel directing a man to do something, the poor fellow was anxious to do it right; but every attempt was wrong; at last I discovered he did not understand a word that was said to him."

Later on he records Captain Martin's words to a few of the sailors who were opening brandy bottles, calling some by name, "Don't do that, boys,—don't die cowards!"

With a reserve depôt no ship need ever run the risk of being manned like this.

We do not see why, with such remarkable advantages as Feltham possesses, it should not come to be recorded that nearly cent. per cent. instead of 88 per cent. of the boys turn out well; and the fault must be, if we understand the subject rightly, that the boys are not left sufficiently long under the entire control of their *pro tem.* guardians, but can once more fall into the power of their parents before their tastes, ideas, and principles are sufficiently matured and strengthened to enable them to resist the low allurements which a life of non-control and vice may have for them.

The magistrates were desirous to have other and greater powers given to them than are contained in the Act; especially the power of detaining the children longer than three years, particularly those under the age of twelve, and the power of ultimately disposing of them independently of their parent or parents; they were, however, compelled to confine their application to the powers contained in the Act as the greatest the Legislature would grant.

This seems rather a grievous error; where

the parents fail, ought not the State to step in and become the parents of these worse than orphan children? In a higher sphere they would become wards in Chancery, to whom efficient guardians are assigned. Ought not these children to become wards of the nation? And when a body of excellent and honourable gentlemen of high position step forward and offer to become the guardians of these waifs and strays, it seems short-sighted policy for a Government not to help them in the good work, or to put unnecessary impediments in their way, especially as the Government have it always in their own hands to supervise these establishments, and see that discipline never degenerates into thraldom.

We are accustomed in these latter days to dip our pens in milk-and-water, and write on rose-leaves. One hesitates often before taking the trouble, like Samson, to shake the pillars of the temple of many a rotten old system, burying false idols in the rubbish, and to erect in their stead theories with larger vistas and more extended views. There ought to be members who have the power to advocate in the House such a Bill as we have alluded to. They would thus help more of these utterly helpless little ones, and advance some system that would prevent their sinking into the mire from which they have been drawn,—into a life, as Mr. Antrobus says, in which moral law is unknown, and where the detection of a crime is thought worse than the crime itself.

"Cases have been known where boys have never, or for two years at least, slept in a bed, or known a friend; and all that time had supported life by eating raw vegetables and cast-off meat in Newgate and other markets; or, owing to the abandoned and dissolute life of their parents, were so deficient in mental powers as to render it almost impossible to teach them."

And, speaking, of such children who but recalls the eloquent words of Dickens, uttered by the spectre in the "Haunted Man," as he points to the wild elf-child that has crawled from the streets and sought shelter in the haunted man's house:—

"Look," he says, pointing to it, "look! there is not one of these,—not one,— but sows a harvest that mankind must reap from every seed of evil. In this boy a field of ruin is grown that shall be gathered in and garnered up, and sown again in many places in the world, until regions are overspread with wickedness enough to raise the waters to another deluge. Open and unpunished murder in our streets would be less guilty in its daily toleration than one such spectacle as this. There is not a father by whose side, in his daily or his nightly walks, these creatures pass; there is not a mother among all the loving mothers in this land,—there is no one risen from the state of childhood,—but shall be responsible in his or her degree for this enormity. There is not a country on the earth on which it would not bring a curse. There is not a religion on earth it would not deny; there is no people on earth it would not put to shame. Behold, I say, in that child the fruits of man's indifference."

If, feeling this, and seeing some means towards remedying so dire a state of things, —and Mr. Antrobus assures us that the London street boy, brought up in the haunts of vice and living in a state of destitution is, when removed from their influence, as easily reclaimed as any other,—a Legislature refuses to help, is it not in some degree responsible before Heaven for such a state of things? Rather than let the children fall back into their old life, "it were better to put a mill-stone round their necks and drown them." To work for the good of all ought to be agreeable alike to Conservative, Liberal, or Radical. For whatever party spirit may be in the House, we must hope a true Englishman's desire is first his country's good.

The Training Schools and Ships Bill seems admirably calculated to help towards elucidating this vexed question, and if any one wishes to judge for himself how the system of a training-school will answer, let him visit Feltham, and see from the seed sown there what elements of good can spring; how from the living material the safest and the surest bulwarks of our realms can be constructed; he will see young men grown up there, who have been taught to uphold the dignity and respectability of the working man at home or in our colonies, or to "float our flag untarnished o'er a thousand seas"; men who may enable their commanders to reiterate the words of the immortal bard,—

"Come the three corners of the world in arms
And we shall shock them. Naught shall make us rue
If England to herself do but rest true."

CARLEON.

The Female School of Art.—The annual exhibition of students' drawings which have obtained the various medals and premiums offered will take place at 43, Queen-square, on this Friday, 18th, and Saturday, 19th.

STEEP INCLINES.

A CORRESPONDENT, signing "C. E.," demurs to our remark,—"A rise of 1 in 20 is the limit of ordinary engine-power, as all that a locomotive can do is to ascend such a gradient without any load." He says:—"Within ten miles of this place (Newport) there is a railway with a gradient of 1 in 20, several miles long, upon which passenger-trains and heavy goods-trains are daily worked by single locomotive engines; there is another line, eight miles long, the gradients of which vary from 1 in 28 to 1 in 39, worked daily by locomotives. I have myself worked gradients of 1 in 12 by locomotives, and loads of 50 to 100 tons including the engine."

Vol. lxii. of the "Minutes of Proceedings of the Institution of Civil Engineers," p. 388, gives a table of "Surmountable Gradients." This includes—

	Gradient.	
Eaghien and Montmorency Railway.	1 in 22	Steepest incline in Europe worked by ordinary engine.
Certain railways in America.	1 in 20	Limit of ordinary engine power.

The "Navigation Incline" of the Taff Vale Railway, sixteen miles from Cardiff, averaging 1 in 20 for half a mile, is worked by a six-wheeled coupled engine of thirty-six tons weight, which takes a regulated load of twenty-five tons. The co-efficient of adhesion was calculated as one-tenth.

On the Great Southern and Western Railway of Ireland a six-wheeled coupled locomotive, weighing thirty tons (20 per cent. less than the former engine), will draw a weight of 607 tons on a level at a speed of twenty-five miles an hour. The proportion for a thirty-six ton engine would be 728 tons, as against twenty-five on the "Navigation Incline."

An ordinary engine, weighing twenty tons, with twelve tons weight on the driving-wheels, and tender weighing fifteen tons, would have an adhesion of 1·2 ton, and a resistance, from gravity alone, on an incline of 1 in 20, of 1·7 ton. It would, therefore, *not* take up its tender, when the rails were slippery.

On the Fell Line over the Mont Cenis, the twenty-one-ton engine has been known to pull twenty-four tons up the incline of 1 in 12½ (in favourable weather), by the driving-wheels alone. But the cost was 9s. 8½d. per train mile, or 4·177d. per ton mile of train; above twenty times the average cost of working the railways of the United Kingdom.

PATENT RECORD.*

APPLICATIONS FOR LETTERS PATENT.

4,725. H. Skerrett, Birmingham. Flushing water-closets, &c. Oct. 28, 1881.

4,731. J. H. Johnson, London. Compositions for stone, wood, &c., to render the same impervious to air, water, &c. (Com. by G. O. Kramer & Co., Osnabrück, Prussia.) Oct. 28, 1881.

4,741. J. Thomas, Bangor. Chimney-pieces. Oct. 29, 1881.

4,745. R. T. Gillibrand, Darwen. Apparatus for heating water and consuming smoke, &c. Oct. 29, 1881.

4,787. J. Dunnachie, Glenboig. Stoves or heaters for apartments. Nov. 2, 1881.

4,795. G. W. von Nawrocki, Berlin. Kilns for burning bricks, &c. (Com. by E. Arnold, Fürstenwalde, Prussia.) Nov. 2, 1881.

4,796. G. H. Jennings and S. Jennings, Stangate. Lavatories and urinals. Nov. 2, 1881.

4,821. W. Jones, Manchester. Apparatus for measuring water and other fluids. Nov. 3, 1881.

NOTICES TO PROCEED

have been given by the following applicants, on the dates named.

Nov. 1, 1881.

2,820. H. Fabian, Erith. Floor-cramp. June 28, 1881.

2,845. T. Drake, Huddersfield. Apparatus for heating water, &c. June 29, 1881.

3,968. F. T. Bond, Gloucester. Appliances for heating water, &c. Sept. 14, 1881.

4,020. G. West, New Lenton. Smoke-consuming apparatus. Sept. 19, 1881.

Nov. 4, 1881.

2,920. W. W. Hewitt, Swanscombe. Screw apparatus for conveying cement from place to place. July 4, 1881.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending November 5, 1881.

1,138. W. P. Van Wyk, London. Ornamental blind.

To form a blind with a perfect framed border, it is made in two separate pieces of cloth, &c., one of which forms the body of the blind with stripes lengthwise at the two sides, whilst the other forms the border at the top and bottom by being sewn across the former piece. March 18th, 1881. Price 6d.

1,143. W. R. Comings, London. Door-locks.

Instead of the usual bent springs of irregular shape, a straight spring is used, which operates both the lever or tumbler and the latch. (*Pro. Pro.*) March 16th, 1881. Price 6d.

1,286. O. Wolff, Dresden. Warmth reservoirs.

A cylinder is partly filled with water, which is brought to boiling-point by a gas-jet underneath. A perforated mantle is placed over the cylinder. A vessel, filled with hyposulphite or acetate of soda, is melted in the boiling water, and then placed between the cylinder and the perforated mantle. This retains the heat for a lengthened period. (Com. by A. Nieske, Dresden.) March 23rd, 1881. Price 6d.

1,304. J. Rettie, London. Binding for scaffolding.

A chain is used, having a tongue at one end and a loop at the other. The tongue has rows of slots, and when the chain is passed round the poles, the loop is slipped over the tongue and a wedge inserted in one of the slots. March 23rd, 1881. Price 4d.

1,352. W. Heggott, Bradford. Apparatus for regulating fanlights.

A bracket is attached to the top or side bar of the frame, in which is a worm gearing into a worm-wheel, on the axis whereof is a deep grooved pulley, to which is attached a cord or chain, which regulates the fanlight. March 26, 1881. Price 4d.

1,366. F. W. Hagen and G. C. Akrigg, Kingston-upon-Hull. Trap for drains and sewers.

A well is formed below the grating, closed at the bottom, but with a side opening and curved syphon pipe to connect with the drain or sewer. An inner case is made of the same section as the well, with gratings all round or opposite to the side opening only, and with a handle at the top, so that it can be lifted out. All solid matters falling through the grating will remain in the inner case, while the liquid portion falls through the drain. March 28, 1881. Price 4d.

1,367. T. Wrigley, London. Construction of ceilings.

A number of discs, in shape the frustrum of a cone, are secured to the lathes, joists, or surface to which the plaster is to be fixed, the smaller surfaces of which, when secured by tacks, screws, &c., bed against the laths forming the foundation of the ceiling. (Com. by S. Müeller, Nürnberg, Germany.) March 28, 1881. Price 6d.

1,387. T. Bradford, London. Apparatus for riddling or sifting cinders.

In an outer box is hung on bearings an inner tray with a meshed wirework bottom. A vertical hand lever agitates the tray and sifts the cinders, the ashes falling through to the bottom of the outer box. March 29, 1881. Price 6d.

1,414. J. S. Rigby, Farnworth, and J. Mangnall, Manchester. Lead or other ductile pipes for water services.

The piping is made sectionally of an oval shape, and in the larger sizes a midfeather connects the flat sides in the direction of the minor axis of the oval. March 31, 1881. Price 2d.

1,420. J. Russell, Westminster. Glazing.

The sash-bar or rafter, grooved or rebated at the sides, is covered with lead in one piece in the width, formed with water gutters each side, and so arranged that the free edges can be folded down over the edges of the glass, and hold it in position without the use of putty. March 31, 1881. Price 6d.

1,429. J. Turner and J. Robertshaw, Manchester. Sanitary appliances and receptacles.

The sanitary pail has a perforated false bottom to allow and liquid to percolate through and fall on to the pail bottom, from whence it is drawn off. March 31, 1881. Price 8d.

1,434. H. Barron, London. Disinfectant and deodorising apparatus for water-closets.

A cistern for the disinfectant is arranged above the closet, from whence one pipe leads to the upper rim of the closet-pan, and another to the neck of the syphon under the pan valve. (*Pro. Pro.*) April 1, 1881. Price 2d.

1,440. B. Giles, Blackheath. Means for preventing the explosion of kitchen boilers, &c.

When the pressure in the boiler has reached its determined limit, the heated water is discharged by the rupture of a metallic covering to an opening made in the boiler. The cap of the opening is made of thin sheet copper, which presents to the water a convex face. The extra pressure will thrust this outwards, reversing the form and showing a concave face, which will rupture this sheet and allow the water to escape. April 1, 1881. Price 6d.

1,446. T. Kauffmann, Cologne. Venetian blinds.

Small chains are used with rings fixed thereto, to which are fitted pins to be fixed directly to the latter. The roller has two drums upon which the pulling-up cords, which are of flexible metal, are rolled up. A ratchet wheel forms a stopping arrangement and guides are used to expand the blind. April 1, 1881. Price 6d.

* Compiled by Hart & Co., patent agents, 29, New Bridge-street, E.C.

1,450. R. McDonald, Wishaw. Safety and alarm apparatus for kitchen boilers.

This is applicable to pressure kitchen boilers. When the water is circulating freely through the ascension pipe it presses a ball float up and keeps a valve leading to a whistle closed. But when the water is too low the ball sinks, opens the valve, and blows the whistle. (*Pro. Pro.*) April 2, 1881. Price 2d.

1,457. R. D. Reeves, Parkhurst. Ventilating apparatus.

This is an improvement on Patent No. 1080 of 1874 in forming the front plate with corrugations and openings through it. Opposite the inner ends of these openings are recessed chambers with corrugated sides. Between the back of these recessed chambers are other conical or inverted bell-shaped pieces also with corrugated surfaces, which are capable of movement so as to regulate the extent of the passage for air. April 2, 1881. Price 6d.

1,459. W. Baird, Dublin. High pressure ball-cocks and air-valves or air-inlet combined.

The water in the pipe holds the valve of the ball-cock in its seat when the cistern is full, but when the cock at the lower part of the house is closed and an intermediate cock opened, the valve is forced from its seat by the pressure of the air, and prevents thereby any freezing or bursting. (*Pro. Pro.*) April 2, 1881. Price 2d.

DECEIVING THE DISTRICT SURVEYOR.

A WARNING.

In a case which came before the Judge of the Lambeth County Court last week, the plaintiff, William Bilham, of Coldharbour-lane, Brixton, sued the defendant, Alfred Geard, of Linnell-road, Camberwell, a builder, for the sum of 9*l.* 17*s.* 8*d.* on a contract. The plaintiff stated that he had entered into a contract with the defendant to do the bricklayers' work of four houses in Shenley-road, Camberwell. The defendant had paid 96*l.* on account, leaving a balance of 4*l.* There were certain alterations in addition, charged for as "extras," which brought up the total to the sum claimed. Amongst these alterations was a charge of 2*l.* 1*s.* 6*d.* for bay-windows. The alterations were rendered necessary through an order from the district surveyor, the plaintiff admitting that he had endeavoured to elude the surveyor, at the suggestion of the defendant, by putting in 3 in. of brick instead of 4½ in.

At this point the Judge observed that the plaintiff could not recover this part of the account, because he had conspired with the defendant to act contrary to law.

Mr. Ody, who appeared for the plaintiff, said that practically the endeavour to deceive the district surveyor was the act of the defendant, when his Honour replied that it was the act of both. It was like his saying to a person, "I will give you 10*s.* if you knock my friend down," and that person then endeavouring to recover the amount. He did his best to elude the Act of Parliament, but failed; and he (the Judge) did not think he could recover. It would be a very bad principle if such claims were allowed.

Judgment for the defendant.

THE NEW WAR AND ADMIRALTY OFFICES.

It is announced that, after careful consideration, it has been determined to propose to Parliament the erection of the new buildings for the War Office and the Admiralty on the site of the present Admiralty, the Paymaster-General's Office, and the area now occupied by Spring-gardens, New-street, and Spring-gardens-terrace. On this site it will be possible to erect a block of buildings which will have a frontage to Whitehall from the Horse Guards to Messrs. Biddulph's Bank; its façade to the Horse Guards Parade will be on the line of the Admiralty garden wall; its west front will be upon the site of Spring Gardens-terrace and the end houses of New-street. This site will afford space for a block of buildings with three large and two smaller courts, giving 112,000 square feet of building space, which will be amply sufficient for the accommodation of the two offices. The War Office will adjoin the Horse Guards, which it is not proposed to interfere with, and the frontage to Whitehall will be divided equally between the War Office and the Admiralty. Official houses for the first Lord of the Admiralty and the First Naval Lord may be erected on the west side of Spring-gardens. The private garden in front of Spring Gardens-terrace and New-street will be added to the park.

London and Middlesex Archæological Society.—The opening meeting for the present session was held on Monday evening last. We defer our report until next week.

LANDLORDS' LIABILITIES AND DILAPIDATED HOUSES.

At the Lambeth County County, last week, Mr. Boyes, the tenant of a house in Brixton, was summoned by his landlord for the rent of a house which he occupied from the latter, and which he had left without notice. In answer to the demand, the defendant said he had left the house without notice because he had found it all to pieces. There was no water laid on, the door was a disgrace to the road, and the inside of the house was equally bad. He had written to the plaintiff, calling attention to its condition, and telling him that if it was not attended to within a week he should go elsewhere. The defendant did not attend to it, and he left accordingly. The plaintiff said sufficient time had not been given him to carry out the repairs, but the judge ruled that ample time had been given to the plaintiff to take notice of the defendant's complaint, and judgment would be in the defendant's favour, and he should also allow the defendant's costs, as he considered he had been treated in a very arbitrary way.

Other authorities have ruled differently from this in apparently similar cases. It is very desirable the law on the subject should be made clear.

CHRIST CHURCH, KENSINGTON.

The east window at this church has been slightly altered in the tracery, so as to afford better scope for the subject of the new painted glass. The idea represented is a less common one than usual, being Our Mortal Life, the Resurrection, and the Life Eternal through our Saviour. Commencing from below,—(1) the Teaching of our Lord; (2) Our Life, encompassed with Sorrow and Sin, calling for Resignation and Penitence; (3) the Resurrection of the Body, the Earth and Sea giving up the Dead on the sounding of the Last Trump; (4) the Kingdom of Heaven, as illustrated by our Lord; (5) the End of Time, as proclaimed by the Angel in the Book of Revelation. The cartoons are by Messrs. Weekes, and the remainder of the work by Messrs. A. L. Moore & Co., of Southampton-row. The glass is the gift of Miss Debnam, a member of the congregation. The choir vestry has been enlarged and a new clergy vestry added, Mr. Hockly, of Kensington, being the builder. The architect has been Mr. B. Edmund Ferrey. The new reredos was supplied from the establishment of Messrs. Jones & Willis.

THE AGE OF CLEOPATRA'S NEEDLE.

Sir,—I was somewhat astonished to read the following in an evening paper the other day:—

"*Cleopatra's Needle.*—All the additional art-decorations which have been in course of preparation in connexion with the obelisk on the Thames Embankment are now finished. The principal tablet, which faces the river front, has the following inscription:—

'Through the patriotic zeal of Erasmus Wilson, F.R.S., this obelisk was brought from Alexandria in an iron cylinder; it was abandoned in the Bay of Biscay, recovered, and erected on this spot by John Dixon, C.E., in the forty-second year of the reign of Queen Victoria.'

And on the west side will be the following:—

'This obelisk, quarried at Syeni, was erected at Heliopolis by the Pharaoh Thothmes III., *about* 500 *B.C.*'"

with other details of the ancient history of the relic.

Can this be authoritative?

Without any further observations, however, I will ask you to be good enough to quote two paragraphs from Sir Erasmus Wilson's interesting little pamphlet on "Our Egyptian Obelisk, Cleopatra's Needle," which must be familiar to all interested in the slightest degree in the history of that ancient and wonderful country whence this obelisk came:—

"Originally there were seven or more obelisks at On,* but of these only one single obelisk now remains, almost the sole surviving relic of that ancient city. The existing obelisk is the oldest in the world, having been erected upwards of 3,000 years before the Christian era, and consequently nearly 5,000 years before the present time. Four of the remaining obelisks were set up by Thothmes III. and his family, *more than* 1,600 *years before the birth of Christ*, and, therefore, about 3,500 years from the period. Two of these four were called Pharaoh's Needles, and now serve to decorate the cities of Constantinople and Rome; while the other two were transferred to Alexandria to become celebrated as Cleopatra's Needles.

Cleopatra's Needles, whilst at On, stood in front of the temple wherein Moses received his education, where he made himself proficient in Egyptian philosophy, and where his mind became fortified for the great work he was afterwards destined to accomplish, the liberation of his fellow-countrymen from the harsh dominion of the Pharaohs, and the exodus of the Hebrews from the land of Egypt. Rameses the Great,* *one of the heroes of our obelisk*, has the reputation of having been the oppressor of the Jews, his great undertakings, no doubt, contributing largely to that result, whilst Menephtah, his successor, was the acknowledged Pharaoh of the Exodus."

The italics in all cases are mine. Why, may I ask, should the principal tablet on the base of Cleopatra's Needle face the river front?

H. H. Bridgman.

*** Since this letter was in type, the *Daily News* (for Thursday, the 17th) has published an account of what is being done. According to that journal, while the text of the first inscription, as above quoted, is substantially though not verbally accurate, the date mentioned in the second inscription (of which only a portion is quoted above) is "*about* 1500 *B.C.*," not 500 B.C.

* Heliopolis of the Greeks.

SIR CHRISTOPHER WREN.

Sir,—It may be interesting at this time, when the life of Sir Christopher Wren by Miss Phillimore is just published, to state that some letters of Bishop Matthew Wren (uncle of the great architect) exist in Lambeth Palace Library. In the picture-gallery hangs a small full-length portrait of Dr. Wren, Dean of Windsor, similar to the print in the "Parentalia." Another MS. of much value is entitled "An Account of the Re-building the Cathedral Church of St. Paul, from September, 1666, to September, 1700. Connected with this subject are the notes of John Evelyn, who visited Archbishop Sancroft in 1682; he was accompanied by Sir Christopher, and brought for the Primate's approval "a plot and designe of the college to be built at Chelsey." In 1684, the diarist went with the great architect "to Dr. Tenison, when we made the drawing and estimate of the expense of the library to be begun this next spring near the Mews." This refers to Archbishop Tenison's library, which was standing until 1860 in St. Martin's-in-the-Fields, when the contents were sold by auction.

The magnificent roof of this great hall (Juxon's) is said to be the work of Wren, and there are other indications of his skill here. I wish to express the liberality with which the Primate has not only extended the hours of study at this library, but approved of the loans of books in the adjacent parishes, and to the clergy and laity in the diocese of Canterbury.

S. Wayland Kershaw, M.A.

Lambeth Palace Library.

CLEANING CISTERNS.

Sir,—Is there any clause in the Metropolis Water Act, 1871, or any regulation that can be enforced against me for having a plug in the bottom of my cistern for the purpose of running the water off, so that I may clean it out that way instead of drawing it off at the sink? I have an overflow-pipe, or warning-pipe, near the top, which is easily seen from a window without going outside. The old standing waste-pipe is bossed over and soldered on the top, and is now simply a plug to run the water out, certainly into the drain as before, but no foul air can rise into the cistern, or any water go down unless the plug is lifted. The water inspector, or whatever he is called, objects to this, and has served notice to take it out and solder over the hole. If this regulation is carried out, good-bye to clean cisterns, at least, in the poorer neighbourhoods. I myself have very recently seen some with 1 in. to 2 in. of mud at the bottoms, even where easily got at.

Alfred Lawrence.

COMPETITION FOR BOARD-SCHOOLS IN BARROW-IN-FURNESS AND ROOSE.

Sir,—About fifteen sets of designs were sent in for the above schools. At the first meeting of the Board to decide, the plans of Mr. Holtom, of Dawsbury, were selected for the Barrow schools, and Mr. Eli Cox's, of Kendal, for those at Roose. At a subsequent meeting the Board could not agree, so they were referred to Sir James Ramsden, and he gave the final award in both cases to the first named gentleman. It seems a strange way to select plans at one meeting and send for the architect to meet the Board, and then at another meeting to undo the thing again.

A. B.

The Coming Electric Exhibition at the Crystal Palace.—The authorities of the Crystal Palace sent out on Saturday last the allotments of space to the principal exhibitors of electric lighting appliances at the forthcoming exhibition. If the electric lighting companies and firms carry out their promises and intentions, the Palace will be lighted from the London, Brighton, and South Coast Railway Station to the north end.

* Rameses II.

FALL OF A HOUSE.

About six o'clock last Saturday evening the foundation of the outer party wall of the end building of a block of five or six houses and shops now being erected by Mr. James Whitaker at the corner of Clifton-road and Maida-vale gave way, bringing down the front and back walls also. The buildings,—ready to be roofed in,—are built of sound stock brick. The mortar, —mill-made,—seemed fairly hard in joints, but the ground is treacherous clay; moreover, the concrete under the walls had not hardened. Some suppose that there must be an old cesspool or drain under or near the new wall (an old house having previously occupied the site), for the front part of the party-wall has sunk down with a regular incline very considerably, and pulled away from the back part. There must have been a sudden collapse, for the wall,—18 in. thick in basement,—could scarcely have been gradually sinking to such an extent without being observed in time to shore up. An investigation should be made as to the cause: none of the other houses,—at the time of our visit,—appeared to be affected.

Since the above was written, and just as we go to press, we have received a copy of a report made by Professor T. Roger Smith, who, at the request of Mr. Whitaker, has made a survey of the property. In his report, which we cannot print *in extenso*, Professor Smith, after showing that there is nothing, either in the structure of the building or the nature of the materials, to account for the calamity, says,—

"A kind of dumb-well appears to have been formed to receive surface-water, and a tie-drain was taken from it to the drain in the street. The mouth of this drain is 5 ft. from the angle of the party and front walls, and 15 in. below the bottom of the concrete. This I saw exposed, and all the space round it for some distance is now a mass of very soft wet clay, and the clay round the footings of the party wall, when cut into, is found soft, and allows moisture to escape. There can be hardly any doubt that the surface-water making its way into this drain at so short a distance from the angle which has failed, and at so low a level, must have actually passed under the foundations of the wall, and have occasioned part of the clay below the foundations to slide on what lies below it. It is probable that a sudden slip of this sort took place, followed by the speedy subsidence of the wall and of the front and back walls connected to it; and that this is the reason of the suddenness of the accident."

Miscellanea.

The Surveyors' Institution.—A crowded audience assembled in the hall of this Institution on Monday evening to hear the opening address of the president, Mr. Edward Ryde. There was a very large number of applications for admission to the fellowship. The occasion was one of special interest, being the first meeting of the institution since its incorporation by royal charter. The President referred in terms of congratulation to the prosperous condition of the institution, which has now become the accredited representative of the profession; and afterwards called special attention to the clauses of the charter which provide for the examination of all classes of members admitted after certain dates. We hope to return to the address.

The Competition for the "Meade Memorial" at Philadelphia, U.S.A., is just concluded. The first prize has been awarded to W. Alex. Milne Calder,—who is at present executing the commission for the groups of sculpture upon the new public buildings in that city. In the model, General Meade is shown sitting easily upon a magnificent charger attentively watching the battle. Mr. Calder, who is a native of Aberdeen, and has been in the States some fourteen years,—receives one thousand dollars premium.

The Smoke Abatement Exhibition at South Kensington will be opened by the Lord Mayor. We are told that the east and west arcades, and the pavilions and quadrants around the Royal Horticultural Gardens, South Kensington, instead of affording a space which it was at first supposed would be but scantily filled, are found to be barely sufficient for those exhibits the executive committee have decided on admitting.

The Clarkson Memorial, Wisbech, was unveiled on the 11th inst., by the Right Hon. the Speaker. The memorial, which has cost about 2,000*l.*, has been erected by Messrs. Farmer & Brindley, from designs of the late Sir Gilbert Scott. We gave a view of it six years ago (see *Builder*, vol. xxxiii., p. 909).

Edinburgh Architectural Association. At the opening meeting of the Edinburgh Architectural Association, the president, Mr. John M'Lachlan, gave the inaugural address, the subject being "Notes on some Old Edinburgh Architects." He said they lived in a city of unsurpassed beauty, a beauty attributable in a great measure to its unequalled natural position, but due also in no small degree to the great beauty of many of its buildings. It was a matter of regret that, although the city owed a deep debt of gratitude to her architects, their names and memories had been treated with scanty regard. He had experienced the greatest difficulty in getting material for his address about architects who lived even so recently as within the last thirty or forty years. Mr. M'Lachlan then gave some very interesting notes on the local architects who flourished in Edinburgh since the commencement of the building of the New Town, and mentioned some of their chief designs in the city and elsewhere. Several designs by some of these architects were exhibited and greatly admired, and on the conclusion of the address the president received a vote of thanks. At the meeting of the association, held on the 16th inst., a paper on "The Building Stones of Scotland" (with specimens) was contributed by Councillor Gowans.

Illegal Building.—At Highgate, Thomas Watkin Smith, builder, of Hamilton-road, Finchley, appeared before Messrs. Bodkin, Bayley, Homan, and Minto, to answer two summonses taken out by order of the Finchley Local Board of Health, and charging him with not having used bars of wrought iron in the openings of the chimneys at six houses erected by him in Hamilton-road, Finchley, and with not having the chimney-breasts tied in with bars of wrought iron; the other summons charged him with placing timber or woodwork in these chimney-breasts. Mr. Stevens read a report from Mr. Brooking, the Board's surveyor, stating that since the adjournment he had examined the chimneys at one of the houses, and found that a piece of iron had been inserted at one of the openings, but the wooden bar had not been removed. Mr. Stevens asked for a substantial penalty to be imposed, otherwise it paid builders to run the risk. The Bench imposed a penalty of 5*l.* and costs on each of the two summonses, making a total of 14*l.* 14*s.*, and, in consequence of the attempted fraud, refused to allow defendant time for payment, a month's imprisonment in default being ordered in each case, the terms to be consecutive.

Messrs. Alfred Reed and Corney Grain, having completed their fifth year of joint management of their popular entertainment, have renewed their tenancy of St. George's Hall, Langham-place, for a term of years. Several improvements have been made during the autumn recess; the stage has been rebuilt and considerably lowered, a green-room built for the artists, and the general arrangements both before and behind the scenes have been materially improved. On Monday night, November 21st, will be revived the successful operetta, "Ages Ago," written by Mr. W. S. Gilbert, and composed by Mr. Frederick Clay, who has re-written portions of the music. This will be followed by an entirely new musical sketch, by Mr. Corney Grain, entitled "Out of Town."

The Clapton Orphan Asylum Building.—"General Booth," of the "Salvation Army," has secured this large building for 15,000*l.*, which will be accepted by the owner in fifteen annual instalments of 1,000*l.* The building will probably take nearly another 1,000*l.* for necessary repairs, alterations, and other work before it is fitted for its new purposes.

The Aquarium.—A series of grand international vocal and instrumental concerts has been commenced, under the conductorship of Sir Julius Benedict. A special feature at these series concerts will be the appearance of some of the best military bands from the Continent, and patriotic songs by 250 performers.

The New Tay Bridge.—The contract for the erection of the Tay Bridge has been given to Messrs. Arrol & Co., of Glasgaw. Mr. Arrol arrived in Dundee on Wednesday, and was engaged with Mr. Barlow, C.E., selecting sites for the erection of workshops, &c. Messrs. Arrol are also the contractors for the Forth Bridge undertaking.

The New Meat Markets at St. Helier's, Jersey, are now rapidly approaching completion. The roofs are glazed by Mr. Helliwell, of Brighouse, Yorkshire, on his patent imperishable perfection system of glazing without putty.

"The Glow" Stove is an open slow-combustion grate, recently patented by Messrs. Everitt & Barnard. It will be exhibited at the Smoke Abatement Exhibition, to be held at the South Kensington Museum this month. The bottom, as in all slow-combustion stoves, is closed in; below this, in the front, are a number of holes carrying a draught of air beneath and parallel with the surface on which the coal rests. These openings are connected with an air-chamber at the back of the grate, which chamber has an outlet immediately over the fuel. A "baffle" of fire-brick, reaching the front, and about 1 in. above the openings of the air-chamber, extends the full width of the stove, springing from the back at an angle of about 60°. The objects of this "baffle," which becomes red hot, are to form a combustion chamber in which smoke is consumed, to accumulate the heat, which would otherwise escape up the chimney, and to throw the accumulated heat into the room.

A Steeple Jack in Elsecar.—A piece of skilful work was done at the parish church here on Friday in last week, by Mr. Joseph Ball, the well-known steeple-jack, of Oldham. The spire, built in 1843, has been found to be out of repair, and the matter being placed in the hands of Mr. Ball, he commenced operations in the afternoon by erecting eight ladders, connected together, one at a time, as he rose from the churchyard to the weather-vane at the top of the spire, the time occupied from start to finish being only two hours and a half. After Mr. Ball's examination and report a new lightning-conductor is to be erected, and the spire restored by him.

Magdalen Bridge.—The proposal of the Oxford Local Board to rebuild and widen Magdalen Bridge is received with dismay, and no wonder it is so, by all lovers of one of our most beautiful and historical cities. The committee of the Society for the Protection of Ancient Buildings is preparing for signature a memorial to be presented to the Board protesting against the threatened defacement of this beautiful structure, believing, as it does, from the personal knowledge of several of its members, that the exigencies of traffic do not at present necessitate the re-building of the bridge.

Public Buildings for Leamington.—The Leamington Town Council have decided to apply to Parliament for an Act to confer powers for the making and collecting of rates and the creation of funds on mortgage or debenture bonds for the erection and maintenance of a new town-hall, public library, museum, school of art, and assembly-rooms. It is estimated that the proposed new buildings will cost 30,000*l.*

Theatrical.—It may be interesting to some of our readers to hear that Miss Ethel Pierson (Mrs. F. E. Randell) was last week presented with a handsome bracelet by the members of Mr. D'Oyley Carte's "Pinafore and Sorcerer" Opera Company, with which she was associated as *prima donna* for nearly three years. The bracelet is a massive gold one, and bears a flattering inscription. The name Randell (and Saunders) is well known to our readers.

Society of Arts.—The opening meeting of the session 1881-82 was held on Wednesday evening, when Sir Frederick Bramwell, F.R.S., chairman of the Council, delivered an address treating of a number of very important subjects, to which we may be able to refer hereafter. This week we have received enough matter in the shape of papers read at meetings to fill the whole of our columns.

Drawing in Board Schools.—The annual exhibition of drawings by scholars and pupil teachers in the schools of the School Board for London is being held during this week at the Saffron-hill School, Cross-street, Farringdon-road (near the Metropolitan Railway Station). The exhibition is open from 10 a.m. till 9.30 p.m. each day, and will finally close this (Saturday) evening.

The Committee of the Spanish Colonial Exhibition have selected the plan of Señor Latorriente, a Madrid architect, for the exhibition building, which is to be finished by January 1884. The exhibition is to be held in May of the same year. Belgium has secured the contract for the ironwork.

Northern Architectural Association.—Mr. John Tillman, F.R.I.B.A., of Sunderland, was on Tuesday last elected President of the Northern Architectural Association for the ensuing year.

New River Shares.—At the Auction Mart, on Wednesday, Messrs. Edwin Fox & Bousfield sold parts of a king's share in the New River at prices ranging from 94,000*l.* to 97,000*l.* per share. The income on each share last year was 2,400*l.* They also sold ten new 100*l.* shares (fully paid) at from 383*l.* to 394*l.* per share, the dividend being at the rate of 11*l.* 12*s.* 10*d.* per share, and ten annuities of 2*l.* 10*s.*, at 70*l.* each.

His Majesty Oscar II., King of Sweden and Norway, has been pleased to confer upon Mr. Josiah Griffin, secretary of the Surrey Commercial Dock Company, the Knighthood of the Order of Wasa, and the insignia of the Order have been conveyed to him by Count Piper, the Swedish Minister at our court.

Interlocking Bricks.—Mr. J. Pitt Bayly, architect, claims to have invented a new brick, that renders structures erected of them "gale proof," and also proof against the greatest possible strain; each brick is locked one into the other.

Masonry. — "The Cosmopolitan Masonic Calendar for 1882" (Geo. Kenning) gives lists of the lodges all over the world, and shows the wonderful extent of the craft at the present moment.

TENDERS

For the erection of the Queen Anne tavern, Crown-road, Fulham, for Mr. A. J. Christey. Messrs. Wm. G. Habershon & Fawckner, architects:—

We should not advise an architect however, to contest the matter at law unless such notice had been given).—C. H. C. (if a ladder be lengthened by uniting another to it, the can scarcely be described as two ladders).—Clerk of Works (next week).—Tewkesbury Abbey (next week).—Eastbourne (next week).

All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication

We are compelled to decline pointing out books and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under ..... 4s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

Terms for series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under ..... 2s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

REPLIES TO ADVERTISEMENTS,

Addressed Box —, Office of "The Builder,"

Cannot be forwarded, but must in all cases be called for, and the Office Receipt produced.

THE CHARGE FOR A BOX IS AS UNDER:—

For "Situations Wanted" Advertisements ..... 3d. per Week.
For all other Advertisements ..... 6d. per Week

PREPAYMENT IS ABSOLUTELY NECESSARY.

. Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, King-street, Covent-garden, W.C. to

DOUGLAS FOURDRINIER, Publisher,
Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied *direct* from the Office to residents in any part of the United Kingdom at the rate of 18s. per annum, *prepaid*. Remittances payable to DOUGLAS FOURDRINIER, Publisher, 46, Catherine-street, W.C.

New Admiralty and War-Office Buildings.

FEW persons will be likely to dispute the propriety of the resolve, which, in a very straightforward manner, has been announced by the Government, no longer to allow our great Ministries of War and of Marine to seek shelter for their official staff in a series of private houses, wholly unfitted for the orderly transaction of the business of these important departments. The only possible objection at which the official circular hints, that of cost, if properly looked at, applies, not to the new buildings, but to the maintenance of the present makeshift. Costly, indeed, has that proved to be in more ways than one. Irritating as is the loss of time occasioned by such an imperfect distribution of clerks and heads of departments; hostile to the orderly, and thus to the efficient and economical, transaction of business as it has been long admitted to be, we have paid yet a heavier tax for our neglect. We need not here recall the names of those whose loss has been lamented in our own columns,—public servants not easily to be replaced, who have sunk victims to the unsanitary condition of the substitutes for ministerial buildings. And we have a word or two to say as to the primary caution against the perpetuation of this evil in the new building.

Nor is it with regard to the sanitary provisions for the new building alone that we see some ground for anxiety. We confess to certain qualms that are raised by one expression in the circular issued by the First Commissioner of Works,—which, to the lay or non-architectural reader, may seem only to point out an obvious requisite. So obvious, indeed, to the architect is the principle that plan should regulate, rather than depend on, elevation, that to dwell too much on the fact seems rather to intimate that architecture is regarded, not as a structural, but as a decorative art, and that it is one thing to arrange a building with due regard for its proper purposes, and another to adorn it with an *appliqué* façade. It is unnecessary to insist, in speaking to our own readers, on the mischief that cannot fail to arise from such a thorough misconception of the functions of the architect. Nothing can more surely lead to what we may call pictorial failure, than the idea that "architectural features," and "interior arrangements," may be independent of, or hostile to, one another. "It is intended," says the official circular, "that the architectural features of the new building shall be subordinate to its main purpose of a great public office, and not the determining cause of its interior arrangements; but the frontage to Whitehall, and that looking up the Mall, will afford opportunities for well-proportioned and handsome façades."

The hesitation that we express as to this sentence is not owing to any idea that plan should be sacrificed to elevation. Nothing can, indeed, be more truly unarchitectural. To place a triumphal arch, or some equally useless bit of work, as a central feature, and to allow the business arrangements of the place to sneak as best they may around the base of such a monumental centre, would be a piece of folly, not perhaps without precedent, but against which we trust that it is really unnecessary in the present day to protest. But the point on which we insist is, that the "interior arrangements" of a great public office are, if properly designed and carried out, eminently "architectural features." It is from the adequate design and fitness of such features for the main purposes of great public offices that the true organisation of the whole edifice must grow. "Well-proportioned and handsome façades" are not to be stuck on a pile of offices as something independent, as mere decoration, employed like a coat of paint or of stucco. If the façades do not find their motive in proper interior arrangements they will be nothing but shams, and, therefore, nothing but failures. What is wanted, and what the nation and the age demand, is, not a nest of rooms with here and there a façade stuck on, but a fitting and noble building, a whole and complete work, well designed, both as respects accommodation and appearance.

The first point to inquire into is, What are the main requisites for such a public building as on the Continent would be called by some name equivalent to the English word "Ministry"? Of these we have abundant examples in Paris, Vienna, Naples, St. Petersburg, and other Continental cities. And in face of that prevailing misconception of the true nature of architecture as to which the Ministerial circular only too truly represents the general tone of lay feeling among us, it might be useful to obtain plans and elevations of such of these buildings as best answer their business ends, as well as best fulfil their architectural requirements, in the various European capitals; and to exhibit them in some convenient locality when the matter is brought before Parliament. There would then be some chance that the debates which are sure to occur will not be wholly ignorant and purposeless.

The leading requisite of the buildings, we venture to suggest, will be the collocation under the same roof of a sufficient number of distinct apartments to provide for the whole staff of what, in other countries, would be called the Ministries of War and of Marine. There is no reason, of which we are aware, for any great variety in the size and distribution of these rooms. Interior courts, as mentioned in the circular, will be necessary for the purposes of lighting and ventilation. This will involve the construction of one or more *portoni*, or carriage-entrances, which will naturally form central features in the façades, relieving the otherwise too great repetition of the numerous windows by their deep shadow. Bold and rich decorative features may well adorn such principal entrances; and a great staircase, or pair of staircases, will also afford occasion for the display of a true architectural taste.

One difficulty, as far as our experience goes, in the distribution of the buildings, is that of lighting the corridors. Not only on account of the value of the site, but for the sake of official convenience, the buildings will have to be in three or more stories. The lighting of the corridors will thus be impracticable in the best mode,—that is to say, by skylights, except in the top story. End windows, no doubt, will be introduced; but the light thus obtained is both feeble and dazzling to the eye in a long corridor; and the use of borrowed light from the rooms on either side, which always gives a gloomy and prison-like effect in London, in certain states of the atmosphere, can only make darkness visible. The expedient of artificial light during the day, which has been adopted in one very ugly but very commodious Ministry in Italy with which we are familiar, is objectionable on many grounds. Considering the revolution now in progress in the practice of illumination, especially as illustrated in those American cities to which we recently called attention, it may be hoped that the danger and evil odour which are too apt to attend on the introduction of gas may be avoided in the new buildings.

The elevation of the Palace at Stockholm (apart from the arrangement of the approaches, which would be inappropriate to the London site), is one to which we call attention as likely to suggest, at all events, very useful hints for the design of the new Ministries. In the simplicity and grandeur of the whole design, in the opinion of very competent judges, this building stands unrivalled among the palaces of Europe, with the single exception of the Palazzo Farnese at Rome; and in some respects its proportions are even better than those of the latter edifice. And it has especially to be borne in mind that Nicolas de Tessin, who built this palace for King Charles XII., was here unusually happy in the adaptation of architectural forms to a Northern climate. In the garden front and in the cortile of the Farnese Palace, in the arcade of the Barberini Palace, another Roman example, in the elevation of the Chiericate Palace at Vicenza, in the proportions of the Doria Palace at Genoa, in the wings of the Durazzo Palace, in the same city, and in not a few other noble Italian examples, the adaptation of the building to a Southern climate is so evident, as to render the reproduction of any similar elevation in London simply ridiculous. The Palace at Caserta would be less liable to this objection. But in this the basement story is so evidently sacrificed to the grandeur of the *piano nobile*, or first-floor, as to be hardly appropriate for our habits. Still, Caserta is a

very noble building, and is an example of the effect of mass and of repetition rather than of richness of detail, in producing the impression of grandeur. But the Ionic pilasters at Caserta give unreality to the elevation. The Glyptothek at Munich, the Ruhmes Halle, near Munich, the Museum at Berlin, and we may, perhaps, add the Town-hall, Antwerp, are examples of those styles of building which (whatever may be their excellence in the localities and for the objects cited), it becomes the London builder carefully to eschew.

The area covered by the Stockholm Palace is about 144,000 square feet, of which nearly half is open court. For the Whitehall buildings 112,000 ft. of building space are mentioned by the Circular as afforded by the area.

Of course we want no reproduction. We point to these structures as examples that at once occur, worthy to be considered by those architects who will be called upon or invited to submit designs for the new buildings.

We make, with all reserve, another suggestion. Shelter for carriages is now a necessity for any great London building. It has been recently attained, in some instances, as is the approach to the Paddington Station, by a glass roof, which, however comfortable, can hardly be regarded as ornamental. Too much space would be lost at Whitehall by the introduction of an outer court, such as that now existing at the Admiralty; and, as before hinted, a *portone*, giving access to the central court, will no doubt be adopted in the new building. We do not see why the whole central court should not be protected by a glass roof, raised high enough above the roofs of the sides of the quadrangle to allow of free ventilation, and of the admission of some pure light, yet adequate to keep the inner court from being drenched. And in case of the adoption of this convenience, which it was not within the power of the great French and Italian architects to command, it is at least worth consideration how far the same shelter might be utilised for overcoming the difficulty before mentioned as to lighting the corridors.

The main buildings, no doubt, will contain two apartments in width. The difficulty is as to lighting the corridor, if placed in the midst. There are yet, we fancy, extant, picturesque examples of the manner in which this difficulty was overcome in Old London, to be found in some of the inns in Bishopsgate-street. The mode is not unfamiliar in the south of Europe. We remember examples at Avignon. It might be worth while, at all events, to try upon paper how far the requisite conditions of access, shelter, and light might be secured by internal galleries, open on the courtyard, only supported by such structures as would be necessary for solidity, reached by external staircases, under the same shelter, and giving access to one set of rooms, which would be lighted from the side of the gallery, while the second set would be lighted from the external wall. That the inner row would form ante-chambers, giving access to the outer rooms, would in most cases be rather convenient than otherwise; and in the case of the rooms of the Minister, the Commander-in-Chief, or the heads of departments, a separate entrance could be easily arranged, either by short corridors opening on the gallery, or even by private staircases. As to this, it is to be understood we are not speaking further than to suggest the idea to the consideration of the architect.

On one point, however, we speak without any reserve. It is one to which we have on former occasions called attention; and as to which, if due attention is not now given to the matter, we venture to say that the concentration of the occupants of the thirty-eight houses now filled with the officials of the War Office and the Admiralty will only be a concentration of ill-health. We refer, of course, to the sewerage of the area on which the new offices are to be erected. We urge all those who are responsible for, or who take an interest in, the health of our officials in these great departments, to consult the twenty-fourth volume of the Minutes of Proceedings of the Institution of Civil Engineers. At page 280 they will find a paper on the main drainage of London, which was read by Mr. (now Sir) J. W. Bazalgette to the Institution on March 14th, 1865. On plate 17, which illustrates this paper, they will find a section of the Thames Embankment, showing the sewer miscalled the "low-level sewer," which drains, or rather does not drain, the site of the new buildings. The centre line of this sewer is only 13 ft. 6 in. below the high-water line, and is consequently from 7 ft. to 10 ft. above the low-water level at which the ancient sewers of Westminster made their escape into the river. The consequence of this most disastrous choice of level has been the penning back of an unknown amount of damp, wet, and old,—if not recent,—sewage over the whole area between the Thames and the Park. To this, to a considerable extent, the unsanitary state of the present Government offices can be traced; and to this, unless the matter be at once looked in the face, will the future ill-health of the occupants of the new buildings be attributable. Near Chelsea Hospital, as will be seen on the plan accompanying the paper in question, is a lift, which raises the sewage of an area of about eleven square miles to a height of 17 ft. 6 in. It is this very lift which is fatal to the salubrity of the most important district of London. At Marlborough House the difficulty has been met, we believe, by a special lifting apparatus. It is not for us to decide how it should be met in the case of the Admiralty and War Office. But we give fair warning to all concerned that if the new buildings are erected without looking this terrible evil in the face, they will prove nests of enteric fever. From Charing-cross, under the Mall, and down Grosvenor-road, to the sewer below the lift,—below, that is to say, in level,—measures a couple of miles on the map. Whether the really "low level" sewer would be able to take that fresh contribution to its contents we are, of course, unable to say. But unless by this or by other means a true low-level drainage be now substituted for that which exists in this part of Westminster, it needs no prophet to foretell evil, rather than good, from any concentration of the officers of the Government under the same roof.

We trust that the matter will be taken up in a becoming spirit, free either from crotchet, from party feeling, or, above all, from ignorant optimism. Of points of style and taste we are unwilling to speak. It will generally be held that the character of the Whitehall Banqueting-house must necessarily to a great extent limit the choice of the architect. But on the two distinct points,—first, that we require a complete building, not a parcel of rooms with a façade or two stuck on; and secondly, that sanitary safety of the foundation ought to precede building,—we feel that it is impossible to insist too strongly. We sincerely trust that all those minor points on which great differences of opinion are likely to arise will be kept in abeyance until the propriety of attending to these two primary requisites is fully admitted, and not only so, but practically carried into effect.

THE PROFESSION AND THE PRESS.

The address of the President of the Royal Institute of British Architects, reported in our pages, has awakened in the daily press what may be called a series of Irish echoes. A speaker occupying the position of the President has the advantage of both a scientific and a practical knowledge of the subject with which he deals, which he is by no means called upon to advertise or to magnify, but which forms the very atmosphere of his thought. The writer in the daily press, devoid of this special information, and very probably destitute of any special scientific or practical training of any kind, is at an unusual disadvantage when he takes upon him to comment on the language of one of the leaders of any liberal profession. The journalist may feel,—as we all do,—the pressure of much that is inconvenient, much that is to be lamented. But he is unaware either of what has been done, of what is doing, or of what it is practicable and desirable to do in the way of amendment. Thus his column of leaded type is little more, very often, than a sort of school-boy essay, in which there may be what is true, and even what is brilliant, but of which the outcome, if full of "sound and fury," none the less "signifies nothing."

Thus such a statement as that "at no period, it may be safely asserted, was the average English house less well adapted for attaining the main object which Mr. Street boasts English architects have particularly compassed" may be left to shine by its own light. Small wonder that the unscientific press has not, in this country, either the power or the status that it has attained in France, when it lends some of its oldest organs to such repeated attacks on an entire profession as we have before now had to mention with small favour in our columns.

There are now, in England and Wales, considerably more than three times as many inhabited houses as there were in the year 1800. In the month of May last, nearly 47,000 houses were in course of erection. Between April 4th, 1881, and April 3rd, 1871, 575,000 had been added to the number of our inhabited houses. Any person who has had occasion to travel through almost any part of England has the opportunity of noting the change that the last forty or fifty years has effected in our architecture, public, urban, and rural. Of the ten thousand churches reared since 1840, which have been either newly built or restored at a cost hardly less than that of rebuilding, we have before spoken. Since the passing of the Education Act the voluntary efforts of members of the Church of England have provided school accommodation for 935,993 additional children, making a total of 2,301,073. The Board schools have provided accommodation for 1,016,464 children. The Roman Catholics have increased their former school-room from 101,556 children to 242,403, or nearly two and a half times. The British, Wesleyan, and other schools have enlarged their limits from 411,948 to 582,403. Thus in the nine years following the passing of the Act, the English architect has provided school-room for 2,263,640 children, more than doubling the accommodation which existed in 1870, for 1,878,584 children, and bringing up the total accommodation to the amount of 4,142,224.

It is not only in the thousands of steeples and towers that dot our landscapes, or in the gables and porches of our thousands of new and generally picturesque schools, that the architect has been of late transforming the face of the country. What are the cottages of the poor now compared to their condition at the commencement of the century? Let any one recall what cottages were even forty years ago. What were those on the estates of the Duke of Rutland, in Derbyshire; of the Duke of Bedford, in Bucks; of the Marquis of Ailesbury, in Wilts,—of almost any great landowner? And what are they now, when an architect has been employed? The change is a positive transformation. We have an official record that throws some light on the growth of domestic architecture during the present century. That growth has been about 5 per cent. in advance of the growth of the population, something in the way of improvement, if not much. In 1800 there were 564 inhabitants to every 100 houses. In 1880 there were 537 inhabitants to every 100 houses. We take no note, in either case, of houses uninhabited or in course of building. In 1800 the uninhabited houses in England and Wales amounted to 3·1 per cent. of the inhabited houses. In 1880 the proportion had risen to 7·8 per cent. When we compare the visible improvement in size and accommodation which has taken place in both urban and rural domestic architecture with the facts that there are 4·8 per cent. fewer inhabitants in every average house, and that there are more than double the proportion of empty houses from which to choose a residence, it will, we think, be tolerably clear that the accommodation for the individual now offered is in advance of that which was the case at the commencement of the present century; and, where an architect has been employed, an advance also in the direction of comfort.

There is one style of journalism with which we have no sympathy. It is the style of the hopeless grumbler. It is pleasing, no doubt, to many people, or it would hardly be so often adopted as is the case. But we confess a grave doubt as to the utility of the purely critical in journalism. To point out faults is all very well,—if it lead to remedy; otherwise it has rather a demoralising tendency. One writer, as our readers will remember, was for imparting a new and sudden perfection to our "vernacular architecture" by the simple plan of turning all the architects adrift, and putting their work into the hands of the "inspired workman." Our own opinion points in diametrically the opposite direction. And we candidly appeal to those men who have the best opportunity of arriving at the truth,—architects who are largely consulted by intending purchasers or lessees of houses, or inspectors of metropolitan and urban districts. What is the general inference to be drawn from the cases of bad design, bad materials, and bad execution, which are constantly attracting the attention of such competent judges? May they not, nine times out of ten, be summed up in the remark,—absence of the control of a competent architect?

The speculative builder has generally enough

knowledge of his business to be aware that, as far as its legitimate exercise goes, it is a false economy to try to substitute uneducated agents for proper architectural control. He knows, well enough, that the services of a thoroughly competent architect will repay the amount of his commission over and over again. It is not for that cause that the jerry builder is his own architect. The saving that he strives to effect is a saving of that kind known as scamping. At every turn and corner of a house, from the sewers to the chimney-pot, it is possible to effect a considerable and a shameful economy. Bad materials, mud in lieu of mortar, bats instead of bricks, sappy wood, inferior slates, pipes badly laid, lath-and-plaster partitions instead of internal walls, shells of houses which, when by any chance a section is opened to the eye, bear about the same proportionate thickness to the interior of the house that the thickness of an egg-shell does to the volume of the egg. These are the points in which the unscrupulous builder saves outlay at the cost of the future inhabitant. These are the things which no respectable architect will sanction, and that is the true reason why his services are dispensed with.

We wish to keep this matter clearly before the public. In all occupations in a civilised state of society there are the higher and the lower grades. In the higher grades are to be found not only the practical experience collected throughout all the grades, but more complete education, and greater command of the whole subject. It has, therefore, been found, as a rule, to pay to engage the services of the highest grade; the higher price paid for it being, in point of fact, an economical outlay. Thus the barrister, the physician, the expert of all kinds maintains his position and his fees, because it is for the public interest, as shown by experience, that he should do so. Money out of pocket may be saved by taking a quack prescription to a chemist, instead of consulting a physician; by applying to that lawyer who, as the proverb says, has a fool for his client, and so on. But the saving turns out a loss. So it is, notably, in the craft and art of the builder, where supervision of a thorough and incorruptible kind is of the utmost value. You may need a physician once in four or five years; a lawyer once in ten; but you need a house every day and all day long. The counsel of the barrister or of the physician is given on a stated case, and there an end. The eyes of the architect, in person or in deputy, should be on every brick and every plank that is laid, while the house is in building. Therefore, the first thing for the intending tenant to inquire about before he takes a house is,—What architect, known to the profession, is responsible for the building?

If the householder be once made fully aware of what is the real significance of building without an architect, a signal blow, and great discouragement would be given to the class of jerry builders. We are not here touching the æsthetic part of the question. There it may be said the game flies too high. It might seem invidious to point out the glaring evidence that exists, in some very high places, of an unfortunate economy in the way of professional counsel. The thing for the public to get hold of is, that they will no more obtain thoroughly good houses,—to say nothing of handsome or picturesque houses,—unless by the intervention of a thoroughly good architect, than they will get through a dangerous illness without a good medical man, or a troublesome law-suit without a good lawyer.

It may even be inquired whether it would not be a boon to the householder at large for the architectural profession to include in its organisation a method of registration. We are not blind to certain inconveniences that might attend the introduction of such a method, but they would gradually tend to disappear. And the result, some little time hence, would be that "Built under the supervision of Mr. Flayscamp" would be an addition to the advertisement of a house to let or sell that would add more than the five per cent. to its real value. Houses would, by degrees, become classed not only according to size and locality, but also according to the warrant of thoroughness of construction that would be given by the signature of certain names. When the public once become aware of the evils attendant on quack building, more will have been done to ensure thorough excellence in our houses than will be effected by any number of miles of letterpress of which the theme is the incompetence of the English architect.

A NEW BOOK ON ARCHITECTURAL THEORY.

We return to the consideration of some of the more special points in regard to architectural art, which we deferred in speaking lately of Mr. Eidlitz's treatise.*

In the chapter headed "Monuments," which is not altogether so practical or so concentrated as it might have been, we come on an idea which is well worth more consideration than it has received, namely, as to the essentially new problem presented by the multiple character of many buildings required for the necessities of modern life. The author makes what to some will be the startling suggestion that architecture "for all the goodly age of this globe, is still in its infancy. We have seen in a former chapter that it deals with single cells, groups, and piles. In truth, the art has not yet risen above the single cell. In Mediæval architecture we certainly find groups of cells and exceptionally rambling piles, but the former are not yet fully developed, and the latter are mere accident, not premeditated, hence not art-work in that sense." This seems at variance with the illustration we quoted in our previous article, of the cathedral with its various divisions of baptistery, chapter-house, &c, as exemplifying architecture which is expressive of certain ideas; and the author is not quite consistent here. From another passage we conclude that in classing even the Mediæval cathedral under "single-cell" buildings he has been regarding it rather externally than internally, but even so it can hardly be classed, in this sense, with the Greek and Roman temple, except with a considerable modification of the definition. But we can pardon him this lapse of consistency, if his remark will but draw more attention to this essential distinction of modern architecture, multiplicity. As he says in another chapter, "The Greek temple is the expression of a single idea, and a single act illustrating it. Most modern structures are the result of a series of related acts, or, perhaps, of a series of ideas of various values, which must be exhibited in order to tell the story of the monument; and hence such a structure cannot be clothed in the simple drapery of antiquity." Considering the matter in this light, the composition of architectural groups is, as the author says, a problem reserved for the future. "This opens to us a vista of activity, which, when fairly reached, will generate works compared with which the cathedrals of the Middle Ages and Greek and Roman temples are the alphabet of art." This is a bold prophecy, and its realisation presupposes a period of architectural ability and genius which we do not see much sign of at present; but that this is a problem hardly solved, hardly even attempted, by most of the architecture of the present day, is unquestionably true, and we only wish the consideration of it could be kept more before the thoughts of architects and those who are interested in architecture. It at least offers us a field for the development of original architectural creation, such as seems almost inexhaustible, as the problem must continually vary and become more complicated with the progress of civilisation. How many town-halls are there among our modern structures (to take one class of building only) which make any attempt to exhibit a grouping derived from the actual arrangements and requirements of the plan?†

In the first part of the chapter on "Form and Construction" the author continues, to some extent, the consideration of the external expression to be given to the internal grouping of buildings, concerning which we will only say that his critical views are what we quite assent to. This portion of architectural designing may be considered as the modelling of the building as a whole, and of its groups; and in connexion with this we may glance at what is said elsewhere as to the modelling of parts. Here (pp. 366-7) the author suggests the true method of learning from Mediæval architecture and applying its principles without copying its details. "Architecture is the art of the development of structural forms." Having developed the main structural form of the whole, we have to express the function of organic structural parts. "If we know that more perfect structural expression may be attained by modelling each part than by facing it with a scenic representation of matured architectural form, then the architect *must* so model each part, and he cannot return to Roman practice, which fails to deal directly with the masses. The architect may reject Gothic forms, and necessarily must do so if the expression of the idea he attempts to materialise results in other forms, as it necessarily will, because the idea is modern and not Mediæval; but he cannot reject this Mediæval method of modelling structural masses." This is undoubtedly the true way to read Mediæval architecture as a suggestion for modern architecture. To make suggestions as to the manner of modelling parts of the structure so as to express their several functions would, of course, be futile, nor does the author attempt it. We come at that point upon the region in which individual thought and perception can exercise themselves in the development of modelling, and it is a question of innate perception, assisted no doubt by mental training, but innate to begin with. The man who does not possess such innate perception can acquire it by no course of teaching, and should not try to be an architect.

A long chapter is devoted to the subject of style, but the author's conclusions might have been expressed and justified (from his own point of view) in much briefer space. They amount to this, that the study of the styles of the past, or the method of regarding architecture as a subject made up of so many styles, is a fatal delusion which tends to destroy any following out of architecture in its true path,—in the only path in which it can become a living and developing art. This is much what Mr. Fergusson has already said; and we may observe that Mr. Eidlitz by no means seems to be aware how many of his own views have been anticipated by other writers on architecture; or, if he is aware, he is somewhat disingenuous in not acknowledging their previous teaching in the same direction; and it is certainly not fair to cite St. Peter's, as the author does, as being the central object of admiration of the architects of the Renaissance school, nor as "the greatest outcome of the Renaissance movement," unless "greatest" refers merely to measurement in feet or yards. No one, as far as we know,—no one who has any understanding of architecture, that is,—regards St. Peter's as the central or most important outcome of Renaissance architecture. On the contrary, it may be doubted if there is any important building about which there is such a general *consensus* of condemnation or dissatisfaction among architects and architectural writers of this generation; and no one has more strongly condemned it in detail than Mr. Fergusson in his "History of Modern Architecture," and on exactly the same grounds as those stated by the author we are now discussing.

Seeing so much space included under the heading of "Style," we looked to find some attempt to define wherein the property called "style" consists, but this part of the subject the author ignores. He does not seem to recognise that the expression "style," besides being applicable to one or another of the forms in which architecture has been practised in the past, has also a more abstract meaning as defining a quality, which is present in all art that is worth anything. The author exhorts the architect to "get rid of every vestige of that baneful thing he calls *style*," that is to say, to escape from regarding architecture as a series of styles, and to regard it as an art to be carried out on its own independent practical and æsthetic basis; and in that we entirely agree. But he ignores the other and very important meaning of the word "style," the quality which is so difficult to define, and which it is the last attainment of æsthetic culture to rightly perceive, but which may be said to consist, in architecture, in the coherent treatment of all the details in reference to one predominating constructive motive. Mr. Eidlitz may reply (and such a reply would not be without reason) that architecture carried out on the principles which he advocates would necessarily have "style" in this sense, but it would have been better, in that case, if he had been more precise in stating his case, and had discriminated between the two meanings of the word "style," the concrete and the abstract: because it is certainly hardly reasonable to urge architects to avoid the baneful influence of "style," when, in fact, style is the very quality

* See p. 593, *ante*.

† We recollect, *apropos* of this, that at the time of the exhibition of the Law Court designs, a letter appeared in one of the daily papers, asking whether it was not a falsity to provide for the concentration of the courts in one immense building, giving the idea of unity of structure; whether they should not have appeared rather as a combination of a number of court buildings of separate design placed in intercommunication.

that so much of our modern architecture wants, and which no truly-developed architecture can well be without. If he had said, "The baneful influence of styles," it would have made all the difference. The architect should avoid imitating *styles*, but should aim at realising *style*. The question "What style is it in?" is one that the architect may disregard; but "Is there any style in it?" is quite another question in regard to a design, and one of vital importance.

In the chapter on "Proportion" the author has run his pen into one or two fallacies, and made one or two hits. Proportion, he says, is generally taken to mean this: "Given a temple of a certain length, what is to be its breadth and height, and what the respective dimensions of its columns, bases, capitals, and entablatures, &c., in order to respond to the laws of beauty?" This the author stigmatises as the popular way of putting the matter, which leads to this mischief, that the laws of beauty (if such laws exist), which are only relative, are by this reasoning raised to positive laws, derived from isolated examples. "Whenever it is asserted by a leading architect that the monument excels in the quality which is designated as beauty, it is assumed that all elements of beauty must be attributes of that monument. Proportion being one of those elements, the monument is said to be a model of proportion, and its proportions are recommended for use in other monuments erected in the same style." These proportions, as Mr. Eidlitz says, are determined by "taste," that vague guide, which has decided that Greek and Roman proportions are beautiful, and has measured them and laid them down as patterns for our modern cutters-out to model the architectural garment upon. This is the philosophy of the idea of universal ratios of proportion in architecture, which so many people have wished to impose upon us as the safest guide. Whether these ratios were really considered of such paramount importance by the Greeks as Vitruvius would have had us believe, is one thing, upon which there may be much room for discussion of a not very profitable character; at all events, they are of no use as guides to the architect of to-day, unless he wishes to sink to a mere servile imitator of "the orders," and we have all of us pretty well got past that now. There is another consideration in regard to "proportion," however, which is very important indeed, and is often quite overlooked in designing, viz: the influence of scale on proportion of parts, and on this point Mr. Eidlitz draws attention to what he regards as an inherent fallacy attendant upon the application of Greek "order" proportions to any scale indiscriminately. He observes that if a design which is considered to be in fit proportion of parts, in regard to the strength of the supports and the weight of the superstructure, be simply doubled in scale, the increase of the mass of the superstructure takes place in a greater ratio than the increase in the area of the piers or supporting masses, consequently that an increase in the scale of the whole, without in any way altering the ratio of the parts, must lead to a disturbance of the due constructive proportion. This is a very important point in determining the proportion of parts in a structure, and it certainly appears to us that it is fatal to the Vitruvian theory of the proportion of the Orders; we say, advisedly, the Vitruvian theory, because we consider it very doubtful whether the theory of Vitruvius was that of the Greeks, or whether he really understood or represented the method and principles of the Greek architects. But we doubt whether there is much truth in the application that Mr. Eidlitz makes of this to the question of the relation between a small-scale drawing and the actual proportions of the building when executed. He suggests that failures in architectural proportion may and often do arise from the architect arranging his proportions in relation to the small-scale drawing of the design on paper, and finding these proportions unsatisfactory in the actual building. This may be, and often is, we suspect, a cause of failure and disappointment, but we believe it is generally in the reverse direction. The tendency in making a small-scale drawing almost always is to exaggerate the thickness of the smaller masses, such as shafts and mullions in Gothic design, and cornices and surbase mouldings in Classic design; and there are probably few small-scale drawings in which such features are not shown more thick and massive than is found to be desirable when the details come to be worked out full-size. It must also be observed that features which appear agreeable in proportion on a large scale would appear weak and fragile when used in the same proportions on a smaller scale. This is seen when, for instance, the Classic column is used or misused as a baluster, as has been sometimes done, when it always appears fragile and weak. This is probably due to an intuitive perception that, while we have so greatly reduced the mass of matter employed, the cohesive power of the material remains absolutely the same, and is, therefore, felt to be insufficient for so small a thickness of material. Nevertheless, the remarks on the subject are very suggestive, and are true at least in one sense, in regard to the proper structural relation of masses.

The chapter on ornament and colour decoration is an exceedingly good one, and we recommend its careful perusal. The author understands very well the function of ornament in assisting the expression of a building; and he combines with his remarks on this some rather novel observations as to the effect of different ways of finishing the surface of a building material. He observes that "a rough quarry face, as well as a polished surface of many sorts of stone, reveals a vigorous crystallisation, and heightens the colour, and thus indirectly the apparent capability of the material to do mechanical work. The experiment may be tried with various cubes of one and the same stone, and of equal dimensions, which may be made to range from a rough quarry face to a finely-tooled surface, and it will be found that the rougher the surface the greater the seeming rigidity of the material." The reason he assigns for this is that the rough stone betrays the nature of its crystallisation, of which we know, from practical experience, that it serves to resist great pressure; while in stone that has been rubbed to a smooth surface, the natural grain is obliterated, and an artificial grain substituted, which resembles the grain of other matter (not stone) which we know to resist pressure but indifferently, unless the stone is further polished, and in this way again made to betray its crystallisation. That this is practically felt in many cases is obvious from the frequent use of rough stone in the basement of a building and tooled stone above; and the device known as "Rustication" is a logical deduction from this, and a carrying out of the same effect artificially on a larger scale. In referring to the effect of colour on apparent structural stability, the author lays down the rule that "the deeper the colour of a structural part, the greater its apparent resistance to strain," and this we believe to be quite true. A heavily-decorated vault in deep colour, resting on white marble columns, would always appear insufficiently supported.

Mr. Eidlitz does not illustrate his remarks by any drawings or diagrams, without which some of his observations will not, perhaps, be readily intelligible except to professional architects. To which class his book is intended to be directly addressed, to the professional or the lay readers, is not very apparent. To those of the profession who have got into practice it is not of much use to appeal for any reconsideration of the theory of their profession; they have got into their groove, and cannot, in the practical sense, afford to make a new departure, even if they attached any weight to another man's judgment, which architects are not more ready to do than other professional men. Young architects who have not yet commenced their profession, or got their ideas about it crystallised beyond the possibility of readjustment, would do well to read Mr. Eidlitz's book, and give consideration to some of the suggestions contained therein; and if the book gets into circulation among general readers, it ought to produce a beneficial effect in giving some more correct ideas as to what architecture really means than most people at present possess. We certainly desire to see a book of this kind gain the ear of the public. Some very foolish and empirical architectural books have obtained circulation of late years, and have been recommended by the "critics" of the daily papers in all the innocence of ignorance; we hope that a book, which, at all events, contains more good sense and logical thought than the average of architectural writings, may obtain some attention also from a public much needing to be enlightened on the subject of which it treats. The best theories of architecture, however, are of little account, and can hardly ever be exemplified as the best, till they find their way into practical demonstration. We do not mean to imply that the author forgets this; on the contrary, if we understand him rightly, it is the keynote of his treatise that architectural style is among the problems of which it may emphatically be said, *solvuntur ambulando*.

THE PROBABILITY OF DEARER COAL.

The importance to all the great trades of a cheap and full supply of fuel, as well as its importance to every household, make the question of the possibility of a considerable advance in the price of coal one of great moment. It is worth while, then, ascertaining whether the prospects of the coal trade tend in that direction. After the sudden bound upwards in the price of coal eight years ago, there was a slow but as complete a fall, and the price of coal has been for some years so low that it has left little profit to the coal-owner. Indeed, in the past year, the collieries of one of the largest coal-owning companies in the north-west of England, —the West Cumberland Iron and Coal Company,—have been worked at a loss, which has lessened the profits in the iron and steel branches of the company's undertakings. But there are indications that this state of affairs in the coal trade is likely very soon to pass away. One of the reasons for this is that the price of raising coal has been of late permanently raised as the result of legislative action. Another reason is more immediately connected with the output of coal. It is usually the case that when there is an increased demand for coal, it is shown first by an enlargement of the output, and then by an increase in the price. For the past five years, —down to last year,—the output of coal has been, on the whole, stationary, whilst the price tended downwards. But the demand that burst out nearly two years ago for iron and steel for the United States caused a very great advance in the demand for coal, and the production for the past year showed one of the most surprising increases that have ever been known in the history of the coal trade. But there are grounds for the belief that when the official returns are procurable for the year 1881 they will prove that that increase in the production has continued throughout the year. Some of the figures that are already tabulated show that the increase has been continued in some of the chief modes of disposal of the coal output. More has been sent to the metropolis; more has been exported to other countries; and though figures are not to hand to show it, it is tolerably clear that more will have been used in manufactures. Other sources of consumption, — such as for railway uses and for the gas manufacture,—show enlarged use, and hence there is tolerably safe ground for the opinion that in the course of a few months we shall learn authoritatively that the coal output of the kingdom has continued to increase even from the high figures attained in the latest year yet returned by the tardy official figures.

As the coal output is increased in this way, the cost of production of coal is on the average raised. This is because when the price is very low, the pits and seams of coal that are cheapest to work are those that are kept in operation; and as additional ones are needed to be put to work, it is those where the cost is rather higher that are started. Moreover, the demand draws nearer the extent of the supply that is available. Some of the producers find the whole of their production taken up, and the tendency of the market is to "stiffen" under these circumstances. This process is now in progress, and there is at the present time a distinct addition to the general prices of coal that had prevailed up to, say, five or six months ago. There are no signs of abatement of the increase in the demand for coal for mining and metallurgical purposes, and the normal increase in the consumption for marine steam purposes, for the gas manufacture, &c., shows no sign of checking. Hence it may be assumed that there will be a growth of the demand, and from the causes just glanced at a slight addition to the prices. But the wages of the workmen are now a very important factor in prices, and as these are now regulated by the price of coal in very large degree, it may be expected that the wages will tend in a slight degree upwards, and thus a stimulus to a further movement will be given for the future; and it would be impossible to define, with any attempt at probability, the extent of that influence. There is, and must be, an increase in the consumption of coal, and though the economies that have been effected in the consumption lessen the rate of that increase, and may in the future still lessen it, yet its

effect is only to retard and not to stop the onward movement. Unquestionably, it will be felt more in some of the coal-yielding districts than in others,—probably that effect being defined in great degree by the nature of the coal that is chiefly raised.

One of our great metallurgical and mining authorities, Dr. Siemens, years ago stated that we had entered upon an era of comparatively cheap coal, and he indicated at length his reasons for that belief. The event has proved that the assertion was one soundly based. But some of these reasons do not now hold good, and we have seen that there are grounds for believing that an increased consumption of coal is probable. If the increased consumption were put to its fullest use, it would be a subject for national congratulation; but this is not the case. There is an enormous waste of coal, and of the power that it represents. Especially is it the case in the household consumption and in that for the purpose of raising steam-power. And in view of the increase in the price of coal that seems to be now probable, and of what may be considered perhaps as the increasing scarcity that may be said to be possible, it is a subject that will need to be brought forward and keenly canvassed, whether there cannot be a check put to the increase in the use of coal by the better consumption and diminished waste of the quantity that we do use. We have seen what has been done, and is being done, in this direction by the ironmasters and by others interested in allied industries; it has been clearly demonstrated how large a proportion of the coal used could be saved if there were proper boilers and engines; and it is to be hoped that the subject will obtain the needful attention before high prices render it an imperative necessity. We have not only a waste of power by the imperfect combustion, but we are thereby converting part of a blessing and a source of strength into a curse and a weakness; and it is to be hoped that the question as to the cheapest fuel,—gas, coke, or coal,—and that of how to extract the largest amount of power therefrom, may speedily impress the national conscience.

THE EARLY YEARS OF MARIETTE-PACHA.

An interesting contribution towards a complete biography of the distinguished Egyptologist, Auguste Mariette, has been recently published at Boulogne-sur-Mer, his native town, by M. Ernest Desoille, under the title of "Les Débuts de Mariette-Pacha," from which we may glean some particulars of the early life of an indefatigable worker and an upright and honourable man.

Edmond About, in his book "Le Fellah," written in 1869, has painted a vivid and lifelike portrait of Mariette, whom he met at the inauguration of the Suez Canal, and the concluding paragraph of his description is remarkable, inasmuch as it is already proposed to raise a statue to him in his native town.

"He is," says About, "one of the most finished men in the world; learned as a Benedictine monk; brave as a Zouave; patient as a copper-plate engraver; natural and kind as a child, although he flies in a rage at everything; unfortunate as few are, and gay as nobody is now; burned as if at a slow fire by tropical heat, and wounded most cruelly by those most dear to him; wretchedly paid; almost poor in a position in which much is expected of him, regarded with suspicion by those in power, and by the people, who do not understand him, and who look upon science as a European superfluity; warmly attached in spite of everything to that mysterious country which he has probed now for nearly twenty years to extract all its secrets; upright and sensitive to an extent that appears to be ridiculous; an obstinate curator of the museum he has formed, and which but few visit; publisher of ruinous books which posterity will perhaps buy for their weight in gold, but which now solicit in vain the encouragement of Government, he is an honour to France, to Egypt, to humanity, and when he has died of despair he will perhaps have a statue."

Mariette was descended from a respectable family, the members of which had distinguished themselves in jurisprudence, in art, and also to a small extent in literature. His great-grandfather was a barrister, and is mentioned in the "History of the French Protestants" as having been one of the four jurisconsults who protested against the execution of Calas. His grandfather was an officer in the Royal navy, and a letter is extant addressed to him in England (where he was imprisoned during the Seven Years' War), written by direction of the Duke de Richelieu, informing him of a proposed exchange of prisoners, from which it has been inferred that the duke attached some importance to his services. Mariette's father was born in Paris in 1793; but family affairs led to his removal to Boulogne-sur-Mer, where he was appointed head-clerk to the Mayoralty, and here, in the Rue de la Balance, his second son, François Auguste Ferdinand Mariette, was born on February 11th, 1821.

Young Mariette is described by his contemporaries as having been a fair-complexioned lad, slight in figure, with an animated countenance, and as being full of fun and frolic. He was at first sent to a private school, but on the opening of the Communal school he entered it among the elder boys in the third form. He does not appear to have distinguished himself at school, except in drawing,—an accomplishment which in after years was of great service to him. In his youth he chiefly employed his talents in this direction in the production of caricatures and sketches of animals. On the walls of the old Communal school at Boulogne are some admirable geographical maps, drawn by Mariette, which show his skill and boldness of handling.

In 1837 Mariette obtained a first-class prize in geometry, a prize in physics and chemistry, and in literature a prize for Greek version and an *accessit* in Latin, English, and history. At the conclusion of his school studies he assisted his father at the Mayoralty from 1837 to 1839. In the course of this latter year he obtained the appointment of French master and teacher of drawing in a school kept by a Mr. Parker, at Stratford, where he remained until 1840, when he removed to Coventry, and endeavoured to obtain a living by designing for ribbon manufacturers, but finding that this branch of industry was miserably paid, he returned to his native country, with the intention of resuming his classic studies.

At the end of six months he was ready for his examination, which he passed at the March session, 1841, at Douai. He took his degree as Bachelor of Arts, with honourable mention, and resolved to devote himself to teaching. A short time afterwards we find him at the Communal school in his native town, first as a monitor and then as French master (with a salary of 56*l.* a year), and finally as *régent dans la classe de septième*, or assistant master (1841-43).

About this time Mariette's literary talents began to develop themselves, and he commenced by contributing occasional essays, mostly of a topographical character, to the local newspapers. These early efforts, of most of which a record has been kept by his biographer, are described as showing great originality of treatment, and giving signs of promise which were afterwards fulfilled, not, however in the manner which was anticipated.

An event which occurred in 1841 decided Mariette's future vocation. This event was the death of Nestor Lhote, the companion of Champollion, which occurred in that year, and Mariette, who was cousin of the deceased, was entrusted with the duty of putting his papers in order. The examination of these manuscripts by him fixed at once the bent of his inclination, and he became from that time an enthusiastic student of Egyptian antiquity. He was assiduous in his attendance at the Museum of Boulogne, which contains a respectable collection of Egyptian antiquities, part of the spoils of Napoleon's celebrated campaign, and diligently sought to penetrate the secret of the hieroglyphics without any other master than his own untiring patience, and sustained by an enthusiasm which rose to the height of the heroic.

Among the works projected by Mariette was a history of the Boulogne pirates, towards which he had collected a considerable amount of materials, but its completion appears to have been prevented by a taunting allusion in an opposition journal to the precautions he had taken, in the portions already published, to avoid wounding the susceptibilities of the English nation. This reproach, if deserved, will not tend to lessen our admiration for the character of M. Mariette, who at a time when the relations between France and England were somewhat strained, appears to have risen above petty international jealousies.

In 1843 Mariette became editor of *l'Annotateur*, a Boulogne paper. He did not, however, relinquish his position at the Communal school, and in addition he gave private lessons. In June, 1845, he married the sister of one of his pupils, Mdlle. Eléonore Million. Notwithstanding his numerous occupations, he found time to interest himself in local affairs, and was an active member of the local committee for primary education, secretary of the Agricultural Societies, a member of the Friends of Art, &c.

In 1846 he resigned the editorship of *l'Annotateur*, alleging that he found it impossible, from his numerous engagements, to devote that attention to the newspaper which he considered due. He employed the time thus gained in writing a letter to M. Bouillet on his article upon Boulogne in his "Dictionnaire Universel d'Histoire et de Geographie"; a second letter upon the incursions of the Normans; and some contributions towards a history of Wissant. In March, 1847, he published a "Catalogue of the Egyptian Antiquities of the Museum of Boulogne," a small octavo pamphlet of nineteen pages, the first-fruits of his studies in Egyptology.

In 1849, Mariette attracted the notice of M. Ch. Lenormant, the curator of antiquities of the National Library, and professor of archæology at the College of France, by means of a pamphlet on the inscription on the left side of the Hall of the Ancestors of Thothmes III., which Mariette sent him in manuscript. Mariette went to Paris and obtained an appointment as assistant in compiling the catalogue of Egyptian antiquities at the Louvre, at a salary of 2,400 francs (96*l.*).

While engaged on the catalogue of the Louvre he still pursued his studies and wrote a memoir (not published) on Coptic bibliography, and a note upon a fragment of the royal papyrus of Turin, published in the *Revue Archéologique* in 1849.

The memoir on Coptic bibliography obtained for him a scientific mission from the French Government, by which he was directed "to explore all the convents of Egypt, and principally those of the Thébaïde, which contain libraries of Coptic, Syriac, Arabic, and Ethiopian manuscripts, with the object of forming a collection of Oriental manuscripts relating to the history and antiquity of Christian Egypt."

To conclude, in the words of Mariette's friend and biographer of his early years, "The 4th of September, 1850, arrived, and he started. It was soon seen that, from his stature, his strength, and moral force, he was the man to accomplish his difficult mission. His mission, did I say? He went beyond it; for, sent to collect manuscripts already carried off by an unscrupulous Englishman, he discovered temples,—the Serapeum and the ruins of ancient Memphis. Then he will assist to reconstruct in fancy the cities of Heliopolis, Abydos, Thebes, Sakarah, Karnak, Denderah, Gebel, Barkal,—tombs of a buried civilisation. Then he will found the French School of Egyptology, the Egyptian Institute, the Museum of Boulak, where, after his death on the 18th of January, 1881, his body will be transported in a magnificent casket, a sarcophagus of the thirteenth dynasty, selected by himself for that purpose, to remain for ever in the midst of those archæological treasures he had exhumed from the sands of the valley of the Nile, and to attest the French origin of the museum which he had created." J. H.

REMARKS ON THE POSTURE OF STATUES.

That is after all but a hybrid statue which has its origin partly in delineation from a portrait taken from life, and partly from the imagination of the artificer. Thus any full-length representation of Shakspeare is partly realistic, partly fanciful, because there is no record of the poet's whole figure extant; all of his likeness that has been handed down to us is his bust, and when an artist takes upon him to put a body and legs to this bust, the nether part of the figure he concocts is entirely fanciful, and no more authentic than a mermaid's tail.

No stereotyped attitude should be introduced into the statue of a special individual. The attitude should be peculiar to, and characteristic of, the individual portrayed. It is requisite that the artist, as well as the historian, should curiously observe wherein one man differs from his fellow men as well in small as in principal points; but the large leading characteristics ought to be attended to in the first place. The artist who gives us a fair representation of these may be pardoned should he neglect some trifling detail; but he who bestows all his attention on small details to the neglect of leading characteristics offends seriously. It is possible to make too much of Cromwell's mole.

Oliver Wendell Holmes has a sentence in one of his books which is pertinent. Looking back to the period of his childhood, he says he could recall the image of many posturing friends. The sculptor should strive to catch glimpses of

his subjects, as Professor Holmes recalled the image of his departed relatives,—as posturing friends,—every one with his own individual and special postures. It is not every one who has the eye to catch up at once and in whole what may be termed the trigonometry of the individual human form. Not every one is a Tobias Smollett,—able to take note of the attire, the projection, the rake of each figure he observes, at a glance. Yet without some such ability, natural or acquired, how is the artist to produce correct portraits, whether on canvas or in marble? As Sallust, in his writings, has portrayed his characters in the height of their passions, unreduced, unaneled,—with all the prejudices, propensities, proclivities,—encrusted thick upon them, and has disclosed to view all the idiosyncrasies of their inner man,—so should the sculptor, when producing a statue, strive to present us with a verisimilitude of the outer man for our contemplation. In waxworks, the posture of the figures is often studied and stiff, and this detracts from the interest of the statues, for as they are generally appropriately, picturesquely, and splendidly dressed, one finds that the greater number of the spectators are taken up with observing the minutiæ of their clothing, and are indifferent to the bearing and contour of the figures. Yet when they meet with the likeness in *facsimile* of some object whom they know, how warm is the expression of their approbation,—perhaps the model of a blind beggar of the town pulled along by his faithful dog attracts their eye,—this group delights them, because they recognise in it the very counterpart and image of that man and that dog which are familiar to them.

A statue is the counterpart of the quick body, and should be life-like; but too often the sculptor makes it stiff, stony, and like a figure from which life had departed. It is by the deed implied in the posture of the statue that the life-like impression can best be conveyed to the mind. The man should, so to speak, be arrested in the very act and turned to bronze or porphyry. Those statues will always be most attractive which present their subject not in repose, not resting from work, not sitting in a studied attitude as if expecting that their portrait is about to be taken, but in the heat of labour, and engaged in some customary or representative movement,—the general leading on his troops to battle; the poet beating the heaven-born flame; the mechanic employed with his tools; the musician playing on his instrument; the physician bending over his patient; the preacher exhorting his people; the king holding out the sceptre of mercy to the prisoner.

The directions given to Flaxman for his statue of William Pitt, designed for the Glasgow Council-chamber, were that the great statesman was to be represented exactly as he stood on the floor of the House of Commons when addressing the House. How well Flaxman carried out his instructions can yet be seen.

We find, frequently, attempts made to depict the figures of men performing deeds in which the men themselves are not usually nor likely to be often engaged, and in which it cannot readily be known whether the model is rightly posed or not, and, therefore, in which it is difficult to decide whether the form of the figure which has been attained to is twisted or even. In many statues it seems to us that the human form is contorted quite unnecessarily and unhappily. It is a great matter to have every limb set in its natural position, but it is not the easiest thing in the world in every case to arrive at this destination. In the awkward and forced position of the limbs in some rustic statues, we have one of Lord Chesterfield's observations paraphrased in stone,—"His figure (without being deformed) seems made to disgrace or ridicule the common structure of the human body; his legs and arms are never in the position which, according to the situation of his body, they ought to be in, but constantly employed in committing acts of hostility upon the graces." It is almost incredible after what egregious designs some statues have been modelled; for example, we have it on good authority, that in the case of the stone figure of Tam o'Shanter, kept at Burns's monument, Ayr (in conjunction with that of his equally famous drouthie cronie "Souter Johnnie"), a small attenuated grasshopper of a man sat for the body, in place of a big carter with herculean limbs who sat for the legs.

Every limb should not only be perfect in itself, but it should be in harmony with all the other limbs and parts of the body, and the junction of the limbs with the trunk must be cleanly made, and the flow of the contour ought not to be interrupted by it. The pose is everything in a statue; but how much does not this imply? Not only does it cover an appropriate attitude, but it demands also that no feature or limb should be absent from or indifferent to the sentiment which dominates in it. All parts must tend to enhance the value of the main intent of the figure. The eye must not be distracted and drawn from one point to another, and deluded in the attempt to construe the meaning of the piece. No large or prominent feature should be exaggerated, nor any insignificant feature reduced, but each must be written out to its own proper size and comparative dimension.

Nothing can be more despicable than to trick out and overdeck what is plain and mean in itself. What the sculptor has to do is to look for such graces as his object has, and display them, and not to bestow graces upon it which it has not. There may be small dimples, and nodules, and flutings, which connect and unite in one the prominent parts of the face, the development of which may give a fine flavour to the countenance and form the point of its whole illustration. A club-nose can never be a beauty in itself, yet it may have a certain comeliness when blended with corresponding, complementary features, well expressed; and it is the business of the artist to discover and disclose such a harmony as this will be, wherever it exists. It is evident that, owing to the usages of the ancients, their necks were more powerful in marking expression than is the case among civilised people now-a-days; but now in modern days, just as in ancient times, upon the neck depends the distinct and distinguishing carriage of the head. And if the character of the figure can be heightened by bestowing attention on the bearing and contour of the neck, assuredly it ought not to be neglected. The artist must search diligently for the hidden treasures of the whole bust, and bring them to sight. He must turn the light of his lanthorn upon it; pass it carefully over it, and discover where beauty lurks. There may be a lovely shell in the convolutions of an ear; there may be a pretty circular bias in the wave of a nostril, which is well worth being carefully noted and copied out. As a little tick placed at the beginning and the end of a sentence decides the question of its orginality, so may the turning up or the drawing down of the ends of an eyebrow or the wicks of a mouth make all the difference between the bestowal of the air of reality by which a likeness is at once recognisable, or the withholding of it.

Sculptors have each and all their own opinion with regard to the draping of statues, and it is hazardous to speak on the matter. Loose, flowing drapery, which is so often preferred and employed, makes some men look as grand as Roman senators, but it makes others look as if they were in a barber's shop prepared to get their hair cut. Every man looks most natural in the clothes he is accustomed to wear, and it is in such that we would have the sculptor model his people. Some costumes are condemned as being wanting for purposes of artistic effect. We do not think that almost any dress of any period in which people conducted their business and wrought their work, could ever altogether conceal the existence of a goodly form underneath it. The grace of feminine beauty and the spring of manly strength will show through any garb that people can freely move in. And as for those who shrink away in their clothes, and seem to strive to hide themselves behind their own shirt-collar,—they will certainly appear most at home in the clothes they have been in the habit of wearing,—and to put them into loose drapery or strange clothes, however fine, would simply be to hide them from view altogether. Let all celebrated persons be transmitted to posterity as they appeared to their contemporaries,—not in fanciful masques in which nobody would recognise them,—and in which they were not in the habit of appearing.

The classical, when reduced to its least common measure, is the appropriate and the becoming. If a monarch dresses himself unbecomingly, and without reference to his social status, it is impossible to picture him in classic shape. His usual attire and make-up are not classical; and to represent him in classical robes, and made up like a classical form, would be to perpetrate a caricature. Carlyle complains that, in all the portraits, except one, his hero Frederick the Great is represented with a common air, and is given the look of a head drill-sergeant rather than that of a *grand monarque*. The truth is that Frederick acted very much the part of a head drill-sergeant, and dressed shabbily beneath his rank, and accordingly was painted correctly just as he stood; besides, what could be expected of the portraits of a king who, as Carlyle himself informs us, was naturally inclined to be dirty, and who also, as Wraxhall tells us further, pulled on his boots in bed?

The artist ought, nevertheless, to seek out and display the best points, even of a sorry figure. As a fine woman knows exactly how much of her charms to expose to view in order to excite admiration, so should the sculptor study the contour of his subject, and make his drapery disclose and bring out all its good points. He must also make the display, as she does or ought to do, in attitudes which are apparently unstudied, and with what is termed unconscious ease.

Let not the young artist forsake the beaten track of his profession in search of too many novelties. If he attempts dispensing with the routine and customs of his profession, to strike out a new path for himself, and pretends to copy no one, but aspires to be entirely original, he is sure to make a splendid muddle of it, and to bring forth an illustrious piece of disorder. He is to conceive, indeed, but it must be naturally and rationally, as other efficient men in the same line have conceived before him,—not monstrously and absurdly as his own heady inclination would lead him to do. To be successful he must betake himself to the highways and not the byways of his art.

In addition to this, he must be watchful to avoid slovenliness on the one hand and stiffness on the other. When labouring to bring up his surface to the roundness and smoothness of a flute he is apt to make his work stiff. On the other hand, if he tries to avoid this, in order that he may appear easy, he is not without temptation to become slovenly. He must try to steer clear of both of these disturbing pitfalls. Of the two blemishes, stiffness is the more likely to be overcome by constant practice. Slovenliness rather grows on one. How often have we not seen that the inferior and less noticeable parts of a statue, instead of being carefully and artistically wrought out, have been knocked off skimble-skamble, — have been settled as much by chance as by design. Wherever there is either imperfect conception or careless execution the work is deteriorated, and the value of the piece is detracted from; this may not be evident when the statue is first uncovered, but it will become only too plainly apparent so soon as it has lost the gloss of newness and has got worn a little.

Slovenliness may be shown in three ways. There is sometimes slovenliness in arranging the model,—this may be passed off as natural ease and truthfulness to life; sometimes in the execution of the work an attempt may be made to pass this off under the style of "working in rough," and sometimes in finish this last may very readily be passed off under the name of "boldness of touch," but any of the three acts of slovenliness will mar the statue.

If there is an art in which perfection is required,—and nothing short of perfection suffices,—that art is sculpture. When a statue is finished it should look as if it had never been touched by human hand, but had sprung into existence complete as it stands. It is not often that one comes into the neighbourhood of a work of art, and when he does it is generally a piece of sculpture, which, in a moment, at the first glimpse, evokes a burst of pure and perfect joyfulness in the heart. Once or twice, however, have we been surprised by coming unawares into the presence and beneath the halo of a sparkling animated form, in white marble, all dripping with grace and light, the dazzling beauty of whose posture shot ethereal fire out of the eyes, and made us happy even in the thought that any such delightsome handiwork of man existed on the earth, fast and safe, and was not a mere dream and illusory. Moreover, we would not class as a work of high art any statue or any piece of sculpture which has no quickening power, which never moves the soul at all, which finds us calm and leaves us calm.

Florence.—The ex-Grand Duke of Tuscany has undertaken, at his sole cost, the restoration of the front of St. Mary of the Flowers at Florence.

SO-CALLED ACOUSTIC POTTERY.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the ordinary general meeting of this Institute on Monday evening last, Professor T. Hayter Lewis, vice-president, in the chair, Mr. Farrer was introduced to the chairman on his attendance for the first time since his election as Honorary Associate, and it was announced by the honorary secretary, Mr. Maclvicar Anderson, that Mr. Farrer had kindly undertaken the office of Honorary Solicitor to the Institute, in place of the late Mr Frederick Ouvry, F.S.A., his partner.

Mr. Gordon M. Hills then read a paper on "Earthenware Pots (built into Churches) which have been called 'Acoustic Vases.'" The author said that the assumption that the earthenware vases found built into the walls of several churches, not only in England but in other countries, were used for acoustic purposes was evidently based on a statement made by Vitruvius to the effect, as he (the author) understood it, that there were recesses made under the seats of the theatres, and in each of those recesses was placed a brazen vase with the mouth downwards, but supported at the front edge. Vitruvius remarked that he knew nothing of these vases himself, but that he derived his account of them from an old Greek writer. He also expressly said that there were none of these vases used in the Roman theatres. In the year 1861 the ancient monastery of the Celestins at Metz was pulled down by the French engineers. The author said he apprehended that no earthenware pots were found built into the walls, because the Metz archæologists made no mention of them. But the pulling down of the monastery led to a German archæologist taking up the study of the history of the monastery, and in the course of his investigations he discovered that one of the monks, under the date 1432, had recorded that in that year the Prior Ode le Roy introduced into the church of the monastery an arrangement of acoustic vases, having been greatly struck with the good effect of such a device in another church. A marginal note, attributed to the chronicler, said "Ecce risu digna." The Abbé St. Leger's work (1665), entitled "L'Apocalypse de Meliton," gave this instance of the neglect of their duties by the religious orders,—"Of fifty singing men that the public maintain in such and such a church, there are sometimes not more than six present at a service; the choirs are so fitted with jars in the vaults and in the walls, that six voices there make as much noise as forty elsewhere." A theory tracing such arrangements back to the ancient Chaldeans might be regarded as exploded. As had been shown by the editor of the *Builder* in 1857, the terra-cotta cones discovered by Mr. Loftus were constructive, not acoustic. Examples of acoustic vases belonging to Classic times had been collected by Mr. R. R. Brash. The greater theatre at Hierapytna, in Crete, had at least one row of bronze *echeia* or jars. At Lyttus there were three rows. Like provision seemed to have been made at Saguntum. The ancient theatre at Scythopolis, in Syria, had seven recesses for *echeia*, in the position indicated by Vitruvius, and like arrangements had been found in a theatre at Arizani, in Asia Minor. Coming to Mediæval examples of so-called acoustic vases, Mr. Hills remarked that they had all been found solidly built into walls,—a departure from the Vitruvian doctrine, suggesting a different purpose. Beginning with Continental instances, M. Stassoff, editor of the official archæological journal of St. Petersburg, was cited to prove that acoustic pottery had been found in a great many ancient Byzantine or Græco-Russian churches in his country. For Sweden and Norway, M. Mandelgren, a Swedish architect, claimed a pretty considerable number of churches furnished with earthenware pots built into the walls and vaults, with their orifices turned towards the interior of the building. One example cited by Mandelgren was the Church at Bjerejoë, a small vaulted structure very much resembling Kilpeck Church, Herefordshire. Passing on to France, where the evidence seemed wholly negative as to the survival of any fragment or trace of the pots put up by Ode le Roy in the Church of the Celestins at Metz, Mr. Hills said it was in April, 1842, at the Church of St. Blaize, at Arles, that the first modern French discovery of earthenware pots built into the walls was found. Of this a detailed description was given, after M. Didron, who called the pots found "cornets" of baked earth, and "pots acoustiques." They were shaped like the horns used by French herdsmen. The so-called acoustic pottery had also been found at Aberbrach, in Brittany, St. Martin, Angers, and Clisson. In Switzerland it was commonly said that numerous examples of acoustic pottery in walls were known. A few particulars were cited from Mr. Albert Way, F.S.A., and Dr. Keller, President of the Society of Antiquaries at Geneva. Crossing over from the Continent, Mr. Hills found one Irish and a few English instances, on all of which he dwelt. The Irish discovery was at the fine old collegiate church of St. Mary's, Youghal. The English finds of pottery built into church-walls were next spoken of in order, from the earliest at Fairwell, in Staffordshire, in 1771, to the latest, in 1878, at Leeds Church, near Maidstone. This last Mr. Hills elaborately described from personal examination of the site and all the architectural features and facts. Examples discovered between these dates were the pots found in the churches of St. Nicholas, Ipswich, where the discovery was made in the course of repairs going on about 1848–9; St. Peter Mancroft, Norwich, in 1852 (described and illustrated in the *Builder* for 1863, p. 893, by Mr. Makilwaine Phipson, to whom Mr. Hills expressed his indebtedness for much information); Fountains Abbey, Yorkshire, in 1854; St. Peter Mountergate, Norwich, in 1860; St. Olave, Chichester, in 1851; Upton, near Southwell, Notts, in 1863; Denford, Northamptonshire, in 1864 (illustrated in the *Builder* for 1864, p. 953); St. Clement, Sandwich, Kent, in 1869; East Harling, Norfolk, in 1872. In conclusion, Mr. Hills spoke as to the purpose of the embedded jars, reviewing the evidence for and against the acoustic theory, but inclining to agree on the whole with M. Didron, who deemed such an acoustic device quite childish, if not with the Metz chronicler's derisive judgment, "Ecce risu digna!"

In the discussion which followed,

Mr. Loftus Bröck, F.S.A., said the subject was one of great archæological interest. He thought it to be unquestionable that, rightly or wrongly, the earthenware vessels which had been found built-in in the walls of Mediæval buildings were intended by those who placed them there to serve some acoustical purpose. Most of the articles of pottery that were found did not seem to have been made for the purpose: they were the ordinary culinary vessels of the periods in which they were built in. It was noteworthy that so many specimens of earthenware vessels had been found in the walls of Norfolk and Suffolk churches. Possibly it would be found that the insertion of a few earthenware pots in the west wall of a modern church would effectually stop the echo which was so often found. An early volume of the *Builder* contained an account of the checking of a great echo in St. John's Cathedral, Antigua, by placing a screen of perforated boarding at the west end of the nave. He had in his own experiance found similar expedients to be effectual in attaining the same end, and therefore it was possible that there might be a practical outcome to the interesting archæological paper which had been read.

Mr. Joseph Clarke said that most of the earthenware vessels discovered during the restoration of St. Clement's Church, Sandwich, were filled with mortar.

Mr. Thomas Blashill said that not only vessels of pottery, but the skulls of horses, had been used in buildings with the view of improving the acoustic properties of a building. The skull of the horse was exceedingly cavernous, and therefore appeared to be well adapted to serve the same purpose as that which was intended to be fulfilled by the hollow earthenware vessels. Just thirty years ago he was at a large meeting at an inn in a place called Portway, a few miles west of Hereford. On that occasion the landlord stated that the floor of the room in which they were assembled was laid on horses' skulls, with a view, as he said, to improve the sound of the fiddle, the room being used at times for dancing. A few years ago, when he was in the neighbourhood, the inn was being altered and pulled about, and the workmen having come upon these skulls (which were, he understood, found to be secured in three rows to the under side of the floor by screws), they had decorated the top of each of the scaffold-poles with a skull. Unless he was mistaken, a similar use had been found to have been made of horses' skulls in Lancashire.

Mr. Arthur Cates, in proposing a vote of thanks to Mr. Hills for his interesting paper, said that besides the openings found in the theatres at Saguntum and elsewhere, there was another curious instance which might serve to throw some light upon the principles which guided the Swedish architect who devised the vault of the church at Bjeresjoë with its five rows of vases, one row being along the apex. In one of the early editions of Terence, there was a sort of introductory notice by a commentator, who mentioned the use of vases of brass for the purpose of increasing the sound. He wrote: "In certain temples of antiquity which have come down to our time, there are, at the foot of the vaults and at the upper part, rows of cavities in which brazen vessels were placed, with the mouth turned outwards, which served to increase the distinctness and the melody of the voices of those who sang within the temple."

Mr. Charles Fowler said that Mr. Hills had not mentioned any pre-Roman examples of the use of such vases as were mentioned by Vitruvius for acoustic purposes. One such example occurred to him, however, and that was the theatre at Taormina. When he visited Taormina thirty or forty years ago the acoustic properties of the theatre seemed to be very good, notwithstanding the imperfect state of the building. Some of those present would remember possibly that the late Professor Cockerell intended,—if he did not actually do so,—to apply vases for acoustic purposes, in a concert-room at St. George's Hall, Liverpool, the vases being placed under the seats, which rose one above another as in a Greek theatre.

The Chairman said he thought the vases were placed in the ceiling?

Mr. Fowler said that was the case in the large hall, and the arrangement was due to Mr. Rawlinson, the engineer, but he was referring to a concert-room, of which he remembered seeing Cockerell's working drawings.

Professor Kerr said that in the music of the ancients the scale was different to that which we used. The scale which the ancients used was that furnished by the black notes in our pianofortes, and it produced music in a minor key. It occurred to him that the bells,—for such they really were,—which Vitruvius described, might really have served the purpose for which they were stated to have been used,—that of producing resonance.

Mr. Stannus suggested whether the pots found with perforated bottoms might not have been used for purposes of ventilation.

The Chairman, in closing the discussion, said that a few months ago he was in the ancient theatre at Argos, which was 500 ft. diameter,—the orchestra (the part in which the chorus used to perform) being itself 200 ft. in diameter. He and some friends who were with him tested its acoustic properties, which were found to be remarkably good. In regard to Fountains Abbey, a very good account of the acoustic pottery found there was contained in the reports of Lord de Grey.

Mr. Hills, in acknowledging the vote of thanks accorded to him, said, that whatever might have been the actual result, he believed the Mediæval pots which had been described had really been intended to improve the acoustic properties of the churches in which they were found.

IN AND ABOUT THE TEMPLE.

If Charles Lamb or any other past frequenter and admirer of the Temple could rise from the grave and observe how rapidly its features are changing, he would doubtless regret that its quaint and somewhat sombre characteristics are leaving it. In truth, in few parts of London, considering the space, have the changes recently been greater than in the Temple. At the present time, perhaps, the more noticeable point in connexion with it is the variety of architecture that is to be found there. If variety is charming in architecture, as it is supposed to be in other things, there can be no question that the Temple should excite admiration. For our part, we are somewhat doubtful if so much variety in such close proximity does not spoil the general harmony of character which should be one of the most attractive features of such a place as the Temple. As we all know, there is, first of all, the celebrated church, with its severe and simple Norman and Early English styles; then, close beside it, on the south, is the square and grimy red brick block known as Lamb-buildings; whilst immediately opposite is the new Hall of the Inner Temple, in the Decorated

Gothic style, in grey stone. Joined on to this, and of the same material, is the library of the same Inn, in a more domestic style of Gothic, and still in progress is the new extension to the library, forming a northerly wing and joined to the clock-tower. But here is again a diversity, because this new building is red brick with stone windows and facings, and by no means in the same style as the building of which it is to form a part. But what strikes the observer is that it would have been more productive of architectural harmony if the new addition had been in the same material and more nearly in style an approach to the existing library, and had also been designed so as not to have been overpowered, so to say, by the clock-tower of the library. Opinions may differ, but we give this as a criticism which may be worth consideration, because it is quite clear that building operations in the Temple will not yet cease, and care should be taken to make whatever is erected worthy of so famous a spot. To turn now to another part of the Temple, the late Mr. E. M. Barry's block of buildings known as Temple Gardens, which has its main front to the Embankment, and which is in the style of the Renaissance, florid and elaborate in detail. There can be no question that this is a successful work, regarded from the Embankment; it is a valuable addition to London. But unfortunately it forms an end to the grey pile of Harcourt-buildings, and, seen from the Temple, it dwarfs this block and is quite out of keeping with the rest of the architecture in the Temple. Taken alone, there can be no question about its attractive and handsome character; taken with the rest of the Temple and that part which it joins, there is a distinct sense of incongruity about it. Nor internally is it quite as well planned for the purpose for which it is required as could be desired. The turrets at the corners give spaces which are very odd and almost useless, and many of the rooms are too large for their use. The great desideratum of chambers in the Temple is that they should be moderate in size. When it is remembered that for a fair-sized room on the first floor the rent is about 60*l.* a year, and that large rooms are not of practical utility for a barrister's work, the importance of keeping the rooms of moderate proportions is very great. But the most remarkable thing in the way of building has recently been achieved by the authorities of the Middle Temple. Between the north-western end of the late Mr. Barry's Temple Gardens and the southerly end of a three-storied red brick block known as Plowden-buildings until lately was a small open space. Here, however, has just been erected a small block of buildings in grey stone, in the Perpendicular style, much lower than the so-called Temple Gardens, so that the northerly end wall of the Temple Gardens stands up far above the new block quite naked, so to speak, and dwarfing the new-comer in the most marked way, who looks as if he had dropped from the skies, having no relation to his neighbours either in size or style. The Temple is a spot where the building capabilities are almost unique in London, and it is melancholy to see such want of taste as is exhibited by the erection of the new block. We have criticised Temple Gardens in regard to its want of accord as a single building with the general style of the buildings in the Temple, though we have expressed our admiration of it; but of this new addition no good word can be said. Something, indeed, has been said about certain claims in respect of light to buildings across the roadway, but we cannot think that there would have been any substantial deprivation of light caused by a higher building; nor can we believe that the authorities of the Inner Temple would have so little regard for the beauty of the Temple as to let any narrow feeling of jealousy of the Middle Temple induce them to prevent the erection of a fitting continuation to Mr. Barry's handsome block, even though it might render somewhat less valuable their rooms which front the roadway. Assuming even that their back rooms were somewhat darkened,—though they would not be more gloomy than dozens of other rooms in the Temple,—yet the Temple generally would have gained by the additional stories to the Middle Temple. If any such course, however, has been taken by the Benchers of the Inner Temple, it is another sign that the Inns of Court should be ruled by a representative committee from all ranks of the members, not by a self-elected body of Benchers, who are either too busy to attend properly to their work, or have lost touch of the general feelings of the members generally, and are an age behind the time. Nor have the Middle Temple authorities been happy in Fountain-court. They recently purchased a house or houses fronting on Essex-street, and with the back looking on the well-known fountain of the Temple. In front of this newly-acquired property they have placed a building with a ground-floor only and a flat roof, most common-place in character, thereby losing the opportunity of increasing the general space round the fountain and adding a thing certainly not of beauty, but of ugliness, to the Temple, and exhibiting a want of taste which one might have hoped,—looking to the pecuniary resources of the Temple and the character of the gentlemen who are its guardians,—would have never been allowed, especially as the amount of room gained by this single bit of building is very small.

Connected also with the Temple is another point of practical importance, namely, the necessity of a connexion in the nature of a subway between it and the New Law Courts. The crossing of Fleet-street is a most tedious business at the best of times, and when it will have to be done constantly by lawyers with bags, books, and often with flowing gowns, on wet days, it will be simply an intolerable vexation. It would be perfectly feasible to make a short subway from Middle Temple-lane, and we feel convinced that it is only a question of time. But we would urge that it should be undertaken at once for the purpose of professional and public convenience, and that it should not be postponed till the demand of the lawyers and the public makes it necessary to neglect it no longer. As soon as Fleet-street is widened, as it soon will be, at its commencement, the need will be greater than ever, and the difficulties of the transit increased. Therefore, again we say, let a subway be made at once.

RAILWAY DEVELOPMENT.—NEWHAVEN HARBOUR.

A GREAT WORK IN CONCRETE.

The vast extent to which railways and railway traffic have been developed, within say the last thirty years, would be almost incredible if not attested by official documents of indisputable authority. Mr. James Allport, of the Midland Railway Company, a man of large and accurate railway knowledge and experience, has recently given the public a series of carefully-prepared tables touching the growth of railway traffic. These tables and accompanying letters have appeared in the *Times*. It appears from these that in 1850 the total length of the railways in England and Wales was 4,679 miles; in 1880 it was 12,547 miles. The number of passengers carried at the one period was 58,514,134, and at the other 540,669,175, or nearly tenfold. The receipts from passenger traffic were, in 1850, 5,888,600*l.*; in 1880, the receipts had risen to 20,341,096*l.* The 7,868 miles of additional line, made or opened between 1850 and 1880, involved, of course, many important and costly engineering and structural works in tunnels, cuttings, embankments, viaducts, bridges, station buildings, grand hotels, &c. In the former class are the heavy works on the Settle and Carlisle line of the Midland Company, the direct South-Eastern, *viâ* Tunbridge, and many other new lines that might be named. As regards stations and hotels connected with them the period includes the erection throughout, or the remodelling and enlargement of the Charing-cross, Cannon-street, St. Pancras, Liverpool-street, Holborn Viaduct, Waterloo, London Bridge, Euston, and King's-cross stations. Great works in the same direction have also been executed in joint stations, at Carlisle, Leeds, Liverpool, Manchester, Birmingham, and other provincial towns.

The works referred to have been executed, for the greater part, for the accommodation of traffic within the confines of the United Kingdom, but the boldest projects of some of the companies whose lines radiate from London are undertaken with a view to the creation and fostering of an interchange traffic with places beyond these confines. The companies are not content that their termini should be fenced in by the seaboard, and having conveyed their train-loads of passengers or goods to the English ports by their steam-horse, they provide their fleets of marine locomotives to carry them traffic across the North Sea, the Straits of Dover, and the English Channel, and to bring thence return freights. The important harbour works of the London and North-Western Company at Holyhead, that were for so many years in progress, are not perhaps quite in this category. The main object for which these great works were undertaken was, we believe, to perfect the company's Irish Express Mail, passenger, goods, and cattle service, now one of the most superb known in any part of the world. The Great Western does also a large Irish carrying trade to and from the fine docks at Milford Haven, but there is no Continental traffic worth mention west from Plymouth or north from the Land's End. The Great Western Company make use of Weymouth to do a large carrying trade with the North-western Provinces of France, and the South-Western Company do the same *viâ* Southampton; but the great bulk of the passenger and fast traffic between the south, south-east, and east of England is done by other companies and through other ports, as by the Brighton Company between Littlehampton and Honfleur, but much more extensively between Newhaven and Dieppe. The South-Eastern Company has its ports for departure and arrival at Folkestone and Dover, and is about to have its Port Victoria at the mouth of the Medway. The Chatham Company also uses Dover Harbour, and Queenborough, near the confluence of the Medway with the Thames, on the opposite bank from its new rival, Port Victoria. Turning up the Thames, the enterprising Midland Railway Company, the whilom "Midland Counties," which was extended to London some years ago, has now almost completed its own extensive dock, harbour, and warehouse system, at Blackwall, on a costly property bought from Messrs. Money Wigram & Co., and it is not at all improbable that the company that commenced by doing a little railway traffic between Derby, Leicester, and places at a moderate distance from them, may have ere long its fleet of powerful steamers for Continental traffic. The Great Eastern Company, as is well known, does a very large Continental carrying trade *viâ* Harwich.

Obviously the necessity of waiting for the tide must be a great annoyance to passengers, and detrimental to Continental traffic by a line of communication that is handicapped with such necessity. The South-Eastern Company, by the construction of the new pier, of which the Prince of Wales laid the foundation-stone at Folkestone the other day, intends to get quit of this disadvantage; and the Brighton Company is executing the bold and costly project they have in hand at Newhaven, in order that they may be able to take out of port, or bring in, their steam vessels, whether freighted with passengers, "perishable cargo," or both, at any time or state of the tide.

Newhaven is situated at the mouth of the Sussex river Ouse. It has not always had this name, and the river has not always disembogued at that place. In a time long past a violent storm altered the course of the river, which forced out for itself a new channel at the place where it has ever since flowed into the sea. The old channel, some three miles to the east, at or close to Seaford, got completely filled up, and became "Old-haven," and the new creek became "Newhaven," formerly Meeching. Seaford was at one time a place considered of sufficient importance to have two representatives in the House of Commons, but was shorn of them after the passing of the Reform Bill in 1832. Newhaven increases, and is certain in the future to increase greatly, but Seaford does not necessarily decrease; it is a very pleasant little town, rapidly growing in favour as a place healthy for residence, and as a pleasant summer resort. The spirited directors, general manager, and accomplished staff of the London, Brighton, and South Coast Railway Company have astutely adopted Newhaven as a port through which to interchange French traffic. Notwithstanding the harbour defects, that they are removing with so much energy and enlightened enterprise, the carrying trade of the company, and through the port, keeps largely and continuously increasing. Newhaven is the nearest place to London on the seaboard at which the construction of a good harbour is possible. It, as well as Dieppe, the companion French port, is almost on a straight line drawn from London to Paris, and the route is, in land and water mileage, the shortest between those cities. It would be safe to predict that on the completion of the harbour works the place will become of considerable commercial and maritime importance. The route from Dieppe to Paris is very attractive from its varied beauties.

The "formation" at the *débouchure* of the Ouse at Newhaven is peculiar. A considerable area on the east bank is flat marsh land. On the western bank a spur from the South Downs bends round as a high ridge that terminates abruptly at Harrow Head, close to the mouth of the river, or of the harbour as it is now. The end of the ridge, Castle Hill, is surmounted by a fort, that has on its inner sides an imposing and picturesque feature in its wide and deep moat. An excellent view of the harbour works in progress, and of the harbour, the site of the proposed dock, and of the surrounding country, with Seaford in the middle, and Beachy Head in the boundary distance, is obtained from the Castle Hill. Inland, behind the ridge, there is a considerable area of flat land well adapted for future dock or harbour extension. On this, the west side of the harbour, are the little town of Newhaven; a large timber pond; the bonded warehouses, custom-house, coast-guard station, and various other public and private buildings, the latter including a little hamlet of white huts that have been put up for the men employed on the harbour works and their families. On the opposite side of the harbour are the railway company's wharf, 800 yards long, the railway station, the company's fine hotel,—the London and Paris,—the company's engine and boiler works, with their 80-ton shears on the wharf; and, beyond these, the gasworks, engine-sheds, &c. A very wide swing-bridge, laid with a tramway, crosses the harbour close to Newhaven town. We noticed several sailing and steam vessels of considerable tonnage lying above the bridge in a fine sheet of water.

For the first quarter of the present century Newhaven was quite unworthy, either from width of entrance, depth of water, or for facilities for loading or landing passengers or cargo, to be called a harbour. It was merely a tortuous, narrow, shallow stream, that deposited some of the silt it brought down in its own bed, and, intermittently, sent down a portion to meet the shingle carried along by the tide, with which the silt united to form a bar at the entrance. The flow of the tide that brings the shingle is from the westward. The strongest gales experienced on this part of the coast are from the south-west and west. The rise of the tide, it may be mentioned, is 20 ft. at ordinary spring and 15 ft. at neap tides.

Many attempts have been made to improve the harbour, and eminent engineers have been called in from time to time to advise and report upon the means to be adopted for the purpose. In 1810 Rennie, the engineer, made a survey and reported upon the then existing state of the harbour. At that time, as he reported, there was only a depth of 12 ft. instead of 20 ft. at high-water spring tides, at the entrance to the harbour, and within half a mile from its mouth. He recommended certain works, including the construction of a pier or breakwater, widening and deepening the harbour, erecting wharfs, &c., at an estimated cost of 200,000*l*. No action was taken on his report and recommendations. At that time the management of the harbour was vested in the Upper and Lower Ouse Navigation Commissioners. In 1847 they were superseded by trustees, appointed under an Act passed for the improvement of the harbour. The trustees in their turn, made way under an Act passed in 1878, by which the management was transferred to the Newhaven Harbour and Dock Company that was then formed. If we mistake not, the directorate of the Harbour and Dock Company and of the Brighton Railway Company are pretty much "one concern."*

The harbour improvements, executed prior to 1878, were all in the right direction, and necessary parts of a large, bold, skilful, and complete plan for the enlargement and permanent improvement of the harbour. Such a plan was in that year adopted in its entirety, and the works were entered upon in accordance with the recommendations and designs submitted with a report by Mr. F. D. Banister, engineer-in-chief of the Brighton Railway Company. They are being carried out with great ability and vigour under the superintendence of Mr. A. E. Carey, resident engineer. Mr. Banister states frankly, and with becoming modesty, that his recommendations are almost identical with those made by Mr. Rennie in 1810, and by Sir Robert Peel's Commission in 1844, whose report stated that "Newhaven is a convenient tidal harbour, and may be considerably improved inwardly, as well as by carrying out a breakwater from Harrow Head into a depth of three fathoms at low-water spring tides, by advancing the piers seaward, giving a wider entrance, and dredging the channel between them." These, *inter alia*, are the important works in progress, the breakwater being the most noteworthy of all.

The flow of the tide that bears along the shingle that forms the bar at the mouth of the harbour is, as we have said, from the westward, and on that side of the entrance the breakwater is in progress. In front of the cliff that abruptly ends with Castle Hill there is a considerable stretch of artificially-levelled area that will, in time, be found very valuable for divers uses. This area has been filled in with chalk taken from the cliff; it is faced to the sea by a strong sea-wall of concrete that is about 1,200 ft. long, and stands about 6 ft. above high-water mark, and extends from the western side of the entrance to the harbour to the Fricker rocks; it curves to seaward at the west end, and the breakwater is its continuation. This important work,—the breakwater,—is to be 3,000 ft. long; about 270 yards of it, running direct out to sea, are built, and have withstood successfully many severe storms, including the memorable and terrible tempest of the 14th ultimo, to the full fury of which the structure was exposed, so to say, broadside on. The portion built is nearly straight; when further advanced the work will curve round to the east. The large water-area that will be sheltered by the breakwater, it may be here mentioned, will be dredged to a depth of from 12 ft. to 18 ft. at low water, and will certainly be resorted to as a harbour of refuge for the ships of all nations, there being no other on the south coast between Portland and Dover. Notwithstanding this almost certainly destined use, the harbour and railway companies have not received or been promised any Government subsidy, as is reasonably due to them.

In section, the breakwater has a foundation about 70 ft. wide, and about an average of 20 ft. deep from the bed of the sea to the level of low water. At this level the work is 40 ft. wide, and 30 ft. higher, or about 6 ft. above high water; the width is 30 ft.; but on the weather side a portion of the work is carried up 10 ft. higher. This portion is about 12 ft. wide at the base, and provides an arcaded covered way below and a promenade on the top, fenced on the outer side by strong and sightly iron rails and stanchions. The footway is about 16 ft. above high-water level of ordinary spring tides. The breakwater and sea-wall have a uniform batter of 1 in 8. At the outer end of the work there will be a lighthouse rising from a circular platform, about 18 ft. in diameter; it also will be of concrete, and have a total height of 135 ft. from the foundation at the bed of the sea, or 95 ft. above high-water mark. The arched openings are 6 ft. high in the clear, and 5 ft. 6 in. between the centres of the supporting pillars, that are 18 in. square, and are moulded in boxes close to the place where they are to be set up. They have plain capitals and bases, and are chamfered at the angles with short lengths of arris left at the top and bottom. A smooth-finished stair, with 12-in. treads and 8-in. risers, conducts to the promenade at the landward end of the breakwater. In this locality the concrete is prepared and carried out to the work in progress by a railway of 16 in. gauge,—Décoville's patent,—with automatic self-acting points, the handy little iron wagons used tipping their contents on either side as may be required. When the work is further advanced the materials will be taken out in a dry state, and will be mixed and wetted nearer the place where the concrete is to be used. The proportions of the concrete are,—one cement, two of sand, and five of gravel. At favourable times for working, nearly 500 tons of cement are used in a week. A large number of samples is taken from the bulk from time to time and carefully tested. The supply delivered is only accepted if the test is satisfactorily borne.

The operations connected with the submarine portion of the breakwater are specially interesting. Different methods have been adopted in the construction of such works; the great breakwaters at Portland, Plymouth, Holyhead, and other places have had the foundations laid upon the *pierre perdue* system, in which an embankment of loose stones is formed from the bed of the sea to low water by throwing in the material from stages erected for the purpose. The bank is allowed time to consolidate, and divers then dress the top and prepare for the deposit of the vast blocks upon which the superstructure is to be reared. Another method has been adopted at Dover, Cherbourg, and other places where large blocks of concrete have been employed for the foundations. In this system the disadvantages encountered have been the difficulty of making and handling under water blocks large and heavy enough to resist heavy seas, the necessity for staging to lower the blocks, and for the employment of divers to place them in position. Mr. Cay, engineer to the Harbour Board of Aberdeen, overcame these difficulties in building a breakwater at that port in 18 ft. of water at low tides; this was done without the use of stages, machinery for swinging the blocks, or the help of divers. The work has for eight years resisted successfully the heavy storms and seas of the north-east coast. Mr. Banister has adopted, with modifications and improvements, the system of Mr. Cay. So far what is practically a ridge of solid concrete 70 ft. wide and from low water level about 20 ft. deep, has been successfully constructed on the bed of the sea and carried out for about 1,000 ft.

Great weight and mass is a necessity in such work, and thoroughness and exactitude are essential in handling concrete. These *desiderata* are secured. As regards weight and mass the foundation-stones of the breakwater, using the term expansively, are 42 ft. long, 8 ft. wide, and 6 ft. deep; each of them weighs about 100 tons, and is worth between 30*l*. and 40*l*. The mixing of such a mass of materials by hand-labour with the necessary degree of rapidity is a difficult feat, and Mr. A. E. Carey, the resident engineer, was stimulated to the invention of a concrete-mixing machine driven by steam; in the production of such a machine he has been signally successful. The concrete-mixing house and machinery are situated near the entrance to the harbour. The proportions are thoroughly mixed by the machine, in a dry state; they are, by another operation, again mixed, with water added, the green unset concrete is next, shot down to the hopper of the steam barge waiting for it in the harbour below. The hopper is lined with canvas, and is of the dimensions above stated, 42 ft. long, 8 ft. wide, and 6 ft. deep. It is a little longer and wider at the bottom than the top to facilitate the discharge of the load. When the hopper is full, the canvas is laced up, and the barge steams out to the end of the breakwater, whence, by signals well understood by the workmen, the barge steams precisely to the place where the next great bagful has to be let down; the folding-doors at the bottom of the hold are opened, and the enormous mass drops into the place waiting for it and adjusts itself, before setting, to the situation. The concrete steam-hopper then returns to the mixing-mill for another load. By the method employed the services of divers and of stages are rendered unnecessary. One of these 100-ton blocks is turned out in about twenty minutes, about twenty-five labourers being employed in the work. The saving in time and labour by the use of the machine is very great, and the work is done more thoroughly and efficiently than it could be by manual labour. Upon the bags of concrete deposited, till they reach to above low water, the superstructure is built in enormous masses of concrete packed into wooden frames tied by iron rods. This work is accomplished to the level of high water in less than the interval betw en high and low water. The remainder of the structure is then added, about sixteen hours sufficing for the completion of a section. The successive masses are grooved and dovetailed into each other, so that the structure when finished is continuous. The foundation is now laid for more than 200 ft. beyond the point where the workmen are engaged on the superstructure.

Under agreement with the Harbour Company the Brighton Railway Company undertake the

* At a luncheon in the London and Paris Hotel, Newhaven, on the 13th ultimo, Mr. S. Laing, M.P., chairman of the Brighton Railway Company, presiding, The Right Hon. Sir Henry Brand, Speaker of the House of Commons, whose seat at Glynde is in the vicinity, replying to the toast of "The Newhaven Harbour Company" expressed his belief that the harbour had "a great future before it. The key to the strength of the harbour lay in the strength and security of the breakwater. No one who had visited it repeatedly, as he had done during the last eighteen months, could be otherwise than satisfied with it. It had withstood a great many serious storms, and, so far as they could judge, it would be one of the permanent institutions of the country. Having obtained a safe defence to the entrance to the harbour through that breakwater, he had not the slightest hesitation in saying that Newhaven—depending very much on the fairness of the railway company—would become the Liverpool of the south; he had no doubt of it himself; it was a question of will on the part of the railway company."

duty of dredging the harbour and the bar, and in this they have constantly at work two powerful dredging machines. One of these delivers into barges that convey the silt to sea. The other is a hopper-dredger, worked by a pair of 35-horse-power engines, and when at sea by twin-screws. It is capable of removing at one trip 500 tons of silt or shingle, and depositing it out at sea; it was built for the company by Messrs. Simons & Co., of Renfrew. During the last half-year 118,600 tons of mud, &c., were removed by the dredgers.

An eastern quay, about 1,650 ft. long, is nearly complete. The two entrance-piers will probably be finished in about twelve months, and the 24-acre dock some time thereafter. The entrance will be widened to 200 ft. For several years past from 500 to 700 men have been employed upon the works, which will not be completed for several years to come. The consumption of timber in the new entrance piers is very great. It is imported from Norway direct in shiploads.

The directors and all concerned may be congratulated upon the energy and success with which these works are being prosecuted. Whether Newhaven will ever be the "Liverpool of the South" remains to be seen; that its harbour has a "great future before it" seems certain."

THE CASTLE HILL, GAINSBOROUGH.

About a mile and a half north of the ancient town of Gainsborough, on the right or east bank of the river Trent, which there divides the counties of Lincoln and Nottingham, the high ground from the east ends in a sort of rounded bluff towards the river, and forms a noticeable feature in a county much of which is exceptionally flat. For about a quarter of a mile or so this ground is occupied by Thonock Park, but at its head, towards the river, it is covered by earthworks of considerable mass and extent, and which, though obscured by trees and brushwood, appear to be tolerably well preserved. The main work, that which occupies the brow and western slope of the hill, is in form concentric, the innermost and highest area being contained within a bank of earth, now about 8ft. high, outside and at the foot of which is a deep and broad ditch, in breadth about 40 ft. and about 20 ft. deep from the top of the bank, and with a counterscarp of about 10 ft.

Near to and outside of this ditch, is a second bank of earth, and beyond it a second ditch, the two being about the same dimensions with the inner works, with a rather lower bank, so as to be commanded from the interior. Beyond this again, but about 30 yards in advance of the second ditch, is a third bank, and beyond this a third ditch, which seems to be the outer defence of the place. The entrance is by a succession of three causeways of earth filling up the ditches, and connected with as many cuttings through the corresponding banks. This entrance is probably original. It is on the south side, and runs nearly directly through the defences, or rather with much less obliquity than is usual in hill camps. So far as could be observed through the brambles the figure of this entrenchment is rudely circular, but this figure seems due rather to the configuration of the ground than to any setting out with regularity. It was evidently intended as a camp, not as a regular dwelling. It has nothing of the character of a Saxon Burh or moated mound, but much more resembles an entrenchment such as the Britons would have thrown up to accommodate a tribe.

It appears, however, that this earthwork is far later than the British period, and the work of invading Danes. For Gainsborough has a history, some of the particulars of which extend to its contiguous villages. Gainsborough was one of the points whence the Danish invaders overran the districts of Lincoln and Nottingham, and whence they ruled the country they had conquered. Early in the eleventh century Sweyn or Swend, son of Harold Blaatand, and king of Denmark, was known and dreaded on the eastern and southern shores of England. His galleys, from the Humber, ascended the Trent, and in 1013 he established his camp at Gainsborough, and there received the submission of the five boroughs, and thence proceeded in his invasion, which speedily became a conquest, of England. His tenure, indeed, was of the briefest, for in February, 1014, he died at Gainsborough, and it was there that his followers hailed his second son, Canute, as his successor in England. Local and very probable tradition attributes to Swend and Canute the formation of the Thonock entrenchment.

Besides this principal earthwork others of a different character are described as existing and connected with it on its upper or eastern side. One is said to be oblong, and tending to the rectangular in figure, and about 150 yards by 50 yards in area. And this is on that account supposed to be Roman. There is also said to be a smaller camp, also rectangular, with a length of 80 yards, but the breadth of which has not been ascertained.

Unfortunately all this ground is carefully fenced and guarded, and has much the aspect of a favourite pheasant preserve, so that the passing traveller has no chance of giving it a proper examination; but it is probable that if the Lincolnshire Society were to make a proper application a careful and correct survey might be laid down of these earthworks, one of which, it may fairly be concluded, is not inferior in interest to any remaining in Britain.

October, 1881. C.

THE "HOMES" OF THE LONDON POOR.

Two inquests held last week illustrate the wretchedness which surrounds the lives of the very poor in London. No doubt many of the worst "rookeries" which existed thirty years ago have been removed, but that much remains to be done in this direction is only too evident to all who have looked into the matter.

The first inquest was held by Dr. Danford Thomas, at the Middlesex Hospital, on the body of Alfred Coombes, aged four months, the son of a music-printer, living at a house in Newman-street, Oxford-street, who was asphyxiated. Evidence was given showing that the parents lived in a wretched room in the basement of the house, sleeping in the same bed with the deceased and another child, a third child also sleeping in the room. Dr. Whitefield, assistant divisional surgeon of police, said that the deceased had died from suffocation, and the death was partially owing to the state of the room in which the parents lived, which was totally unfit for human habitation. The poorer classes were now, he added, a great deal worse off than they were before the metropolitan improvements and the Peabody Trust were carried out. In reference to that trust he could not help saying that it had been worse than useless. The money left by the American philanthropist had been scandalously abused. Instead of finding the poor and needy in the Peabody Buildings, the better class of artisans, earning 2*l*. or 3*l*. per week, were in possession of the rooms. The abject poor, and their ill-clad, half-starved children, still inhabited the styes to be found all over the metropolis, and still generated those pestilent diseases which over and over again claimed their thousands of victims.

The other inquest was held by Mr. Samuel F. Langham, Deputy Coroner for Westminster, at St. Martin's Vestry-hall, Strand, touching the death of William Howard, aged eleven months, lately living with his parents in Hanover-court, Long-acre, who died, it was alleged, from the unhealthy and unsanitary condition of the house. The mother of deceased said that her child had been sickly from its birth. At about seven o'clock in the morning deceased was taken with a fit, and it rallied until ten o'clock, when it had another. She had no time to go for a doctor, but a neighbour went for one. Deceased died in half an hour. The mother said she believed her child had died from the stench that came from the water-closet and yard. She had not made any complaint to the landlord until after the death of the deceased. The water-closet was outside the house, near the window. The cistern was right underneath the window, and near the dust-hole. Night-soil had been put from the closet into the dust-hole. There was no lid on the cistern. Mr. Robt. W. Dunn, a medical gentleman, deposed to having attended the house and finding the child dead, the cause of death being convulsions. Several people in the house complained of the unhealthy state of the place, which smelt of sewage. It made him sick when he entered. The foreman of the jury said that Hanover-court ought to have been shut up long ago. There are officers paid for looking after these fever dens, and they ought to be made to do it. The jury returned a verdict in accordance with the medical testimony, adding that the attention of the medical officer of health should be called to the state of the houses in the court.

The *Daily News*, commenting on this subject, says,—"So long as landlords are allowed to take rent for dwellings which are unfit to be inhabited, so long these abominations will continue to exist. If a tradesman is fined for selling adulterated milk, or bad meat, or unwholesome fish, why is a house-owner permitted to sell unwholesome lodgings with bad domestic arrangements, and water and air full of the foulest adulterations? This question is everywhere asked by those who know a little of the horrors which lie behind the house fronts in many of our streets."

MONUMENT TO COMMEMORATE THE DEFENCE OF PARIS IN 1870.

The piece of sculpture which certainly attracted the most attention in this year's *Salon* was the group by M. Barrias, "The Defence of Paris in 1870," of which we now give a view. M. Barrias obtained the first prize in a competition opened by the municipality for the best group to commemorate the above event. The figure of Paris, grand and vigorous, is represented as a young woman dressed in a military coat, and standing in an attitude of determined defence; in the right hand she holds a sword, while with the left she grasps the national colours, appearing to shield them with her body. At her feet a wounded national guard, reloading his gun, supports himself against her; on the other side, a woman, representing the country mourning, is sitting, with arms crossed, in an attitude of disconsolate grief. The *ensemble* is noble and picturesque. On looking attentively at the face of the wounded National Guard one can see that M. Barrias, with the sentiment of an artist, has intended to honour the memory of the deeply-regretted painter, Henri Regnault, killed while fighting for his country on the fiercely-contested slopes of Montretout.

The group will be erected on the Rond-point at Courbevoie, replacing the statue of Napoleon I., which was pulled down and thrown into the Seine on the direful 4th of September. The municipality have not yet decided whether to execute the group in marble or bronze; opinions incline towards the latter.

SALE OF SOUTH METROPOLITAN GAS STOCK.

The gradual introduction of the electric light invests with interest an extensive sale of stock in the South Metropolitan Gas Company, which took place a few days ago at the Auction Mart, Tokenhouse-yard. The property offered comprised 20,000*l*. of the ordinary "C" stock of the company, being the second portion of additional capital authorised to be raised in pursuance of the Company's Act of 1876, and the scheme for the amalgamation with the Phœnix Company. The stock offered was divided into 200 lots of 100*l*. each. Mr. G. A. Wilkinson, of Bucklersbury, who conducted the sale, said a dividend was payable since the price of the company's gas had been reduced to 2s. 10d. per 1,000 ft., adding that it was confidently expected that further reductions in price would take place, resulting in an increase of dividend of 5s. per cent. for every 1d. reduction. The company's reserve fund, which last year was 183,000*l*., amounted now to 190,000*l*., which was a tolerable guarantee for the maintenance of the dividend. He said that the stock would be sold with dividends accruing as from Friday, the 11th inst. The several lots were then submitted, the purchaser of any one lot having the option of taking four more at the same price. The first lot submitted was sold for 195*l*. (the purchaser taking four more lots), which represented a premium of 95 per cent. The next fifteen lots were sold for 194*l*. each, followed by twelve others at 193*l*., and thirty-three succeeding lots at 192*l*., 191*l*., and 190*l*. each respectively. From this point the prices fell gradually from 189*l*. to 181*l*., all the lots being sold. The total proceeds of the sale amounted to 36,355*l*., showing an aggregate premium value of 16,355*l*. or about 82 per cent.

The Chevalier Benedetto Albano is reported to have died in London on the 7th inst., at the age of eighty-five. He converted the old Covent Garden Theatre into an opera-house, and was for some time architect to the Board of Works at Paris and Madrid.

A DADO AND BORDER.—Designed by Geo. C. Haite.

PROPOSED HOUSE, WOODFORD, ESSEX.

This house is about to be erected from the designs of Mr. Henry Shaw, architect, of New Broad-street. The materials to be used are picked stock brick hollow walls, with red brick quoins and dressings up to first floor level; the first floor being in timber and plaster finished rough cast. The upper story in gables and under eaves will be in half-timber work; the whole roofed in with Bridgwater tiles.

HOUSES NEAR WIMBLEDON.

These houses, with slight alterations, are being erected from the designs of Mr. Henry Shaw, architect. Mr. Holloway, of Marmion Works, Lavender-hill, Wandsworth-road, is the contractor. We give a plan of one of them.

DESIGN FOR A DADO AND BORDER.

This design for a dado and border may be described as in the Egyptian style of decoration. It is suitable for printed wall-paper or stencilwork, and would adapt itself readily to any scale required. The lotus flower and leaf selected as the *motif* have been adopted from the lotus-flower so frequently used by the Egyptian painters and sculptors, and to be seen upon their sarcophagi and mummy-cases.

While studying these objects, and examining them for an example of the leaf of the lotus, their favourite flower, the designer was struck by the rarity of its occurrence. Although the flower is used so frequently, the use of the leaf is in comparison exceedingly rare. The best example discovered was pictured as springing from the mouth of a fish. Here there were two leaves, one on either side of a flower. On this example is based the leaf and treatment in this design.

Although a pattern of this kind would look well and complete in a single print, as red or gold on black, yet by the careful introduction of colour, a rich and satisfactory result could be produced. But the colouring of a design of this severe nature would require the most judicious care. It would be by far the best and most safe plan to keep to the Egyptian key of colour, while to ensure a perfectly satisfactory result, the colourist should be conversant with the principal Egyptian colours and the method of their use, or the repose of the pattern,—its greatest virtue,—would be lost. To give a key of colour, as far as words can convey, we should advise the flowers to be in a dull Indian or Venetian red, the smaller petals in a deep brownish ochre, leaves in a dull sage-green, the whole outlined with the background, which should be black, or a very deep brown or red. In the border the same colours might be used a trifle brighter, and a well-broken white introduced. As to its application, it would be best suited for a library, dining-room, passage, entrance-hall, or places of the like description, but its use would necessarily be of a somewhat restricted nature, owing to the severity of its style and treatment.

While speaking of the Egyptian style for decoration, let us say that it is to be regretted that this, the foundation and fountain of all decorative art, should be so little known, and still less appreciated.

A lecture-hall decorated in this style would possess an air of repose and solemnity that no other style or treatment could give.

FULHAM INFIRMARY COMPETITION.

The Guardians have adopted the report of their referee, Mr. H. Currey, and have awarded the first premium (100 guineas) to the design marked "Experience," and the second (50 guineas) to "Simplicity." The authors of No. 1 are Messrs. Giles & Gough, 28, Craven-street, Strand.

The referee, in his report, says the design, "Experience,"—

"Has been carefully worked out. The arrangement is very simple, admitting of easy supervision, and ready communication with the different departments. A straight corridor running the whole length connects the different buildings, which are laid out in what is technically called the pavilion principle. All sanitary requirements have been fully observed. The dimensions of the blocks for the patients have been generally determined by the Instructions, but the size of the administrative department has been left to the discretion of the architects. This appears to me to have been provided on a judiciously ample scale sufficient to meet the requirements of the future extensions, which have been also duly considered."

BUILDING STONES OF SCOTLAND.*

No inquiry can be more interesting or of greater importance to the architect and builder than that respecting the nature of the material which they have to use in the buildings they may be entrusted to design and erect. From the Solway on the south to the Pentland Firth on the north this country is full of a variety of rocks suitable for building purposes, and this is shown by the massive, elegant, and enduring structures of past ages, edifices of so much value both historically and architecturally. When the appliances for quarrying were of the most primitive kind, and the means of conveyance to any distance a work of great difficulty, the architect was forced to adopt a style of building suited to the material nearest at hand; but now, with railways interspersing the country, he is not tied down to any particular stone or material, but may adopt that which he finds best suited for his purpose. What the architect has to look for is a stone that will be durable, strong, and of a colour which will best bring out the architectural features of his design. With the view of noticing stones that have been used in some of the oldest structures before referred to, as well as those of more modern date, I have had cubes of sandstones and granites prepared, so as to bring before the Association in a practical way some information respecting those stones most useful for building; and, to do so, I would begin by noticing the building stone that has been used in our own city. In the older buildings, such as Heriot's Hospital, Holyrood, and the residences of the Old Town erected centuries ago, the supply was drawn from quarries in the immediate vicinity, an example of which is shown in specimen No. 1, taken from the old red sandstone found on the southern side of the town, which has been tested by time, and proved to be of the most durable kind. In the New Town, when quarrying appliances were better understood, other quarries were brought into use, such as Craigleith, Ravelston, and Redhall. These were chiefly used before the canal and railways afforded means of bringing stone from greater distances. Then Binnie and Humbie by the canal, and later on by railway such quarries as Dunmore, Polmaise, and Plean in Stirlingshire, Dalmeny in Linlithgowshire, Fairloans, near Hawick, and the quarries of Lanarkshire, such as Overwood, Giffnock, Auchenlee, and Dalzell, specimens of which are now before you. The respective qualities of the stones I have referred to I will now notice; and taking together Craigleith and Redhall, as occupying the same position geologically (being of the lower sandstones of the carboniferous strata, or perhaps better known as the carboniferous limestone groups) their analysis may be taken as an index of what goes to constitute stone of the most enduring kind, viz.:—

Silica	98·3
Carbonate lime	1·1
Iron and alumina	0·6
	100

To specify examples of these in the city, as affording proof of their durability, I would notice:—1. Craigleith, as shown in the Old University, and many of our finest squares and streets in the northern portion of the New Town, while a notable example, not only of the stone, but of what I consider the best masonry in the city, is the tenement at the northern corner of Randolph Cliff. 2. Redhall.—St. Paul's, in York-place, and St. John's, in Princes-street, as public buildings, are good specimens of this stone as to durability and quality, the carving on them being as sharp now as the day it was chiselled. 3. Humbie and Binnie quarries belong also to the carboniferous limestone group amongst the shales. The Humbie stone was greatly used some thirty-five years ago, and specimens of it are to be found all over the city, but it was abandoned through being unable to compete with other quarries. 4. Binnie may be set down as a stone of the first-class. The first prominent specimen of it was the New Club in Princes-street, built about forty-five years ago, and adjoining it the palatial building of the Life Association of Scotland. The following public buildings were also taken from it, viz.:—Scott's Monument, National Gallery, the Bank of Scotland, British Linen Company's Bank, Commercial Bank, Donaldson's Hospital, and the Post Office. Owing to this quarry being situated among the shale beds, the best fakes are saturated with bitumen, and this is so abundant that I collected a quantity and sent it to the Exhibition of 1851 in the shape of black candles, which the jurists simply noticed in a very short paragraph. Stones that have been extensively used since the advent of railways are those of Dunmore, Polmaise, and Plean. These all belong to the upper part of the carboniferous limestone group, the two former, however, lying above the Plean sandstone. These stones have been greatly used, not only in this city, but in Glasgow, and from Stirling northwards. They are pure sandstones, having a large proportion of silica in their composition. Buildings from Dunmore are the New Post Office, Bank of Scotland, Merchants' House, and Union Bank extension, Glasgow. These stones are preferred for their pleasing colour and durability, while the cheapness of dressing them overcomes the expense of bringing them from such a distance. The Dalmeny stone is of more recent introduction, but perhaps one of the best tests of its durability is that of Dalmeny Chapel, which was no doubt built out of the same strata, so long ago that little or nothing is known of its history except what can be obtained from its architectural character. Another stone in the immediate neighbourhood is that of the Hailes, which has been worked for 200 years at least. This stone, owing to its laminated structure, is used greatly for foundations of buildings, plats, steps, &c. A stone which was used in the renovation of St. Giles's Cathedral about fifty years ago (now being so admirably restored to its original architectural beauty through the munificence of Dr. Chambers and the careful superintendence of Mr. Hay) was taken from a quarry lying to the west of Burntisland, called Callalee. This quarry was for a long time abandoned, until it was re-opened by the late Mr. Bryce for the erection of Fettes College. The stone is durable, but owing, I believe, to the expense of quarrying and difficulty of dressing, it has not continued in use. Another stone in the same district as the above is that of Grange, which has been long in use, particularly in Leith, and a specimen of which is to be seen in Dalkeith West Parish Church, built about forty years since. This stone belongs to the carboniferous period, below the shale, and about 20 fathoms above the Burdiehouse limestone. In mentioning Burdiehouse I am reminded of the Straiton stone, which lies almost in the same position geologically as the Grange, and Dallachy, in Fife. Another stone which has been brought into Edinburgh, and which is of excellent quality, is that of Fairloans, near Hawick. It is capable of a high polish, and greatly used for monumental purposes. It will be observed from the following analysis it is formed nearly of the same chemical ingredients as Craigleith and Redhall; and this refers also to such quarries as lie in the Bannockburn district, such as Dunmore, Polmaise, and Plean:—

Sand	95·64
Oxide of iron	1·62
Carbonate of lime	1·20
Carbonate of magnesia	0·52
Moisture	0 60
Loss in analysis	0 42
	100·0

Going westwards into Lanarkshire, and treating of stone used largely in Glasgow, as well as brought to this city, the Kenmure Quarries may be first mentioned. They belong to the carboniferous limestone, and lie above the Bishopbriggs coal-beds. They were worked to a great extent for many years, but now, I believe, are abandoned. A section of this rock may be seen at the upper end of the Queen-street Tunnel, Glasgow. Of the best stones, among many others in this county, are Giffnock and Overwood, both near Glasgow; also Auchinlee and Dalzell, and the Wishaw Quarries, all of which are among the upper coals of the coal measures. Among the buildings erected from Giffnock Quarry, in Glasgow are the Academy, *Herald* Office; from Overwood, new Municipal Buildings, Greenock; City of Glasgow Bank, and new Stock Exchange, Charing Cross Hotel, and Clydesdale Bank, Glasgow. Another stone of reddish colour, which lies immediately over the coal measures in the bottom of the new red sand stone, near to Hamilton, is of good quality, and is used extensively in that and the surrounding districts. This stone is exposed in a quarry which may be seen from the Caledonian Railway Glasgow line. Before leaving this country, Bellside Quarry may be noticed. It lies in the true coal formation. Going south and west, we pass through stone strata, both yellow and red

*Read at the meeting of the Edinburgh Architectural Association, 20, George-street, on the 15th of November, by Mr. Gowans.

in colour. Of the latter, the Ballochmyle stone, of which the magnificent viaduct on the South Western Railway is built, is a fair specimen. Further on, we get into the old red sandstones of Dumfriesshire, of which specimens are submitted. To the east there are the yellow sandstones of Langholm Hill, as well as the red sandstones found in the Hoddam district, all of which are good building stones.

Coming back to the north of the Tay, the old red sandstone is found to overlie the country from Lochlomond along the face of the Grampians to Montrose, where stones for building purposes are to be found. The most important workings of this strata are those of the quarries which supply Dundee. Mylnefield Quarry may be noted for a stone not only durable, but capable of resisting an enormous pressure without fracture, so much so that in the erection of the Rallochmyle bridge, before referred to, that stone was carried across the country at great expense to form the ringhead of the centre arch, which has a span of 180 feet, and a height from the bed of the river to the keystone of the same dimensions. In mentioning this quarry, one is surprised that in restoring the Tay Bridge such stone as this is not used, instead of a combination of artificial material such as brick and iron. The crushing strength of this stone is given at 425 tons per square foot.

In speaking of Forfarshire, I cannot fail to notice the quarries which supply pavement, not only to this country but to all parts of the world; and as one of the industries of that county, and as showing the development of that trade, the Carmyllie Quarries, near Arbroath, fifty years ago, were worked by the aid of a single-power crane and a windmill for pumping the water from the bottom of the working, the few stones got in that way being carted a distance of about seven miles across the moors to Arbroath for shipment. About twenty-five years ago, in connexion with the late Earl of Dalhousie and a friend, I made a railway from the main line to the quarry, which has had the effect of developing the trade to such an extent that, instead of the windmill and the old crane, there are now ten planing-machines, besides stone-cutting machines, moulding-machines, &c., worked by seven steam-engines, showing the extensive use that is made of that stone not only for paving, but for steps, plats, &c. Specimens are now laid before you. The crushing strength is given at 500 tons per square foot. In speaking of the old red sandstone as useful for paving, the Caithness stone must not be overlooked, and for wear and tear it takes precedence of all others. As another branch of industry the development of this trade is quite as important as that of the Forfarshire stone before referred to. As an example of the value of this stone when subjected to continued wear and tear, the pavement in front of the New Club may be quoted, which was laid down forty-five years ago. Another example showing the same quality of durability, and also the size of stone that can be produced, is that in front of the Register Office, which was laid when the screen wall of that building was set back some thirty years since. The crushing test of this stone is given at 420 tons per square foot. In referring to sandstones, the length of this paper precludes me from giving in detail a description of the numerous quarries, and the immense quantities of good stone that lie along the eastern edge of the Moray Firth, of which Elgin Cathedral is a most notable specimen. Besides the care which the architect and builder should take to make themselves acquainted with the nature of the substance of which the stone they are to use is composed as to its durability, it is of importance, where great weight has to be carried, that its power of resistance to pressure should be known, as well as its tensile strength. The difficulty, however, is to ascertain from the compression of small cubes the relative strength of what the same material would be if enlarged in size. This was very forcibly brought under my notice by taking part with the late Mr. Buchanan, C.E., in testing stone and brick for the chimney of the Edinburgh Gas Company at the North Back of the Canongate, erected in 1845. These tests were made in the most careful way, by crushing cubes of 1-inch square of stone from the following quarries:—

RESULTS OF TESTS.

	Crushed at Tons per square foot.
Craigleith	315
Humbie	240
Hailes	235
Redhall	215
Binnie	182

A second test of Craigleith showed that, before being crushed to powder, it sustained a pressure of 440 tons per square foot. The appearance after fracture of the different cubes was that of a pyramid or wedge, and this led me to assert that if the cubes were enlarged a greater increase of strength would be gained; and, further, that if the pressure was vertical to the line of cleavage a greater resistance would be got, so that such a stone as Hailes, which is a laminated stone, would increase in strength, according to its surface, more in proportion than that of a liver-rock stone, such as Craigleith, Redhall, or the other stones that were tested. This led to discussion and further trial, the result being that, with a 4-in. cube from Hailes quarry, the resistance was equal to 567 tons per square foot. It may be worth while to give the results of the experiments we made in testing the brick. A great many different kinds of bricks of different composition were tried, the result being as follows:—

No.	Description of Specimen.	Dimensions. Length.	Breadth.	Thickness.	Weight.	Crushing Weight on each brick.	Crushing Weight per sq. foot.
		In.	In.	In.	Lb.	Tns.	Tns.
0	Common Fire Brick	9	4½	2½	7¼	89½	311
1	Extra size and quality from Mr. Livingston, Brick Work, Fireclay, and Ironstone	10	5	3	10½	153	440
2	Do. do.	9½	4½	2¾	9	140	443
3	Do. do.	9	4½	2¾	9	89½	285
4	General quality	9½	4½	2½	9	63½	204
5	Do. do.	9½	4¼	2½	9	140	443
6	Same quality as specimens sent to Glasgow	9½	4¼	2¼	7¼	51	135
7	Common stock brick taken at random from a building	9½	4½	2¼	8	51	150
8	Do. do.	9½	4½	2¼	8	25	73
9	Common general quality bedded with mulled board	9½	4¼	2¾	9	51	153
10	Do. bedded with clay	9½	4½	2¾	9	140	443
11	Do. do.	9½	4½	2¾	9	153	489
12	Stone from Hailes Quarry	4	4	4	5½	63	557

As to tensile strength, this is also important to the architect where corbelling, steps, plats, &c., have to be used, as well as in stones which have to be placed over voids, where both crushing and tensile strain are combined. The following were the results after careful and repeated experiments:—

	Breaking weight. Tons.
Craigleith stone	453
Hailes stone	336
Redhall stone	326
Humbie stone	283
Binnie stone	279

Although I did not test Arbroath and Caithness pavement, the following may be taken as safe:—

	Breaking weight. Tons.
Arbroath	507
Caithness	417

As to the resistance to pressure and tensile strain, the architect and builder should, after satisfying themselves as far as tests can, keep in view that the stability of the structure depends a great deal upon the proper constructive use of the material. Unless stones are fairly bedded there will be weakness and fracture, and unless the style of masonry adopted admits of every stone taking its equal share of the superincumbent weight put upon it there will be failure. This leads me to notice what I have observed with regret in the architect or engineer mixing the character of the masonry in such a way that one stone has more to bear than another. I have seen viaducts, for instance, built with rubble masonry of all sizes in the piers, while the corner-stones were made of increased dimensions, the result being that when the strain came, these corner-stones were fractured by the load pressing unequally upon them. But this leads me away from my text, so I hesitate to go further.

Another consideration for the architect is using stone which absorbs a great quantity of moisture. I have found, for instance, extensive buildings erected in a wet country with a stone which absorbed moisture to such an extent that the dampness which penetrated the walls not only rendered the house unequal in temperature, but led to the decay of the timber which passed into the walls; and caused what was called "dry rot," but what was really nothing else but wet rot, or timber taking consumption from lying in a damp bed. Vitruvius, the Roman architect, 2,000 years ago, says some very wise things both as to stone and timber. He recommends as to stone that it should be quarried in summer, and seasoned, by being allowed to lie two years before being used, so as to allow the natural sap to evaporate and test the stone as to its wasting; and for timber, he says, it should not be cut down in the spring, but in the autumn when nature is dormant. But this, again, I feel is leading away from my subject, so I come back to treat on Granite. Following up the northern district, I may take, first, what has been done by the well-known firm of Messrs. Macdonald, Field, & Co., from their extensive quarries all over Aberdeenshire. Fifty years ago the uses of this enduring material were confined chiefly to local purposes, although long before then a considerable export trade was done in street pavement, as well as more important works, such as lighthouses, docks (Portsmouth), bridges (Waterloo and London). The development of its various uses, both red and grey, was brought about principally by the energy and enterprise of this firm, while by the introduction of machinery that obdurate but enduring material can now be dressed with the greatest accuracy and finish at a cost greatly less than could be done when operated on by hand. Other gentlemen who have developed this trade were the late Mr. Gibb, and latterly and at present Mr. John Fyfe, whose quarries of Kemnay and Cove, near Aberdeen are the largest in the country for the production of stone used for curb and paving, as well as for the larger blocks required for such works as the Thames Embankment, part of which he supplied. There is so much to interest and instruct in a visit to the works of Messrs. Macdonald and the quarries of Mr. Fyffe that members of the Association could not spend a more useful holiday than in going to see the various applications of machinery in dressing and polishing such a stubborn stone, where columns and such like are turned with as much apparent ease as that of the wooden baluster of a staircase. Specimens of granites from the quarries of Messrs. Macdonald, Field, & Co.; Mr. Fyffe; and Messrs. Shearer, Field, & Co., are on the table, as well as a stone showing a very singular junction of colour, one half being of a beautiful red, the other grey; and this, I understand, divides the hill in a straight line from top to bottom. Returning to the south, I have to mention the extensive quarries and dressing machinery of Messrs. Shearer, Field, & Co., and Messrs. Newall & Co., at Dalbeattie. The Dalbeattie granite is obtained from deposits on both sides of the river Urr, near the town of Dalbeattie, in Kirkcudbrightshire. In colour it is a bright clear grey. It is a hard, close-grained granite. The close aggregation of its different minerals is a very important feature in it, and makes it well adapted for engineering and building purposes. It is also very suitable for ornamental purposes, as it is uniform in the grain, takes a fine polish, and is agreeable in colour. This granite was brought to the front for engineering and paving purposes about twenty years ago, by Mr. Hugh Shearer, of Great George-street, Westminster. He had the first contract for the supply of the granite for the Thames Embankment at Westminster, and got it approved and introduced into that great national work. Since then he and his firm have steadily and energetically used it in many other important works, such as docks, bridges, fortifications, lighthouses, and fronts of buildings. The same granite crosses the country very much in the route of the Portpatrick Railway, and was used for the principal viaducts on that line on to Creetown, where at Kirkmabreck extensive quarries were opened by the Liverpool Dock Trust, who not only built their dock walls with it, but the dock offices and sheds. It is worth noticing that the engineer who first opened up these quarries adopted a style of building by using the blocks at random, of all shapes and sizes, the same as was done by the Roman masons, and which, apparently, has the same endurance as to structural stability.

I come now to speak of the value of this material with regard to its strength. While tests have been made to ascertain its resistance to pressure, too much dependence must not be placed on results given in text-books. Granite, like other material of which I have had experience, has a cleavage the same as sandstones have, although this is not the popular opinion, and would be condemned by the orthodox geologist, as it touches on the theory as

asserted of granite being an igneous and not an aqueous rock. I mention this not for the purpose of geological dispute, but to reiterate what I have before asserted as to sandstone, viz., that to use granite so as to get the greatest resistance to pressure, the stone should be used so that the force should be at right angles to the cleavage or bedway of the materials. That brings me to this, that granite, like sandstone, laid upon its natural bed, will increase in strength in the ratio of its superfice. However, I repeat as to crushing that if granite is fairly bedded on an equal and resisting foundation no load can in ordinary circumstances crush it. It may be safe enough in dealing with granite, to take from 684 to 848 tons per square foot as a fair test of its strength. The remarks I have made as to granite apply also to other rocks such as trap, graywacke, and mica-schist rocks, which are to be found in districts where sandstone may be too expensive to get. The method of using these for building is admirably shown in Hawick, Galashiels, and places where such stone is readily found. If properly treated, nothing can be more enduring or more suitable for harmonising with the landscape of the district in which it may be placed. A popular fallacy is that these rocks draw damp. This is not the case; they condense the atmosphere in the same way glass does, and if this is provided for in the building, there is not the slightest danger of any water penetrating the walls. In acknowledging the honour you have conferred upon me in asking me to bring this paper before you, I feel that the short time I have had for preparation has not allowed me to give the subject the justice it deserves, neither would one lecture be sufficient to exhaust it. I feel very much in the position of a hewer, who has merely roughed the stone, and who has not had time to continue the operations necessary to give that finish to the surface which might develop beauties and results that could never be seen in the rough. The selection for use of a material such as building stone goes much further than ordinary observation. Enduring structures speak not only of the habits of the people, but of the civilisation they have attained. The enduring Pyramids of Egypt, the ancient buildings of Greece and Rome, the Temples of Cambodia (which country has no history except in the elaborate limestone buildings which remain), show that the profession of an architect has to do with what every nation should prize, that is, that to all time their architecture should faithfully represent, as far as it can, the people with whom it originated.

The lecture was illustrated by specimens of the various stones referred to.

At the close, Mr. Lorimer proposed, and Mr. Whitelaw seconded, a vote of thanks, which was heartily accorded.

THE CHISWICK SCHOOL OF ART.

This institution, situated on the Bedford Park Estate, Turnham-green, has been opened for work some six or seven weeks, and bids fair to be successful, for already it has 140 students on its roll-book. The building has been erected from the designs and under the superintendence of the honorary secretary of the school, Mr. Maurice B. Adams, architect, who has aimed at giving it a distinctive character while making it to harmonise with the peculiarities of its surroundings. Only a portion of the building is yet erected, larger studios than those now in use, and other additions, being intended in the rear when the wants of the school call for increased accommodation. The apartments now in use appear to be well adapted to their purpose, and are suitably furnished and provided with all necessary appliances. The furniture throughout the building, including the revolving model-throne, was made by Messrs. Robertson & Sons, of Alnwick. Special attention has been paid to the gas-fittings, which are adapted to the use of the different classes, and provided with reflectors and ventilating exhausts, executed by Mr. Elsley, of Great Portland-street. The details of colour internally, and of all necessary apparatus for school work, have been arranged by the directors of the school (Mr. E. S. Burchett, of the South Kensington schools; and Mr. F. Hamilton Jackson, formerly of the Slade School) The building was on Saturday evening last the scene of a "house-warming," in the shape of a *conversazione*.

Mr. A. J. B. Beresford-Hope, M.P., in taking the chair at a meeting held later in the evening, said he was glad of that opportunity of making himself personally acquainted with one more of the noble network of institutions which had spread and were spreading a knowledge and love of art in this country. Planted as it was in Bedford Park, in a very city of art, and being almost a part of that great and important experiment of making a London dwelling graceful, picturesque, and lovable, as well as inhabitable, the Chiswick School of Art started under very exceptional advantages, and was likely to take a foremost place amongst its brethren. Students at schools of art might be divided into two or three classes. First, there were those who went there for technical instruction to help them on in the path of life which they had chosen to follow, and who exemplified the noble quality of self-help. Secondly, there were those who went for elegant drawing lessons: of that class he would say nothing at all. There was a third class, to whom he should proceed to address himself, viz, those who, whether they had taken up the study of art as a profession in the highest sense of the word, or whether they had taken up as a pastime, also in the highest sense of the word, meant to pursue their studies thoroughly, and to derive the utmost advantage they could from the instruction which they would receive. To this class of students he wished to point out that education in art was education in a great deal more than the mere mechanical facility of transferring to paper or putty the forms which the students saw before them. The drawing or model produced by the student had its value, but that was as nothing compared with the value to the student of the exercise of his mental and moral faculties which the production of the drawing or model necessitated. Such exercises would bring home to the mind of the pupil as nothing else could do that great divine law of proportion, which governed all things, and was at the bottom of all things, moral, metaphysical, and natural. Was not the virtuous man the man who had all his qualities in due proportion,—the wise man, he who had his reasoning powers in due proportion,—the wit, he who had a knowledge of grave and gay in due proportion,—the poet, he who had a knowledge of things seen and things unseen in due proportion? One of the greatest surgeons of the day, who began life as an artist, and who was still one of our best water-colour artists, had stated that he conceived he had gained great benefit in his professional education and work from his art-training, which had taught him sharpness of eye and neatness of hand. There was no royal road to art, and the students of schools of art should not rest content when they had acquired a slipshod, scratchy method of sketching, which, whatever drawing-room popularity it might bring them, would never bring them fame as artists. Perfection in art could never be reached without assiduous study, constant thought, and continual striving after improvement. The cleverest sketches were those which contained the fewest lines, and which depended on the outline for effect instead of on a mass of stippled work, but the artists who made those clever outline-sketches had only attained their skill gradually and by dint of hard study, dispensing bit by bit with stippled surfaces. Although it was not likely that any student in that school would ever become a Turner, a Teniers, or a Raffaelle, that was no reason why every student should not do his or her very best to excel. He exhorted them to set-to with a hearty spirit of goodwill, good temper, and good-humoured through dogged determination to succeed in the race.

Mr. T. Armstrong, Director of the Art Department at South Kensington, said he had been much gratified by what he had seen on the Bedford Park estate, and especially by the cheerful and well-appointed School of Art in which they were assembled. As he had had but a short experience of seven weeks only in his official capacity, it would be presumptuous on his part were he to attempt to enter at length into the subject of the best mode of carrying on the work of the numerous schools of art which were governed from South Kensington. There were colleagues and coadjutors of his at South Kensington who were more competent for that task. He entertained the greatest respect for the methods of teaching pursued by his predecessor and his staff, whose methods would be continued substantially unchanged, although there would be further developments as requirements called for them. He wished very much to stimulate the study of modelling from the figure, and should like to see life classes formed in every country town. It was his own feeling that painting from still-life had been a little overdone. He would not propose to discountenance it altogether, but a little less of it would suffice. He believed he had the authority of his political chiefs, Earl Spencer and Mr. Mundella, for saying that the tendency of art education at South Kensington under the Department would be towards fostering the arts of design in connexion with industry. That, in his opinion, was the *raison d'être* of the Department and of the schools in connexion with it. Art education, provided at great cost to the State, should not aim at producing a race of painters of pictures. He hoped and believed that in connexion with the schools of art, the technical schools, of which so much had been heard lately, would have increased influence for good on the industries of this country. That the art schools under the care of the Department had done much for the industries of the country was testified by foreign nations, particularly France and Germany, who were imitating us in our methods of art education, and were sending over distinguished men to examine into our system and report upon its results, with which they expressed themselves to be very agreeably astonished. He trusted that the advice which Mr. Beresford-Hope had given to the students would be taken to heart by them. The people who resided on the Bedford Park estate owed great thanks to Mr. Carr. He was the Moses who had brought them out of the Egypt of darkness and filth which lay to the eastward. Bedford Park, with its picturesque houses, its pleasant club, its school of art, and its æsthetic public-house where unadulterated spirits were sold, was, he thought, a very desirable place to live in, and he wished all happiness and prosperity to its colonists.

Mr. George Augustus Sala moved a vote of thanks to Mr. Beresford-Hope for the address which he had given, and urged the students of the Chiswick School of Art to be earnest in the pursuit of their studies. He observed that the success which schools of art had met with awakened in his mind sad reflections, and he advised those who welcomed their success to read the autobiography and letters of Haydon, who strove for many years to establish schools of design in this country, and almost wore out the stairs of Downing-street by his vain footsteps after Ministers. He was laughed at for his pains, and treated with indifference and contempt. The great Duke of Wellington, in a curt note to him, told him that there was no chance of Parliament devoting a halfpenny of the public money for such a purpose. But everybody knew what had been the result of the establishment of art-schools in this country, the success of our system having been so great that even France, the mother of European arts, herself came to learn of our work. Mr. Sala concluded by humorously referring to the days, forty years ago, when he was a pupil at a Pestalozzian school at Bolton House, Turnham-green. Among other accomplishments which he learned there was that of being able to design a sort of ornamental pediment containing a figure of Minerva rewarding the young gentlemen of Bolton House for diligence in their studies by presenting them with cornucopias, pairs of compasses, beehives, &c. The work was executed in plaster by an Italian gentleman in Leather-lane, and duly affixed to the front of the house, where it remained for many years; but, alas! it and the house had, within the last few years, totally disappeared.

THE EDUCATION OF SURVEYORS.

In the course of the opening address at the Surveyors' Institution, on the 14th inst., made by the President, as mentioned in our last, Mr. Edward Ryde said:—The scheme of technical education is believed to have been of very material assistance to us in obtaining our charter. I have always been an ardent advocate for the extension of education; but I am bound to say that I approached the consideration of the question as applied to the admission of members of this Institution with much caution and reflection. That I did so is the more satisfactory to me now that I have formed a mature judgment that the course which the Council finally adopted, and which they have now to carry out under the charter, will be conducive of much good to the profession. The subject of education generally is a very extensive one: its con-

sideration and development have become very popular and almost universal, and no profession can safely refuse to give it attention.

As showing to some extent the direction in which general opinion is running in connexion with this subject, I may mention that the International Committee of the Surveyors of Europe, sitting as a Congress in Paris, in 1879, discussed, among other questions, the desirability of requesting the respective Governments of the several countries represented at that Congress to institute by compulsory enactment that every surveyor should take out a diploma, after the manner of the surgeons and apothecaries of England, previously to being permitted to practise. But the English deputation to this Congress was of opinion that its own Legislature would not be likely to interfere in favour of a profession, at the instance of such profession, without some special demand on the part of the public. They further urged that after all, too much importance must not be attached to the possession of such a diploma, inasmuch as the real qualifications of a surveyor could only be acquired after years of experience, coupled with integrity, perseverance, and intelligence. Hence it constantly happened that surveyors of large experience were taken from one part of England to another on account of the special qualifications which they possess,—a distinction which the possession of a diploma acquired in early life could not command. In no professions in England, except those of Law and Medicine, was any compulsory examination required, except as before mentioned. This was to be accounted for or explained in the case of Medicine by the fact that the consequences of incompetency might involve questions of life and death; and the same might be said with respect to the legal profession in connexion with criminal law. It would also be observed that the same rule applied in the cases already referred to of surveyors appointed under the London Building Act, where infringements of the law relating to the construction of buildings might lead to fatal consequences. In the case of other professions, incompetency generally merely resulted in pecuniary loss, which, it was assumed, might have been guarded against by a careful selection. But the English deputation was, nevertheless, prepared to vote in favour of a diploma, which they could understand was probably more needed in France than in England, owing to the compulsory subdivision of property at the death of the owner, and the consequent necessity for a numerous class of surveyors of ascertained skill whose services should be within reach of everybody.

I cannot do better than refer to the very excellent speech made by our much-respected first Associate of Council, Mr. J. H Lloyd, at the first meeting of the Institution of Surveyors, which speech will be found reported in vol. i. of our Transactions, at p. 14. I cannot describe to you the advantages of our Institution in words so happily put together as those which were then used by Mr. Lloyd, and all I can say is that any member of the Institution who has not read that speech would, I think, find pleasure in doing so. Taking that speech as my model, and pointing to the charter which we have obtained as the result of the labours of the Institution down to the present time, I think I may fairly assume that the effect of the charter has been to transform our Institution from a private society into a public body, having a fixed and well-settled constitution, with by-laws which cannot be altered without the previous approval of the Privy Council.

Although it is not made compulsory for a period defined in the charter for a surveyor to pass an examination prior to his election as a Professional Associate, it is open to the Council to frame rules so as to enable him to submit himself for examination at once, and in the same way the admission of Fellows may be facilitated. It is satisfactory to find that a considerable number of young men are availing themselves of the educational courses of the charter. Many have already joined the student class, and many others are preparing to do so. They see the advantage which a certificate so obtained will give them at once when the next opening shall occur, whether they look to get appointments or clerkships in the offices of others, or start in practice on their own account. To employers, moreover, the advantage of the certificate will be most useful as a distinguishing mark between those who have been brought up to the profession and those who have not.

If I am asked what I consider to be the best course of education for a surveyor, I may reply that I consider any of the subjects which are contained in the educational course of the Institution desirable; but it is impossible for any one man to qualify himself for practice in every branch of the profession. A surveyor and land agent should have a thoroughly practical knowledge of agriculture, including a knowledge of agricultural chemistry and geology; he should also make himself a good accountant and bookkeeper. He should possess a knowledge of measuring land and making maps, a knowledge of timber and the art of measuring it, and, above all things, he should acquire, in as practicable a manner as possible, a knowledge of the best systems of managing estates.

The recent depression in agriculture, and the troubles which have befallen the landed interest generally in recent times, have rendered this last qualification more important than ever. However much the practice of agriculture may have been retarded, recent difficulties have shown more than ever the necessity for the services of skilled land-agents. It has been very much the custom during the last quarter of a century to assume that estates can be managed by gentlemen who have not had suitable previous training. It seems to me that that state of things must now be brought to an end. A land-agent responsible for the management of a large property must be able to determine by his own experience the exact amount of rent which a farmer can afford to pay under every circumstance which can arise. Moreover, the complaints of a tenant must, on the one hand, have proper attention, and, where necessary, must be met by relief or remedial measures; on the other hand, if every complaint of a tenant is to result in a reduction of rent, or some other advantage to the tenant, and disadvantage to the landlord, it will soon be found that there will be universal complaints, and that the landlord's interests will suffer. Again, an agent must be able to discriminate between a beneficial expenditure of capital and one which is not beneficial. On some estates it may be very advantageous to expend large sums of money in rebuilding farm buildings: on others it may be a great waste of money; as, for example, in the case of land near London or any other great centre of population, which, after a few years from the present time, will become building land.

If a surveyor has intended to devote himself more particularly to the business of a building-surveyor, or, in provincial towns, to that of an architect and surveyor, he will, of course, turn his attention more particularly to the valuation of buildings and building lands in town than to agriculture and the management of country estates. Some knowledge of architecture, however, will be useful to a surveyor in any branch of practice; but I am now assuming that my address is made to surveyors, and that architects, strictly speaking, are without the limits of our Institution.

LIVERPOOL ARCHITECTURAL SOCIETY.

The second ordinary meeting of this Society was held at the Royal Institution, Colquitt-street, on the evening of the 16th inst., the president, Mr. Charles Aldridge, F.R.I.B.A., occupying the chair.

The prizes for drawings submitted at the various meetings of the Class of Construction and Design during the last session were awarded to the successful students: the first to George Hornblower, and the second prize to Richard Holt.

The paper for the evening, entitled 'Recent Notes from the Continent in Pen and Pencil," was then read by the author, Sir James A. Picton, J.P., F.S.A., and was illustrated by numerous sketches of features of interest at the various places visited by him.

A discussion followed, in which the president and Messrs. Joseph Boult, G. H. Moreton, and H B. Bare took part, and the meeting terminated with the usual vote of thanks to the author of the paper.

The Electric Light adopted for Hove.

The Town Commissioners of Hove, adjoining [illegible] Hove, it is stated, decided to illuminate [illegible] light, with as little delay as possible, the whole of the town, at an estimated cost of 2,000*l.* per annum. The system agreed upon is the Brush system. The present cost per year for the gas is about 1,900*l.*

ARCHITECTURE AND ARCHITECTS IN LEEDS.

The inaugural address to the Leeds Architectural Society was delivered on the 10th inst. by the President, Mr. J. B. Fraser, F.R.I.B.A. In the course of it the President said:—I should like to occupy your time for a very few minutes in calling attention to some of the more prominent of the new buildings in our immediate neighbourhood, or at least to such of them as have come under my observation; and, first of all, as being of perhaps the greatest public interest, let us glance at the School Board and Municipal Offices in Calverley-street. The School Board Offices are, as you know, complete and occupied, and the block containing the Municipal Offices, &c., is sufficiently far advanced to enable us to form some idea of its ultimate appearance, although until complete it will be unfair to pronounce any definite opinion. I think all will admit that Mr. Corson tackled with his usual ability a very difficult problem when he designed a block of public offices under the very shadow of one of the architectural gems of the country, our noble Town-hall, and where the breaking up for the different floors and rooms necessitated a treatment on such a totally different scale; he was, also, still further handicapped by having to divide his building (which was originally designed as one block) into two distinct structures. Whether he has overcome the difficulties presented with entire success will, of course, be a matter of opinion, but every one will acknowledge the great skill and care exercised in planning and working out the different details. The treatment of the arched ceiling in the public reading-room is novel and worthy of attention as an attempt to utilise the materials of fireproof construction in decoration. I anticipate that the arrangement of parti-coloured blocks in the soffits of the arches may give rise to some criticism. I would particularly draw your attention to the free use of terra cotta as a means of internal decoration, and the admirable manner in which it has been introduced into these buildings. The Athenæum buildings by Mr. Bakewell claim our attention as being a very bold and successful design, but I must take some exception to the weak effect produced by the exceedingly flat pointed arches and small piers between the shops of the ground-floor. The shop-keeper cries for plate-glass, which Mr. Corson alluded to in his address, is here especially noticeable. The large warehouse in Park-square, designed by Mr. Ambler for Messrs. Arthur & Co., has a striking principal front, as regards the combination of cutting or rubber bricks and dull red stone, and the treatment throughout is novel and bright. The carving, especially over the central entrance, is excellent, and there is a good sample of wrought-iron work in the area panels. Old-fashioned, sleepy-looking Park-square will soon be losing its time-honoured characteristics, and already presents in vivid contrast the quiet style of the first quarter of the century and the eclectic ideas of its last quarter. The block of shops at the corner of Somers-street and Park-lane, by Messrs. Smith & Tweedale, appears to me to be a very satisfactory example of street architecture, although with no features calling for special comment. By the same architects a good example of the treatment of brickwork may be seen in the Cap and Clothing Factory of Messrs. Brook & Co., in Grace-street. The additions to the Oriental Baths, Cookridge-street, will attract considerable attention, both on account of the public interest attaching to the building, and architecturally because of the attempt to transform into a nondescript modern Gothic front the well-designed Saracenic elevation of Mr. Brodrick; the result, as far as we can judge at present, can scarcely be considered a gain from an art point of view, and the change from the old familiar dome to the turret over the central block is, I think, by no means an improvement, and it is to be regretted that the architect was not allowed to design an entirely new front. Messrs. Adams & Kelly are to be congratulated on their exceptionally successful treatment in raising and enlarging St. Ann's Roman Catholic Schools. The building, though unimportant, is neat and pleasing, and the additional story has much improved it. Mr. W. Turton's new stables, off North-street, are valuable, as being the outcome of long practical experience in the ownership and care of horses. There is nothing specially novel in the plan: the stables are lofty and wide, and show clearly

that even in the midst of a crowded town it is not judged desirable to risk the horses' health by overcrowding. Glazed bricks are, of course, extensively used, and vitrified bricks for pavement. A bath for the horses, sunk down in one corner of the stable-yard, is worth making a note of. One cannot help being somewhat disappointed at the introduction of an old-fashioned stucco front into our principal business thoroughfare, and therefore I cannot think the Imperial Hotel altogether satisfactory as far as its external appearance is concerned; internally, I believe, the building is a success. While speaking of stucco it may be interesting to observe that some of our London brethren are commencing to use cement concrete cast in blocks, moulded and coloured to their designs, for external dressings, and also for internal features. This is quite a new departure, and the experiment will no doubt be watched with interest. Where stone is exceptionally costly, terra-cotta uncertain in the burning and twisting, and bricks hard and unsuitable for elaborate treatment, the use of concrete blocks in string-courses, cornices, and other features, would certainly appear to be of value to the architect, who is expected to produce effective and sound work with inexpensive materials. The shops by Mr. Bakewell, on the north side of the new approach to the joint station, while giving evidence of careful thought in design, and in the matter of safe and economical construction, are, I venture to think, of too plain a character for so important a situation, and it is open to question whether such extreme plainness is not a mistake from a financial as well as an artistic point of view, as there can be no doubt our shopkeepers are year by year adopting, and finding the advantage of well-designed and attractive-looking places of business. Glancing in passing at the Covered Market, I think we may compliment the Corporation on having gained an increase of rent-producing space by the addition of a gallery over the outside ground-floor shops. I think this addition somewhat of an improvement. I cannot but regret the waste of public money expended in the building of the market in Vicar's Croft, and am sorry to notice that the streets are not covered so as to protect the public from the weather. The Boroughh Coffee-house, by Mr. T. W. Baxandall, is a good, honest, substantial-looking building, and well suited to its purpose, and must certainly take rank amongst our street improvements. The Model Lodging-house, in Harpur-street, by Mr. D. Dodgson, is well planned, and it is interesting as a sign of the constantly-increasing demand for better provision for the bodily comfort and for the improvement of the mental and moral status of the poorer classes. The People's *Café*, just over Leeds Bridge, is another example of modern social requirements, and is a noteworthy and handsome addition to our public buildings, and very creditable to the architects, Messrs. Adams & Kelly. The addition to the *Leeds Express* Office is an example of the unsatisfactory effect of engrafting on a well-balanced and carefully-designed building, a wing by another hand, and in a totally different style. The Police Station at Crown Point-street, Hunslet, though unimportant as to size, deserves a passing note, as being one of the latest Corporation works, and as showing that ability and artistic taste can be occasionally found amongst our corporate officials. I must call in question the good taste of the extremely disproportionate coat of arms over the entrance. I suppose we ought and do feel proud of our ancient belongings; but in a building so practically associated with the failings and shortcomings of our frailer citizens, it might be more respectful to the shield of our forefathers to keep it in the background. Mr. Alf Cooke's new printing-works, Hunslet-road, by Mr. Ambler, are well arranged and amply lighted, and are, taken as a whole, an encouraging and satisfactory feature of architectural progress, and I would specially draw your attention to the use of terra-cotta for the external ornamentation, as being a pleasing example of the adaptation of this material. It has hitherto been too much the custom of our manufacturers and employers of labour generally to relegate the planning and erection of the workshops necessary for their business to a respectable and trustworthy builder, thereby saving considerably, as they imagine, in the matter of the architect's commission, &c. These hard-headed, money-making, and money-saving people are now apparently finding out that the long worked-for experience of the architect is worth paying for, from a purely economical point of view; but if a slight additional expenditure beyond that of the requirements of the bare walls and square-hole order of architecture is required, the ultimate result in the cheerfulness of his place of business, the better health of his *employés*, and the improved appearance of his native or adopted town must more than repay an ordinary thoughtful and liberal-minded man. It may, perhaps, not be out of place here to offer a word of congratulation to, and a hope for the further success of, Mr. Cooke, in his efforts to improve the class of work which he has taken up with such vigour, and which may be designated in general terms as art for the million. Messrs. Kitson's block of new offices, by Mr. Chorley, presents a business like and appropriate elevation, the most interesting feature being the carved brickwork, which has been freely used, and, I think, with very considerable success. We must regret the necessity of further additions to Holbeck Workhouse, especially as the expenditure touches all of us so nearly in one of the tenderest spots,—our pockets; but as the work has to be done, it could scarcely fall into better hands than Mr. Hill's, who is carrying it out. The buildings erected by the Leeds School Board at Headingley and Kirkstall, many of you will have observed, are being built externally entirely of stone. I do not, for my own part, think the change, from the admirable groups of brick and stone buildings designed by Messrs. Adams & Kelly, by any means an improvement. It is scarcely necessary to say that, as far as they go, the new schools, though very plain, are designed in good taste. In addition to the foregoing new schools, the Board have also carried out additional alterations to the Ellerby-lane, Jack-lane, Bewerley-street, and Stanningley Schools. The new work has been designed to harmonise with the existing buildings. I have been specially pleased with the satisfactory appearance of two pairs of semi-detached villas at Far Headingley, designed by Messrs. Smith & Tweedale. The colour of the brickwork is very rich, and the absence of any glaring contrasts in the way of white dressings enhances the thoroughly warm, home-like, and comfortable effect. The residence at Headingley, off Shaw-lane, by Mr. Hill, designed in the Domestic Gothic style, is a most successful effort, and shows how this class of work can be adopted for modern houses. The Wesleyan Methodist Chapel at Meanwood, also by Mr. Hill, is a simple picturesque example of Ecclesiastical Gothic architecture. An admirable specimen of Free Classic design in brickwork, and one in every way worthy of attention as showing what can be done by the aid of good cutting bricks, is exhibited in the Baptist School in Meanwood-road, designed by Messrs. Smith & Tweedale. The details are carefully wrought out, and all seems suited to the material used. The carving is, I think, if anything, too much undercut and of too florid a character, otherwise this little building is quite a success. The new laboratory at the Leeds Grammar School, designed by Mr. Chorley, in strict harmony with the previously existing building, has been carried out in a very complete and efficient manner.

DISTRICT SURVEYORS AND THEIR DUTIES.

At the meeting of the Metropolitan Board of Works on the 18th inst., reference was made to a point of considerable importance connected with the duties of District Surveyors

The Building Act Committee reported that they had considered the letter from the Vestry of Paddington, relative to the District Surveyor's professional connexion with certain buildings in course of erection at the rear of Nos. 397 and 399, Edgware-road. "The Vestry recently called the attention of the Board to these premises, stating that they abutted upon a roadway 25 ft. wide which had not been approved by the Board. As the entrance to this approach was enclosed, the Board requested the District Surveyor to inform them of any alteration which might enable them to take action in the matter. The Vestry now state that they have been informed that the services of the District Surveyor have been retained by the freeholder of the estate and the builder of the premises. The Vestry also express an opinion that if the works had been superintended by an independent surveyor, the existing difficulties might have been obviated. Mr. H. Gundry, the District Surveyor, has attended your committee, and stated that he was professionally engaged by the leaseholder of No. 399, and gave notice thereof to the Board, who appointed another district surveyor. Mr. Gundry admits that he was employed by the freeholder of the estate to let the property, and that no surveyor was appointed to supervise the works at No. 397. By thus acting for the freeholder, it appears to your committee that the District Surveyor also became virtually responsible for the works at No. 397, in respect of which no notice was given to the Board. Your committee are of opinion that, although the District Surveyor may not thereby have infringed the letter of the 37th section of the Building Act, such a practice is highly objectionable, and they recommend that they be authorised to further consider the case in connexion with the proposed amendment of the Building Act; and that the Vestry of Paddington and the District Surveyor be informed accordingly."

On the motion of Mr. J. E. Saunders, who, as chairman of the Committee, brought up the report, the recommendations were adopted.

ARCHITECTURAL ASSOCIATION.

The first ordinary general meeting of this Association for the session 1881-82 was held on Friday, the 11th inst., Mr. Aston Webb, president, in the chair. Sixty-two gentlemen were nominated members.*

The report and balance-sheet for the past year, together with the reports of the various classes, were, on the motion of Mr. Thomas Blashill (who congratulated the Association on the great increase in the number of its members and in the increased usefulness of its work), unanimously adopted.

The annual report reviews the work of the past session, and contains the following passages as to the work of the future:—

"Admission to the Associateship of the Royal Institute being now attainable only by passing an examination, the committee have thought it desirable to vary somewhat the arrangements of the classes, with a view to making them specially useful to members preparing for that examination. The meetings of the classes generally have been rearranged, an entirely new class for the study of Professional Practice has been started, and courses of lectures, dealing especially with Design and Construction, and connected with these classes, have been arranged to be given by Messrs. E. J. Tarrant and T. Blashill, which the committee believe will be of considerable advantage to the members generally, as well as to those about to present themselves for examination.

The thanks of the Association are due to the delegates, Messrs. J. D. Mathews and H. L. Florence, for their services in representing the Association on the committee appointed to prepare the scheme for the above examination."

The balance-sheet showed the total income of the year to be 665*l.*, including 416*l.*, received on account of members' subscriptions, and 62*l.* for entrance-fees. The total expenditure was 552*l.*, a balance of 112*l.* remaining in the treasurer's hands.

The reports of the classes detail a great amount of good work done.

The President said a letter had been received from the Chairman of the Working Men's Club and Institute Union asking the members of the Association who might have works in progress to conduct parties of workmen over the buildings on Saturday afternoons. The President commended the matter to the attention of the members, as he was convinced that it was a good thing to bring architects and workmen together.

The President then delivered his inaugural address, portions of which were given in our last (p 627, *ante*).

In the discussion which followed,

Mr. J. Douglass Mathews, after congratulating the President upon occupying the chair of the Association, expressed his conviction that the present was a very important era in the history of the Association. Probably one of the most important subjects touched upon in the President's address was that of Mr. Street's suggestion for the fusion in some way of the Institute and the Association. It was not very surprising, perhaps, considering the great success of the Association, that such a suggestion should be made, but he (Mr. Mathews) sincerely hoped and trusted that the Association would never for one moment entertain any question of fusion with the Institute. The question had been mooted before, and the offers made had been firmly refused, as he hoped such offers always would be. Although, if such fusion took

* The number of members whose names are given in the "Brown Book" for the present session is 863, of whom 691 are resident in London.

place, the members of the Association, might be left pretty much to govern themselves, they would feel that they had not that perfect freedom which was so essential to enable them to pursue their work. Although he thought they would all be opposed to such fusion, they had no differences with the Institute in any shape or way. Each body had its own work. The Association had shown that it had every desire to help the Institute, and the statistics which had been quoted by the President showed that there was no animosity between the two bodies. For the last few years he had had an opportunity of knowing pretty well the working of both societies, and he knew that one society could and did help the other constantly. The Institute had no need to be afraid of the Association; it need not think that, because the Association had increased, its own members would not increase. It was found in practice that the greater part of the members of the Association who followed the profession in earnest looked forward to the Institute as a kind of goal, and it was gratifyng to know that the members of the Association who joined the Institute did not forget the Association. The Association should be, and indeed was, a kind of nursery or feeder to supply the Institute. The Association had shown itself to be in earnest in helping the Institute, by taking up the examination scheme most thoroughly, with the view of making it a success, and he did not hesitate to say that it would be a success. He begged to move a vote of thanks to the President for his able address.

Mr. Blashill said the advice which the President had given as to a curriculum of study for young architects was most useful, and he hoped it would lead to something being done in the matter. With regard to the proposed fusion of the Association with the Institute, having very thoroughly considered the matter, he, like Mr. Mathews, should regret most sincerely if anything of the kind took place, although at the same time he claimed to be thoroughly loyal to the Institute. With all that had been said by Mr. Mathews on the subject he fully agreed. He ventured to say that the more the gentlemen who thought that good would arise from the proposed fusion made themselves acquainted with the actual position and method of working pursued by the Association, the more fully would they see the futility of their proposals. Of course it was a very plausible idea: everybody liked union, but in reality there was no disunion, and there never had been any discord between the Institute and the Association,—at least, not during the last twenty-one years. The work done by the Association during the last one-and-twenty years fully justified its determination to continue in its own course. The proposal for fusion was full of objection. The new examination scheme, he was convinced, was going to succeed, and its success would be largely due to the support which was given to the Institute by the Association.

Mr. E. C. Lee expressed the pleasure with which he had listened to the President's advice to young men entering the profession, and urged upon all such the desirability of drawing up and adhering to some systematic line of work and study.

Mr. Lacy W. Ridge said, with regard to the suggestion thrown out by the President of the Institute the other evening, he hoped the Association would retain its soul in perfect confidence. It was an amiable idea, likely to occur to a gentleman who, from the dignity of the chair upstairs, surveyed the whole of the profession for the first time. That suggestion would never come out of the room wherein it was started. The feeling of the Institute itself,—he might even say the feeling of the Council of the Institute,—would be strongly opposed even to the making of an offer for fusion with the Association, and therefore the members of the Association might dismiss the matter from their thoughts. The feeling of the Institute as a body, and especially of the members who were also members of the Association, was unanimous in saying that union with the Architectural Association was not to be thought of for one moment. It was not only true that the Association was a feeder to the Institute in the way of supplying it with members, but that it had done in the past and would do in the future a great deal in sending into its ranks architects who were thoroughly trained.

Mr. Gotch said that with regard to the question of curriculum, a great evil of the present system of architectural education was that so much of it was optional.

Mr. Stannus observed that he thought Mr. Street's suggestion had been scarcely understood by the gentlemen who had spoken. He hardly thought it should be characterised merely as an amiable suggestion, for Mr. Street had had a wide and clear outlook on architectural matters for many years past, and although he had only just taken the chair of the Institute, he was quite capable of offering a mature opinion on the subject. He thought that Mr. Street's idea was not so much that there should be an actual fusion of the two societies, as that they might combine with the Institute and other architectural societies for certain purposes, and send delegates to sit at the council-table for the consideration of specific matters.

Mr. Vacher suggested that it would be well to appoint a committee to draw up something like a complete curriculum, and also to frame, with the assistance of the honorary solicitor, a more perfect and satisfactory form of agreement than those at present in use in connexion with the "articling" of pupils.

Mr. S. Flint Clarkson said that the proposed scheme of fusion was so thoroughly considered and so unmistakably decided a few years ago, that nothing would be gained by the reconsideration of the subject at the present time, except that the undesirability of fusion would be demonstrated more clearly than ever.

The President having acknowledged the vote of thanks, the meeting terminated.

THE LONDON AND MIDDLESEX ARCHÆOLOGICAL SOCIETY.

The first meeting of this society for the present winter was held on Monday, the 14th inst., at No. 4, St. Martin's-place, Trafalgar-square.

Mr. Alfred White, F.S.A., presided, and gave a brief review of the work of the past session, in the course of which he incidentally referred to the discoveries made during the works now in progress at Leadenhall Market. He had no doubt that much remained to be discovered on the same site, and as the excavations were now reaching the Roman level, he trusted that Mr. Price, who was watching over the work, would soon have some additional important and interesting discoveries to report. It was very satisfactory to know that Mr. Price and a few other gentlemen had free access to the excavations just now taken in hand for the completion of the "Inner Circle Railway," which would traverse an extremely interesting part of Roman London. During the summer a number of members of the Society paid a visit to the excavations which had revealed the Roman villa at Brading, which, though far from Middlesex, possessed much interest for the members, owing to the presence of Roman remains in London. The excavations at Brading were under the direction of Mr. J. E. Price and Mr. Hilton Price, both of them members of the Society. The villa had attracted so much interest that as much as 60*l.* per week was received in shillings during the summer for admittance to see the remains. In that way he hoped that the public would contribute a considerable sum of money towards the expense of the excavations and the cost of roofing over and otherwise preserving the remains which were discovered. Theirs was not the only society which had taken an interest in these discoveries. The Society of Antiquaries had contributed funds towards carrying on the excavations, and another society, the Royal Institute of British Architects, had not only contributed money, but had printed in their "Transactions" a very valuable paper, illustrated with coloured representations of some of the pavements, while others were given in outline. The paper was one well worthy of the attention of archæologists, and everybody who subscribed 2*l.* 2*s.* to the excavation fund would be entitled to a copy of it, including the illustrations mentioned. Alluding to the losses of the year, Mr. White referred to the deaths of Dean Stanley, Lord Hatherley, and Mr. George Russell French, all of them members of the Society.

Mr. Edwin Nash, F.R.I.B.A., then read a brief paper entitled "Archæological Notes on Middlesex." At the outset he spoke of the confusion often caused in archæological discussions by people who used the words "antique" and "ancient" as convertible terms. The word "antique," as he understood it, was a special term significant of the art of Greece and Rome. The "Apollo Belvedere" and the Parthenon and its sculptures were "antiques" in the proper sense of the word, but it was incorrect to talk of furniture, belonging, say, to the Elizabethan period, or even of the architecture of the Egyptians, as "antique": they would be more properly characterised as "ancient." Then came the question how far back must the archæologist of the present day go in order to arrive at a period whose productions could justly be called "ancient"? Opinions differed on that point, but he was inclined to draw the line of demarcation between ancient and modern at the end of the sixteenth century. To be a good archæologist was no easy task, for it needed a rare combination of qualities. A great deal had been said of late years about restoration. Now the most important point in connexion with the restoration of a building was to make the preservation of the original character of it the main point, neither adding to nor taking from it a single detail. Of course, in cases where enlargement was demanded, the architect should have free play, so that the modern addition should have a character of its own. Proceeding then to the more immediate subject of his paper, Mr. Nash pointed out that, small as is the county of Middlesex, it contains a great many interesting remains, foremost amongst which are many specimens of Roman work, and such buildings as Westminster Abbey, the Temple Church, St. Bartholomew's Smithfield, and St. John's Chapel in the White Tower. With regard to St. Bartholomew's, Mr. Nash asked where were the church restorers? Had they all gone out of town? It would seem so, from the condition in which they suffered this church to remain. What a creditable and delightful thing it would be to see the remains of this church restored to their pristine condition! It was true that something was done some years ago, and it was good so far as it went, but it was very meagre in extent, after all. With regard to St. Giles's, Cripplegate, the whole of the interior had been well restored, and as there were funds available, he hoped to see the outside of this church, particularly the fine tower, judiciously restored. The tower was of the fourteenth century, although it contained some sixteenth-century insertions, and the top stage was missing. After noticing the churches of St. Mary Aldermary, St. Andrew Undershaft, and St. Mary, Hadley, Mr. Nash spoke of the necessity for watchfulness on the part of archæological societies in order to avert the evil influences which threatened the existence of ancient remains. Destructive agencies were always at work. He was not an advocate for letting any good work go to decay through neglect, but it might just as well be allowed to perish of neglect as to disappear by more immediately-effective destructive processes. However carefully they might guard the ancient remains which were still left them, modern necessities would inevitably remove some of them year by year, and he therefore thought it would be a very good thing if some simple dictionary, or rather catalogue, of ancient remains extant in the county, could be compiled. For instance, under the head "Crypt," which he would define as "an underground chamber, vaulted," he would enumerate and describe all the crypts known to exist in the country.

In the course of an interesting discussion which ensued,

Mr. J. G. Waller, F.S.A., on the subject of restoration, criticised the mode of procedure often adopted by church restorers in dealing with fragments of brasses. It was a common practice, with the view of preserving such fragments, to affix them to the wall of some part of the interior of the church, but, translated in this manner, unaccompanied by the slabs on which they were found, they were generally wholly unintelligible, although, before their removal, the *matrices* existing in the slabs furnished a clue to their interpretation as a whole. He thought that the proposed catalogue or dictionary of county antiquities would be of the utmost value, but he doubted whether its preparation was a work that could be undertaken by the Society.

Mr. S. W. Kershaw (Hon. Sec.) referred to the existence of wall paintings in old churches, instancing those in the chapter-house of Westminster Abbey, depicting the Apocalypse, as interesting specimens.

Mr. Barron, F.S.A., in illustration of the necessity for a catalogue of county antiquities, spoke of the continual demolition of the old overhanging timbered houses of London.

The Rev. Hawley Clutterbuck mentioned the recent discovery, in the church of St. Lawrence,

Reading, of a palimpsest brass. One side was found to be the brass of a benefactor of the Charterhouse, Sir Thomas Popham, he thought. It had probably been removed when the Charterhouse was given over, and, finding its way into the brass shop, had emerged with the other side engraved as the brass of a citizen of Reading. This brass had now been removed from the floor of the church at Reading where it was found, and hinged to the wall, so that both sides could be examined. Incidentally Mr. Clutterbuck mentioned that the parish church of St. James's, Clerkenwell (built early in the present century), was about to be "restored and beautified," and he trusted that advantage would be taken of the opportunity that would thus be offered to bring to the light of day some of the interesting ancient monuments at present preserved in the vault of the church, among them being that of the last prior of the Order of St. John of Jerusalem.

Mr. Blashill, in the course of a few observations, said that some such catalogue as was suggested by Mr. Nash for Middlesex was much wanted for every county. They would take time to prepare, of course, but many helpers could, he thought, be found. Such catalogues might be usefully supplemented by archæological maps to a large scale, coloured so as to show the period to which the remains existing in any part of the county belonged.

The Chairman brought the discussion to a close by tendering the thanks of the meeting to Mr. Nash for his interesting paper, and announced that the next meeting of the Society would be held on Monday, December 12, when Mr. Rivington will read a paper on the Stationers' Company.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

The first meeting of the session 1881–1882 was held on Wednesday last, the Rev. S. M. Mayhew in the chair. The discovery of a Roman villa, evidently of considerable extent, at Wingham, Kent, was announced. Aided by a grant from the Kent Society, the villa is being excavated by Mr. Dowker, and already three rooms with tesselated pavements have been uncovered, while a fourth has a hypocaust. The work is very fine, the walls in one room being lined with mosaics. Funds are much needed for the prosecution of the researches.

Mr. Loftus Brock also reported the efforts made by the Association with respect to the safety of Stonehenge since the meeting there last year, and read a letter from Sir E. Antrobus, the owner, who disclaimed all intention of "restoration" in the works undertaken there by him. These are but for the safety alike of the monument and the visitors. Nothing permanent will be done until the spring.

Mr. Way exhibited some Mediæval pottery from Southwark; the Rev. S. Maude a unique denarius of Gallienus, with the name of Germanicus on the reverse; and Mr. R. Soames a drawing of remarkable sculpture in Brixworth Church. It is called an eagle, and is supposed to have been brought from the Roman villa which existed close to the building, where it is now built into one of the walls. Mr. G. R. Wright, F.S.A., exhibited some drawings of Mulgrave Castle, Yorkshire, and described some of its curious windows.

The first paper was on the "Bourg elz Ziffar, Cairo," by Professor Hayter Lewis, F.S.A. This is one of the angle bastions of the wall of Cairo, now almost covered by sand. It has an octagonal central chamber, 26 ft. in diameter, formed of neatly-cut stone. It dates probably from the time of Saladin.

Mr. J. W. Grover, F.S.A., in the discussion which followed, alluded to the appearance of the pointed arch in a developed state here, and to the magnificent museum of Egyptian antiquities at Boulak.

The second paper was by Mr. Gordon M. Hills, and was on the "Measurements of Ptolemy applied to the Northern Part of Britain." He identified Hornsea Lake, east coast of Yorkshire, as Ptolemy's Portus Sinus, and Penrith as the starting-point of the tenth iter; Salava, the second station, he placed at Gallaber, near Trebay.

National Portrait Gallery.—This gallery has lately been enriched by the addition of several important portraits bequeathed by the late Lord Hatherley.

THE FORCE OF THE LATE GALE.

The opening meeting of the Meteorological Society for the present session was held on the 16th inst.; Mr. G. J. Symons, F.R.S., president, in the chair.

The evening was devoted to an account of the gale which passed across the British Isles Oct. 13th and 14th, 1881, which had been prepared by Mr. Symons, with the assistance and co-operation of Mr. C. Harding and other gentlemen. There is evidence of the storm being formed in the Atlantic about 150 miles south of Nova Scotia on Oct. 10th, and that at noon on the 13th there was a considerable disturbance about 600 miles west of Galway. At that time there were scarcely any instrumental indications in the British Isles of the coming storm. The curves of barometric fluctuation show very plainly the advance of the depression from west to east, for while at Valentia the minimum occurred at two a.m. on the 14th, on the east coast of Norfolk it is recorded that it did not occur till four p.m. This fall, coupled with others, seems to indicate an easterly progression of the barometric minimum at nearly forty miles per hour. The area over which injury was produced was very large, and although not without precedent, it was happily rare. The record of 56 lb. per square foot at the Royal Observatory, Greenwich, was the highest ever registered in that locality, and close by thirty-five trees were blown down in the park, and 15 ft. blown off the top of a spire which had been erected about forty years, the stone of which shows no sign of decay, and which had retained its position almost, if not wholly, by the gravitation of its mass. The general opinion seems to be that the structural damage over the greater part of the country was by no means unprecedented, and in the greater part of Ireland and the south-west of England was not even of an unusual character; but along the east coast, and in the east midlands, the damage was excessive, and on the north-east coast unprecedented. In Scotland the destruction of trees was enormous.

EXPERIMENTS WITH CLOSET TRAPS.

On Saturday, the 19th inst., and on Monday, the 21st, a series of public experiments were made on the premises of Messrs. Pullen & Son, Penton-place, Newington Butts, with the view of testing the comparative efficacy of improved forms of the ⊔-trap, Beard & Dent's round pipe ∩-trap, and Smeaton's "Eclipse" trap. Each of these traps was placed in turn beneath one of "Underhay's pattern" valve-closets, made by Messrs. Bolding & Son, of South Molton-street, and was tested, firstly, for resistance to "unsealing" by what Mr. P. J. Davies (who assisted Messrs. Pullen in the conduct of the experiments) called "momentum," and, secondly, for its power to withstand syphonage due to a vacuum. All the traps tested were 4 in. size. Mr. Pullen, Mr. Davies, and others, maintain that a round-pipe trap, where used beneath a valve-closet, is extremely liable to become "unsealed," owing to the momentum of the water rushing through the valve, when the latter is suddenly opened, being so great that so much water is carried out of the trap that sufficient does not remain behind to "seal" it, the momentum with which the water passes into the trap being aided in effecting this undesired result by the facility which the round-pipe trap possesses of being rapidly cleared,—in itself a good quality, inasmuch as it ensures greater cleanliness than is possible with the ⊔-trap, although Messrs. Pullen & Davies claim that the improved form of the ⊔-trap is quite as clean in use as the round-pipe ∩ or ℧ trap. We do not think they can succeed in establishing this part of their contention; but their failure to do so will not prevent the use of the ⊔-trap in positions where it can be proved that the round-pipe trap is likely to prove less reliable than one of the ⊔ form. The experiments which we witnessed went to show that under the condition as to water-supply hereafter stated, Beard & Dent's round-pipe trap and Smeaton's "Eclipse" are neither of them proof against being unsealed in the manner indicated by the momentum of the rush of water from a valve-closet when the valve is suddenly lifted. The ⊔-traps shown in action seemed, however, to be proof against being unsealed in the same way. It should here be observed, though, that the water-supply was not laid on in the ordinary way to the closet used for the tests, the water being conveyed into the basin by a piece of rubber tubing as required. Had the water supply been connected with the closet so that, simultaneously with the opening of the valve of the latter, water could have been admitted into the basin, the test would have been more conclusive, for some of the fresh water admitted into the basin would pass through the valve before the latter was closed, and so help to preserve the seal of the trap. All the traps named were afterwards subjected to tests to resist being unsealed by "syphonage." The tests were as follow:—Each of the traps was placed in its turn beneath the valve-closet before named, the out-go being connected by an arm 4 in. diameter and about 18 in. long, running horizontally from the trap to the vertical soil-pipe, which was also 4 in. in diameter. At 20 ft. above the point of this junction was another arm leading from a ℧-trap on which was fixed a Sharp's hopper closet. In this hopper the water to the extent of about a pailful was retained by a plunger until discharged. With a cap over the head of the vertical soil-pipe, and with the valve of the closet held open, the vacuum caused in the arm connecting the valve-closet with the soil-pipe by the rapid passage of the water downwards past the junction was sufficient to unseal Beard & Dent's trap, and Smeaton's also, the ⊔-trap alone remaining sealed. The same tests made without the cap on the head of the soil-pipe, and with the valve of the closet closed, had the same results, with the exception that Beard & Dent's and Smeaton's traps did not lose so much water as under the previous conditions. All the foregoing tests were made with all the traps unventilated. In a subsequent test, the round-pipe or ∩-trap was provided with a 2-in. ventilating-pipe between the water in the trap and the junction of the arm with the down soil-pipe, but charges of water passing down the latter under the same conditions as before did not disturb the water in the trap,—proving that where an ∩-trap is used, it needs to be sufficiently ventilated. The tests were made with appliances fitted up for the purpose in connexion with a lofty scaffolding. A large number of persons interested in the matter were present on Saturday, but there was by no means unanimity of opinion as to the results obtained. We may add that the appliances and the scaffolding which supports them will remain up some days longer, and Messrs. Pullen invite inspection of the same by architects, builders, plumbers, and others interested in the question.

"MODERN EASTBOURNE."

In the notes descriptive of the progress of Eastbourne, lately given (p. 601, *ante*), the sum named as the cost of Mr. Shone's sewerage works there should have been called 4,000*l.*; the sum named by the writer,—16,000*l.*,—represents about the total cost of the town's drainage, irrespective of the cost of Shone's ejectors. An "Inhabitant of Eastbourne," proud of its progress, thinks we might have given even a fuller and more complete account than we did. No doubt of it; and still have left unsung some of the beauties and conveniences of this flourishing watering-place. Of course; but this is not intended. All that is proposed in such notices is to give a general idea of what is going on in the places mentioned. As to the washing away of more than 200 yards of the new sea-wall during the late gale, "concerning which the ratepayers are very sore," this occurred after our commissioner's visit. Our present correspondent says:—"All Saints, a stone church at the back of the Grand Hotel, is one of the handsomest churches, but it is built on lower ground than its surroundings, and so does not appear to advantage. Another church is talked of in the stead of the chapel-of-ease to St. Saviour's, which is near or on the site of the new town-hall. On the Marsh a large church, All Souls, is in course of erection, built of red and white brick, to seat 800 or 900; the architects are Messrs. Parr & Strong, and the builder is Mr. Peerless, who also is contractor for the Cavendish. The church stands in a very populous neighbourhood, and is the gift of Lady Victoria Wellesley, who intends to spend 20,000*l.* on it and its endowment. St. Saviour's, without the tower, is the gift of Mr. Whelpton, the father of the present incumbent; the tower was added by subscriptions and offertories. There have been several large gifts towards All Saints. Altogether the private

liberality towards church-building in Eastbourne has been unusually munificent. The Bishop of Chichester spoke of it the other day. Christ Church has just had aisle and apse added; and there is a new Mission-room at Norway, an outlying district. Trinity Church has been much improved by the green fence being cut down, so that the church as now seen forms quite a picturesque object in the Seaside-road. There is also a Workmen's Hall provided by the liberality of Mr. Leaf, containing a large room, and tea, coffee, and reading rooms, in the Seaside-road; and, further on, just before Christ Church, is a coffee-palace; there are also two coffee-stalls. There are several handsomely-built chapels, and also a Protestant service in French once a week. The principal shops are in the Terminus-road, and the place possesses the doubtful advantage of shops built by threes and fours in among the other houses; whereas a whole street or row of shops would have formed an attractive lounge for visitors, as the King's-road at Brighton. In Eastbourne there is not one shop facing the sea. The place is insufficiently lighted at night, so many trees make it difficult to diffuse the light; but what there is is not good, and the darkness is more than visible,—it may be felt."

SEVEN DIALS.

A NEW Mission-house for the Seven Dials District of St. Giles's parish has been erected in Short's-gardens, in connexion with the London Diocesan Home Mission. The work in this place (which has existed for more than twenty years) has been hitherto carried on in a small and incommodious room divided from the street by a bakehouse attached to a baker's shop adjoining, and which was very unhealthy through defective drainage, badly lighted, and much out of repair. This has been all cleared away, with the exception of the side and back walls, and the new building now extends the whole length of the site, being about 80 ft., and has a frontage to the street of simple First Pointed character in stock bricks, the arches and jambs being of red brick and Bath stone. The design consists of a main gable finishing the end of the open-timbered roof to a bell-gable at the side. The building is well lighted from the roof by dormers between the principals. The drainage has been entirely reconstructed, and the premises have been made healthy. The opening took place on Tuesday, the 1st inst. (All Saints' Day). The architect was Mr. William Milford Teulon, of Upper Woburn-place; and the builder, Mr. Andrew Killby, of Appold-street, Finsbury, who has done his work well.

SCHOOL BOARD SCHOOLS IN THE METROPOLIS.

AT a recent meeting of the School Board for London, a report was brought up from the Works Committee, and ultimately adopted, containing the following recommendations:—

"The Committee have invited tenders for the erection of a school to provide accommodation for 1,200 children on the site in Homerton-row (Hackney). The Committee recommend that, so soon as the plans shall have been approved by the Education Department, the lowest tender, that of Mr. C. Wall, of Lots-road, Chelsea, amounting to 11,400*l.*, be accepted. Cost per head of school buildings only, 7*l.* 6s. 9d.; total cost per head, 9*l.* 10s.

The Committee have also invited tenders for the erection of a school to provide accommodation for 1,000 children on the site in Heberroad, Dulwich. The Committee recommend that, so soon as the plans shall have been approved by the Education Department, the lowest tender, that of Mr. W. Tongue, of Plumstead, amounting to 10,619*l.*, be accepted. Cost per head of school buildings only, 8*l.* 13s. 5d.; total cost per head, 10*l.* 12s. 4d.

On the 15th of August last, the Education Department sanctioned the provision of 400 additional places on the site in Bath-street, City-road. As the school which was then being erected on this site was nearly completed, and as Messrs. Wall, Brothers, the contractors, were willing, while their plant was on the site, to carry out the enlargement on the contract schedule of prices, the committee instructed them to proceed with the work. They recommend that the action taken by them be confirmed; and that the tender of Messrs. Wall, Bros., based on the contract schedule of prices, and amounting to 4,390*l.*, be accepted. Cost per head of school buildings only, 10*l.* 12s. 1d.; total cost per head, 10*l.* 19s. 6d.

HOW TO BUILD.

(FROM A JERRY BUILDER'S POINT OF VIEW.)

Rules and Regulations for the Prevention of Rheumatism, Fever, Cold, &c.

First buy your ground; to be, of course, the cheapest lot you've seen:
For choice, an ancient brickfield, or where once the ground has been
Dug out for sand or gravel, with the holes all newly fill'd
With rubbish from the dust-heap, such as cats, untimely kill'd
Old bottles, cabbage-stalks, and tins,—to name them all is hard,
Though you'll find the chief components in the dust-bin in the yard.
Now, ere proceeding farther, it is best to first procure
A copy of the by-laws for the district; then be sure
To spend each leisure moment trying how to circumvent,
Within the law, if possible, their very plain intent.
Next excavate, put concrete in,—here 1 to 12 will do;
Then start your footings, *any* bricks! they're not exposed to view.
For mortar, take a little lime, some sand, some ash, much earth;
Be sure, when mix'd together, of the latter you've no dearth.
For damp-proof, lay a course in tar, and, just to save a brick,
Plug up all holes with concrete in the inside work, but pick
Your best bricks for the facings; you may halve the headers, too,
Have a straight joint up the centre, with, now and then, "a tumble."
Get first-floor joists on in a week to hold the walls together,
Get slated in in three to keep the *st*r*e*n*g*th from the weather.
The doors make thin, two from a deal's the plan you understand,
The only season'd work to be that purchased second-hand.
You'll connect the drains, of course, at the end next house, and thence
Run them a few feet underground and leave, to save expense:
You'd fix your cistern where you choose, and take the utmost care
That afterwards it can't be reach'd for cleansing or repair.
You'll let the same supply the bath, the closet,—all the last,—
Take waste and soil pipe down in one to where the drains are not.
But finish your fronts with care, with stone dressings, bays, and strings;
Inside with showy paper, deep cornice, and such like things.
And mortgage it floor by floor after the manner of old,
And put up a bill when finish'd, "House to be let or sold."
Then when you've secured a victim,—a tenant he's call'd by you,—
You'll migrate with a peaceful heart to "fresh fields and pastures new."

G. H. L. S.

PATENT RECORD.*

APPLICATIONS FOR LETTERS PATENT.

4,840. J. B. Spence, London, and E. Ormerod, Belvedere. Manufacture of concrete for receiving an enamelled surface. Nov. 4, 1881.

4,845. J. H. Johnson, London. Apparatus for flushing water-closets and urinals, &c. (Com. by T. Guinier, Paris.) Nov. 4, 1881.

4,848. H. Gibbons and A. Anthony, Hungerford. Locks and latches. Nov. 5, 1881.

4,859. J. Adams, Sheepbridge, and J. Bonehill, Rotherham. Fire-grates, &c. Nov. 7, 1881.

4,862. J. Harley, Glasgow. Astragals and sash-bars for glass, &c. Nov. 7, 1881.

4,876. W. Teague, Illogan. Ventilating and clearing places of gas, smoke, foul air, &c. Nov. 8, 1881.

4,878. J. P. Bayly, Paddington. Appliance to render structures proof against strain. Nov. 8, 1881.

4,893. R. H. Clive, Birmingham. Locks and latches. Nov. 8, 1881.

4,902. J. F. Smith, Leicester. Constructing bridges, &c. Nov. 9, 1881.

4,927. E. de Pass, London. Manufacturing artificial stone. (Com. by R. H. Stone, Brighton, Victoria.) Nov. 10, 1881.

4,928. J. Thompson and C. Morris, Birmingham. Stoves for heating, &c. Nov. 10, 1881.

4,929. H. J. Haddan, Kensington. Stoves. (Com. by J. Schneur, Paris.) Nov. 10, 1881.

4,937. F. R. Baker, Birmingham. Spring hinges and door-springs. Nov. 10, 1881.

NOTICES TO PROCEED

have been given by the following applicants, on the dates named.

Nov. 8, 1881.

2,935. J. Louis, London. Supporting and protecting persons outside buildings for window cleaning, &c. July 5, 1881.

2,969. E. Aldous, Peckham. Apparatus for ventilating buildings. July 7, 1881.

3,067. J. Gilmore, Norwood, and W. R. Clark, Peckham. Apparatus for inducing an outward draught from chimneys, &c. July 13, 1881.

Nov. 11, 1881.

2,898. F. Grinnell, Providence, U.S.A. Apparatus for extinguishing fires in buildings, &c. July 2, 1881.

2,945. F. D. Harding, Hampstead. Applying decorations to door and other panels. July 5, 1881.

3,055. C. M. Scott, Dalkey. Disinfecting apparatus. July 12, 1881.

4,191. G. J. Cox, Maidstone. Gas cooking and heating stoves. Sept. 29, 1881.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending November 12, 1881.

1,327. T. Morgan, Westminster. Magazine heating-stove, with flues for circulation of air and ventilation.

This is a vertical stove in which the fire is carried in an internal cylinder, and the air passes between the internal cylinder and the outer cover, through flues in which it is heated. (Com. by O. Elterich, Nuremberg, Bavaria.) March 24, 1881. Price 6d.

1,432. W. Morgan, Bristol. Deodorising water-closets.

A pipe is led from the upper part of the pan of the closet to the eaves of the house in which a gas-burner or oil-lamp is placed, which creates a draught and draws off all the effluvia through the pipe. April 1, 1881. Price 6d.

1,449. A. MacPhail, London. Firegrates, stoves, &c.

The grate has a corrugated bottom and backing of fire-clay, and behind and above the grate is a space, through the front wall of which are a number of holes. The lower end of this space opens into the flue. The front bars of the grate are vertical, and curved over towards the fire, and a screen is placed against the bottom bar, on which the vertical bars rest with holes, so that, when the fire is lighted, the air passing through these holes drives the gases and smoke through the holes in the wall into the space behind, where they are consumed. April 2, 1881. Price 6d.

1,466. J. Sainty, Wisbech. Apparatus for lighting fires.

A blowing apparatus, containing bellows worked by a lever, forces air into a wind chest from which a flexible pipe conveys the wind to a lamp. This consists of a number of flat wicks, so placed that when they are lighted the wind propels forward a horizontal sheet of flame. The grate need, therefore, only be filled with coal, no wood, &c., being required. (*Pro. Pro.*) April 4, 1881. Price 2d.

1,473. G. B. Jerram, Walthamstow. Pipes and syphon-boxes, or traps for drains, &c.

The sockets and spigots of the pipes are tapered, the space between being filled with soft material. The syphon-boxes are made with a loose cross partition, which forms the seal. This is made to slide up and down as required, and may be altogether removed for cleaning purposes. April 5, 1881. Price 6d.

1,475. W. H. Dandy, Great Driffield. Dwarf window-blinds or screens.

These are made of a number of vertical laths ranged side by side, which are ornamented or cut as required. They are secured to narrow strips of wood placed at the top and bottom. April 5, 1881. Price 4d.

1,484. C. Haarburger, London. Expanding fire screen.

This is composed of a number of strips of metal or wood, &c., which are laid diagonally over each other, and articulated together so as to be capable of expansion. A curtain or backing of cloth may be used to prevent the heat passing through the interstices. (*Pro. Pro.*) April 5, 1881. Price 2d.

1,485. G. Tall & J. Daddy, Kingston-upon-Hull. Compound for preventing escape of steam, gas, water, or air, from joints of pipes, &c.

This is composed of ordinary brickyard clay, 12 lb.; linseed oil, 2 lb.; black-lead, 2 lb.; pipeclay, 3 lb.; and whitening, 2 lb. These ingredients are mixed and ground together, and sufficient water is added to make a paste, which keeps the joints perfectly tight. April 5, 1881. Price 2d.

1,520. R. Applegarth, London. Decorating bricks, tiles, &c., by the use of mica.

Enamel, dissolved in water, is spread upon the surface. Upon this is a second coating of gummed water, and powdered mica is then sprinkled through a sieve upon this. The decorated article is then placed in a muffle, and baked. (Com. by E. A. L'heureux, Paris.) (*Pro. Pro.*) April 7, 1881. Price 2d.

1,528. W. T. Sugg, Westminster. Uniting gas, water, and other pipes or tubes.

The ends of the pipes to be joined are gripped between

* Compiled by Hart & Co., patent agents, 28, New Bridge-street, E.C.

an internal ring of soft metal and two external rings or socke s with a flange, through which bolts are passed to secure them together. (*Pro. Pro.*) April 7, 1881. Price 2d.

1,545. J. C. Mewburn, London. Apparatus for moistening, cooling, and purifying air.

Water is held in a horizontal pipe, in the upper part of which are a number of atomising cocks. Compressed air or steam enters the pipe, and forces out the water in an atomised state, which cools and purifies the air. (Com. by A. J. Desmarest, P. Cosnard, E. Sée, and F. Sée, Lille, France) (*Pro. Pro.*) April 8, 1881. Price 2d.

1,561. W. Lawley and J. Lawley, West Bromwich. Metallic road gutters.

To render road gutters capable of being cleansed easily, the trough-shaped body is fitted with a hinged covering plate, which can be turned back, exposing the whole width of the gutter, and rendering the operation of cleaning easy of accomplishment. (*Pro. Pro.*) April 9, 1881. Price 2d.

3,388. C. Detrick, Philadelphia, U.S.A. Continuous underground pipes.

These are formed by excavating the ground to the required size and then forming within, upon cores of the desired shape, a mass of plastic material that will subsequently solidify, and when the cores are removed will form a pipe, after which the excavated substance may be replaced in the trench. August 4, 1881. Price 8d.

VINEGAR MANUFACTORY, BREWERY-ROAD.

Large new premises are fast approaching completion in the Brewery-road, Caledonian-road, for Messrs. Crosse & Blackwell, of Soho-square, to be devoted to the extension of their present vinegar manufactory, which they face in the same road. A building lease having been granted by the Corporation, substantial premises covering an area of 20,000 superficial feet, inclusive of the yard, have been erected, consisting of two tun-rooms, each of which is 88 ft. by 50 ft., with a cooperage, loading-stage, and warehouse over on the one side of the yard, and a foreman's residence, with stables and a van-shed, &c., on the other side.

The building is faced with red pressed bricks from the Adderley Park Brick Company, with Portland Stone bands and dressings, the spandrels of arches being filled in with ornamental bricks from the same company.

The tower, which is 75 ft. in height, is the chief object of importance, and contains the staircase to warehouses, with cloak-rooms and lavatories on each alternate landing.

A subway will be formed, permission having been accorded by the parish authorities, under the roadway, through which it is contemplated to carry steam, water, or gas-pipes, as also to supply a means of communication between these premises.

The architects are Messrs. Roumieu & Aitchison, of Lancaster-place, Strand; and the contractors, Messrs. David King & Son, of Billiter-avenue.

BUILDERS' BENEVOLENT INSTITUTION.

The fifty-sixth election of pensioners in connexion with this Institution was held on Thursday at Willis's Rooms, St. James's, the President, Mr. Ex-Sheriff Burt, J.P., in the chair. There were six candidates,—five men and one woman. It was originally intended to elect only two men and one woman, but in consequence of the large amount subscribed in connexion with the recent anniversary festival,—the success of which was due, in no small degree, to the zeal of the Secretary, Major Brutton,—it was determined by the committee to elect three men. The candidates were:—John Willis, aged 65 (second application), who received 2,307 votes; Charles Henry Wood, aged 63 (second application), 1,819 votes; John Loat, aged 84, 1,412 votes; Jonathan Parsons, aged 67, 432 votes; John Cooper, aged 78, 625 votes; and Amelia Stone, aged 60, widow of William Stone (second application), 2,897 votes. Shortly after the close of the poll at three o'clock, the scrutineers (Messrs. Thomas Stirling and T. F. Rider) reported the results of the voting as above given, and accordingly the Chairman declared the successful candidates to be John Willis, Charles Henry Wood, John Loat, and Mrs. Stone. Votes of thanks to the chairman and scrutineers brought the proceedings to a close.

The Number of Failures in England and Wales gazetted during the week ending Saturday, November 19th, was 229. The number in the corresponding week of last year was 250, showing a decrease of 21, being a total decrease, in 1881, to date, of 859.—*Kemp's Mercantile Gazette.*

TEWKESBURY ABBEY.

Sir,—I am glad attention is being called to this restoration, and hope you will use your influence to stop money being spent on the interior till the exterior is put in fair repair.

The north arcade to the clearstory should be dealt with first. Surely no society would object to the removal of this wretched modern work.

The turrets at the west end are the most beautiful I have ever seen, and I confess I should like to see the west window out, and, if there is any evidence, the part restored that is deficient. Where slate roofs form the clearstory at present, this looks weak, and spoils the effect of the beautiful west end.

Who is responsible for the horrible black brick paving round the abbey, that seems suitable for some cheap local Board, but is unworthy such a building?

I was surprised to hear there was no clerk of works employed, the only *man* mason I saw there telling me it was left to his master.

A number of youths were working mouldings far beyond their skill, and a comparison of the sections of the new work with the old showed the want of careful supervision.

On the nave clearstory a youth was whistling a tune and rubbing a piece of card wire at random over a moulding, altering its profile entirely. I looked round for a brick, and if I had found one at the moment I fear I should have been made acquainted with the interior of a very different building.

Large sums have been spent on the building, and it is unfair to the architect, his time being taken up so much with committees, to leave the work without supervision.

If it is want of funds, I feel sure that the class to which I belong would subscribe towards the salary of a competent man experienced in Gothic masonry, the bedding and jointing of stones and their selection, and who by his reading and observation would make the construction rather than the history of the place his study.

I regret that too many of my brethren neglect the construction, and though talking glibly of the abbots, can tell me nothing of the tooling or jointing of the different periods.

A Clerk of Works.

CONTRACTS AND QUANTITIES.

Sir,—Being lowest for a tavern to be erected at Fulham this week, under a firm of architects well known, who supplied their own quantities, I found the contract terms were to include the following:—

"The quantities were to be taken as correct, opportunity being given to the contractor to verify them before signing." "In case of any dispute between employer and contractor, the architect's decision to be final, binding, and without appeal."

On seeing this, I applied for opportunity to verify the quantities, which was refused, as the client (who was present) insisted on the matter being settled at once. As the architect refused to incorporate the quantities with the contract, I refused to sign, and the matter accordingly fell to the ground, as far as I was concerned.

I want to know, sir, whether this form of contract is legal, as I am informed it is not, and can be upset in law. It seems to me inconceivable that a man who insists on being paid 2½ per cent. for the quantities he supplies should not be responsible for their accuracy.

Young Builder.

Sir,—From time to time I have observed advertisements emanating from H M. Office of Works, inviting builders to tender, in which the following paragraph invariably appears:—"The Commissioners do not hold themselves responsible for the accuracy of the bills of quantities, which must be verified by the persons desirous of tendering."

It is a marvel that builders can be found willing to tender upon such objectionable terms as these. In the first place, a builder desirous of tendering has no option but to take the quantities supplied to him by the Commissioners, and in the absence of the name of the quantity surveyor there is nothing to indicate that the quantities have been prepared by an experienced person; in fact, one might very fairly infer from the disclaimer of responsibility on the part of the Commissioners that such an eventuality as the quantities being found inaccurate had presented itself to their minds.

I am not aware whether these quantities are prepared by a salaried surveying clerk in the Office of Works, or by an outside quantity surveyor, charging his commission in the usual manner. If the former, the Commissioners are acting in a high-handed manner and a spirit of unfairness, by binding down the builders to accept as correct the quantities prepared by their own clerk, which, in the event, may turn out to be inaccurate. If the latter, there is no occasion to disclaim responsibility where none exists, as, in the event of inaccuracies in the quantities, the builder has his remedy against the surveyor whom he pays.

I have assumed that inaccuracy means "short quantities"; cases of "full quantities" seldom or never arise. But the worst point in the advertisement is the compulsory verification of the quantities. If this is to be honestly done, it is tantamount to retaking-out the quantities, the expense of which must, of course, be borne by the builders, and I should like to know, supposing builders could be found willing to incur this expense, whether the Commissioners would allow the time and afford the facilities necessary for such an operation to be performed? If not, it is a farce to talk about verifying quantities, and as the Commissioners must know that, in fact, it is not and cannot be done, they in effect obtain tenders in the usual way, but with a reservation very much in their favour, and against the builders.

Of course, as long as there are builders who are willing to be bound hand and foot to quantities they know nothing of, so long will this class of advertisement continue to be put forth; but it rests with the builders themselves, by declining to tender upon such arbitrary terms, to effect the withdrawal of this kind of invitation to tender.

Sidney Young.

CONVICT LABOUR.

Sir,—Referring to the *Builder* of the 5th inst., I was much interested in your article on "Convict Labour as applied to the Drainage and Reclamation of the Irish Bogs." It appears to me that the influence of your journal might be made the means of agitating for a Parliamentary inquiry as to the practicability of the measure, and if possible in the ensuing session.

It is probable that the question of the maintenance of military surveillance of extra strength during the present disaffected state of the country, and the possible connivance of the convicts in any alarm of outbreak, might have some weight attached to it. Otherwise, as you observe, the *pros* of the question will outweigh the *cons*. If the movement resulted in a revival of the peat fuel manufacture, as it doubtless would, this should also be a source of profit to the Government, though as a commercial undertaking it is usually profitless, owing probably to the amount of labour required in draining, cutting, stacking, wheeling, and generally manipulating the peat. The accomplishment of this is part of the scheme, and the wholesale shipment of the peat fuel to London would materially abate the smoke nuisance of the metropolis, and more or less bring the "coal ring" to sense.

P. A. Williams.

BIRKENHEAD TOWN-HALL COMPETITION.

Sir,—Permit me to call your attention, and that of the referee (Mr. Barry), to a feature of the above which I fear has not received the attention it deserves.

You are doubtless aware that the first competition is for sketches only, five of which are to be selected and finally worked out by their authors, Clause 5 of the Instructions saying,—"In order to obviate the possibility of the sketch designs lodged in the preliminary competition being made use of by the competitors invited to take part in the final competition, such sketch designs will not be allowed to be seen by any one except the council and referee, and will be retained until the final competitive designs have been sent in."

This seems very fair, but it assumes a very different aspect when the fact is considered that the said council contains two architects and the father of a third who will likely be competitors, and yet have every opportunity of seeing the sketches and making such use of the information, as they may see fit. Surely, Mr. Editor, the council should not permit these gentlemen to see the sketches.

C.

COSTLESS POWER.

Sir,—Most cities are supplied with water by gravitation; and here, it appears to me, is a source of power which is wasted, and which might be taken advantage of in the production of the electric light. In such cases as those of Edinburgh and Glasgow, where the supply is derived from a great elevation, the pressure must be considerable, and that power might be made available without detriment to the water-supply of these cities. I am not prepared to go into details, but must confine myself with throwing out a hint which may be taken advantage of by those who possess more practical knowledge of such matters than I can boast of.

Signet.

The Fire in Essex-road, Islington.—Messrs. Jeffrey & Co., paperstainers, write to say that the fire which occurred on their premises on Monday morning was confined to a portion of their factory, and that most of their blocks and stock was saved. They have made arrangements to carry on their business as usual.

SCOTCH NEWS.

Montrose.—The old houses on the north side of the new street leading to the North British Railway Station have been removed. Ever since the street has been opened these rickety old buildings have been a perfect eyesore, and their removal will greatly improve the appearance of the street. The ground on which they stand belongs to the railway company; but it is understood that an offer has been made for it for feuing purposes by the North of Scotland Bank.——At a recent meeting of the Police Commission, the Provost presented a report made by Mr. Aitkenhead, architect, on the baths proposed to be erected in Bridge-road. As to the cost of the structure, Mr. Aitkenhead says,—"A very plain but substantial building, consisting of a model first-class pond, with thirty dressing-boxes and gallery, say five or six well-appointed private baths, three shower, one douche, one spray, and one vapour bath, large lavatory, water-closets, towel-boxes, entrance-hall, ticket-office, waiting-room, master's house of three apartments, enclosing walls, gateways, foot-pavement, as also a wash-house, boiler-house, with stalk, say 50 ft. high, engine-room, and coal-shed, and, inclusive of all engineering work and other necessary fittings, will, I consider, cost about 2,450*l.* I deem it also advisable to suggest, considering the conspicuous and isolated nature of the site, the building on which will be exposed to view on all sides, and situated as it is on one side of the principal entrances to the town, that a further sum of say 200*l.* be expended by way of moderately embellishing the external appearance." The report was referred to the committee for consideration.

Dundee.—The *Railway News*, noticing Mr. Barlow's plans for the new Tay Bridge, says:—The new bridge substantially agrees with that designed by Sir Thomas Bouch, though with several well-marked differences. Foremost amongst the latter must be named the provision for a double line of rails, by which a wider base is secured, and the strength of the structure to resist lateral pressure is proportionally increased. Another special feature is the use of wrought-iron throughout for the piers on which the girders rest, and as the substructure is 3 ft. higher, and the maximum height 11 ft. less, the highest of the central piers, besides being doubled in lateral strength by the provision for two lines of rails, will be individually about 14 ft. shorter than those which fell. As the greatest height is only continued over four of the principal spans, a better gradient towards the Dundee side is secured, a fall of 1 in 114 being begun at the fifth 245 ft. span, so that the extreme north pier of the largest spans will be considerably shorter than the corresponding pier in the former bridge. On the Dundee shore portion of the new bridge brick piers will be used, and in many points of detail, such as the form and arrangement of the iron pillars, the design differs from the bridge now so far existing. The works on the existing bridge will not be utilised further than that the piers standing in the water may prove useful as so many solid *points d'appui* from which the work of erecting the new bridge can be carried on.

Books.

The Science of Building: an Elementary Treatise on the Principles of Construction. By E. Wyndham Tarn, M.A., Architect. Second Edition. London: Crosby Lockwood & Co. 1882.

Practical Geometry for the Architect, Engineer, Surveyor, and Mechanic. Second Edition. Same author. Same publishers.

The appearance of new editions of these volumes serves to justify the high commendations they have already received at our hands. To the "Science of Building" considerable and valuable additions have been made, and all who are preparing themselves for the forthcoming examinations, as well as those who look forward to do so, will find it necessary to possess themselves of it. It is, of course, necessary that the student should be acquainted with geometry and algebra.

The second edition of the volume on "Practical Geometry" has been increased by the addition of short chapters on the method of applying geometry to the determination of strains in framework, and on isometrical projection.

VARIORUM.

The name of Treloar is so often mentioned in connexion with Ludgate-hill, that one is not surprised to receive a little book titled "Ludgate-hill: Past and Present," with that gentleman's name at the foot of the preface. It is a pretty little book, with a number of appropriate illustrations, and is published by Griffith & Farran, of that neighbourhood. A large amount of interesting matter concerning the world-famous spot of which it treats has been brought together in a clear and pleasant manner, and when once the book is opened it is difficult to put it down again. One is never tired of reading about wonderful London, even though we may have heard parts of the story again and again.——"Professional Papers on Indian Engineering," published at the Thomason College Press, Roorkee, reach us as usual. These are edited by Major A. M. Brandreth, R.E., Principal. The number before us (xli., July, 1881) consists of eight papers treating wholly of water-works and water-supply. It is mentioned incidentally, while speaking of glazed stoneware pipes from Lambeth as being imperishable, that the life of iron pipes in Indian soil impregnated with saltpetre does not extend over twenty-five years.

Miscellanea.

Tunnelling the Pyrenees.—The Paris correspondent of a contemporary says:—To the various subalpine and submarine tunnels now in course of construction, or planned only on paper, is to be added another enterprise of the greatest importance to France and Spain. This is no other than a scheme for piercing a tunnel under the Pyrenees at a point as nearly as possible equidistant from the Atlantic and the Mediterranean. The great natural barrier between the two countries has, up to the present, only been surmounted by the iron road at the two extremities of the range, near Bayonne and Perpignan. Both of these routes necessitate a long *détour* for traffic between the south of France and the north of Spain, even the carriage-roads over the mountains being all inaccessible during the winter months. The advantages of a direct railway midway through the Pyrenees would, therefore, be unquestionable, as, in addition to developing intercourse between neighbouring provinces, at present separated by an unbroken wall, the monotonous journey between Paris and Madrid would be shortened by about 100 kilomètres. The initiative of this useful undertaking is due to the Spanish Government, which has introduced a Bill into the Cortes authorising the construction of the tunnel, and of a railway leading from Madrid directly to its entrance. The Government of King Alfonso offers to provide half the funds for the tunnel on condition that France undertakes an equal share in the expense.

Theatre-building in New York.—The new Wallack's Theatre, now building on Broadway near Thirtieth-street, is intended to be as far in advance of the other places of public entertainment in New York in security against fire as the Madison-square Theatre is in ventilation and mechanical appliances. The *American Architect* says:—The front, side, and rear walls of the structure are of brickwork nearly 3 ft. thick, the proscenium wall, between the stage and the auditorium, is 2 ft. thick, and the exits are of unusual size. As only the rough walls are done, it is of course impossible to judge of the remaining part of the construction; but it may certainly be said that the skeleton of the structure has all the qualities that need be desired. This example proves that the additional cost of erecting such buildings in a manner at once solid, safe, and beautiful, does not deter managers from their enterprises, and it would seem in every way desirable that the New York Building Department should seize the opportunity to adopt as nearly as possible those admirable regulations for the construction of theatres which have been recently promulgated in Paris. No hardship would be inflicted upon any one by the enforcement of these rules in relation to all future edifices of that class, while the ultimate saving of life and property would probably be of inestimable importance. The coming decade will undoubtedly witness the building of many theatres in the upper part of New York, and it is quite time to make sure that Mr. Wallack's example will be generally followed, and, if possible, improved upon.

Birmingham Architectural Association. The total number of members is now forty-four, of whom twenty-nine are ordinary, and fifteen honorary members. The annual meeting was held on the 2nd of November, and was well attended. The president, Mr. George Ingall, delivered an address; and the whole of the class drawings were exhibited, in addition to a numerous collection of sketches, photographs, &c. The ordinary meetings held during the session were occupied as follows:—Address by the Chairman, Mr. R. B. Morgan; papers on "Poetry in Relation to Art," by Mr. T. W. Camm; on "Architectural Physiognomy," by Mr. Fred. W. Cross; on "Decoration," by Mr. W. H. Kendrick; one entitled "Some Ideas on the Practical Ventilation of Private and Public Buildings," by Mr. William Henman; lecture on "Art Workmen,—Past and Present," by Mr. John Roddis"; papers on "Proportion," by Mr. A. Reading; on "Japanese Decorative Art in its Relation to the Architect," by Mr. J. W. Tonks; on "Pictorial Art," by Mr. W. H. Vernon; on "Bricks and Terra Cotta," by Mr. Enoch Wood; and on "Renaissance Architecture," by Mr. O. Essex. The meetings of the classes were generally well attended, and a fair amount of work was contributed by the members, especially by those who joined the Elementary Class of Design. The Saturday afternoon visits to buildings were as numerously attended as in previous sessions.

Carlisle.—Extensive alterations and additions have been made to the premises in English-street, recently purchased by Mr. Jas. Atkinson, draper. The back buildings have been entirely rebuilt, and the main front buildings have been gutted and re-modelled. The interior of the shop is effectively lighted by the lantern-roof over a gallery on the first floor. The new premises, comprising shop, show-rooms, millinery saloon, workshops, and workrooms, are now among the most complete of their kind in Carlisle. The works have been expeditiously carried out in a satisfactory manner, Mr. T. Milburn being contractor for brickwork and masonry, and Messrs. Bates & Forster for carpenter and joiner's work; the remaining trades were carried out by local tradesmen. The prismatic lights have been supplied by Messrs. Hayward Bros.; the mosaic floor by Mr. Ebner; and the revolving shutters by Messrs. Clark, Bunnett, & Co. The works have been carried out from the designs and under the superintendence of the architect, Mr. Geo. D. Oliver, of the firm of Messrs. Hetherington & Oliver, of Carlisle.

Moving a Large Hotel.—A large hotel in Boston, the Pelham, was lately moved a distance of 13 ft. 10 in., with a view to widening Tremont-street. The building is of freestone and brick, with frontages of 96 ft. and 69 ft., a basement and seven stories, the total height above the tramways used being 96 ft. The weight was 5,000 tons. The furniture was not disturbed during removal, nor were the occupants of the stores on the first floor and in some of the rooms, the various pipe connexions being kept up with flexible tubes. Substantial stone and brick foundations were made for iron rails and rollers, and the building was forced to its new position by means of fifty-six screws operated by hand against timbers arranged to uniformly distribute the pressure against the building (which was firmly braced in the lower part). Two months and twenty days were occupied in preparation. The moving itself was begun on August 21st, and finished on August 25th, but the actual time of moving was only thirteen hours and forty minutes. The greatest speed was 2 in. in four minutes. The whole cost was about $30,000.

The Church of St. Mary-at-Hill, Eastcheap.—The rector of this parish has given notice of appeal to the Judicial Committee of the Privy Council, from the decision given last week by Lord Penzance in the case of Peek *v.* Trower, refusing a faculty to expend from the parochial funds about 500*l.* for alterations in the interior of the church, which faculty Dr. Tristram, Chancellor of the Diocese of London, had decreed.

The Largest Printing Establishment in the North of England has lately been erected at Leeds, by Mr. A. Cooke. It is three stories high, and consists of a large open ground-floor, with two stories of galleries running all round, and a large open well. It is mostly lighted from the roof, and the roof glazing is done by Mr. Helliwell, of Brighouse, Yorkshire, on his patent system of glazing without putty.

The Female School of Art.—The exhibition of works executed by the students to whom medals and prizes have been awarded for the past year is satisfactory, maintaining the advance which has been lately apparent in the school. Ninety awards have been made to forty-eight students. The Queen's Scholarship, of 30*l.*, has been gained by Constance Wood; the Cloth workers' Scholarship, of 20*l.*, by Mary Elizabeth Harding; the Gilchrist Scholarship, of 50*l.*, second year, by Ethel Chapman Nisbet; first year, Ottilie Amalie Bodé; the Queen's Gold Medal, by Mary Elizabeth Harding; a National Silver Medal, by Florence Reason, Ethel Chapman Nisbet, and Mary Emily Carter; National Bronze Medals: for study from the antique, gladiator, Norah Waugh; for group in water colour, Rose Ethel Welby; for water-colour studies, Edith Harris and Lilian Abraham; and for design, Edith Robinson. National Book Prize, monochrome, the Wrestlers, by Norah Waugh. Gilchrist Prize, 3*l.*, advanced ornament, is divided equally between Edith Rowe and Agnes Lee; the Baroness Burdett-Coutts Scholarship, of 40*l.*, has been gained by Dora Crittenden; and the Baroness Burdett-Coutts Prizes, for modelling a hand from nature, 2*l.*, by Henrietta Marcus; for design for cameo brooch, 1st prize, 5*l.*, Florence Reason; 2nd prize, 2*l.*, Edith Ellison. Some specimens of wood-carving by female students of the National School of Wood Carving, at the Albert Hall, are creditable.

Mr. George Hill, Sculptor.—We regret to announce the death of Mr. George Hill, monumental sculptor, of Merton studios, Manresa-road, Chelsea, which took place on Thursday, the 10th inst., after a short illness. Whilst pursuing his daily vocation, he was seized with paralysis, and died the following morning; he was interred in Brompton Cemetery. For many years Mr. Hill was connected with the late eminent sculptor, J. Birnie Phillip, and took a prominent part in the execution of the podium of the Albert Memorial in Hyde Park, representing architects and sculptors, the Ludgate-hill Viaduct, masonry piers of Blackfriars Bridge, and the spandrel arches of Chelsea Bridge. He was very successful in designing mural tablets; amongst his latter works may be mentioned the reredos sent to Mocha, "Mauritius," pulpits to Chichester Cathedral and Liverpool Memorial Church, of which notices have, from time to time, appeared in the *Builder*, together with many other works executed during his thirty years' sojourn in Chelsea.—*West Middlesex Advertiser.*

Death of Mr. Joseph Nettlefold.—Mr. Joseph Nettlefold, of Birmingham, died suddenly at his Northern residence, near Pitlochry, Perthshire, on Tuesday last. Mr. Nettlefold was for some time the partner of Mr. Joseph Chamberlain, the President of the Board of Trade, and since their enormous screw manufactories passed into the hands of a company, under the title of "Nettlefold's (Limited)," deceased has acted as chairman of the directorate. Only six weeks ago he announced that his magnificent collection of the paintings of David Cox, which has been valued at 40,000*l.*, was to become the property of the Art Gallery Committee upon his death, which has so soon followed. One of the conditions of the bequest is that the paintings shall be exhibited only in a gallery lighted by electricity.

Cantor Lectures.—On Monday evening last (21st inst.), the first lecture of the first course was delivered by Mr. Thomas Bolas, F.C.S., the subject being "Some of the Industrial Uses of the Calcium Compounds." Mr. Bolas alluded to the distribution and occurrence of calcium in nature, and the abundant existence of carbonate of lime as limestone, chalk, marble, calospar, shells, &c. He referred to the new metallurgy of Davy, as initiated by the isolation of potassium; and pointed out the probability that some of those metals which are abundant, but not in general use, may soon come into notable importance.

Birmingham and Suburban Tramways. About twenty miles of tramways are proposed to be laid, for connecting Birmingham and the suburbs, and application will be made to the Board of Trade immediately for the provisional order. The projected scheme will include in its radius stations at Perry Barr, Nechells Park-road, Saltley-road, Small Heath, Sparkbrook, and Moseley. The proposed termini are Albert-street and Corporation-street. The engineer for the northern division, including Perry Barr, Nechells, and Saltley, is Mr. E. Pritchard; and for the other part, Mr. Shipway.

The Hindley Sewerage Scheme.—A special meeting of the Board was held at the Board-room, and the sewerage schemes which had been invited to be sent in, and which numbered ten, were carefully examined, and it was decided that the premium offered, 60*l.*, be awarded to the author of plan No. 7, under the motto "Health," but that the Board do not bind themselves to carry out the scheme. The following were the authors:—No. 1, "Indicator," by Henry Bancroft, Manchester; No. 2, "Non nobis solum," by Winstanley & Ashworth, Manchester; No. 3, "Simplicity," by James Lomax, Bolton; No. 4, "Complete," by Gotto & Beesley, London; No. 5, "Endymion," by J. S. Caldwell, Hindley; No. 6, "Simplicitas et Utilitas," by Newton & Smith, Manchester; No. 7, "Health," by T. & J. H. Nuttall, Bury, Lancashire; No. 8, "Salus Populi," by George Heaton, Wigan; No. 9, "1881," by J. F. Tyler, Parbold; No. 10, "Practical Experience," by Goodison, Atkinson, & Forde, Liverpool. It was decided to send the plan "Health" to the Ince Local Board for inspection.

A New Brewery has just been completed at Burton-on-Trent, for Mr. T. Sykes, of Liverpool. It is erected upon land belonging to the Marquis of Anglesea, near the Midland Railway, upon the south side of the town, and comprises in addition to the complete brewery buildings, the necessary stores, stables, &c., together with roads and boundary-walls. The contractors for the buildings have been Messrs T. Lowe & Sons; for the coppersmiths' work, Messrs. Bindley & Briggs; and for the machinery, Messrs. Buxton & Thornley, all of Burton. Messrs. Gimson & Co., of Leicester, have supplied the ironwork for the building, and Mr. J. Stanyon has acted as clerk of works. The whole work has been carried out from the designs and under the superintendence of Mr. J. B. Everard, C.E, of Leicester.

Wonders at Welbeck Abbey.—H.R.H. the Prince of Wales, during his visit to Welbeck Abbey, will observe the marvellous works carried out by the late Duke of Portland, not the least of which is the new range of stable buildings, erected upon a magnificent scale, presenting a noble appearance on approaching, and the interior of which, for 130 horses, was fitted up by Mr. James Barton, of 151, Oxford-street, London, from designs and special patterns approved by the late Duke. The stall and loose-box mangers were made of iron, and surface coated, both inside and out, by the patent enamelled process, rendering them easy to cleanse, and obviating any possibility of infection. The work is said to be probably unsurpassed in the kingdom.

National Association of Master Builders of Great Britain.—Mr. Stanley G. Bird, of London, the president, accompanied by Mr. E. Hughes, of Liverpool, has been making a tour of the Northern provinces with a view of inducing the Local Builders' Associations to join the National. They also brought before the trade in the North the question of their insurance against accidents arising under the Employers' Liability Act, advocating the advantages offered by the Builders' Accident Insurance, which is established on mutual principles. We understand agents were appointed at Preston, Carlisle, Edinburgh, Glasgow, Newcastle, and South Shields.

Clarkson Memorial, Wisbech.—Messrs. S. & W. Pattinson, of Ruskington, say that they were the contractors for this work, although Messrs. Farmer & Brindley executed the sculpture and carving.

TENDERS

For the erection of a new building at 14, Austin friars, for Mr. Henry Oppenheim. Mr. E. A. Grüning, architect. Quantities by Messrs. H. Blackwell & R. Griggs:—

John Mowlem & Co.	£11,229	0	0

MANUFACTURERS OF
IMPROVED HOT-WATER APPARATUS,
FOR WARMING AND VENTILATING
Private Houses, Churches, Schools, Hospitals, Manufactories, Greenhouses, &c.
OFFICES AND SHOW-ROOMS:—
No. 34, UPPER GLOUCESTER PLACE, DORSET SQUARE, LONDON, N.W.
Illustrated Pamphlet on "Heating" post free for Twelve Stamps.

CHAPPUIS' PATENTS FOR REFLECTING LIGHT.

DAYLIGHT REFLECTORS OF EVERY DESCRIPTION,
ALSO
ARTIFICIAL LIGHT REFLECTORS.

WHY BURN GAS?—CHAPPUIS' REFLECTORS DIFFUSE DAYLIGHT.—They are exclusively adopted by and fitted at Buckingham Palace, all H.M. Government Offices, Houses of Parliament, H.M. First Commissioner of Works, the Metropolitan Board of Works, British Museum, South Kensington Museum, Royal Institution, Guildhall Museum, on board H.M. Ships, also Railway Companies' Offices, Hospitals, Institutions, Banks, Insurance Offices, Manufactories, Private Houses and generally from Noblemen's Mansions to Artisans' Workshops. 30,000 in use in London alone. Patronised by leading Architects, Engineers, Contractors, &c., &c.

N.B.—For Prospectuses and Diagrams, address Stamped Envelope to

P. E. CHAPPUIS, Patentee and Manufacturer, 69, FLEET-STREET, LONDON.

NOTICE.—The POLYGONAL REFLECTOR (Latest Patent) FOR ARTISTIC and PICTURE GALLERIES.
Its construction allows of the angle of light being readily altered so as to reflect in any desirable direction.

The Builder.

Greek Houses, and Those who lived in them.

IN the article on Homer's description of the palace of Ulysses it was incidentally remarked that the structure in general distribution had considerable resemblance to the Greek house of historic times. It is as well to be a little more explicit on the limitations under which this can be accepted, for the authorities as to the later Greek house are either scanty or perplexed. Of one general and very important point of resemblance there is no uncertainty, that is, the division of the dwelling into a strictly secluded set of apartments appropriated to the women and the privacy of family life, and another portion comparatively public, where the intercourse of men with men, either for sociability or business, was openly carried on. We may be assured that this rule was adhered to with particular cautiousness at Athens, where the life of woman was one of peculiarly close retirement. The same absence of external windows or openings for light might be assumed, apart from other evidence, from the habits of the Greek burglar, whose name is evidence that he did his "burglaring" chiefly by undermining or digging through walls, having little opportunity to avail himself of the help of faulty or neglected fastenings. Greek houses, like those of any other nation advanced in civilisation, were, of course, very different, and at different times, in extent and in degrees of dignity. Demosthenes could point to the still well-known houses of Themistocles and Miltiades as models of simplicity, while in his own time the expense which was lavished on private dwellings put public monuments to shame. That the houses built in streets of fortified towns, where space was always important, were constructed with walls in common,—not party-walls,—follows, of course; and that with one open market-place, streets and alleys were very narrow,—witness Mediæval Florence and Roman London. But still it is interesting to read in Thucydides how the Platæans broke in hot haste communications through walls of adjacent houses, and so mustered a force in a position to drive a body of intrusive enemies into panic-stricken flight from the Agora, to be hunted down through lanes in all directions. The same causes led to the usual encroachments and their correction. As early as the days of the tyranny of the sons of Pisistratus, a check was placed at Athens upon the projection of upper stories over the streets, the occupation of public pathway by steps, undue extension of front railings, and the system of making street-doors open outwards. In the country no such interference was required, and it was here that the wealthy indulged at once in a national passion for the country, and every variety of taste in the lavish decoration of their mansions.

The arrangements of the house and household of an Athenian citizen of very moderate means are given to us in a speech of Lysias, which has always been celebrated as a model of lucid and effective narrative of circumstances. It was written for Euphiletus in justification of his killing an adulterer whom he surprised within his walls. The defendant has occasion to lay stress on the narrowness of his means as proving his superiority to sordid motives in the vengeance which he took in preference to accepting compensating ransom; he speaks of his house as a small one, and he had but one young female servant, apparently a slave, to go to market and to attend on himself with his wife and infant.

His dwelling, he says, consists of two floors of equal extent, above and below,—*gynæconitis* and *andronitis*, that is, as distributed into female and male divisions. Small as the house might be therefore, there was at least the same understood separation which was much more of a reality in larger establishments; just as our builders are called on now to provide nominal kitchen, dining-room, and drawing-room in small houses where the occupants disregard by choice or perforce all such niceties of appropriation. In the house of Euphiletus the stairs were as steep as they must be in cramped space, so much so that to avoid peril to the wife in going down stairs with the infant when it was to be washed—high service was not—the husband changed the usual arrangement, and put the women on the ground-floor; he himself not only sleeping above, but having his ordinary living-room there, so when he brought home a friend whom he casually met belated, it was there that they dined. On another occasion when he returned unexpectedly from the country, he took dinner in the upper chamber with his wife; afterwards she went down, professedly with reluctance, to attend to the infant that the servant, her accomplice, had caused to cry, and after some banter of pretended jealousy shut the door upon him and locked him in. In the course of the night while alone, he hears both the doors go, the *aulcios* and the *metaulos*, but his curiosity for the cause was parried by a tale that the lamp kept by the infant had gone out and had to be re-lighted from a neighbour's. In this small dwelling the dignified titles for the doors signify no more than the house-door and the room-door; the door of the hall and the door beyond the hall or entrance passage. On a later occasion, Euphiletus has warning from the servant-girl of the injury done him; by threats of hard labour and torture which he was competent to inflict on his own responsibility, he had frightened her into confirming information received from a slighted paramour of the seducer. He is able to descend and quit the house without passing through rooms on the ground-floor, and carries out his purpose; in fact, he brings in a number of friends to bear witness to his act and its provocation, as well as for aid in case his injurer is armed, bursts in the door, first binds Eratosthenes hand and foot, and then, rejecting all supplications and offers of money, kills him on the spot, as by the Athenian laws he was in such case held harmless in doing.

In another speech of Lysias (adv. Simon., 96), the scene of an offence complained of was a house large enough for the usual female apartments to be on the ground-floor. The notice illustrates the strictness with which the separation was sometimes if not ordinarily preserved; the words are,—"he came to my house at night intoxicated, and, forcing the doors, made entrance into the women's apartment, among my sister and nieces, orphan girls who have led such well-ordered lives as to be abashed at being seen even by members of the family."

Another act of violence which came before the courts introduces us to a domestic scene in the country-house of an Athenian of sufficient property to be liable to the onerous charge of a trierarchy. We are not concerned with the general merits of the quarrel or validity of counter claims. Upon whatever pretence, Euergus and Mnesibulus broke down the door of his house that communicated with the garden, and came upon his wife and children as they were at a meal in the *aule*, which here is evidently a proper court. An old nurse of the owner was with them at table; she had received her freedom from his father and afterwards married; but being left a widow and unprovided for, was taken back into the family from respect and gratitude, and also as a useful help to the wife in keeping house during the absence of the master on public duties. The old lady certainly gave proof that she merited most loyally the confidence placed in her, and to be spoken of as attached and faithful. The rest of the female servants were in a tower (*purgos*) which they ordinarily occupied, and when they heard the noise of the intruders, fastened themselves in and escaped molestation. The intruders, in fact, were seizing all they could lay their hands on in the house, after having already carried off a flock of sheep in the field, with the shepherd and a boy in charge of a copper vessel of considerable value. The wife protested with spirit, but in vain, that some of the objects seized were her separate property—part of her dowry. The old nurse, seeing how things went, caught up the vessel (*cymbium*) from which she was drinking and put it in the fold of her upper dress; the material is not mentioned, but it seems to have been of value by the fight that was made for it; she did not loose her hold till she had been beaten, half throttled, her arms and hands

twisted back, and she was so much injured as to need a doctor afterwards. The tower also was plundered of its contents the next day; by its name and the resistance which it offered at first, it reminds the writer of the ancient tower, — round in this instance, — which remains attached to the rebuilt farm of Godlingstone, near Swanage; by the thickness of its walls, and other indications, this has the appearance of having been provided as a place of refuge in case of danger of surprise by marauders from the adjacent coast.

Another informant of peculiar intelligence is Xenophon. Xenophon is never so much in his element as when he is insisting on the value of intelligent organisation; whether he is arguing for the existence of a Divine Providence from the bodily and mental constitution of men,—from the scheme of dentition by which incisor teeth are placed conveniently in front and the molar behind at the sides, or from the distribution of instincts between man and woman, by which one sex is as well fitted for the care of the young and supervision of the home as the other for procuring its comforts through exposure, labour, and conflict of all kinds out of doors; whether he is illustrating, by theory or record of his own practice and experience, that great principle of the art of war,—the combined employment of all arms for mutual support under variable circumstances, or reporting the maxims of domestic and economical management as accepted by a shrewd agricultural speculator. In the introductory chapter of his "Œconomics" he introduces Socrates as leading up to a primary definition in his favourite way, by citing the contrast, admitted at once to be familiar, between some men who built houses at enormous expense to find themselves most inconveniently lodged after all, and others who at comparatively small outlay provided themselves with dwellings which gave them everything that could be desired. The model economist, Ischomachus, is afterwards quoted as in possession of a house of which the best bedroom supplies a secure place for the most important valuables, while appropriate storage is provided in a cool place for the wine, and in dry places for the corn and like produce of the farm; these are included in the female division of the house, which is capable of being shut off from that of the men, more promiscuously frequented, as well for the prevention of pilfering as to keep the numerous male and female slaves effectually apart. The house was built with the principal frontage to the south, and the living-rooms were so arranged as to have full advantage of the winter's sun, while escaping the severest heats in summer. This was effected, as Xenophon tells us elsewhere, by the particular degree of projection given to the protecting porticos. The problem may be stated thus. In the latitude of Athens the noonday sun at Midsummer has an altitude of 70 degrees, and at the equinox, of 50; let it be required to give such projection to a screen from the vertical wall that a given breadth on the ground in front will always be in shade at midday in the interval between the vernal and autumnal equinox. A right angle to scale represents the vertical wall and ground line in section; from the point marking the extent of breadth of the latter required to be protected, draw a line at an angle of 50 degrees inclined outwards, then a straight line meeting any point in this from any point on the wall line, will give the projection to scale of the screen required from that point. The problem is scarcely more complicated for other aspects and other hours and seasons. The matter might be worth consideration when windows are about to be protected at random by such verandahs as the dealer happens to keep in stock.

Ischomachus impresses on his wife the value of order from the example of a model of naval architecture,—a large Phœnician merchantship, encumbered as it was necessarily with sails, oars, and ropes, with provision of abundance of weapons and other armament for protection against pirates, and the utensils for a numerous crew; and though thus the space vacant for merchandise was not larger than a dining-room for ten guests, it was, nevertheless, thanks to system, sufficient for storage of a great variety of goods, all within easy reach, and ready for instant delivery, as required. This lesson is part of a course of instruction to his wife which Ischomachus very amusingly details. She might well be thankful for some help, considering the full scope of the duties he expected from a girl whom he says he married in her fifteenth year, and who had been so carefully tended and [brought up on the Athenian system as to have previously been allowed to see and hear and make inquiry about as little as possible. What experience she did bring was in looking after maids engaged in spinning wool, in cutting out a garment, and, what our agriculturist expresses high appreciation of, a knowledge of cookery. He comes in at last for a touch of that irony from which few of those who talked with Socrates got off scot free. He vaunts in lofty terms the distinction of his father above all the Athenians for the love of agriculture, which he himself has inherited. Socrates gently brings him into the position of having to admit that this love is much the same that a merchant has for a cargo of corn; it is at last a love for the money it brings. "You are sportive, Socrates," is the reply; "but this, I conceive, is no more than is the case with those who are said to be fond of architecture,—who are used to sell houses as soon as they have completed them, and begin at once to build others." "Yes, by Jove, Ischomachus! and I dare swear that I have full confidence in your naturally conceiving that all men love whatsoever they conceive they will make a profit by."

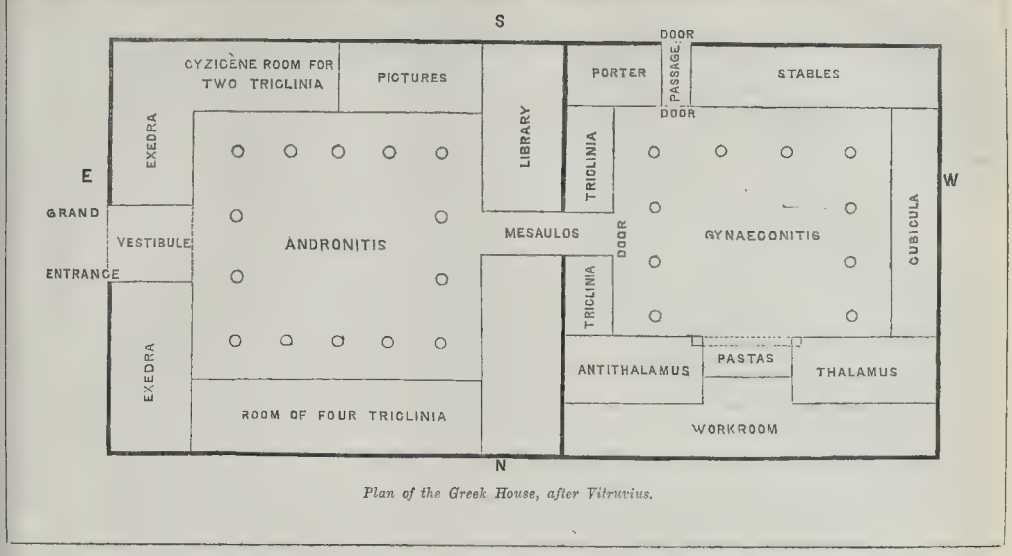
In the pseudo-Aristotelian "Œconomics" the rule is stated that a house should be airy or well ventilated in summer and sunny in winter, and, therefore, protected from the north,—that is, of southern aspect,—and it is to be not of equal breadth (*isoplates*); which seems to mean, not forming an equal-sided block as unfavourable to circulation of air. So, it is said, both daily comfort and health will be best consulted.

Not much more is to be obtained from the Greeks at first hand respecting their houses; but we have now to turn to the description of one in considerable detail by Vitruvius,—to turn, but at first with rather a heavy heart. The description as we read it cursorily is a mass of confusion and inconsistencies; few critics have satisfied themselves in an attempt to reconcile it to reason. The nearest approach to a plausible vindication of it has scarcely fulfilled the condition of being a subject of discussion, by meeting with a seconder. However, one more attempt has to be made, if only to mark distinctly where the description is manifestly at fault or involved in perplexity.

The Greek house, then, that Vitruvius describes as a contrast to the ordinary type of Roman house, is one of a high class,—an example from an earlier and more fortunate time, when refinement and wealth were at their acme in Greece. For anything that appears, he regards the structure as isolated; he gives no hint as to consideration of approaches, prospect, or surroundings, of outbuildings or garden; nor does he trouble himself to inform us about more than the ground-floor; upper chambers, cellars below, and stairs to give access to them, might not exist for any mention he spares of such; he gives no notice of windows opening externally or otherwise for light, or of any arrangements for artificial warming or escape of smoke.

Even as regards the ground-plan, he has scarcely taken us over the threshold before we stumble; we naturally assume that we are brought in for our survey of the mansion through the front door,—the principal entrance; but we find ourselves at once in the women's apartment, the *gynæconitis*, and come to a stand puzzled,—incredulous. There is the usual temptation to take refuge in an accusation of the text as disarranged and corrupt; but Vitruvius is too frequently confused for us to allow him the benefit of any such supposition in the present case, and we must not evade our own responsibility to make the best of the text as it stands, before imputing more than incorrigible clumsiness of exposition to our informant, to whom, after all, we have some reason to be grateful. He says:—"As the Greeks have no occasion for the *atrium* (of the Roman house), they do not construct any, but make a passage of no great breadth from the door of entrance, between the porter's room on one side and the stable on the other, and closed again by an interior door. This space from door to door is called in Greek the *thuroreion*. A peristyle is then entered; this has a portico on three sides; on the side which fronts south it has two *antæ*, very openly spaced, which carry beams, with a recess two-thirds of their interval in depth; some call this a *prostas* and others a *parastas*. Interiorly from this is the large apartment in which the materfamilias presides over the women occupied with spinning their wool. To the right and left of the *prostas* are placed the bed-chambers, of which one is called the *thalamus*, the other the *anti thalamus*. Around in the porticos are disposed the day-rooms for meals, bedrooms, and domestic offices. This part of the building is called the *gynæconitis*" (or feminine division).

Nothing, upon consideration, can be clearer than that Vitruvius introduces us into the house by what would be accounted a back door, by comparison with either the arrangements of the palace of Ulysses or of the modified Greek houses of Pompeii. His mention of the omission of an *atrium* at starting is misleading enough, as it is a natural inference that the next feature he describes is a substitution for it in position.



That a doorkeeper is mentioned elsewhere, as we shall see, as the custodian of the main entrance to an *andronitis* of a dignified mansion, makes no difference. We do not need the information that Aristotle volunteers, that in a large house, comings in and goings out required to be watched, and that the duty might be assigned to a slave who happened to be incompetent for other work. Such watchfulness was even more needed at the domestic end of the house than at the other, where, however, a doorkeeper would also be needful; the house was *amphithuros*, with an external door at both ends, like that by his knowledge of which Lysias himself, passing three doors in all, escaped from the emissaries of the thirty tyrants who were guarding the door of the front court. The porter's room would occupy but little space as compared with the stable, and therefore the entrance passage, which by its express narrowness, has none of the character of a main entrance, would not be in the centre of the front unless a portion of this side of the building was utilised for chambers entered from the peristyle within. The palace of Ulysses was entered, as we have seen, through the equivalent of a farm or stable yard, where animals could be turned loose or tied up; but there is an obvious propriety in the Vitruvian situation of the stables at what we have agreed must be regarded as the rear of the house.

The specification leaves us at liberty to construct rooms, if we please, not only opening under the porticos to right and left, but also under that fronting the *parastas* with back wall common to the stable. The *thalamus* is the best bedroom, and the *antithalamus* would come into use with a modern family as a second best or daughters' bedroom, or, it may be, as a nursery.

As the large workroom has to be entered from the *parastas* at the back, it would extend right and left more or less completely behind the *thalamus* and *antithalamus*. These apartments might naturally be contrived to be no deeper than the intermediate *parastas*, or one or both might have additional depth northwards. Whether the large workroom, equivalent of the *megaron* of Penelope, could receive sufficient light from the *parastas*, and if not, how else it was lighted, is not stated. Vitruvius in other passages gives directions as to admitting light through windows in situations confined by opposite houses, and there is no reason why high windows should not be inserted in the north walls of this *megaron*, if it was really an outer wall.

But this brings us to the question how Vitruvius conceived the rooms of the *andronitis* to be connected with those previously described. His description proceeds in terms which plainly show that he comes to the most stately and dignified portion of the house,—the true front,—last. "To the *gynæconitis* is attached a more spacious building (*domus*) with a broader peristyle and four porticos of equal height, unless that which fronts the south has the columns loftier; a peristyle thus arranged is called a Rhodian peristyle. This structure has a fine vestibule and a stately door of its own, and the porticos of the peristyle are adorned with stucco, plastering, and elaborate *lacunaria*. In the portico facing the north are a Cyzicene *triclinium* and *pinacotheca*; in that fronting the east, the library, *exedræ* opposite the west, and a square, or rectangular room, facing the south, of sufficient size to accommodate easily four *triclinia* with space for attendance and games. This room was for the men's entertainments, as it was not usual for the mothers of families to recline. This peristyle, which men occupied without feminine interference, was called the *andronitis*. . . . . There was a passage between the two courts which was called *mesaulos* as interposed between one *aule* and the other."

It will be seen that it comes out quite plainly in this account, that the true grand front and

Plan of the Greek House, after Vitruvius.

main entrance of the mansion is on the side of the *andronitis*, where it might be expected, and it is simply due to the awkwardness with which the description of Vitruvius takes the whole combined structure in reverse, that he has been charged with making the women's domain a general passageway to arrive at that of the men,—a monstrous arrangement anywhere; how much more so, then, at Athens? The entrance-door and vestibule which he assigns to the *andronitis* are emphatically described as important and fine, in contrast to the restricted *thyroræon*, or hall passage, which admits to the *gynæconitis*.

We are left without any specific guidance as to the situation of the connecting *mesaulos*, or the precise collocation of the twin peristyles; so far we are in no way bound to assume that the second peristyle described was placed on the north and south axis, and thus to the north of the first. Such a plan, indeed, would have a primary inconvenience. We should require to place chambers facing the north with their back wall common with that of the large workroom of the women, which would thus be shut in between them and the *thalamus* and *antithalamus* on the other side. We escape this difficulty if we interpret Vitruvius as conceiving that the *andronitis* lay on the east and west axis of the *gynæconitis*; the *mesaulos* then would run east and west from one of its side porticos. There is no reason why this passage, which may be of any breadth, should not be so central as to provide a vista from one peristyle to the other, when doors were opened. Assuming a Rhodian peristyle, the loftier columns of the north portico would be in front of the large room, the dining-room, with its liberal space for those exhibitions and amusements,—the dancing, music, and so forth, of which we have so lively a description in the "Symposium" of Xenophon. The loftier colonnade would admit more of the winter's sun to this apartment, and the greater breadth of the peristyle may be taken to imply such a degree of projection beyond the walls as would intercept the severest summer rays. If we suppose that the outer walls of the *andronitis* continued those of the *gynæconitis*, they might still have a greater lateral extent, and they would in any case have the extra space available for increasing the breadth of the porticos which in the other peristyle is devoted to the *thalamus*.

The *pinacotheca*, which Vitruvius says generally should be of liberal dimensions, is placed on the side of the peristyle facing a loftier colonnade for the benefit of the uniform northern light; and on the same side is a Cyzicene *triclinium*. The normal proportions of this apartment as given demand a ground-plan affording room for two *triclinia* arranged opposite to each other, and passage round them, and a height exceeding the breadth in dimension by one-half. The door was in the middle, with a shuttered window on each side, giving the guests a view, where possible, of verdure. This is an arrangement peculiarly appropriate for a cool summer dining-room, with the enlivenment of a prospect illuminated by the sun. It is noted in another passage that the reason for making the library face the east, is the avoidance of the fading of manuscripts and other damage to books from worms and mould especially, generated by the humid western and southerly winds. The portico fronting westward accommodated *exedræ*. These are rooms for conversation and lounging, which may be of very various forms and magnitude; if they are square, says our author in one passage, their height must be once and a half their breadth,—a rule which, of course, goes for little apart from a specified dimension for a particular plan. Rooms of considerable size are in his mind when he notices that the expanse of wall in an *exedra* prompts to peculiarly broad treatment in pictorial decoration.

If we assume that the larger peristyle is plotted to the eastward of the smaller, the chief entrance and stately vestibule may consistently occupy the centre of the eastern front, intermediately between *exedræ* to the right and left to be entered from the portico; one of these would be in easy communication with the adjacent smaller dining-room, and the other with the larger room for entertainment on the north side. The picture-gallery on the south side might naturally communicate with the library, which, situated under the west portico, would be well remote from any bustle about the entrance and near the more domestic portion of the building.

By this arrangement it will be observed that the stables are thrown to an exterior angle of the building, and are as isolated as circumstances allowed.

A subsidiary extension of the *andronitis* introduces us to some special details of Greek social life. Sets of rooms (*domunculæ*) were provided to the right and left of the great peristyle, exterior to its enclosing wall, where guests were provided with comfortable bedroom and *triclinium*,—sitting-room, in lodging-house phrase,—where they sojourned, with a private door to their independent apartments, and a latchkey or its equivalent (*januas proprias habentes secretam libertatem*). The relation of host and guest was so universal throughout Greece that there was every reason for it to settle down into a system which caused the least embarrassment to either party. The ordinary visit to an English country-house has its unwritten law, which only allows of its exceptional extension beyond the three clear days,—"The rest day, the dressed day, and the pressed day,"—that is, the day when the guest expects to be most cordially urged to stay longer, and may expect to cause perplexity and astonishment, if, like Miss Edgeworth at Bowood, he should unexpectedly comply. The rule with the Greek host was to invite his guests to one formal entertainment, but he fulfilled his duty afterwards if, in addition to lodging, he kept them supplied with eggs, poultry, and farm produce generally.

All rules, however, can be relaxed on occasion, and by whom should they be so, but by one so wealthy as the Athenian Callias? And when so appropriately as at a congress of philosophers? The very liveliest picture we have of an Athenian interior, and that, at the very acme of the age of Pericles, is given by Plato. It seems worth while to translate this, and so to people the scene which we have been engaged in restoring, with dramatic,—with living interest. Socrates then is the narrator,—"With this understanding we set out, and when we had reached the portico we stopped, discussing some subject that had occurred to us on our way; and in order not to leave it incomplete, but that we might finish it first and then go in, we continued our argument in the portico, till at last we agreed. The porter, a eunuch, overheard us, as, I believe, to all appearance, the multitude of visitors had put him out of humour with visitors to the house, and, in consequence, when we knocked at the door, and he opened and saw us,—'Hey, day! Sophists again,' he says, 'he is engaged': at the same time he slammed the door with a will with both hands, as hard as he could. . . . . When at last we entered, we found Protagoras walking up and down the peristyle, and in a line with him there were walking on one side of him Callias, the son of Hipponicus, and his brother by the mother's side; Paralus, son of Pericles, and Charmides, son of Glaucon; and on the other side, the other son of Pericles, Xanthippus, and Philippides, son of Philomelus, and Antimœrus of Meude, who is the most esteemed of the scholars of Protagoras, and studies professionally with a view to become a Sophist himself. Certain others who followed behind these, listening to what was said, seemed, for the most part, to be some of the strangers whom Protagoras is wont to carry off from the cities he passes through, charming them with his voice like a very Orpheus, and they, under the influence of the charm, follow after his voice. Some of our own fellow-countrymen, too, were among the chorus. It was particularly pleasant to me to observe this said chorus, how handsomely they took care never to be in the way in front of Protagoras; but whenever he and they with him would turn, these listeners cleverly and orderly separated to either side, and, wheeling round, kept themselves in the happiest manner still in the rear.

"Next I beheld," as Homer says [the satirical allusion is to the visit of Ulysses to Hades],

"Hippias of Elis on the other side of the peristyle, seated in a chair; and round him on benches sat Eryximachus, son of Acumenus, and Phædrus of Myrrhine, and Andron, son of Androtion, and various strangers, both his own countrymen and others. They seemed to be questioning Hippias respecting physics and details of astronomy; and he, sitting upon his chair, gave his decision to each of them, and went through the questions in detail." [Here, again, there is a satirical parallel to the Minos of the Odyssey, "seated, holding a golden sceptre, giving judgments on the dead." And again in the next clause.]

"'There Tantalus no less these eyes beheld,' for, in fact, Prodicus of Ceus had lately arrived, and was in an apartment that Hipponicus aforetime used as a store-room; but now Callias, from the multitude of his visitors, had cleared it out and applied it to accommodate foreign guests. Prodicus himself then was still in bed, covered up apparently with furs and coverlets in great abundance. There were seated about him on couches close by, Pausanias of Ceramis, and along with Pausanias some youngster, quite a lad, and, as I apprehend, of the most refined and best disposition,—favourite of Pausanias, as likely as not. There was this lad then, and the two Adeimantuses, he of Cetis, and the son of Leucolophides, and some others were visible. What they talked about, however, I could not catch from without, though Prodicus was audible enough,—a mighty wise man he appears to me, and a divine; but in consequence of the grave tone of his voice, a certain hum was produced in the room which made what he said indistinct. And when we had just come in, there came in also, meeting us, Alcibiades, the handsome, as you say he is, and I fall in with your opinion, and Callias, son of Callæschrus."

Leaving these ancient sophists to extricate themselves as best they may when they venture too confidently within reach of the octopus-like dialectic of the son of Sophroniscus, one word of warning and protest may be bestowed in conclusion against "the plan of a large Greek house with two courts," of which it is time that the career should come to an end. We trace it back from the sixpenny "History Primer on Old Greek Life," by the Rev. Mr. Mahaffy, to the "Dictionary of Greek and Roman Antiquities," and thence again backwards to the "Charicles" (1840) of W. A. Becker. The *excursus* of Becker on the Greek house is replete with learning that his successors might gratefully and gracefully give him credit for, if they omit doing so for his plan; this copied and re-copied plan is professedly founded on the description of Vitruvius, but is so divergent from it from first to last, as to be little better than a fanciful conjecture of what a Greek house ought to be. The scheme of the Marchese Galiani, in his edition of Vitravius, is much more meritorious; one of his chief failures is due to a false text, which is corrected on better MS. authority by Scheider. There can be no greater contrast than that between the plans suggested by Perrault, architect of the façade of the Louvre, and Wilkins, except that they are equally inconsistent with the Latin author and the exigencies of Greek domestic life.

ARCHITECTURE IN THE NEIGHBOUR LANDS OF VENICE.

We prefer to express by the above heading the special interest which, from our point of view, is embodied in the volume actually entitled "Subject and Neighbour Lands of Venice," put forth by Dr. E. A. Freeman,* and which is intended as a companion to a former publication of his, "Architectural and Historical Sketches, chiefly Italian." Like the former work, the present one is, to a considerable extent, made up of articles which have appeared in a well-known weekly periodical, where we remember to have read some of them. The author, however, tells us that a larger proportion of matter in this volume is new to publication than was the case with the former one.

The interest of the work is, after all, chiefly architectural, and it seems intended, and is very well calculated, to serve as a guide-book to the architectural antiquities of a line of country which has not yet been overrun and made commonplace by innumerable tourists, nor brought before architectural readers in innumerable photographs, lithographs, and engravings. The special value of Mr. Freeman's disquisitions arises, as we believe we pointed out in noticing his former somewhat similar work, from the fact that he combines knowledge of architecture with knowledge of history to an extent not often met with in the same person. The buildings which he annotates upon and describes are not regarded merely as specimens of architectural style, but as connected with the history and the national and political relations of those who built them. For this reason the book is a useful one for architectural students to read, as it serves to take them out of the beaten track of mere study of buildings, and to suggest a wider view of the subject than architects who go on sketching tours often take to their studies.

The centre around which the contents of the book are intended to be grouped is the remarkable palatial effort of architecture at Spalatro (or Spalato, as Mr. Freeman calls it, but we will keep for the present to the older spelling), in building which, as the author observes, Diocletian "won for himself, or for the nameless genius whom he set to work, a place in the history of art worthy to rank alongside of Iktinos of Athens and Anthemius of Byzantium, of William of Durham, and of Hugh of Lincoln." We know not whether that is the best way to put it; for, after all, we are profoundly sceptical as to the possibility of our ever really knowing decisively whose brain actually contrived the architectural structure and design in these cases; but that the palace at Spalatro is as typical and significant a building as any of those referred to, admits of no question. It may, indeed, be questioned if there is any building in the world which more emphatically marks a great epoch in architectural history.

When we say the book is grouped around Spalatro as a centre, we do not imply that this is obviously or ostensibly so in the arrangement of the volume; but the attention is especially directed to those phases of architectural design of the Romanesque period which arose out of the hints worked out at Spalatro, and on the meaning of which Spalatro furnishes the best comment.

There is, however, a great deal of interest to the architectural student, even apart from Spalatro, in the line of route over which Mr. Freeman acts as guide, for everywhere we are among the beginnings of Gothic architecture; everywhere we are introduced to buildings which, besides their historical interest in the wider sense, are in regard to architecture as links between a great past and a great future. The five divisions of the route are into "Lombard Austria," "Trieste to Spalatro," "Spalatro and its Neighbours," "Spalatro to Cattaro," and "Venice in the Footsteps of the Normans." Much of the book, no doubt, would be chiefly interesting to those who either have gone, or intend to go, over the routes mentioned: the latter probably but a small band. But the general reader who is interested in architecture and its relations to history will every now and then come across facts and illustrations which are full of suggestiveness. The description of Aquileia will appeal strongly to those who look on travelling as something more than a way of killing time, or of conforming to fashion. The author gives happily the idea of the peculiar interest attaching to the place. "Aquileia has a character of its own; it is not a ruined or buried city; nor is it altogether like Trier or Ravenna, which, though fallen from their ancient greatness, are cities still. In the general feeling of the spot it has more in common with such a place as St. David's in our own island, that thorough 'church city,' where a great minster and its ecclesiastical establishment still live on amid surrounding desolation." Mr. Freeman usually has a comparison of this sort at hand, and thereby continually reminds the student either what things were in progress at the same time in different countries, or how similar ideas repeated themselves, or how far European architecture was or was not homogeneous in its progress at a certain period of history. The chapters on Parenzo and Pola are very interesting. The church of Parenzo Mr. Freeman pronounces to be a basilica of the time of Justinian, and one which "will hardly find out of Rome and Ravenna any building of its own class to surpass it." The church is, in fact, of very nearly the same period as San Vitale at Ravenna, but would seem to have some features of interest differing considerably from those which characterise the architectural detail of San Vitale. Every arch of the building, says Mr. Freeman, deserves careful study, because at Parenzo "the capitals seem not to be the spoil of earlier buildings, but to have been made for the church itself. Some still cleave to the general Corinthian type, though without any slavish copying of Classical models. Animal forms are freely introduced; bulls, swans, and other creatures are made to do duty as volutes; and when bulls and swans are set on that work, we may be sure that the Imperial bird is not left idle. Others altogether forsake the earlier types; it perhaps became a church built in the dominions of Justinian while St. Sophia was actually rising, that some of its capitals should adopt the square Byzantine form enwreathed with its basket-work of foliage. But all, whatever may be their form in other ways, carry the Ravenna stilt, marked, in some cases at least, with the monogram of the founder Euphrasius." At Pola we are called on to remark, in the sketch of the double gateway (*Porta Gemina*), a peculiarity that "reminds us that we are on the road to Spalatro, and which already points to the arcades of Diocletian. The columns support an entablature with its frieze and cornice, but the architrave is wanting. Does not this show a lurking sign of what was coming, a lurking feeling that the arch itself is the true architrave? Be that as it may, there it stands, sinning, like so many other ancient works, against pedantic rules, but perhaps thereby winning its place in the great series of architectural strivings of which the palace of Spalatro shows us the crowning point."*

On the road to Spalatro the author touches on other points of interest in the architecture of the Dalmatian district; among others, on the remarkable persistence of the Romanesque style up to very late dates in this region, one completely Romanesque church at Zara dating its consecration, we presume on good documentary evidence, from 1407. The tower of St. Mary at Zara, of which a sketch is given, is a remarkably fine example, in a simple form, of the dignity and solidity of architectural expression attainable in this style,—in this instance without a single touch of what can be called ornament of any kind. The chapter on Spalatro is very picturesquely written; the interest of the subject seems to have lifted Mr. Freeman above the usually rather level style of his writing on these subjects. He draws a brilliant antithesis in comparing Spalatro with Rome:—"By the banks of the Tiber the city of Romulus became the house of a single man; by the shores of the Hadriatic the house of a single man became a city." A passage from this chapter we may quote in full, giving the description of the first impression produced by the ruined palace, and the ideas which its place in architectural history not unnaturally suggests:—

"We land with the moon lighting up the water, with the stars above us, the northern wain shining on the Hadriatic, as if, while Diocletian was seeking rest by Salona, the star of Constantine was rising over York and Trier. Dimly rising above us we see, disfigured indeed, but not destroyed, the pillared front of the palace, reminding us of the Tabularium of Rome's own Capitol. We pass under gloomy arches, through dark passages, and presently we find ourselves in the centre of the palace and city, between those two renowned rows of arches which mark the greatest of all epochs in the history of the building art. We think how the man who re-organised the empire of Rome was also the man who first put harmony and consistency into the architecture of Rome. We think that if it was in truth the crown of Diocletian which passed to every Cæsar from the first Constantine to the last Francis, it was no less in the pile that rose into being at his word that the germ was planted which grew into Pisa and Durham, into Westminster and St. Ouen's. There is light enough to mark the columns put for the first time to their true Roman use, and we think how strange was the fate which called up on this spot the happy arrangement which had entered the brain of no earlier artist,—the arrangement which, but a few years later, was to be applied to another use in the basilica of the Lateran and in St. Paul without the walls. Yes, it is in the court of the persecutor, the man who boasted that he had wiped out the Christian superstition from the

* Sketches from the Subject and Neighbour Lands of Venice. By Edward A. Freeman, D.C.L., LL.D. With illustrations. London: Macmillan & Co. 1881.

* The building not long ago unearthed in Pompeii, with arches springing direct from the capitals of the columns, and of which we lately gave a view (p. 51, *ante*), should not be overlooked in considering this part of the history of architecture.

world, that we see the noblest forestalling of the long aisles of the Christian basilica. It is with thoughts like these,—thoughts pressing all the more on us where every outline is clear and every detail is invisible,—that we tread for the first time the court of Jovius,—the columns with their arches on either side of us, the vast bell-tower rising to the sky, as if to mock the art of those whose mightiest works might still seem only to grovel upon earth. Nowhere within the compass of the Roman world do we find ourselves more distinctly in the presence of one of the great minds of the world's history; we see that, alike in politics and in art, Diocletian breathed a living soul into a lifeless body. In the bitter irony of the triumphant faith, his mausoleum has become a church, his temple has become a baptistery, the great bell-tower rises proudly over his own work; his immediate dwelling-place is broken down and crowded with paltry houses; but the sea-front and the Golden Gate are still there amid all disfigurements, and the great peristyle stands almost unhurt, to remind us of the greatest advance that a single mind ever made in the progress of the building art."

After all, as we have already suggested, there still remains the question whether Diocletian is really to be credited with having imagined or inspired this great step in architecture, or whether it is due to the architect, whose name is unknown. On the whole, we are inclined to declare for Diocletian, and to think that a mind capable of great ideas in other subjects was not unlikely to have his own ideas on the architecture of his palace, and to have them carried out. But whether this was so or no, the significance of the work remains the same in an architectural sense, and the spirit in which Mr. Freeman muses over it is the spirit in which to feel the true significance of the connexion between architecture and history. A second chapter on revisiting the place gives a good deal more information as to the topography, architectural and otherwise, of Spalatro.

Very interesting is the chapter on the remains at Traü, with its stern Romanesque cathedral, of which a sketch is given, and in which some of the elements of Gothic architecture seem in a tentative manner to be just struggling into existence. The latter portion of the book, "Venice in the Footsteps of the Normans," is of much interest, especially the chapter dealing with some of the ancient buildings in Corfu. The interior of St. Jason and St. Sosipatros at Corfu, of which there is a sketch, exhibits solid and heavy round arcades and vaulting, rising from columns which show a strange mixture of Romanesque and Venetian feeling. But we must refer the reader to Mr. Freeman's pages to follow out the subject further.

In the preface the author observes that the illustrations of his former volume (already referred to) met with much criticism, with every word of which he himself agreed, but that he thinks the criticism would have been modified if his critics had seen the original sketches from which the illustrations were made. As the said illustrations were, we believe, reduced from the sketches by a fac-simile process (they had all the appearance of being so), we do not see how the criticism could have been much modified; but we are glad Mr. Freeman has the candour to admit that they *were* very bad, and congratulate him on not having disfigured his present volume with anything like them. The illustrations which are given in the latter are all light and sketchy in style, somewhat too much so in some cases, and none of them can be called effective; but they have the appearance of general truthfulness, and are certainly an immense improvement on those in the former volume, about which we felt bound to express ourselves strongly. The present work is a very interesting and useful contribution towards the study of a rather out-of-the-way corner of architectural history.

Employers' Liability Act.—An action, "Adams *v.* Nightingale," was brought at Southwark County Court on Monday by a carpenter for 200*l.* for damages sustained by the fall of a scaffold. Mr. Fitzgerald was for the plaintiff, and Mr. Kemp, Q.C., and Mr. Macdonell for the defendant. A question arose as to the serving of the six weeks' notice required by the Act. The notice was left at a box or portable office in the defendant's yard after business hours, and never came to his knowledge. The judge ruled this not to be a good notice, and nonsuited the plaintiff.

OBSERVATIONS ON THE CONVEYANCING AND LAW OF PROPERTY ACT, 1881.

OUR readers may very likely ask themselves, when they see the heading of this article, whether it has found its way by mistake into the columns of the *Builder*, and is a waif and stray from some legal journal. But it is no wandering creature, and finds itself in the *Builder* because the Legislature, with that singular want of clearness which distinguishes it in so many of its legislative exploits, has chosen to incorporate in an Act which is largely connected with extreme legal technicalities, some provisions which are of importance to the public at large, and especially to the readers of this journal. We hear a good deal from time to time of the necessity for codifying our laws, but it would be well if the Legislature would act on the primary principles which underlie and are the cause of codification, namely, the clear arrangement of separate topics in separate Acts. The Act in question, 44 & 45 Vict., c. 41, comes into operation on the 1st of January, 1882. As we have already said, there is much in it which can only be of interest to lawyers, and therefore we intend to touch solely on the few but noticeable points which are of more general importance. In Section 14, we find an enactment, the desirability for which occupied a good deal of public attention some two years ago. It will be a surprise to many to find a change somewhat vehemently discussed in the press effected quietly and with little notice in this technical statute. We allude to the question of the forfeiture of leases for breaches of covenant. As most of our readers are aware, it has by very many persons been considered as a grievous hardship that, if a lessee neglects to comply with some covenant in his lease, he should, therefore, forfeit his tenancy. On the other hand, it has been said that if covenants are made they should be observed, and that if the bonds of contracts and conditions are loosened no one will be sure that engagements which he has made will be observed by the party bound by them. On the contrary, it has been answered that if a man has suffered loss by the breach of a covenant, he should only receive a pecuniary recompense when that will meet the justice of the case. Let us now see how the Legislature has dealt with this matter. The first sub-section of Section 14 enacts that a right of re-entry or forfeiture for a breach of a covenant shall not be enforceable until the lessor serves on the lessee a notice specifying the breach complained of, and, if it can be remedied, calling upon him to do so, and in any case requiring him to make a pecuniary compensation. Nor is the covenant to be enforceable unless the lessee fails to do these two things which are required of him. Therefore, supposing a lessee has failed to insure his house, he will only be required to take out a policy within a reasonable time after he is required to do so by the lessor; the latter will not be able to take possession of the premises, because of the oversight of his tenant. Next, subsection 2 deals with cases in which the lessor has begun to enforce, by action or otherwise, his right of re-entry, and then the lessee may apply to the Court for relief, which, according to the circumstances, may be granted by the Court, which has full power over all questions of costs and damages. Here, again, is a further protection for the lessee. By Section 3 there are provisions applicable to the case of under-lessees, and the following sub-section refers to Parliamentary leases. The fifth strongly alters existing contracts, because it enacts that when a lease is limited to continue only as long as the lessee shall abstain from committing a breach of any covenant, it shall continue for any longer term for which it might exist but for such covenant. Thus, if in a twenty-one years' lease such a condition is found, and some breach of covenant is committed in the fifth year of the tenancy, still the tenant will be able to continue for the full term, whether the landlord be willing or not, subject to the former paying proper compensation for any damage caused by the non-observance of this covenant. There are, however, some exceptions to the somewhat sweeping character of the enactments upon which we have touched. Briefly stated, they are that Section 14 shall not extend to any covenant against assigning or underletting or forfeiting the premises in bankruptcy, or the levying of an execution on the tenant's interests, nor in the case of a mining lease to a covenant allowing the lessor to inspect the books, weighing-machines, &c., or the mine and its workings. Nor does the section alter the law as regards non-payment of rent. Still, even with these limitations, there can be no question that the session of 1881, so profitable a one for the tenants of Irish agricultural land, has not been barren for tenants of all classes in England. A tenant now may make a slip without giving a vindictive or a grasping landlord the opportunity of taking possession of his property when he has suffered no real injury, and so far it gives a greater security to the tenant, which must make his position one of greater satisfaction to himself. It is important to observe, too, that these provisions do not affect lessees only who begin tenancies next year, for the Act has a retrospective operation, and applies to all existing leases, "notwithstanding any stipulation to the contrary."

The next provisions upon which we will touch are also, as will be seen, not unbeneficial to tenants. At present a mortgagor cannot make a lease which will be binding on the mortgagee, who may at once, under such circumstances, without notice or demand, eject the lessee. But by the 18th section of this Act a mortgagor, while in possession, shall have full power to make leases, and also a mortgagee, while he is in possession, though he may not have obtained a decree of foreclosure. The kinds of leases which are allowed by the Act are, however, strictly defined, and are building leases for any term not exceeding ninety-nine years, and agricultural or occupation leases for any term not exceeding twenty-one years. It appears, however, to be somewhat absurd to make any such limitation, for why should a thirty years' lease, for example, or a twenty-five years' lease, be more injurious to a mortgagee than one of twenty-one years? Once the principle that mortgagors may make leases is conceded, there is no valid reason why there should be more than one limit to his power, and that limit is that they shall not injure the mortgagee's security. It has long been a settled principle in shipping law that a mortgagee of a ship cannot interfere with a charter of it by the mortgagor unless such charter diminishes the value of his security. A charter is only a lease of a ship for a particular voyage or period, and the same principle is as applicable to lands and houses as to ships. These seem to be the two most important general provisions of the new Act. We may take another opportunity of returning to it, but meanwhile all owners and tenants of land and houses should be made aware of the little kernel, so far as they are concerned, which is to be found within the rather large and very dry legislative nut called the Conveyancing and Law of Property Act, 1881.

THE DUDLEY GALLERY.

THE winter exhibition of cabinet pictures in oil, opened this week, contains some very interesting works, though the portion of the exhibition that we come to first in the order of hanging is not very promising. The best works, on the whole, are landscapes, figure pictures being neither very numerous nor in general very interesting, though there are exceptions. Mr. F. G. Cotman's "The Picture Book" (41), a pretty and carefully-finished interior with two figures, is a very agreeable little work. Mr. Dendy Sadler, who is everywhere just at present with his monks, shows us one of them coming down stairs with a goodly piece of beef on a dish, the sign of "A Feast Day" (101), but it is not the best the painter can do. "The Reluctant Model" (142), a studio scene where a painter is struggling with a recalcitrant lay figure, is a clever bit of humour well worked out. Mr. Dickse's "Charmian," a quarter length of an Egyptian girl, is a fine piece of colour; it is rather inexpressive, and is not Shakspeare's Charmian; but then Shakspeare's Charmian is *not* Egyptian. Mr. C. N. Kennedy's "Miss Nelly Bray" (191), a portrait of a young girl seated in a chair, is more than satisfactory; a very artistic portrait. Mrs. Koberwein Terrell shows, in a head under the title "A Long Time Ago," the same power of giving interest to works which are half studies of expression and half of costume, with which she had already familiarised us under her former name: this painting exhibits her best style of work. A pretty head by Mr. R. J. Gordon, "Clarissa," not far from this, should be looked at. A really original little work is that by Mr. S. Newman Downard, "Au Revoir" (152), where a woman of the lower orders, thin and plain, but not uninteresting, stoops from a

window, which forms a frame to the figure, to say farewell to some one below; a canary hung in a cage by the window gives the one speck of bright colour in the painting, which is a very clever one. The figure subjects which it is worth while to mention specially are, however, really very few in number, and we almost pass them all (excepting Mr. Watson Nicol's "A Boycotter," a good study of Irish boy character) till we come to the screen, where we find the centre place occupied by a very pathetic little work by Mr. Arthur Stocks, "Her Last Sacrament" (414), an interior of a bed-chamber where an old dying woman, with two or three relatives and the clergyman, is receiving her last Communion. This is an unusual little picture, and its combination of unaffected pathos and forcible realistic painting without hardness, recals some of the qualities of Mulready, though with a sufficiently different style of execution. On the same screen are two pretty sketches in which figures are the principal objects, by Mr. J. W. Waterhouse, "Sweet Offerings" and "The Toilet" (413, 428), and a little interior with figures of a girl and a dog, "Farewell" (398), by Mr. Lorimer, which is worth looking at.

Two paintings by Mr. W. H. Titcomb, an English painter who has been in Burmah, are of interest, from their evidently uncompromising realism, though hard in effect; they illustrate a "Burmese Lady and Child" (154), and the "Call to Worship" in the interior of a Rangoon Buddhist monastery (353); a highly-finished interior of which the central object is an emaciated Buddhist priest in an orange-coloured robe. The paintings give us an insight into the realities of Burmese life. Mr. Titcomb is the son of the Bishop of Rangoon, and has a new field of study before him in the people of the locality and their customs.

Among the landscapes two of the most prominent deal with water; one of these is a view of our old friend the "Bridge of Sighs" (253), to which Mr. Macwhirter has really managed to give a new effect by choosing an opportune moment when the sunset gives one deep red gleam at the end of the long narrow avenue of buildings, and the water is golden therewith. This is an exceptionally successful picture in realising the effect and the feeling intended. We regret that it is impossible to say the same of the work in the centre place at the top of the room, by Mr. P. R. Morris, called "The Voice of the Deep" (175), which we at first took to be a view of Alpine scenery. It is, in fact, a study of a stormy beach by moonlight, but there is no motion in the waves, no drawing of the essential forms of water in disturbance. Mr. Morris is an admirable painter of several classes of objects, but the sea is not among his facilities. Among other landscapes may be mentioned Mr. Aumonier's "The Thames at Pangbourne" (153), and Mr. Cyrus Johnson's "Manor House, Great Chalfield" (163), a peculiar work, in which the house is seen in the middle distance over a kind of hazy effect of reeds and rushes; these, as foreground objects, should certainly be a little more made out; the effect is an unusual and pretty, but an artificial, one. "On the Way to Rye" is an effective sketch rather than picture (107), by Mr. C. E. Johnson. "A Passing Good Night," a Thames scene with barges (286), by Mr. Ernest Waterlow, is another work which may be characterised as a large sketch, but a very charming one. The same painter has also a forcible little sketch called "Burning Weeds" (26). Why are painters at the present day so exceedingly fond of pictures of burning weeds? We are certain to find the incident in at least one picture in every exhibition. Several landscapes by Mr. Knight and Mr. J. W. B. Knight exhibit the same qualities which usually characterise the works of these artists, with no falling off and no suggestion of novelty; but the works of both are so good in their way that they are never unwelcome. "On the Rother," by Mr. Dillon (316), is a very carefully-finished landscape, a little artificial and heated in colour.

One of the cleverest things in the exhibition is a small painting of fox-hounds leaping a fence towards the spectator, two of the dogs painted in the middle of their leap. This (71), which is by Mr. Thomas Blinks, is as clever a dog picture as we have seen for some time. Mr. Couldery, who has deserted cats for pug dogs, for the present, has an admirable study of one of those sapient-looking animals on the screen (400); and Mr. Dollman paints a capital picture of crows (379) studying the fate of one of their kind who has been hung up as an awful warning. There are two fine flower-pieces by M. Fantin; and an admirable little bit of flower and still life by Mr. Lance Calkin, "Pansies" (170), may be picked out from among other paintings of the same class that are all more or less good.

SOCIETY OF BRITISH ARTISTS.

This seems to be one of the society's fortunate occasions; the Winter Exhibition just opened this week is certainly a much better one than the last Spring Exhibition. The most ambitious among the figure-subjects is Signor Ludovici's "Feu-follet" (5), an idealisation of will-o'-the-wisp, represented by a life-size female figure dancing through the darkness, and apparently swinging from the right hand a light which catches and lights up the right side of the figure. It is a pretty fancy, and an effective way of showing the nude figure under an unusual light; perhaps hardly worth executing life-size, especially as some of the details of colouring and modelling are necessarily lost or obscured in the half-light in which it is painted. At the top of the room hangs a very clever picture by M. Helmick, an artist who has been making his way on the walls of the Royal Academy, "Presents for his Reverence" (144), a composition in which a large room is occupied by three figures only, two peasant women on the right who bring a basket of eggs and other contributions for his reverence, a thin old man seated on the left with his back to the spectator, and turning his head to examine his visitors and their offerings. The attitude of the old priest, who turns away from an immense volume on a desk at his left, is admirably expressive, and the artist has contrived to give sufficient incident to the whole canvas without disturbing the main motive of the composition at all. The picture is emphatically a "composition," in arrangement and in lighting, and has been carefully studied. Two small figure-subjects near this, "Mending a Pen" (139) and "Counsel for the Defence" (148), by Mr. J. Gow and Mr. J. Morgan respectively, both members of the society, are very good. A more important work than these last is an "Interior of a French School of Painting" under the direction of MM. Bougereau and Robert-Fleury, during a rest of the model (50). This, by Mr. W. H. Bartlett, is a powerfully-painted and interesting picture. Mr. Dendy Sadler, who is a member, exhibits (120) a clever painting of an old monk seated before a bureau, the contents of which have been turned out on the floor apparently in the search for the parchment embodying "The Grant," which he has at length found, and is scanning with great satisfaction. "Otter Hunting," by Mr. Noble (125), is a fine study of otter hounds, life-size, quite devoid of the neatness and over-finish which we so often see in pictures of sporting subjects. There is very sweet expression and refinement in the head of the young lady called "Innocence" (162) by Signor Ludovici, junior; but the drawing of the arm is rather rough. Mr. J. R. Reid's "Old and Young" (203) should be looked at. In the smaller rooms there is a good presentation of "Our Baby" (242) by Mr. A. E. Elmslie; and Mr. A. Hill, whose beautiful nude study in the Academy this year, under the name "Tibicina," will be remembered, has a clever small-scale "study in black" (370) of a figure draped only in black gauze. Mr. A. B. Donaldson's "The Ebbing Tide" (378), the title applying in a double sense to the sheet of water in the background, and to a dying knight in armour in the foreground, aims at pathetic feeling which it does not seem quite to realise.

Among landscapes, the sea-pieces of Mr. S. Ellis are the things that have most spirit and originality, which is rather a Hibernian way of putting it; but artistically, it may be said, sea-pieces rank as landscapes. "Squally Weather" (196) is a fresh and powerful work; we will not say that it is free from reminiscences of other more eminent painters of the sea. As usual, Mr. A. F. Grace's landscapes are among the best things in the collection; No. 30 is the most important, it has only some verses for a title, but the "Arun River" (365) is the best, and is a very beautiful thing. Among other landscapes, Mr. John White's "The Dart" (384) should be noticed, and Mr. Cauty's "Home of the Wildfowl" (238), and the same painter's 179, from the "Cotter's Saturday Night"; Mr. Stuart Lloyd's "Southampton Water" (172), Mr. Wyllie's "Coal Derrick in Bagship Reach" (153), and Mr. Goodall's "Reedham Ferry" (147), a very fresh little bit of river with a sailing-boat coming down it. An admirable little work is "Crumbs" (425), by Mr. J. White which is also essentially a landscape, a small work showing some high qualities of expression and composition. There is a flower-piece, by M. Fantin, "Fleurs des Champs" (288), painted with his usual richness and force of colour, though it is a very heavy and loaded style in which to paint such delicate creations as wild flowers.

The water-colour collection is a good one, as indeed it generally is. Touching on one architectural subject, "Interior of Treves Cathedral," by Mr. Wyke Bayliss (634), while admiring its architectural truthfulness of detail, we regret a certain *too* great hardness and precision of effect, which makes the drawing look rather more like a good architectural draughtsman's perspective than an artist's work, which is not what we can generally say of Mr. Bayliss's drawings. His smaller picture, "Interior of Amiens Cathedral" (91), amongst the oil paintings, is a very agreeable work.

A MUSEUM OF CASTS.

The formation of a museum of casts is no new suggestion; the value of these aids to the study of art has long been admitted, and considerably before the existence of our own Academy, and indeed of any of the foreign academies, collections of casts of the great works of antiquity were formed. Early in the sixteenth century, after the French "discovery of Italy," as it has wittily been termed, one of the first duties of that art-loving monarch, Francis I., was to send back the painter Primaticcio to his country to collect casts, copies, and originals of the great works of sculpture then existing in Italy, and to this day not a few of these replicas, brought to France by Primaticcio, of the treasures of the Vatican, the Uffizi, and other famous Italian collections, will be found at the Louvre; indeed, one of the most interesting courts of that museum consists almost entirely of the casts obtained for Francis, and still serving as instructive lessons to the artists of Paris. As for the debt that England owes to Lord Arundel in the collections he made abroad, it may well be summed up in the words of Peacham, who, in his "Compleat Gentleman," says of Evelyn's friend, the original of Vandyk's familiar portrait, "to his liberal charges and magnificence this angle of the world oweth the first sight of Greek and Roman statues." Evelyn himself, too, may be ranked among those who have thoroughly understood and warmly urged the educational value of good examples to place before the student. The cultivated old diarist in his "Sculptura" (published in 1662) has sketched out at length a model scheme of an art-academy to be provided with casts, and in which was to be supplied ample instruction in drawing and modelling from life, in architecture and perspective, anatomy and geometry, lectures delivered, rewards and travelling studentships to Italy awarded; and let it be remarked, in these days of technical instruction, the suggestion is made "that some professors be well skilled in ornaments, fruits and flowers, birds, beasts, &c., that they may instruct the students in these subjects, which are of great use in our manufactories; and that drawing-masters for schools throughout the kingdom be appointed." The story of Kneller's private academy, which is mentioned by Walpole, that which old Thornhill suggested to George I., and which he himself eventually opened at his own house in James-street, Covent-garden, the long and active existence of the Academy in Peter's-court, St. Martin's-lane, while they form the historically known commencements of the Royal Academy, may all be said to be closely connected with the suggestion of the necessity for a Museum of Casts. As for Sir Thomas Lawrence's collection of casts, which he gathered at such expense, in our youth we remember to have seen it lodged in the cellars of the British Museum, neglected, and certainly never enlarged. It was, it will be remembered, one of the first duties, and one of the most important, of the newly-formed Crystal Palace Company to gather at immense expense, and under the direction of the most competent authorities, its invaluable and well-classified series of casts of the great works of sculpture and architecture down to our days,—a collection which, it may be remarked, though far from unknown to the public, cannot be said to have received the

attention it merits. When, a few years later, the South Kensington Museum was established, among its earliest possessions was a series of choice casts of famous works of art, since when additions have constantly been made to the collection, and a system of exchange with foreign Governments was encouraged. The Architectural Museum, now hidden away in Tufton-street, endeavoured, and not unsuccessfully, to gather a number of casts of works more especially interesting to the architectural student of Gothic art. From various causes, however, the Museum in Westminster has not achieved greatness.

The suggestion re-urged by the President of the Institute of Architects, and supported by the President of the Royal Academy, is, of course, of a more comprehensive and more scientific nature than has been attempted in any of the efforts above mentioned. With the example of Berlin, Munich, and Paris present in the minds of those who have enjoyed the privilege of visiting those cities, it is only too evident that there is in London, as, indeed, in all our great centres, a want of a museum of casts. The cast collection at Munich, in an inceptive condition, and so far but indifferently housed, comprises only copies of Classic works of art; it possesses a very complete collection, there being over 300 entries in the catalogue, consisting of a choice of all the great works known in the museums of Europe, not omitting even the works in the Munich Glyptothek. The collections at Dresden and Berlin are each also as complete; but it will, we think, be found that the Museum of the École de Beaux-Arts in Paris, particularly when it comes to have as an annexe at the Trocadéro Palace the comparative museum of French architectural casts planned by the late Viollet-le-Duc, and which is rapidly approaching completion, affords the most complete existing specimen of what such a museum should be.

When a museum, like that of the École des Beaux-Arts, is able to show to students a *full-sized* cast of an angle of the Parthenon from base to a slice of the pediment, and, as a *pendant* to this superb model, a full-sized cast of the two columns of the Græcostasis at Rome; and grouped round these in the Classic court a characteristic choice of statues ranging from the struggling commencements of the art of sculpture, as shown in the Tenean Apollo cast from the original at Munich, down to the Æginetan marbles, with fully-arranged casts of the pediment figures of the temple, in the excavations of which Professor Cockerell (as has been related in these columns) took so important a share; the Parthenaic pediment in carefully-arranged casts of the well-known figures, as also of that other group with which is so intimately connected the name of Cockerell; the Niobe pediment of the Pitti Gallery, with all the various other later familiar works of Greek and Roman sculpture, among them the Roman horses of St. Mark's ushering in the visitor,—a museum which in its classic court alone offers such a choice as this to the student, and enabling, as we have often seen, the professors after their lecture to point out to the pupils the examples which illustrate their teachings,—it affords, it will be admitted, most of the elements that can be desired. When in addition to this court,—open daily to the public, and on Sundays free to all, — with its adjoining pupils' studies also supplied with a number of other choice works specially lighted for the purposes of study,—the École des Beaux-Arts possesses a Mediæval and Renaissance court, in which can be seen from casts of the quaint Runic crosses from Kirk Braddon in the Isle of Man,—a present, by the way, of the South Kensington Museum, which has exchanged with the French Government several other works here exhibited,—in a specially-designed court, in which are shown, in a light resembling that of the *sagristia* of San Lorenzo, in which the originals exist, the series of the Medici monuments, together with the Moses (not placed, let it be remarked, as in our South Kensington Museum, far above the level of the eye, but in a position resembling that of the original in St. Petro in Vinculo, at Rome),—when, in addition to these, are grouped together as characteristic and numerous a collection of Mediæval and Renaissance works, Italian, French, and German, as the École possesses of Classic sculpture, it will be admitted that much has been done. We possess in England, scattered in different directions, most of the elements necessary for the formation of such a museum as that, the want of which has often been urged. It will be long, unfortunately, before we can hope to possess an establishment of such a peculiar character as the École des Beaux-Arts, with its interesting court-yard crowded with relics of many of the great architectural works of France gathered during the great Revolution by the archæologist, Alexandre Lenoir, the father of the present secretary, with its familiar *cour du mûrier* surrounded by its arcades, decorated with casts of the Elgin marbles, and more recently added to by the coloured copy of the charming della Robbia ware frieze of the Hospital del Ceppo at Pistoja; with its monument to poor Regnault; with a collection of casts as complete as that of which we have given some idea; a collection of copies of the works of the great painters, executed by the "Prix de Rome" students, among which is not least worthy of mention a full-sized copy, by Sigalon, of Michelangelo's "Last Judgment" in the Sistine Chapel, with, under the same roof, a whole series of *ateliers* for the young painters, sculptors, and architects; a "hemicycle" where the prizes are distributed, its walls decorated with the whole history of art in the persons of its celebrities, from the brush of Delaroche; a *salle des modèles* crowded with a mass of smaller casts, such as copies of the beautiful little terra-cotta figures unearthed at Tanagra, and without copies of which no collection of casts can be said to be complete; a huge hall, the well-known *Salle Melpomène* in which are periodically shown the results of the pupils competitions, the "Prix de Rome" pictures, &c. and an art library which, if not as complete as that of our South Kensington Museum, is supplied with all the necessary materials for artistic study, not least among these a bulky collection of the works of several generations of architects, "Prix de Rome" students, gathered in Greece and Italy.

Let this fact be remembered, that our want of such establishments as exist on the Continent, with the facilities given to the public to visit them, places our artists at a singular disadvantage in comparison with their foreign brethren. Our Science and Art Department in default of a by-some-sighed-for Minister of Fine Arts, should look to a point which before long public opinion will urge on its attention. Let us hope that their action when carried out will fully justify the belief of a possibility of "the young student being able to study the rudiments of his science without the necessity of going abroad," a belief entertained and expressed by an artist who may be said to owe almost the whole of his learning and the position he at present occupies to the education he has received abroad.

As bearing on the subject, we give in our present issue a view of the Gallery of Casts which has been founded in Vienna.

THE NEW EXAMINATION, AND WHAT IT INVOLVES.

AT the meeting of the Architectural Association, on the 25th ult., Mr. Aston Webb, President, in the chair, Professor T. Roger Smith read the following paper:—

The examination which all architects proposing to become Associates of the Institute will for the future have to pass comes into force this session, and this Association would hardly discharge the functions which have come to devolve upon it aright were it to take no notice of this circumstance. The step which has been taken in the establishing of this examination is one tending in the direction of measures which have at various times been warmly advocated by this Association. It is one which will largely affect our own members, inasmuch as we include in our ranks so large a proportion of the younger architects of London who are rising up into active practice. There is, therefore, every reason why we should devote an evening to the subject, and I am sincerely indebted to the committee for honouring me with an invitation to read a paper with reference to it.

There are few architectural matters which cannot be better understood by some reference to their history, than if you regard them simply as they present themselves at the present day. Though an examination which has never yet taken place cannot exactly boast of a history, still a little retrospect of the causes which led up to it may help us in understanding its scope. As far back as the oldest member present can remember, that is to say, in the days of Lyon's Inn Hall, the desirability of a diploma for architects, or at any rate of an examination, such as the members of several other learned and scientific professions have to pass, has been dwelt upon in this Association,—and the need of it has always been felt by a certain number of the members of the Institute. Eventually Professor Hayter Lewis, when he was secretary of the Institute, procured the appointment of a committee to consider this question and draw up a scheme for an entirely voluntary examination. The work of that committe was, a good deal of it, done by Mr. Arthur Ashpitel, Mr. John Papworth, Professor Lewis, and myself, and during part of our deliberations we had the co-operation of Professor Kerr. The Institute, as a body, I must confess, looked upon the scheme with coldness, perhaps with some jealousy, and to disarm this jealousy we were compelled to accept limitations which hampered it not a little. No kind of distinction or reward, not even a certificate, was to be gained by passing, no privilege, or grade, or title, was to be accorded to those who passed. The first examination took place in the year 1863, and it is melancholy to think that of those who conducted it, I am the only survivor. The examiners were Sir Gilbert Scott, Sir Digby Wyatt, and Mr. Arthur Ashpitel; the moderators, Mr. John W. Papworth and myself. The result was that eight candidates passed in the class of Proficiency, and in the following year seven, with the addition of two in the class of Distinction, for we had two classes to begin with, and altogether the honour of Distinction was gained by three candidates, all of them well-known members of this Association, Mr Phéné Spiers, Mr. R. R. Bayne, and Mr. T. H. Watson. As years went on this examination languished, mainly, I believe, because it led to nothing; and modifications were introduced with the idea of making it more attractive to students; the most important changes being the abolition of the Class of Distinction; the introduction of a Preliminary Examination; the division of the Proficiency Examination into two portions, which a candidate might take in different places; some modifications of the subjects of Examinations; and last, but not least, the grant of a certificate, and, under some limitations, of the title of Graduate of the Institute. These changes seemed to work well, and the results of the Voluntary Examinations, before and after this introduction, may be summarised as follows:—Ten Examinations have been held during eighteen years. Three students have passed in Distinction, forty-three in Proficiency, and fifty-two in the Preliminary Examination, making a total of ninety-eight successful candidates, whose names you will find in the Brown Book, and many of whom you will recognise as having been in other ways successful since. I must now take a glance into the past, and remind you that some years ago a committee was appointed, at the suggestion of Mr. Horace Jones, to consider what steps could be taken to advance the welfare of the Institute. That committee's report was not agreed to by the general body, mainly on the ground that it advocated the grant of a new charter, and a second committee, which was thereupon appointed, considered the matter afresh. Among the recommendations which it made, this committee reported that after a certain date all Associates of the Institute ought to pass an Examination. The various recommendations of this report were agreed to substantially as they stood, and the changes recommended were adopted. The Examination about to take place is one of those changes, many of which appear to have been of essential service to the Institute, and through it to the profession. I propose now to give you some idea of what we may suppose to be intended by the establishment of this examination, and of what the examination itself will embrace. We may safely put the intention of the Institute as being to render the Associateship of their body a guarantee that the Associate has proved his fitness to be entrusted with work, so far as that fitness can be ascertained by an examination. At present a man is admitted an Associate because nothing is known against him, and something has been said in his favour; but it is not incumbent on him, and, indeed, would not be very possible for him, to prove to the satisfaction of the Council who receive his nomination, or of the general body who elect him, that he is properly qualified; and, accordingly, though Associateship of the Institute has a very considerable value, it is not at all so serviceable to those who have obtained it in the way of giving them standing in

the eyes of the public, as it might be, and as we may hope that in a few years it will be. This being so, the course of examination must be taken as embodying a kind of standard of the qualifications of an architect, and, as such, is a document of no small interest. The draft of it was prepared with great pains and care by a committee on which several members of the Association had seats; it was finally brought to its present shape by the Council of the Institute, and it was passed by the general body, so that among the matters which are involved in the Examination, we may fairly take this authoritative publication of an architectural standard of qualifications as the fairest. A competent architect, then, must be able to design and draw out a building complete, including perspective, details, and ornament, and he must be able to plan and work out a scheme for appropriating a given site to a special purpose. He must be able to write a specification and prepare an estimate. He must also know something of the conditions usually appended to contracts. As far as construction goes, he must be familiar with building materials and how to use them, and calculate the strains upon them. He must know how to drain his buildings, and should have some knowledge of what to do in case of failure and accident. Lastly, as regards art, he should have a general knowledge of the history of our art, and be tolerably familiar with one small portion of that history, and he should possess sufficient acquaintance with the mouldings, features, and ornaments of some one style to be able to use them with correctness in his designs, and to draw them from memory. I do not think that less than this can reasonably be expected of architects who begin practice, in the interests of the public and the profession alike; and should the examination be so conducted as to bring these qualifications to a fair test, the architectural profession cannot fail to reap great benefit. I have recently, before a different audience, given some account of the actual course of examination as proposed in the Institute's programme, and as that must be done here also, you will, I dare say, pardon me if here and there I quote a phrase from the opening lecture of the courses at the University College, the lectures just referred to; though I may as well say at once that I propose to review the course of examination here at much greater length than was requisite in that lecture. The obligatory preliminary work consists of a set of plans with a perspective drawing, a sheet of details, and an ornament. This requirement is, of course, intended to elicit practical skill in architecture generally, and in handling drawing materials and making drawings. Work done as a student,—such, for example, as sketches from ancient buildings, notes, or essays,—may be also submitted at the option of a candidate. This affords an excellent opportunity for a student who has really made studies to show them; and though it does not appear that marks are directly allotted to the preliminary work, there can hardly be a doubt that good preliminary work will tell in a student's favour; for example, it will be likely to induce the examiner to turn the *viva voce* examination into a direction towards which his preliminary studies have pointed. The first subject for examination is the History of Architecture, taking a general view of a wide field and an examination in some detail of a single division of the subject. It is a matter for congratulation that history is thus required, for its value is, I believe, very much underrated. To a certain extent a knowledge of the history of architecture is part of the education of an architect, as distinguished from his mere instruction; and it is a characteristic of the present day that few students, especially young ones, will tolerate any subject of tuition which is to be pursued solely for the purpose of training, expanding, and informing their minds. They want something that will pay. Now that the history of architecture will pay to the extent of 100 marks out of the 600 obtainable, I hope many will give some attention to it, and will, to that extent, get educated in spite of themselves. The answers to this paper are to be illustrated by sketches, and no doubt the judges will be much influenced by really good sketches. The second subject of examination is one intended to show that the student has mastered some one style sufficiently to give him a command over its forms and features,—knows it, in fact, so that he could use it on a building without committing gross errors. This subject is largely a test of practice and drawing, and private study, but there is nothing in which the junior class of design could be more serviceable than in giving the members some idea of what is meant by an accurate use of some one style; though, of course, in preparing for examination, careful private study will be required in addition to attendance at that class. The best preparation by far is measuring, sketching, and drawing out some existing example or examples of the style selected. Even a modern example from the hand of a good architect would be a more instructive study than a book or an engraving. To this subject seventy-five marks are allotted. The third division is Materials and Construction, with Sanitary Science, and I need hardly add, I hope, that practical as well as theoretical acquaintance with these subjects will be necessary, in order to satisfy practical examiners, and must be sought on the works to which the student has access. This group of practical subjects, to which two papers will be devoted, engrosses one-third of the marks, and occupies one-third of the time which is allotted to paper work. It is, therefore, manifestly the most important of the whole, and one in which I venture to think the examiners will be disposed to be more strict than in other cases when marking other papers. The principal building materials can be understood best by those who have experience of their use, and have ripened and extended that experience by reading books, attending classes, making inquiries for themselves, examining, and, when possible, collecting specimens, and witnessing experiments when testing is going forward. "The principles of construction as applied" are words in the programme which seem to cover the theory and practice of building, and the student will have to pursue both. Drainage and sanitary requirements are also named. In this we are all in the position of new brooms, and probably a manifest want of familiarity with the modern ways of executing what is called sanitary plumbing and drainage would induce the examiners to make a clean sweep of the candidate's chances. The application of formulæ will, in all probability, not be pushed far, but it is very desirable that what is done should be right. As there is no preliminary examination, and no subject that is not a strictly professional subject is taken up, the examiners may possibly afford an opportunity for those candidates who are good mathematicians to show their skill by including two or three difficult questions. No doubt, the moderately-trained man will be wise enough to let those questions alone if such are set; and the mathematicians will be heartily glad of them. Considering the heavy risks that attend the failure or fall of buildings, it is a very good thing that this curriculum includes what I may call their pathology. This the aspirant to Associateship cannot learn from any books that I know of; but only from seeing buildings that are dangerous and watching how they are dealt with. It is very desirable to get some notion of how foundations fail, how brickwork fails, how timber breaks or shrinks, or rots, and how masonry yields; and perhaps there is no place which affords more opportunities for the study of these things in old buildings and new than poor leasehold London, founded on clay, run up in haste, with indifferent materials, and too often no professional supervision beyond that of the district surveyor, and no specification save the Building Act. The fourth subject is Planning for a special purpose; it is one more calculated than some of the others to show what the candidate is fitted by nature and training to practise as an architect. No preparation for this paper will be better than making designs in one of our two Classes of Design; but the various opportunities offered by public competitions, by the prizes given in some of the professional journals, and by competing for the Institute prize, and those of this Association, each and all offer good occasions for drawing out and stimulating powers of design. No man is a born planner, and practice is as necessary in this as in any other of the curriculum, perhaps more so. To this subject 75 marks out of 600 are allotted. The fifth subject is writing specifications and estimating, and here a candidate can make 125 marks, though, as the time allowed is rather disproportionately short, he will probably be unable to do as much as he would like in the way of answering questions. My own impression is that specifications will be more thought of than estimating, and, indeed, the questions are described so as to lead one to expect that only a general acquaintance with how to estimate will be required, while an actual bit of specifying has to be done,—and should be well done. The last subject is so much of professional practice as is involved in the general conditions usually appended to a contract. Of course, this must be interpreted as meaning not merely familiarity with the usual clauses, but with the purposes which each is meant to serve, and the dangers and disappointments which each is intended to avert. It does not seem that great stress will be laid on this subject, important though it be, as only 25 marks are allotted to it. The work thus far is done by means of written or drawn answers to printed questions,—*i.e.*, is paper-work only, and it takes up three days,—Tuesday, Wednesday, and Thursday,—the candidates having six and a half hours' work on each day. The examiners, meantime, will give such consideration as they can in the time to the work of each student taken as a whole, with the addition of his preliminary work, and will so prepare themselves for the *viva voce* examination. This, though no doubt actually very formidable to some young men, should really be regarded as a most valuable feature of the scheme. The candidate who has really done something wrong,—as, for example, one who had attempted to send as preliminary work something drawn by another hand (if any one ever was mean enough to try that) might expect to have a bad time of it, as the inconsistency between his preliminary work and his answers would probably have appeared, and he would be pushed hard, and deservedly; but to no student who has honestly prepared himself, and tried to do his best, can the oral examination be other than an advantage. It must not be forgotten that, at any rate in the early examinations, the desire of the Examining Board will be likely to be much more to let men in than to keep them out; and in scanning the work of a doubtful candidate, there will be sure to be a disposition to try to find out the points where he is strong, and give him opportunities of answering some questions about them, than to push him too hard where he has shown signs of weakness. I beg strongly to commend this view to intending candidates who are fairly prepared, and to advise them to look upon the oral examination as their best friend, and not as diminishing their chances of success. The examiners sitting round the table will certainly not desire to admit the unworthy, but I am very sure they will do their best to discover and bring out the worth of the worthy. Finally, the examiners will have to adjudge marks to the work done. The system they will pursue is of course, for themselves to determine, but it will, no doubt, be a uniform one. They will, in all probability, give no marks at all to paragraphs full of irrelevant information, which the student had in his head or had committed to memory, but which are not answers to the questions. On the other hand, correct, exact replies, just to the point, even if brief, will be sure to be marked high. Illustrative sketches, if well done, ought to command good marks; and any answer, be it drawing or be it writing, that is thoroughly right and thoroughly complete, no doubt, will earn all the marks it will deserve. On most systems of marking it would be possible for thoroughly correct answers to all the questions to obtain more than the maximum number. On the least favourable plan, the full maximum must be possible. The limit which a candidate must obtain, in order to pass, is one-half this number, gained not necessarily in each subject, but as the candidate best can; and any moderately good set of answers ought to reach this. If the half is very nearly approached, though not reached, it is to be presumed that the examiners will recur to any memorandum they may have kept of the oral examination, and will re-examine the preliminary work, in order to see if they can fairly increase the number of marks in any subject; and if, after this reconsideration, which I know will be done with a disposition to look into the candidate's merits fairly, and perhaps favourably rather than harshly, the examiners feel bound to reject a candidate, he may be pretty sure that he has not yet properly prepared himself for practice, and that by continuing his studies he will be doing nothing more than that which it is necessary should be done in order that he may, with safety both to himself and to those who may employ him, practise as an architect. Perhaps it is right that I should add that owing to my position at University College, I am, fortunately for myself, not eligible to serve as an examiner, and that in what I have just said I must not be understood as pledging any of the examiners to any special course, but only as speaking from some

experience in the voluntary and other examinations, and from an intimate knowledge of the circumstances.*

THE INTERNATIONAL EXHIBITION OF SMOKE-PREVENTING APPLIANCES.

THE international exhibition of smoke-preventing and fuel-economising appliances, instituted by the Smoke Abatement Committee of the National Health and Kyrle Societies, was formally opened by the Lord Mayor on Wednesday. The exhibition is arranged (by permission of the Commissioners for the Exhibition of 1851, and with the concurrence of the Committee of Council on Education, and the Council of the Royal Horticultural Society) in the east and west arcades and in the quadrants connecting those arcades with the conservatory in the rear of the Royal Albert Hall, Kensington. The catalogue (which, so far as we have tested it, seems to have been carefully compiled) contains a great deal of introductory matter explaining the origin of the Committee under whose auspices the Exhibition has been formed. A useful report on the law affecting smoke is given, and various important meetings held in support of the exhibition are reported very fully. Some of the speakers at those meetings occupy the first rank as men of science, and their speeches,—notably that of Dr. Siemens,—contain much that is valuable and suggestive with regard to what is undoubtedly one of the most important of the many sanitary and economical problems of the day. It has been arranged by the committee that the various appliances and fuels exhibited both for domestic and industrial purposes shall be properly tested for heating power, cost, convenience, quality of combustion, and comparative freedom from smoke and noxious vapours; and to this end they have secured the services of Mr. D. Kinnear Clark, M. Inst. C.E., to superintend the trials, under the direction of the executive committee. Professor W. Chandler Roberts, F.R.S., has undertaken the chemical testing in connexion with the trials of fuel, grates, and stoves. The award of medals on these occasions is often so delusive that we shall look with some curiosity to the result on the present occasion. The exhibition is primarily divided into two classes of appliances, applicable respectively to domestic and to industrial purposes. Objects exhibited in Sections A, B, and C are entirely for domestic, and those in Section D for industrial, use. Section E is reserved for various fuels suitable for either domestic or industrial purposes, or both, and Section F for foreign exhibits of all classes. A plan accompanies the catalogue, and on it the space occupied by the exhibition is divided into blocks or sections numbered I. to XXVII. Boards bearing these Roman numerals are fixed up at intervals to mark these divisions or blocks. Block I. is situate at the south end of the western arcade, and thence the blocks are continued northward into the west quadrant, at the eastern end of which, abutting on the conservatory, is Block XIII. Block XIV. is at the other or eastern end of the conservatory, *i.e.*, at the western end of the east quadrant, and from this point the blocks continue southward until the final one, XXVII., is reached at the extreme south end of the eastern arcade. The stands or stalls, of which there are several in nearly every block, are not separately numbered, but are referred to in the catalogue as being in such and such a block. In the following outline of the contents of the exhibition we will, for the sake of convenience, assume that the visitor will traverse the exhibition from the south-west corner (beginning with Block I.) to the south-east corner (ending with Block XXVII.).

Block I. at the time of our visit was almost destitute of exhibits. Those that were there were not labelled with their exhibitors' names, nor could we find anything catalogued in Block I.

Block II.—Here Messrs. George Green & Sons, of Aberystwith (represented by Messrs. Duncan Bros., of Queen Victoria-street), show a vertical boiler fitted with Green's patent water-hearth, which consists of a shallow box made of boiler-plates, through which the water of the boiler circulates. This box takes the place of furnace-bars, and renders them unnecessary, the upper and lower plates being perforated and connected together with screwed conical tubes of sufficiently large area to allow the ashes to fall through. Messrs. James Newton & Son, of Oldham, exhibit Newton's patent mechanical stoker and fuel economiser, in which the coal, after passing from the hoppers through crushing-rollers, is injected into the furnace by blasts of heated air. The Chadderton Ironworks Company, Manchester (represented by McDougall Bros.) are exhibitors of McDougall's patent mechanical stoker, in which the fire-bars are actuated by what is described as "an eccentricated shaft" of Bessemer steel. The eccentrics are turned on three different centres, and are alternately arranged, each bar resting on and being driven by its own eccentric or cam.

Block III.—Messrs. T. & T. Vicars, of Seel-street, Liverpool, show their patent "self-stoking smokeless furnace," for steam-boilers, &c. In action, a large hopper is filled with fuel, which is fed from thence by plungers, in suitable quantities, on to the bars, where it is coked, and, by their motion, carried backward on to the grated plate. The ends of the bars act as plungers, and break up the large pieces of coked fuel into pieces of a size favourable to active combustion, at the same time forcing it into the flue, where the combustion is completed. The Patent Steam Boiler Company, Birmingham, have on view Knap's mechanical stoking and smoke-consuming apparatus, which consists of a hopper into which the fuel is charged; a slide by which the supply may be at any time cut off; and a crusher-spindle, which revolves very slowly, and carries down the fuel to a reciprocating bar, which feeds the fuel forward through a horizontal shoot. The same company are exhibitors of Root's patent safety steam boiler, which consists of a series of interchangeable tubes of lap-welded wrought-iron. These tubes contain the water and steam. The hot gases and flame from the furnace are thoroughly broken up, on account of the zigzag arrangement of the tubes, which also, being inclined, cause the steam as produced to be collected at the upper ends, and thence to pass through the patent connexions into the steam chamber. Messrs. Knowles & Halstead, of Bradford, show their patent helix furnace-feeder. The helices or screws are made to carry the fuel under the bars and up into the fire at its under side, so as to insure perfect combustion of coal. Mr. James Proctor, of Burnley, shows his patent mechanical stoker and movable fire-bars. Henderson's patent mechanical stoker and patent self-cleaning furnace combined is shown by Messrs. Piercy & Co., of Birmingham. In this appliance, the clinker, instead of being raked out of the furnace in the usual way, by hand, is carried automatically to the back of the grate-bars, and remains there till it is cool, when it is removed without necessitating the opening of the furnace-doors. Mr. Thomas Henderson, of Liverpool, exhibits his patent furnace-front and fire-door for the prevention of smoke in connexion with steam boilers generally, and for the reduction of temperature in the stoke-holes of steamships. Mr. John Collinge, of Oldham, exhibits Blocksage's patent smoke-consumer and fuel economiser, for the steam boilers of stationary, marine, and locomotive engines. It consists of an inclined oven of the length and breadth of the ordinary grate-bars, placed in front of the boiler, and fired by hand. The top and sides of this oven are lined with fireclay blocks, which acquire such an intense heat that the smoke, impinging against them, is consumed. Mr. Collinge also shows some patent fire-backs for domestic stoves, grates, and ranges.

Block IV.—Livet's Boiler and Furnace Company (Limited) are exhibitors of boilers, flues, furnaces, grates, &c., constructed and fitted under their patents. Messrs. Rosser & Russell, a firm well known to our readers, are exhibitors of smoke-preventing doors and bridges, and movable fire-bars, applicable to furnaces for industrial use. Messrs. George Haller & Co., of Lime-street, show Kohlhofer's patent fire-bars and furnace-grates, by the use of which small coal or poor fuel of any kind may be profitably utilised. It is stated that the bars remain cold whilst in use, and that the clinkers do not stick to them. Mr. R. Renton Gibbs, of Liverpool, shows his hot-water heating apparatus, which is favourably spoken of by many architects and others who have used it. We have noticed it on previous occasions. Mr. Josiah Hampton, of Loughborough, exhibits fuel-economising and smoke-consuming fire-bridges for boiler-furnaces, made of cast iron, and having perforations through which air passes to the black smoke and unconsumed gases at the proper point, thus assisting in their perfect combustion.

Block V.—Messrs. J. & J. McMillan, of Port Dundas, Glasgow, are exhibitors of under-grate fuel-feeding apparatus, applicable to boiler furnaces of all kinds. The charges of coal or other fuel are contained in travelling boxes actuated by mechanism. The principle of the invention is applicable, and is shown applied in another part of the exhibition, to domestic stoves and ranges. M. Michel Perret, of Paris, exhibits a grate (*grille immergée*) for boiler and other furnaces, the bars being deep in section and having their lower edges immersed in water. M. Perret's multiple-stage furnace, for heating churches and other large buildings by means of hot air, is shown in action, and appears to be effective. It will burn the poorest descriptions of refuse fuel. We understand that it has been largely used in France during the last four years. The same exhibitor also shows a radiating open fire-grate. Messrs. George Hopewell & Co., of Topsham, Devon, show their patent wrought-iron reversible fire-bars. Mr. T. W. Williams, of Swansea, exhibits a patent oxy-hydrogen furnace for the consumption of anthracite and other smokeless coals without injury to the furnace bars. Mr. M. Holroyd Smith, Halifax, shows some hexagon fire-bars and a model of a helical furnace feeder. Messrs. Geo. Waller & Co., of Southwark, show Smith's patent mechanical stoker and smoke-preventer, for Cornish and other boilers. The Wavish Fuel Economiser Company show a model of a Cornish boiler fitted with Wavish's patent economiser and smoke-consumer; also these appliances adapted to domestic grates. Messrs. W. & S. Deards, of Harlow, exhibit coil and other boilers for heating green-houses, baths, &c. Messrs. G. Hunter & Co., Leeds, are exhibitors of a patent apparatus for smoke-consuming in Cornish, marine, and other boilers. Mr. John Tenwick, Grantham, exhibits patent fire-bars and a smoke-preventing furnace-door.

Block VI.—Messrs. W. A. Martin & Co., of Southwark, show their smoke-preventing doors and furnace-grates, which have been largely used. Mr. C. B. Gregory, of Beverly, New Jersey, U.S.A., exhibits a smoke-burning furnace which he claims to be adapted to all practical purposes, industrial and domestic, and capable of burning all kinds of fuel and refuse matter without smoke. It is portable. The Great Britain Smoke-Consuming and Fuel-saving Company are exhibitors of Orvis's patent appliances. Mr. A. C. Engert, Bromley-by-Bow, shows his patent coking-boxes for the prevention of smoke as applied to steam boiler furnaces. Messrs. Fraser & Fraser, of Bromley-by-Bow, exhibit a Cornish boiler.

Blocks VII. *and* VIII. are chiefly taken up with a large number of exhibits of anthracite and other smokeless coals, besides charcoal, coke, and other fuels. In Block VIII. Mr. George Sinclair, of Leith, shows his patent self-acting mechanical stoker.

In *Block* IX. Messrs. S. Leoni & Co., of the Strand, are exhibitors of gas kitcheners, gas fires, coke and gas fires, hot-air stoves, and grillers and other appliances for cooking by gas.

Block X.—Messrs. Steel & Garland, of Shaffield, show their excellent "Wharncliffe" grate and coal-economiser, the "Kensington" patent smoke-consuming grate (Redmayne's patent), and their patent "Pillar" smoke-consuming hot-air stove. All these specialities will well repay examination. Messrs. Portway & Son, Halstead, are exhibitors of the "Tortoise" slow-combustion heating and laundry stoves. Messrs. W. A. Martin & Co., Southwark, show domestic fire-grates, provided with movable sides to facilitate the combustion of the fuel, which is put on only at the sides in spaces obtained by the propulsion and withdrawal of the movable cheeks. The Eagle Range Company, Fleet-street, are exhibitors of ranges fitted with smoke-consumer and fuel-economiser. Messrs. W. Poore & Co., Cheapside, are exhibitors of American cooking and heating stoves.

Block XI.—Mr. R. W. Crosthwaite, Stockton-on-Tees, shows Armstead's patent hot-air stoves, "Clibanus" cylinders for heating coppers, and Crosthwaite's "Combination" range. Mr. Henry Thompson, Islington, shows his patent grate and apparatus for feeding it with fuel at the bottom of the fire, so as to prevent smoke. Mr. James Smith, Liverpool, shows an open smokeless grate in which the leading feature is that the ash-pit is provided with a close-fitting cover (which can be moved for removal of ashes), and is connected with a pipe or passage

* To be continued.

provided with a damper to control the supply of air. Messrs. J. & J. McMillan here show their under-grate coaling apparatus, as applied to open grates and cooking-ranges.

Block XII.—Messrs. Musgrave & Co., of Belfast, have a large display of their patent ventilating slow-combustion stoves and air-warmers, for burning either coke or anthracite, in which a recently-patented system of air-jets is used to assist in the consumption of the smoke and gases. This well-known firm's "Ulster" smokeless stove-grate is very similar in appearance to a well-designed register-stove grate, but it is provided with a chamber for holding fresh fuel, which replenishes the fire as it burns away, but cannot become ignited until it reaches its proper position in the fireplace. One or two important improvements have lately been made in this grate, which, in its present form, is very well worthy of the attention of visitors. Mr. G. A. Spencer, of Southwark, exhibits an arrangement for feeding stoves and open grates in such a manner that the fresh fuel is introduced below the fire. The Coalbrookdale Company exhibit some fireplaces and cast-iron chimney-pieces and over-mantels in the Adam, Chippendale, and other styles, shown in conjunction with the "Kyrle" and other smokeless grates. The exhibits are distinguished by excellence of workmanship, and fully maintain the reputation of the company. Mr. E. R. Hollands, Newington-Green, shows his patent smoke-preventing fire-grate, in which the fresh fuel is inserted at the bottom of the fire.

Block XIII.—Mr. John M. Stanley, of Rhyl, shows cooking-range, kitchener, room-grate, and baker's oven, in which, by a patented arrangement of outlet flues he claims that the volatile gases are induced by the natural draught of the chimney to pass downward through the fire, and so smoke is prevented. Messrs. M. Feetham & Co., of Clifford-street, are exhibitors of grates, stoves, and kitchen-ranges. The Wilson Engineering Company, Holborn, show their portable kitchen-ranges and stoves, for which they claim the merit of being almost perfectly smokeless.

Block XIV., which is at the west end of the eastern quadrant, adjoining the east end of the conservatory, is wholly occupied by Messrs. Doulton & Co.'s excellent display of tile and other stoves. This firm's slow-combustion radiating tile stoves have on previous occasions been noticed by us. They have come largely into favour, as they deserve to do from their cleanliness, cheerfulness, and efficiency, coupled with economy of fuel. They are thickly lined internally with fire-clay, and will burn for twelve hours or more without needing attention. A large tile stove suitable for use in public buildings is shown. In addition to the internal furnace provided in the smaller tile stoves, it is provided with an open fire-place, which can be used either alone or concurrently with the internal fire. Messrs. Doulton are also exhibitors of ornamental Doulton-ware vases or shafts for use in ventilating on the so-called "Tobin" principle. Their syphon-flue stove is another speciality well worthy of the attention of visitors to the Exhibition.

Block XV.—Mr. William Stobbs, Pimlico, exhibits two American productions, viz., Janes & Kirtland's "Beebe" kitchen-range, for which great things are claimed. The various castings of which it is built up are certainly specimens of finished workmanship. Mr. Stobbs's other exhibit is the Barstow Stove Company's "Crystal" fireplace heater, to burn coke or anthracite coal. It can be fitted to warm rooms above the one in which it may be fixed. Messrs. Newton, Chambers, & Co., of the Thorncliffe Ironworks, near Sheffield, exhibit their "Thorncliffe" improved close and open-fire cooking-range. Messrs. Yates, Haywood, & Co. (Limited) are exhibitors of slow-combustion and other stoves. Dr. Joseph Moore, of Thornton Heath, exhibits an open fire-grate, for use either with anthracite or bituminous coal. It is also constructed with the intention of preventing draughts in a room by precluding more air ascending the flue than is necessary for proper ventilation of the apartment. Messrs. Charles Churchill & Co., Finsbury, show the American "Greene" soft coal cooking-stoves and heating-stoves. Mr. Harry Hunt, Stoke Newington, shows the "Crown Jewel" base-burner anthracite coal-stove, which has previously been described by us.

Block XVI.—Mr. Herbert Lea, Warwick-street, Regent-street, exhibits the "Sunderland" stove. The "smoke-abater" coal-shovel, exhibited by the patentee, Mr. W. S. Melville, of Bow, is an ingenious though simple contrivance for quickly and easily feeding a fire with fresh fuel at the bottom of the grate. Messrs. Clark, Bunnett, & Co., Limited, Rathbone-place, exhibit Ingram's "Kaio Kapnos" fire-gate and kitchen ranges, constructed to burn coke, ordinary house-coal, and anthracite. These grates (which are the invention, we believe, of an architect) are stated to consume their own smoke, and can also be used as slow-combustion grates. The Radiator Range Company show their range and a fire-grate, in which the fire-box is brought forward from the back of the stove. Mr. John Cornforth, of Berners-street, is an exhibitor of open fire-grates designed to consume smoke.

Block XVII.—Messrs. Frederick Edwards & Son, of Great Marlborough-street, exhibit their new smoke-consuming slow-combustion grates, the invention of Mr. Edwards, jun., who is well known to many of our readers as a writer on warming and ventilation. In this grate a body of coals sufficient for a day or a night's consumption is put into the fire-basket or chamber, and upon the top of this mass a fire is made and the coal is allowed to burn gradually downwards. A blind or screen, supported by chains and balance-weights, is moved down by degrees in front of the body of burning fuel. Fur kitcheners, Messrs. Edwards exhibit drawings modifying Count Rumford's principles. Messrs. Barnard, Bishop, & Barnards, of Norwich, have a large and good display of well-designed stoves, kitcheners, and ranges, for slow combustion and otherwise, all constructed for burning anthracite and other smokeless coals. Among the specialities shown by this well-known firm are,—Everitt & Barnard's patent grate; Bartlett's patent grate; the "Anthracite Grate"; and Everitt & Barnard's slow-combustion, smoke-consuming fire-grate, the "Glow." These are all worthy of careful attention.

Block XVIII.—Messrs. Thomson, Sterne, & Co. (Limited), show Clerk's patent gas-engine. Some anthracite stoves shown in this block are exhibited by the patentee, Herr Franz Lönholdt, architect, Frankfort-on-the-Main.

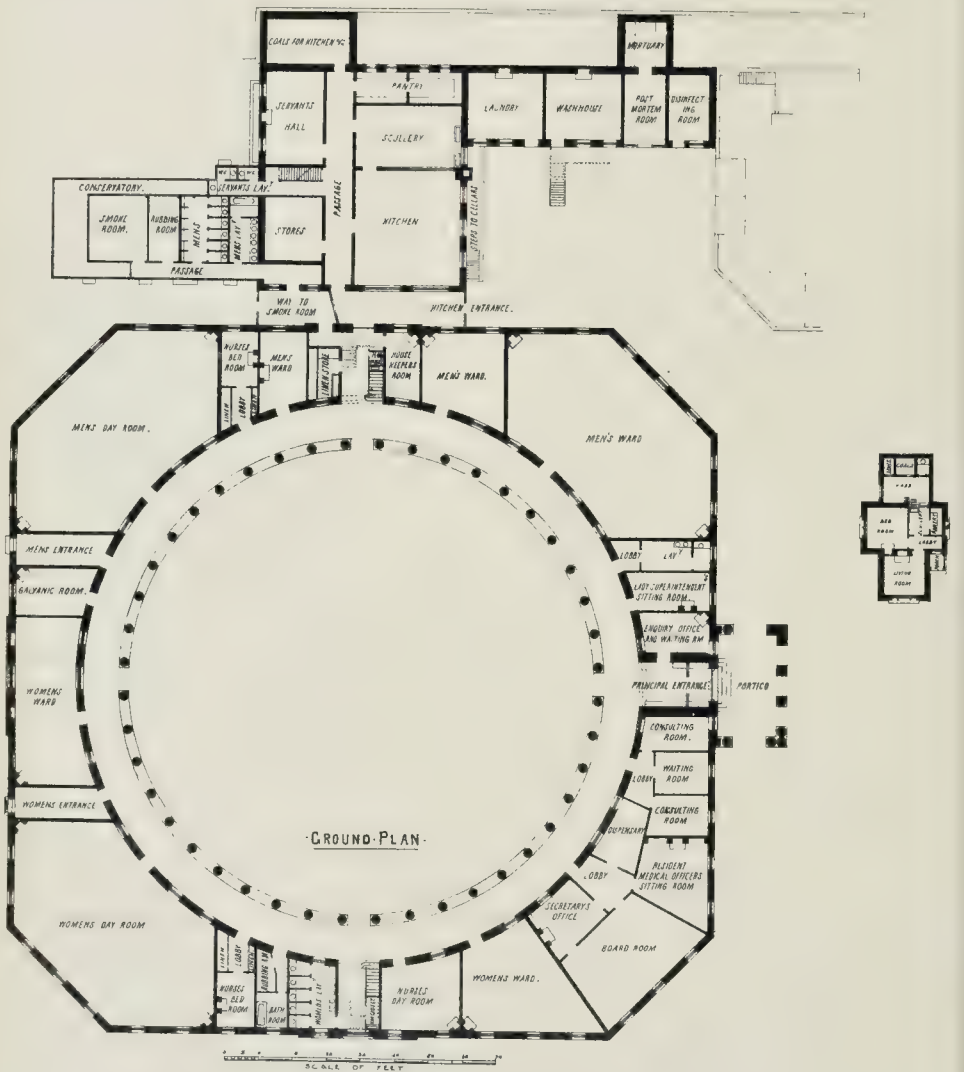
Block XIX.—Messrs. Archibald Smith & Stevens, of Leicester-square, exhibit Russell's patent "Wonderful" self-feeding grates for burning anthracite and bituminous coal, coke, and cinders. This stove, which has been previously described in detail in our columns, is sure to attract the attention of visitors. The British Sanitary Company, Glasgow, show their patent ventilating stove-grate and gaselier canopy. The stove-grate is formed as an enclosed chamber with a glass door and panels. A portable grate, which holds the fire, stands within this chamber. As we understand it, the canopy over the gaselier, when placed in communication with the stove-chamber, is intended to draw off the vitiated air caused by the combustion of the gas. Mr. William Lawrence, of St. Mary Axe, exhibits a variety of stoves for domestic purposes. Mr. G. J. Cox, of the Maidstone Gasworks, exhibits a number of newly-patented inventions for heating and cooking by gas, and he also shows Captain T. S. Clarke's patent smoke-consuming hot-air ventilating grate. Mr. A. C. Eggert shows his coking-box for the prevention of smoke fitted to an ordinary fire-grate. The Derwent Foundry Company, Derby, show smoke-burning register-grates and a smoke-burning gill stove.

Block XX.—Messrs. Thomas Potter & Sons, of Oxford-street, show the patent smoke-consuming revolving fire-grate, the invention of Mr. H. Saxon Snell, architect. It is simple in action, the fire-box or cage being made to revolve upon a pivot, so that when the fire-box is reversed, fresh fuel can be introduced through a hinged grating on its under side, and this fresh fuel is, by the inversion of the the grate, brought undermost. The "Thermhydric" ventilating hot-water open fire-grate, also the invention of the same gentleman, is among the other exhibits of Messrs. Potter & Sons. It is being largely used, with, we are informed, very satisfactory results. Mr. Samuel Rigby, of Blackpool, exhibits smoke-preventing apparatus, which he claims to be applicable to all open coal-fire grates for domestic use. Mr. J. Russell, of Neath, shows a patent flue or blower designed to remedy smoky fire-places. Mr. Henry E. Hoole, Sheffield, shows a radiating and reflecting grate for burning bituminous coal without smoke, and an "interchangeable" grate for burning bituminous or anthracite coal. Messrs. A. Boyd & Son, New Bond-street, show a ventilating warm-air grate for domestic use, in which the iron body, which is lined with fire-clay, is made zigzag to increase the heating-surface. Messrs. Smith & Wellstood, of Ludgate-circus, show anthracite coal and coke burning stoves. Mr. William White, F.S.A., of Wimpole-street, is one of several architects who are exhibitors. Mr. White has here, as in previous exhibitions and in connexion with other subjects, shown that he is capable of uniting practice with theory. His "Shrewsbury" warming-apparatus, and the "Shrewsbury" open-grate radiator and air-warmer, here shown, will be examined with interest. Economy of heat and fuel, and certainty and continuity of action for a great many hours without attention, are among the merits claimed for these appliances.

Block XXI.—Messrs. Brown & Green, of Luton and Bishopsgate-street, are exhibitors of smoke-consuming kitcheners for bituminous coal, and register stoves for anthracite coal. Among their specialities well worth attention are the "Kensington" and "Luton" register stoves. Messrs. J. F. Farwig & Co., of Queen-street, show George's slow-combustion "Calorigen," to burn anthracite or coke. Mr. Robert H. Griffin, of Guilford-street, exhibits his patent ventilating, heating, and smoke-consuming register stove or open fire-grate, of which we have spoken before.

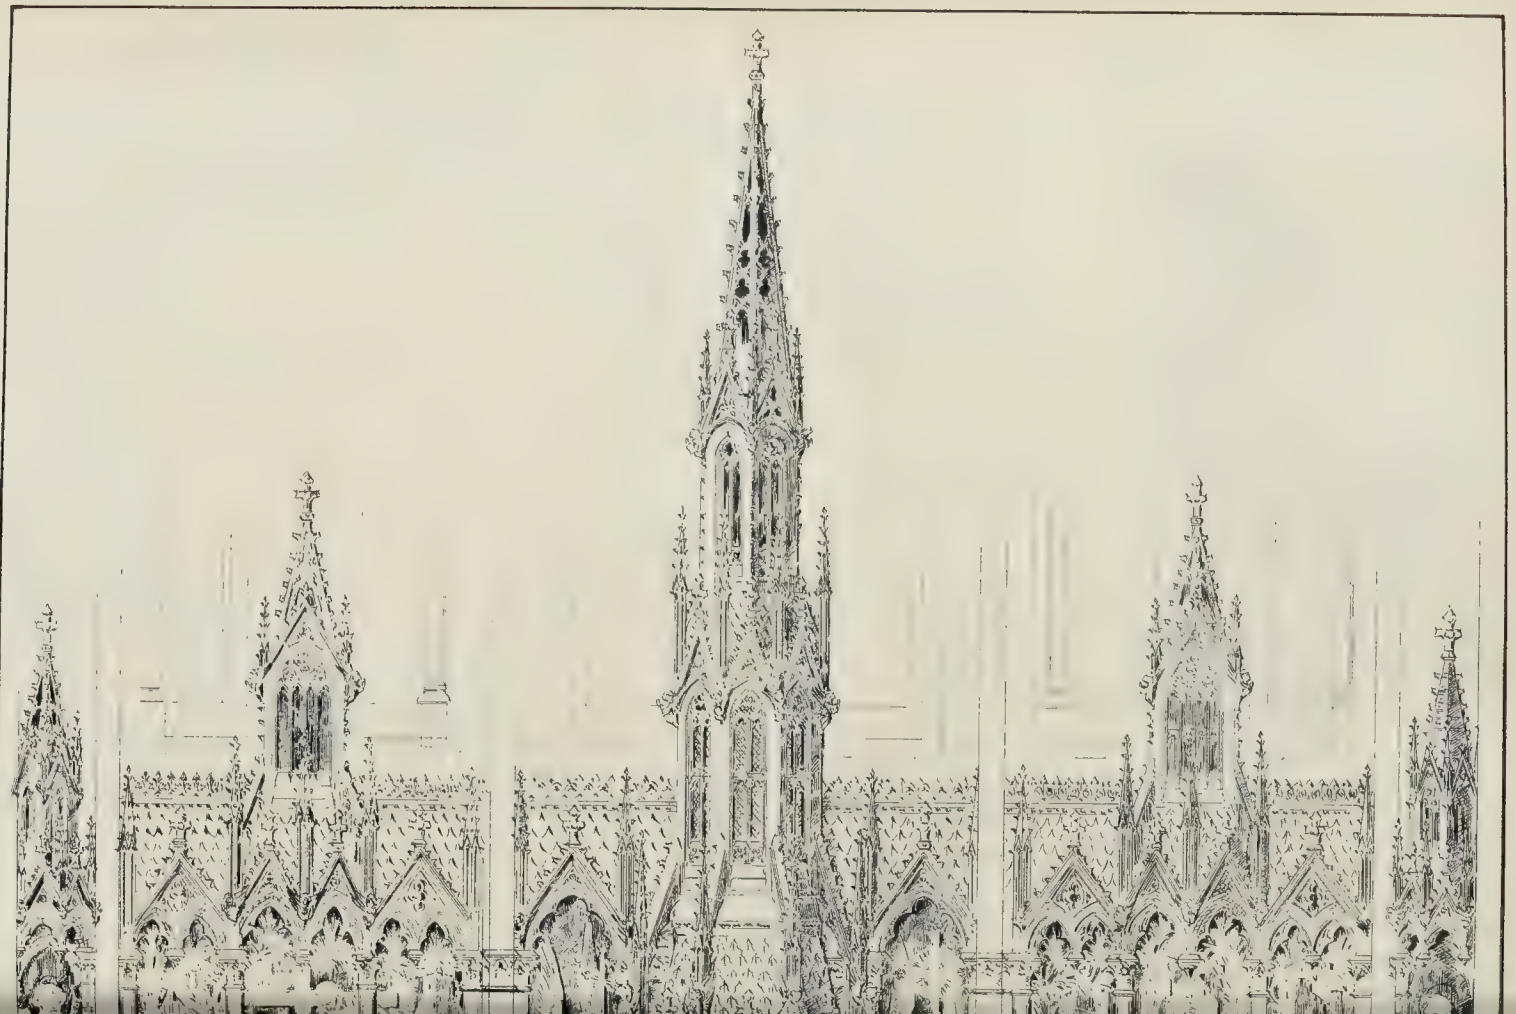
Block XXII.—Mr. Francis Hammond, of Chandos-street, exhibits a hall stove fitted with smokeless fire on Dr. Siemens's principle. Messrs. Deane & Co., King William-street, show Fletcher's patent gas-cooking and heating apparatus, and Crane's patent register grate for burning anthracite, which we described not long ago. The Silber Light Company have a variety of stoves for paraffin and gas.

Block XXIII.—Messrs. Waddell & Main, of Glasgow, show Dr. Siemens's gas and coke fire-grate. There is a hot-air chamber underneath the grate which heats air to between 600° and 700° before it impinges on the gas-jets in front of the grate, performing, in fact, the function of a miniature hot blast. Messrs. James Slater & Co., of Holborn, are exhibitors of steam and gas cooking apparatus. Messrs. George Haller & Co., of Lime-street, show Kohlhofer's hot-air gas-stoves, and Messrs. Ritchie & Co., of St. Swithin's-lane, their "Lux Calor" ventilating stoves. Messrs. Strode & Co., of Cockspur-street, show Schönheyder's patent sanitary stove, containing some recent improvements for heating, lighting, and ventilating, and a great variety of gas fires, stoves, and lighting apparatus, for the excellence of which this firm's name is a synonym. Messrs. Ewart & Son, of Euston-road, exhibit the "Empress" smoke-cure, the "Amethysta" stove, the "New Crown" boiler, ventilating gas-stoves, &c. The catalogue assigns them a position in this Block, but when we saw them they were in Block VII., near the north end of the western arcade.



Block XXIV.—Messrs. J. C. Stark & Co., Torquay, show Stark's patent pure-air ventilating stove, and gas-heating and ventilating stoves. Messrs. John Wright & Co., of Birmingham, are also exhibitors of apparatus for cooking and heating by gas. Messrs. Lewis & Lewis, of Cambridge Heath-road, show a newly-invented gas-engine for small power. The executors of the late Mr. J. E. H. Andrew, of Stockport, show a two-man power "Bisschop" gas-engine. Messrs. Crossley Brothers, Limited show a 2-horse power "Otto" silent gas engine, intended to work with ordinary coal-gas, but here worked with the "Dowson Economic Gas."

Block XXV.—Messrs. George Wright & Co., of Rotherham and Queen Victoria-street, show their patent "Bi-valve" open fire-grates, fitted with, or adapted for, Dr. Siemens's gas and coke apparatus, securing economy of fuel and prevention of smoke without sacrificing the cheerful appearance of an open English fire-place. The same firm are exhibitors of their "Economic Cooker" (previously noticed by us with commendation) and of warm-air stoves. Their exhibit is a good one. The Dowson Economic Gas Company, whose product has already been mentioned, show their gas-producing apparatus at work.



Block XXVI.—Mr. C. R. Stevens, of Lewisham, shows a steam and hot-air heater and a circulating hot-water apparatus. These appliances appear to give good results with a comparatively small consumption of gas, which is the fuel used. Messrs. W. Sugg & Co., of Westminster, show their specialities in the way of gas fittings and burners. Referring to gas-

burners, we may mention that the conservatory is illuminated at night by Dr. Siemens's regenerative gas-burners. Messrs. H. & C. Davis & Co., of Camberwell, are large exhibitors of stoves and apparatus for cooking and heating by gas.

Block XXVII.—Among the most noticeable exhibits in this block are the coke and gas boilers, and heat-radiators, shown by Messrs. Hooking, Franklin, & Co. (Limited), Liverpool. Messrs. C. Kite & Co., of Chalton-street, exhibit smoke-preventing chimney-caps, ventilators, &c. Messrs. Henry Wurr & Co., of Blomfield-street, show the "Ord" patent gas-engine.

The objects which we have here and there selected for mention, though comparatively few in number, are fairly representative of the whole, and will serve to show how much is now being attempted and achieved in the way of economising fuel and preventing smoke.

We shall have something to say on the subject in our next.

GALLERY OF CASTS: ACADEMY OF THE PLASTIC ARTS, VIENNA.

ON the south side of the Schillerplatz, in Vienna, stands the noble building of the new Academy of the Plastic Arts, erected a few years ago, with profuse ornamentation in terra cotta. It comprises, amongst its treasures, on the ground-floor, a valuable collection of original specimens and casts from ancient and modern sculpture, and on the upper floor a valuable picture-gallery, illustrating almost all schools, and particularly the Dutch of the seventeenth century, also many examples of Raffaelle, Paul Veronese, Tintoretto, Titian, and other well-known masters.

The principal staircase leads to a spacious landing, supported on columns, and thence to the Aula, or Court, shown in our engraving, from which are entered seven large halls, filled with various art-works. The court illustrated has rows of columns at the sides supporting a clearstory, and a ceiling handsomely ornamented. It contains a fine collection of casts of the principal creations of classical sculpture.

The library, which adjoins it, contains books referring to plastic art, collections of engravings, and original sketches. The Academy comprises within its walls a school of painting and sculpture, as well as a special school in which are trained young men preparing to become engravers, medallists, and architects.

THE DEVONSHIRE HOSPITAL, BUXTON.

OUR readers will remember that the extension building for the Devonshire Hospital and Buxton Bath Charity, at Buxton, was lately opened by his Grace the Duke of Devonshire. We give plans and sections in our present number illustrating the construction and arrangement, which are noteworthy. The building has a somewhat imposing appearance externally. The outer form is an irregular octagon with an inner circular area 164 ft. in diameter. Within this area is a circle of columns 138 ft. diameter, forming a colonnade 13 ft. wide all round the inner space. These columns with their entablature rise 25 ft. above the floor; and from the entablature springs the dome covering the area. The dome is a segment of a sphere, the diameter of which is 156 ft. 6 in., and springs from the stone entablature of the circular colonnade, which consists of forty-four stone columns, 2 ft. 4 in. in diameter.

The main framework of the roof consists of twenty-two strong wrought-iron latticed ribs, each 4 ft. in depth throughout, which are equally spaced, and are secured at their upper and lower extremities into two complete rings of wrought-iron, which, together with eight rings or tiers of purline framing, combine to render the structure entirely self-contained, and effectively prevents any outward thrust upon the supports.

The lower ring or polygonal bracing rests horizontally on the stone entablature; each bay or space between the main ribs being composed of two wrought-iron plates, each 15 in. by $\frac{3}{4}$ in., interlacing each other at the centre; and the ends being strongly riveted to a third plate, which is combined with and forms part of the foot of the rib itself. The upper ring is vertical, 40 ft. in diameter, lattice-framed, and receives the ends of the converging main ribs between its upper and lower flanges.

The purline framing is of rolled girder iron, 8 in. by 5 in. by 5 in., and, in addition to its attachment direct to the main ribs at the upper surface, is braced diagonally thereto by means of T-iron, extending from the lower flange of ribs to a point on the purline 3 ft. 6 in. from its junction on the rib. This bracing also adds to the rigidity of the arched ribs.

There is also a framework of light rolled girder intermediate ribs, intersecting and attached to the several tiers of purlines, and to the upper central ring. Upon this upper ring, at a height of 76 ft. from the floor, are fixed the cast-iron pillars or supports of the lantern roof, which is 40 ft. in diameter, glazed at the top and sides, and formed of rolled iron ribs, radiating from a centre, and tied around their outer extremities by a ring of wrought-iron plates securely riveted, rendering unnecessary the use of any internal bracing.

A gallery surmounts the exterior at the summit of the dome and foot of the lantern, with suitable guard-railing, to which access is provided.

A Boyle's ventilator, of large power, is fixed on the apex, and there are louvres to all the sides of the ventilating lantern.

The superficial area of this hall is just half an acre, and it is capable of holding 6,000 people. Its cubic contents are about 1,000,000 ft. The heating of the wards, day-rooms, central hall, and building generally, is by hot-water pipes passing under the floor, and coils of pipes placed in the large wards and day-rooms, the smaller rooms, lavatories, &c., having pipes placed above the floor, and the hall having six rows of pipes around its whole circuit, four rows above the floor, and two rows under the gallery. The ventilation, in addition to that obtained through the windows, is supplied by 12-inch glazed earthenware pipes, starting from areas outside the building, passing under the floor, and having branches into each ward and round the colonnade, carried up 8 ft. above each floor level, in specially constructed wooden tubes. This description of the ventilation applies equally to the chamber-floor. In the centre of the roof of the lantern, as has been already mentioned, is a large Boyle's patent ventilator.

The principal entrance is on the east side of the building. On the left or south side of the entrance are the consulting-rooms, dispensary, resident medical officers' room, board-room, waiting-rooms, and secretary's office. On the right of the entrance are the inquiry office, waiting-room, master's and matron's official room, &c. The south side of the hospital contains females' ward, with 899 superficial feet area, nurses' day-room, main staircase in stone, lavatories, &c., bath and rubbing-room, nurses' bedroom and linen-store, and females' ward, containing an area of 2,551 superficial feet. This latter room forms the south-west angle of the building. The west side of the hospital contains females' ward, with 940 ft. superficial area, galvanic room, and separate entrances for males and females. The north-west angle of the building is used as a men's day-room, and has an area of 2,251 superficial feet; the north-east angle is occupied by a men's ward, having an area of 2,251 superficial feet. The north side of the hospital is occupied by two men's wards, having areas of 552 ft. and 294 ft. superficial respectively, a housekeeper's room, linen-stores, nurses' bedroom, and main staircase in stone. Passing under this staircase a covered way leads to men's lavatories, &c., rubbing-room, smoke-room, and conservatory. These rooms are detached from the main building. The covered way in question and a corresponding staircase lead to the different floors of a large block of building, entirely detached from the main building of the hospital, and with separate arrangements, containing ample cellarages, warming apparatus, kitchens, laundries, &c., and also distinct and separate accommodation for accident cases, with independent and easy access, and wards for the isolation of cases of infectious character that may have been inadvertently admitted, or may have manifested themselves as such after admission. The disposition of the wards on the chamber floor is similar to that on the ground-floor. At the south-east and south-west angles of the building are the females' wards, and at the north-east and north-west angles are the men's wards. These rooms contain each an area of 2,251 superficial feet, and are rendered especially light, and their cubic capacity is increased by the open-roof principle of finishing the interior, that is, plastering close under the slates, and thus getting into the room the triangular space enclosed by the usual ceiling and roof. Advantage is also taken of the four angle turrets on the roof to get additional light and ventilation into these wards. The access to all the wards is from the inner circle; on the ground-floor, from the central hall; on the chamber-floor, from a fireproof gallery.

On the east side of the chamber-floor are the bedrooms for the matron, the steward, the resident medical officers, &c., and also bath-rooms, lavatories, &c. On the south side is a females' ward, with 480 ft. area, nurses' bedrooms, linen rooms, lavatories, &c. On the west side is one females' ward, 940 ft. in area, with bedrooms for nurses, &c. On the north side are two wards for men, 252 ft. and 312 ft. respectively, and other bedrooms for officials and nurses. The original buildings cover half an acre of ground, which surrounds the half acre of the covered central hall; the new buildings cover one quarter of an acre, so that the hospital buildings now cover one acre and a quarter, in addition to the surrounding roads, yards, paths, terraces, borders, and shubberies, by which the hospital is entirely isolated. There are broad terraces and terrace walks on the south, in addition to the walks around the shubberies, for the use and recreation of the patients. These grounds, with the one acre and a quarter covered by the hospital buildings, comprise a total area of nearly three acres and a quarter. The extension has been carried out at a cost of 24,000*l.*, from the plans and under the superintendence of the architect, Mr. R. Rippon Duke. Messrs. Rankin & Co., of Liverpool, have done the ironwork. The roof is so stiff that it did not deflect $\frac{1}{4}$ in. after being covered with the timber, slating, lead, glass, ceilings, &c. Messrs. Ellis, of Sheffield, have carried out the hot-water arrangements. These works are complete and most satisfactory. All other trades are by Mr. Warburton, of Manchester, whose work is not quite completed.

REREDOS FOR THE (R. C.) CHURCH OF THE HOLY CROSS, LIVERPOOL.

IT is contemplated to erect at once an altar and reredos for the Church of the Holy Cross, Liverpool, the design for which will be found amongst our illustrations. The chancel is apsidal in form. The high altar and centre canopy will stand quite clear, to admit of sufficient space for steps behind to approach the throne. The altar and canopy will be of alabaster, the altar itself being supported by marble shafts. The shafts of the canopy will be of granite.

Running round the apse immediately under the sills of the windows is the reredos, which will be of Caen stone, and filled with subjects connected with the Holy Cross. On the dexter side next to the canopy will be St. Michael the Archangel bearing his own cross on his shield and another in his hand. Next to that will be the Descent from the Cross. In the niche on the same side will be St. Peter with his cross. On the sinister side there will be the Angel of the Apocalypse bearing the sign of the living God. The next group is the finding of the cross by St. Helen, and the miracle by which the true cross was distinguished from those of the two thieves. In the niche on this side is the figure of St. Andrew with his cross *saltire*. In the space under the reredos will be the panels filled in with diapers picked out with gold. In the quatrefoil in the top of each panel there is a shield, on which will be carved the emblems of the Passion. Below these panels will be a dado of dark marble. The steps of the altar will be of rouge royal of a dark tone. The cost is estimated at about 1,350*l.* It has been designed and will be carried out under the superintendence of Messrs. Pugin & Pugin, of Westminster.

Alhambra Theatre.—After being closed for several weeks for redecoration and to undergo some structural alterations, the Alhambra Theatre will be re-opened this Saturday, December 3rd, with an English Version of *La Biche au Bois*, under the title of the "Black Crook." The Lord Chamberlain having required the directors of the Alhambra to make a fireproof division between the stage and the auditorium, advantage has been taken to make various improvements in the theatre, not the least of which is a widening of the proscenium, and a raising of the seats on the ground floor, by means of which a much better view of the stage is obtained. The dome is to be illuminated by the electric light, the effect of which we will report.

MANCHESTER AND ITS TRADE.

"At social industry's command, how quick, how vast an increase!"

That expression of Wordsworth's, and his description of the huge town, "continuous and compact," may be said to have special application to Manchester. It has the germ of the small hamlet the poet speaks of, though distant in age, but from the building of its collegiate church, from the establishment of schools, it grew slowly, while an increased commerce, as it was made possible by free transit, gave impetus to it. The Manchester of to-day has little or no likeness to that to which the Flemish artisans came five centuries ago to bring woollen manufactures to perfection. It is, indeed, within the last hundred years that cotton has become king of commerce in Manchester, and has made the city great. The power-looms and the inventions of Hargreaves, Arkwright, Crompton, and Watt are the sources of that centreing of trade on the Irwell which has made the place continuous and compact, and which gives to it its life-blood of progress. If even we glance at the condition of Manchester five decades ago, and contrast it with the present, we shall see how in the later years the progress has been most marked. It had then the large population of 187,000 inhabitants, or with out-townships and Salford, 279,000. It was governed by a borough reeve and two constables, and Salford was similarly held in ancient thrall. It was sparsely provided with public buildings,—the Exchange of 1809 was then one of the chief; the old town-hall in King-street was in course of erection. It had a score of churches, and Christ Church was approaching completion; whilst there were more than double that number of Dissenting places of worship. Infirmaries were numerous, public charities many. Its trade was indicated by the fact that it had 20,000 steam looms in the parish. Its general post-office in the Exchange Buildings had six receiving-houses connected with it; there were seven general deliveries. In an old directory of a year or two later, the names of nearly a thousand manufacturers attending its market were given, ten coaches to London ran, and others to all parts of the kingdom, whilst carriers by land and water were almost countless. There were conveyances by railway,—"seven times a day (Sundays excepted) to Liverpool," "first-class trains," four in number; "second-class trains," three. And it is worthy of note that "omnibuses for the conveyance of passengers by the first-class carriages" left the offices in Market-street "twenty minutes before the carriages leave the Liverpool-road Station." There was a literary and philosophical society in those days at 40, George-street,—"John Dalton, esq., D.C.L.," being the president. The Mechanics' Institute existed in Cooper-street; there were barracks for 55 officers and 1,099 men; Cheetham's College Library was in Hunt's Bank; the Tax-office was in Tib-lane, the waterworks office in Piccadilly, the two theatres were in Fountain-street and Spring-gardens. In a sentence, Manchester in those days was the unfilled outline of that great city that we now know.

It is during the greater part of the last fifty years that Manchester has known its growth,—its benefits from the railway system having been great. Records of the growth are to be found in the recognisation by Parliament of its importance at the time of the first Reform Bill; of its incorporation; of its creation into the see of a bishop; of its being the centre of the operations of the Anti-Corn Law League; and of its being the scene of the opening of that Arts Treasures Exhibition that has had no compeer. Its architecture has been improved by the building of stately palaces such as the Assize Courts, and by the removal of some of the worst of its insanitary streets; the town has had the benefit of the formation of grand free libraries, and of magnificent parks, and it has felt the impetus of these changes and of these improvements, so that it is widely different from that of fifty years ago. It has much to do yet before it becomes a model town. In the last two decades much has been done to ornament the city with stately abodes of justice, religion, trade, commerce, and local government. The Assize Courts that make Strangeways dull by contrast with their Gothic grandeur, have been built at a cost of about 100,000*l.*, whilst for a very different use the fine new town-hall has been completed, also at an immense cost; and the Queen's Theatre, the Memorial Hall, and the Assembly-rooms, have been added to the stately structures of the city in the period we have named. Statues have been added, parks completed, great gardens designed, grammar-schools built, and many of the gigantic warehouses of the city erected in the time. The churches and chapels have been increased till they now number about 200, the greater part of them the temples of various shades of Nonconformity, and many of those, of all denominations, stately structures, whilst there is continually in progress an addition to the number, and from the Greek Church to the Quakers, from the Jews to the Moravians, it would seem that every form of faith finds its fitting tabernacle in the great city. With a population that has in its Parliamentary bounds grown to 393,676, it is to be expected that both in the provision for its religious, social, and educational needs there would be required a supply on a scale of magnitude, and this has been found. The local governors of the past in Manchester took an exalted view of the needs of their city, and they endeavoured to bring it up in some things to their ideal. They bought up gas and waterworks, and speedily had from the first a profit of 1,000*l.* a week. They extended the waterworks at Woodhead until their capacity was enormously increased; then the reservoirs, such as Prestwich, were commenced; and finally the Corporation has decided to go far into lakeland to find an adequate supply of water for its needs. Sewerage was laid down by the mile, streets were paved by the score, cellars were closed, and some of the worst of the streets were razed bodily and air-courses run through. Latterly it can scarcely be said that the great efforts that were made at improvement have been continued on so large a scale,—by the Corporation, that is; but some of the great companies have taken an adequate view of the necessities of Manchester, and the provision that has been made at the central station is worthy of the city, and would put to shame that of the older railway efforts if it were not that at Victoria extensions of no mean order are in progress, one railway company alone (the London and North-Western) having for some time spent over 20,000*l.* monthly in the efforts to meet the needs of the city of Manchester for passenger accommodation. That city has grown so great, indeed, that it may be said to be one of the wonders of the country, and though the rate of its progress has been checked, it is but the check that precedes the further growth. It is not needful to give figures to trace its further progress, they are to be found readily in the number of its electors, the area of its borough, the extent of its rateability. It has its criminality, as the 9,000 or 10,000 yearly drunkards attest; whilst 480 public-houses and nearly 2,000 beerhouses should supply the needs of its citizens, and may aid in the needs that require over 800 policemen. In all the essentials of town life, as well as in what must be considered the inevitable, if saddening, accompaniments, Manchester has its full share; but it is to the credit of its people that in stately parks, in noble libraries, and in other ways, it has sought to give compensating recreation to its vast population.

As to the trade of Manchester, it must be said that the vast growth of the past was for years extended and increased when the railway system gave facility of transit, and when its sister, the steamship, gave cheap and rapid sea carriage. For years that great trade in which Manchester is king grew, and others grew with it. Not alone is Manchester at the head of the cotton trade, but many of the textile trades are domiciled in it or in its neighbourhood, and all contribute to its progress in industry. To textile fabrics it has added vast machine-shops, and it is said that there are in it nearly a thousand varieties of occupations, from the cotton-spinner to the enginewright, and from the paper-stainer to the umbrella-maker. A glance at some of its great streets is like that into a fair, and from all these varieties of industry Manchester takes toll, and continues to prosper. It has had its periods of dulness in the great industries to which the others are contributory, or which they depend on, and it finds an increasing rivalry in these, not only at home, but abroad. But the true Manchester man finds in competition a stimulus, and so in that great industry to which he is so largely devoted it has in the past proved, and may do so in the future. At the same time, it is to be held in remembrance that Manchester has to meet a fiercer competition, and one that in some parts of the Continent shelters itself cowardly behind heavy duties. It has also here to meet a state of affairs where taxation is heavier perhaps than in any country; and it is probable that this is a feature of the international competition that our traders have hitherto not sufficiently taken into account, but which they will in the early future have to endeavour to lessen as much as possible. Manchester has felt this especially, locally and nationally, and it has had of necessity slightly to relax its efforts in local improvements on this account. But it will again begin to attack some of the causes that led to its having too high a death-rate: it will have to take advantage of some of the efforts that its railways are making, and to pull down some of the unsanitary and unsightly dwellings that are to be found in the heart of the city; and it will have to complete the task of providing a full supply of the purest water. Its trade will grow as the competition that it has to meet is overcome by cheapened products and increased superiority of production, and especially as it fits itself to supply to newer markets in other lands the materials they need. The opening up of new markets in Africa, in parts of the great East, and in our colonies, is one of the needs of the trades of Manchester; but the men to whom British commerce owes so much should be able to overcome the little difficulties in their way, and should give by these means an impetus to endeavours which should be sufficient to make the trade of their city grow in the future more rapidly even than in its glorious past.

THE NEW PUBLIC OFFICES AND PIETRA DURA ARCHITECTURE.

Sir,—The urgent practical remarks in the *Builder* of last Saturday in reference to the sound construction,—especially from a sanitary point of view,—of these buildings, are not made a moment too soon, and if carried out,—as, indeed, they must be,—the large class of persons interested, and whose health, if not life, is concerned, will be deeply indebted to you.

There is another practical matter which, although it is not of such immediate importance, will, nevertheless, call for serious consideration at no distant date.

When, in 1872, the designs for the Royal Courts of Justice were being discussed, the "battle of the sites," the "battle of the styles," the "battle of the architects" were the themes on which the writers in the daily papers exercised themselves; but we looked in vain for a word to indicate that any combatant in the arena had devoted one thought to the question of at least equal, if not greater, importance to them all,—that between preservation and perishableness, form and chaos, beauty and decay. Now, again, in this year of grace 1881, the war clarion has sounded, and it is satisfactory to hear the notes dwell on a subject of useful and practical importance. The leading journal says, "What will be the fate of its exterior carvings and frettings after another fifty years of London smoke all of us can tell. The same may be said of a thousand other buildings, great and small, that the past generation of Londoners has raised as monuments of its own ignorance of the simplest conditions of good building. . . . . They crowd their fronts with carvings of flowers and fruit, which in a year the soot will blacken past recovery, and in five years corrode beyond recall. It is not in work of this kind, we may fairly believe, that the public money is to be spent in the case of the new offices."

This is strong language; but when we see important and costly edifices restored in the lifetime of the architects who designed them, and palaces patched with cement and painted over every three or four years, before their builders have passed away, what professional man can say that they are too severe, or that they exaggerate the facts?

Against the repetition of these evils,—of such a catastrophe,—what effort can be too great, what measure of defence too costly or too troublesome? It is a point of honour that we have to fight for, and if defeated we are irretrievably disgraced. Hundreds of thousands of pounds sterling are annually expended in saturating wood with creosote, and coating iron with zinc and tin, to secure the durability of various national structures,—ships, harbours, &c.,—but no remedy has been found for the decay of soft calcareous stone in our smoky cities; and yet, in our childish helplessness, we continue to use it daily and year by year

as if we had had no warnings of the folly of doing so.

As you have before allowed me to urge, the only remedy is to be found in the use of the igneous rocks,—granites of various kinds and colours, and the serpentines and basalt, polished so as to exhibit their characteristic beauty, for the general surface, with, in some cases, majolica encaustic tiles and faïence for details. Nothing but the element of fire, natural or applied, gives the requisite power to materials to withstand the powerful and destructive effects of the sulphurous acid and other gases of the London atmosphere.

The invention of the requisite machinery, the extension of railways into the very heart of the inland granite quarries, and low freightage by ship from those on the seaboard, have wonderfully reduced labour and prime cost to that of the best ordinary stone in London. The actual cost of putting a perfectly fair surface on roughly scabbled granite, as delivered from the quarry, is only 7d. per foot super., and 120 ft. can be dressed per diem. By manual labour a foot costs 2s. 6d. The result, therefore, is, that while a day's work with one machine costs 3l. 10s., the same work would occupy a man forty days at a cost of 15l.

Messrs. Mortal, Magué, & Co. report that it takes a man five days to do the work one machine performs in three hours; and the patentees claim that, with proper arrangements of overhead travellers and cranes for rapidly picking up and removing the blocks, one machine will do the work of about forty masons: that the running cost, including power, wages, grinding cutters, interest, and depreciation, is equivalent to the wages of about eight men, showing a saving equal to the pay of thirty-two masons. Lathes, by some patentees, for turning columns, do the work of from ten to fourteen men at the cost of two or three. There is another advantage not to be despised,—machines do not strike.

Polishing granite is an exceedingly cheap process, one or two boys only being required to apply sand, emery, and putty-powder, to a wagon slowly travelling under rapidly revolving rubbers, both worked by steam-power.

The question is, how to secure the benefit of all this for important architectural works in London?

A short time since the writer tried to form a company for the special purpose, and all promised well for success till it was converted into a purely engineering concern for dock and harbour work, to suit the financial ideas of one or two commercial men, who, in the course of formation, became connected with it. But if the proposal would really confer the economical benefits upon the public which is claimed for it, is it not incumbent, and would it not be an honourable proceeding on the part of the leading members of the profession, to form a deputation to the First Commissioner of Works and Public Buildings, and, after laying before him proofs of the futility of any longer persisting in the use of perishable stone, request that a stipulation should be inserted in the conditions to architects invited to send in designs for the intended Public Offices, requiring the exterior to be constructed of the various polished granites, basalt, and serpentine, from quarries in the United Kingdom? By this means not only would all competitors be placed on the same footing, but when the accepted plans were determined upon, and the tenders called for, the granite dealers would find themselves in competition for a noble work, and the utmost economy would doubtless be the result.

With simple and appropriate treatment of the materials,—flat geometric ornamentation in the different and almost unlimited colours obtainable; no mouldings, but only splays; no projecting carvings, but only superficial scrollwork upon dead grounds, which, at option, and for greater richness, might be gilded,—it is more than probable that no additional cost over and above carved and moulded stonework would be incurred.

As a retired architect, I shall, I trust, be pardoned by the profession for going into these details,—the result of a good deal of study,—as it is obviously necessary to do so, but nothing would give me more pleasure than to see some better proposal to meet what is very generally, if not universally, admitted by architects to be an urgent want, and by the taxpaying public a crying evil.

H. TRAVIS.

SKEGNESS BATHS COMPETITION.

AT a meeting of the directors of the Skegness Swimming, Hot, Cold, and Turkish Baths Company held on the 22nd November last, it was decided to adopt the design sent in under the motto "Convenience with Economy"; the author of which, Mr. James Whitton, of the city of Lincoln, was commissioned to carry out the work; the second premium being awarded to Mr. H. A. Goodall, of Nottingham. Seven designs were sent in. The buildings will be commenced at once; the baths will be supplied with sea-water. The materials to be used are red bricks for all walls, stone being slightly used in the fronts. The swimming-baths will have iron roofs, covered with galvanised corrugated iron.

THE MAIN DRAINAGE OUTFALLS AND THE CONDITION OF THE THAMES.

AT the meeting of the Metropolitan Board of Works on the 25th ult., the Works Committee presented a report recommending the enlargement of the reservoirs at the Crossness Pumping Station and Barking Outfall Works, at an estimated cost of 160,000*l*., and that the Engineer be instructed to prepare contract drawings accordingly; and that it be referred to the Finance Committee to see that proper provision is made in the Board's Money Bill of next session for meeting the expenditure upon these works. The report was adopted.

The same committee, reporting on the letter from the Local Government Board, transmitting a copy of a letter from the vestry of Plumstead with reference to alleged pollution of the Thames by sewage from works executed under the Metropolis Local Management Acts, recommended that a reply be sent to such letter in accordance with a report made by the Engineer and the Consulting Chemist.

On the motion that this recommendation be adopted, Mr. Jolley, as representing Woolwich, demurred to the accuracy of the statements contained in the report referred to, observing that at certain states of the tide the Thames at Woolwich was no better than a common sewer.

Mr. Richardson denied this, and the recommendation was adopted.

Mr. Richardson and the majority of the Board notwithstanding, the condition of the Thames, in consequence of its being made the receptacle for the sewage of London, is, as we have often pointed out, very unsatisfactory, and we note that the question of seeing what can be done to purify and keep clean the river has been referred by the Corporation to one of its committees, viz., the Port Sanitary. This committee, having given the subject their best consideration, appointed a sub-committee, with instructions to ascertain the exact state and condition of the water of the river. The sub-committee, after conference with their medical officer, decided to go on with their inquiries at once, so that it should not be said that an exceptionally unfavourable period of the year was chosen, and proceeded to Tilbury on Wednesday in last week, on a visit of inspection. Upon arriving at Tilbury by train, the sub-committee boarded their steamer, and it being just after the ebb-tide had turned, the steamer at once started from Tilbury in the direction of London. Samples of the water were taken off Gravesend, Greenhithe, Erith, and various places near to where the trainingships are moored, most especially at the great outfalls near Crossness and Barking Creek, and also at several points between Barking and Blackwall. Feeling satisfied that, as the result of their efforts, they had obtained fair samples of the water in various parts of the river, the bottles containing the fluid were at once sealed up, and each one numbered in the presence of the committee-men. Several of these samples, the *City Press* states, are, by resolution of the sub-committee, to be submitted for analysis. When it is borne in mind that the estimate, based upon data derived from the best sources, is that the daily average number of persons engaged on craft, small and great, on the river, amounts to 20,000, it will at once be seen that they alone must necessarily pollute the river to a considerable extent. But when we hear that between Teddington and Gravesend there are nearly 400 open outfalls (large and small) it will be seen how important is the work the Corporation have undertaken. Of course, many of the outfalls in question are small and insignificant, but in the aggregate they are considerable, and seriously pollute the river. The greatest source from which the foul matter comes are doubtles the outfalls from the docks and the metropolitan drainage at Crossness and Barking Creek.

THE PROPOSED AMENDMENT OF THE BUILDING ACT.

AT the meeting of the Metropolitan Board of Works, on the 25th ult., it was announced that a letter had been received from Mr. C. Fowler, on behalf of the District Surveyors' Association, requesting to be favoured with a copy of the draft Bill for amending the Metropolitan Building Act, which the Board propose to submit to Parliament in the ensuing session, as the district surveyors are desirous of suggesting one or two important amendments. The letter was referred to the Building Act Committee.

In the public notice which has been given by the Board of their intention to apply for an amendment of the Acts relating to buildings and streets in the metropolis, the following objects are mentioned among those for which powers are sought:—

To confer on the Board further powers as to streets and buildings in the metropolis.

To enable the Board to attach to licences granted by them for buildings of a temporary character conditions as to the term for which such licences shall endure, and to provide for the removal of the building to which such licence relates at the expiration of the term for which the licence was granted, or to impose penalties in cases where the terms and conditions of any such licence are disregarded.

To alter and increase the dimensions of which the Board may authorise the construction of buildings without being divided by party-wall or party structures.

To enable the Board, as well as any vestry or district board, to exercise or put into force the powers conferred by Section 75 of the Metropolis Management Amendment Act, 1862, upon vestries and district boards in the case of buildings erected without the consent of the Board beyond the general line of buildings, and to enable the Board to proceed under the said section to obtain and enforce orders for the removal of buildings so erected, and for the recovery of expenses incurred in carrying out such orders.

To enable the Board to attach and enforce conditions in cases where building beyond the regular line of buildings is permitted, and particularly a condition that any land or space in front of the regular line of building shall be dedicated to or left open for public use.

To control and regulate the alteration of dwelling-houses or other buildings into public buildings, as defined by the Metropolitan Building Act, 1855, or to prohibit the alteration of such dwelling-houses or buildings into public buildings.

To enable the Board to pull down, remove, or alter ruinous or dilapidated buildings, or buildings declared by the order of a magistrate to be a nuisance, and to charge the expense thereof upon the property, and to enable the Board to recover the same, or to require the owner of such buildings to pull down, remove, or alter the same, and to provide for the making, by a magistrate, of orders relating thereto, and to authorise and provide for the recording and registration of any such charge.

To confer on the Board powers as to the removal and pulling down of irregular buildings and structures.

To prohibit or regulate the use or construction of wooden and other structures of a movable or temporary character, timber stages, stacks of timber and wood, and other similar erections, and to enable the Board to license, control, and regulate the same.

To prohibit, during such period as the Bill may define, the locking or fastening of doors, and other means of exit at theatres, music-halls, and places of public resort or entertainment, and to require sufficient notice to be set up in such theatres, music-halls, and places as to the means of exit, and to provide for the inspection of such places, and the enforcement of the requirements of the Board.

To remove or alter existing restrictions as to the distance at which hot-water pipes in buildings shall be placed from combustible materials.

To alter and amend Section 29 of the Metropolitan Building Act, 1855, and to make further provision as to the space to be left in the rear or at the side of houses, and to require an open space to be left between houses built back to back.

To make further provisions as to the projection of cornices of shop-fronts, and to prevent and remove projections.

To make further provisions as to the appointment of an umpire or arbitrator for the settlement of differences between building owners and adjoining owners, as defined by the Metropolitan Building Act, 1855, Part 3 (relating to party structures); or between the owners of adjoining buildings where the owner of one building desires to execute any work which may affect the adjoining buildings, and to confer upon the umpire or arbitrator so appointed the necessary powers for the settlement of such differences.

To enlarge the powers of the Board for directing and enforcing the alteration of the naming and numbering of streets; for preventing the narrowing or obstruction of streets or thoroughfares by posts or otherwise, and for removing any such obstructions.

To amend the provisions of the said Acts with regard to the laying out of streets, and to confer upon the Board further control over new streets, the mode and direction in which they shall be laid out, and as to openings in the same, and to prevent such streets being laid out or made otherwise than in accordance with the directions of the Board.

To amend and extend the powers of the Board relating to dangerous structures within the metropolis, and to confer on the Board further powers for the recovery by them of the expenses incurred in connexion with dangerous structures, and to provide for charging such expenses upon the structures or sites thereof, and for prohibiting any building upon such site until such expenses have been paid, and if need be to authorise and provide for the recording and registration of such charges.

THE METROPOLITAN BUILDINGS ACT.

CAVITY WALLS, ETC.

Sir,—Since it has been announced that the Metropolitan Board of Works contemplate applying for a new Act of Parliament to regulate buildings in the metropolis, with a view, I hope, to embody therein provisions for the many new requirements of the age and to correct the many anomalies of the existing Acts, I wish to draw attention to the question of cavity walls. It has always seemed to me to be a very great anomaly in the present law that a party-wall may be, and often is, built almost wholly composed of flues, and thus practically a cavity-wall with two half-brick enclosing walls and a 9-in. cavity (as a two-brick wall) divided in its length every 14 in. or so by only half-brick wythes, whereas an external wall composed of a brick and a half-brick wall, securely bonded together, having a 2½-in. cavity between them, is not allowed, where a brick and half wall is prescribed, although the Act allows half the surface of the wall to be recessed and only one brick thick, but, to comply with the Act, the cavity and enclosing wall must be added in excess of the thickness. The desirableness of cavity-walls for imperviousness to weather and atmospheric influences no one will deny, but their adoption is thus rendered prohibitive on the score of expense and loss of space. Surely there is more danger from fire in cavity party-walls, even where the flues are well pargetted, than there would be in cavity external walls, and if the pargetting is so great a security in the one case, why not apply it to the other also? Then, on the score of strength, surely a wall built with a cavity of 2½ in., the enclosing 9-in. and 4½-in. walls being well bonded together, is as strong, if not stronger, than an ordinary brick and half wall, and most certainly sounder and stronger than the 18 in. wall with a 9-in. cavity of flues.

Considering the humidity of our atmosphere and the porous nature of the bricks commonly used, it is not surprising to hear so many and frequent complaints of the dampness of our houses; and this leads me to think that, instead of the Act being prohibitive, it should enforce the adoption of cavity enclosing walls in all cases.

I think revision is also very necessary in Part I., section xiv., of the Building Act. For my part, I never could see the reason for setting external woodwork, such as window and door frames, 4½ in. in reveal; it is surely absurd to say that this affords any security from fire, or why should shop-fronts be allowed? And it, no doubt, originated in the classical tendency of the period when the Act was framed. There is an anomaly, again, in this; for although sashes and frames have to be set in reveal, wooden blind-cases, even projecting beyond the face, can be fixed with impunity. I, therefore, cannot see why the restriction should exist, as it to a great extent cripples freedom of design in these enlightened days of art.

I am induced to send you these few remarks, which, if you favour by insertion, will, I hope, call forth the favourable opinion of the profession, and lead to full consideration by the framers of the new Act.

Thomas Harris, F.R.I.B.A.

ARTISTS' ASSISTANTS.

To what extent may artists avail themselves of the talents of other artists in carrying out their works, without laying themselves open to the charge of imposture? This question will, in all probability, have to be legally decided. It is a question, however, less easy of solution than one would at first imagine. In this country it is chiefly by portrait-painters and portrait-sculptors that assistants are employed, for excess of commissions in these specialities falls to a few fashionable favourites.

When mural painting was at its height in Italy, the institution of scholarships was necessitated; for it would otherwise have been impossible for the great painters to have carried out their various series of works. Highly skilled assistance was imperatively necessary, and it is well known that many of Raffaelle's scholars, also eminent painters, assisted him in carrying out his great works. Michelangelo, alone, persisted in carrying out, unaided, his mighty performances in painting and in sculpture.

Till comparatively recently the position of the fine arts in this country was very unstable, partly on account of defective art-educational means, partly on account of the scarcity of public employment for artists, and partly on account of the crass ignorance of all classes of the principles and practice of art. There was Flaxman, self-educated, on the intellectual side of art, but deficient,—exceedingly deficient,—in the *technique* of his art, who was obliged to have recourse to skilled assistance. There was Chantrey, with a mind above wood-carving, who was gradually inducted into the profession of sculpture, on account of his skill in making busts, and without ever having had any thorough and systematic education as an artist, obliged to seek aid from designers, as well as technically-skilled assistants. It is known that the two sleeping children in Litchfield Cathedral, which made his reputation, were designed by Stothard. There was Behnes, who could model a bust and carve splendidly, who was nowhere in regard to composition. The public are in that utter darkness with regard to art-matters that they fancy that any one who may be at all skilled in some art speciality is capable of any art achievement,—is, in fact, a great artist. It is they, the public, who are to blame for forcing men into positions in art for which, as artists, they are not competent. And if men are so forced, what is to be done by these recipients of adulations and favours but to endeavour by hired talent to support the dignity of the positions into which, *nolens volens*, they have been thrust? And, after all, this is nothing more nor less than assuming the position of the manufacturer who employs skilled labour; the proprietor furnishing the capital and courting a demand, whilst the skilled servitors employed enable him to furnish the supply. Whether this be legitimate or not, there can, we think, be but one opinion, that it is highly reprehensible that one who has accepted pay as servitor should be permitted to hold his talent *in terrorem* over his employer. We may have our own private opinion of the merits of the head of an art-manufacturing establishment, as an artist, but this is quite another matter.

Looking at the question, however, from a purely artistic point of view, let us see if we can formulate any definition of the line which should be drawn in the employment of other talent than the artist's own, in carrying out his works, which is discreditable to him. In the case of Raffaelle there can be but one opinion, that his was the master-mind, and that he was fully capable, unaided, of carrying out any of the great works that were produced under his direction by thoroughly educated assistants. Flaxman's case is somewhat different: if he had had to carry out, unaided, his own beautiful designs, they would have been considerably marred by his want of technical skill, yet not one of his assistants could have executed works comparable with Flaxman's with any other aid but his. Chantrey's position in respect to this question is somewhat different still, for he had considerable technical knowledge, and was a bold and facile modeller, but Chantrey was no designer. In this case the question seems to be balanced, Chantrey could not have produced the work in Lichfield Cathedral without Stothard's aid, nor Stothard without Chantrey's. It would appear, therefore, from the foregoing instances, that when a work is indebted *for its merits* to the assistance of an artist of greater mastery than his whose name it bears, his artistic reputation must suffer if the fact becomes known.

CLERKS OF WORKS AND FOREMEN.

Sir,—While architects have two societies in London alone, and, if I remember correctly, fifteen others in various parts of Great Britain, for the purpose of acquiring additional knowledge in their profession, by, if I may be allowed the expression, "mutual friction," and which also enables them by association and good fellowship not only to advance their individual interests, but in many ways to confer a benefit upon the public at large, there is a large class of men with whom by necessity architects are daily brought in contact, having no society of the kind whatever,—I allude to the clerks of works, builders' foremen and managers, and others placed in a similar position. I may be told that there is a society called the "Clerks of Works and Builders' Foremen's Association," or some such title, but I think this is only a benefit society; at any rate, we hear and read but very little about it,—in fact, an inquiry in a contemporary relative to its *locale* and functions failed to elicit a single reply. I maintain that the large body of men fulfilling the positions of clerks of works, managers and foremen to builders, carvers, art metal-workers, decorators, and other trades allied to building, are not only of due necessity the most practical of their respective callings, but are possessed, many at least from large and life-long experience, of varied and technical information that would not only be of much service to their younger brethren treading in their footsteps, but of mutual gain to all concerned.

The *Builder*, many years ago, took up the cause of the present Architectural Association, and I submit that the *Builder* to-day might with equal fitness take up the cause of an Association of Clerks of Works and Foremen Builders. The present age is one of progress, and in the battle of life no effort should be spared, whatever our position, to fulfil, in the best possible manner and to the utmost of our abilities, the duties imposed upon us. The *Builder*, from the first, has strongly advocated the advantages of mutual self-help, and I therefore with the more confidence suggest that an intimation to the effect that you, sir, would be willing to receive the names and occupation (not necessarily for publication) of those willing to move in the matter, and by a small annual subscription provide sufficient funds for the ordinary expenses of an association of the kind, would in the columns of the *Builder*, as an initiatory step, be quite sufficient to test the general feeling on the subject.

A Clerk of Works.

DEVELOPING SOUTHAMPTON.

The Corporation have been for some time past carrying out very important works of street improvements and paving. The whole of the footways of the High-street on each side of the ancient Bargate have been repaved with Caithness stone flagging, supplied by the Caithness Stone Flagging Company, of Thurso, Scotland, the gradients of the carriage-way and line of street being at the same time considerably improved.

In the district of Portswood nearly eleven miles of new roads have been made up and completed. The suburban streets are being paved with Staffordshire blue bricks, supplied by Mr. Joseph Hamblet, of West Bromwich; they are laid upon a foundation of Portland cement concrete, 3 in. in thickness, and well grouted in with Portland cement. A separate system of storm water-drains is being gradually laid over the whole borough for the relief of the existing main sewers.

The works, which up to the present time have cost nearly 15,000*l.*, have been carried out by the borough surveyor, Mr. W. B. G. Bennett, Assoc.-M. Inst. C.E., and at the last meeting of the Town Council it was unanimously resolved to spend a further sum of 6,250*l.* for blue brick paving.

Building operations are being carried on with great activity; in one district alone upwards of 600 houses have been erected by an enterprising townsman, Mr. Jonas Nichols, who has laid out nearly four miles of roads; the district is named Nichols Town, after its founder. The town is greatly indebted to this gentleman for his gifts of several pieces of valuable land for the purpose of public improvements.

A very pleasantly-situated estate known as Westwood Park, adjoining the Southampton Common, has recently been laid out for building purposes, and several villa residences have already been erected, principally from the designs of Mr. James Lemon, F.R.I.B.A. Another extensive estate known as Fitzhughs, in the adjoining district of Shirley, has also been laid out for the same purpose, and a great number of houses have been erected, and many more are in course of construction. Building operations on a large scale have also been commenced on two other estates, and it is proposed to connect a fifth to Southampton by erecting an iron bridge across the river Itchen at St. Denys. A great impetus to building has lately been given by the introduction of the tramways into Southampton.

For many years the Corporation have been endeavouring to prevail upon the London and South Western Railway Company to abandon their level crossings, a source of great inconvenience to the public at Bridge-road and Marsh-lane; their endeavours have been successful, and the company are now constructing a handsome high level bridge across their lines.

This work when completed will be an imposing structure, and a great boon to the public. The contractors are Messrs. Bull & Sons, and the cost of the work is estimated at 40,000*l.*

A very determined effort is being made by the inhabitants to obtain a second line of railway into the town by extending the Didcot and Newbury line from Newbury, and a bill is to be promoted in Parliament in the next session for the necessary powers. The Town Council at a recent meeting resolved to subscribe 50,000*l.* towards the undertaking from their corporate funds. This resolution was enthusiastically ratified by the burgesses at several large public meetings, as was also a resolution granting for the use of the company about 30 acres of the mudlands of the Western Bay, the company undertaking to reclaim in all about 47 acres, and to construct a public roadway 60 ft. wide and 3,000 ft. long, on a solid embankment facing the water. Independently of the sum above mentioned, a public subscription amounting to 50,000*l.* has been raised in the town. The Corporation of Newbury have also resolved to subscribe a sum of 10,000*l.* out of their corporate funds in furtherance of the project, and a similar proposition has been adopted by the Corporation of Winchester. The Harbour Commissioners have not been unmindful of the requirements of the port, and they have recently carried out large works in extending their quays and warehouses, and are about to apply to Parliament for powers to borrow 100,000*l.* for further extension works.

Southampton stands fifth on the list of ports of the United Kingdom, and the familiar saying of the Southamptonians that their town is the Liverpool of the South bids fair to be more than realised, for naturally Southampton is favourably situated for the development of docks and quays.

EXETER.

Restoration of St. James's Church.—The second portion of the work of rebuilding the Parish Church of St. James has been completed, and the ceremony of re-opening took place on November 25th. The church was erected in 1836, but it could not be regarded as an architectural ornament to the city, and it never afforded sufficient accommodation for the church-going population of the parish. When the parish of St. James was separated from that of St. Sidwell, between forty and fifty years ago, the population of St. James's parish was about 3,000. The church was built to accommodate 1,200 worshippers, but it never did afford accommodation for anything like that number. The whole cost will probably be not less than 6,000*l.* The architect is Mr. R. Medley Fulford, of the Cathedral Close. The architectural style of the building is the First Pointed. Mr. Stile was the builder. Prominent as the chief adornment of the new chancel is the east window, erected in memory of the late rector, the Rev. A. Buckeridge. It is a triple-lancet window, 18 ft. high, filled with stained glass by Messrs. Clayton & Bell. The window contains a representation of the Crucifixion, the Blessed Virgin, and St. John. The total cost of that portion of the work was about 1,400*l.* The next section of the work taken in hand was a nave and three bays, with shallow arches, extended eastwards about 20 ft., shallow aisles, west porch, and tower. The final portion of the work, proposed to be undertaken as soon as funds will allow, is that of the two shallow transepts, with the double arches in a line with the future nave arcade, and circular staircases for access to the galleries for school-children, thus enabling them to leave the church quietly. All the principal contractors hail from Exeter. The builder was Mr. Gibbard; the mason Mr. Robert Mitchell; and the gasfitters Messrs. Sheppard & Sons. The carved angels are by Mr. Harry Hems; and the geometrical glazing is by Mr. Fred. Drake.

St. Petrock's Church.—On November 24th the Lord Bishop re-opened the Parish Church of St. Petrock, which has been considerably enlarged and restored from the plans of Messrs. Hayward & Son, at a cost of 1,250*l.* The contractor was Mr. Cumming, of Exeter, and Messrs. Easton & Sons, of the same city, did the masonry.

The Cathedral was lighted with gas for the first time on Advent Sunday, November 27th. Innumerable jets go round the abaci of the capitals. Mr. Fred. Rice, gasfitter, of Exeter, has carried out the work.

The Old Guildhall.—The Elizabethan front of this ancient building was built in 1593. It projects picturesquely over the pavement of the main thoroughfare, and is a unique feature in Exeter's venerable High-street. Some of the stone-work having fallen down, the Town Council requested Mr. Edward Ashworth, architect, of that city, to examine the façade, and he has sent in a report upon it, in which he says that the mode of staying the front, where it has been disposed to bulge, is not quite satisfactory.

CITY OF LONDON SCHOOL: SCULPTURE.

SIX firms were lately invited to send in models and sketches in competition for the sculpture for the City of London School now being erected on the Victoria Embankment by Messrs. John Mowlem & Co., under the direction of Messrs. Davis & Emanuel, architects. The committee having selected those sent in by Messrs. Daymond & Son, these gentlemen are now appointed to execute the work, which consists of allegorical figures in the tympans, representing the Arts and Sciences, the keystones having masks representing the ancient Classics, and the five niches statues of their more modern eminent representatives. In the spandrels will be placed the shields of the City Companies and other donors.

ACTION OF WATER UPON LEAD PIPES.

ACCORDING to reports of the proceedings at last week's meeting of the London Commissioners of Sewers, the medical officer (Dr. W. Sedgwick Saunders) laid upon the table a pamphlet on the action of water upon lead pipes, being a translation which he had made from the French of M. Belgrand, in which, after giving particulars of a series of experiments undertaken in conjunction with M. Felix le Blanc, a distinguished chemist and gas examiner, M. Belgrand says:—"Upon the whole, there is absolutely no danger of poisoning from the use of water flowing through leaden pipes. . . . . I do not think that any other mode of distributing water can be recommended, even to nervous people." It is not stated that Dr. Saunders commented on this assertion; surely, however, there is evidence extant in England of the evil results that have been caused by drinking water of a certain composition which had passed through leaden pipes?

PATENT RECORD.*

APPLICATIONS FOR LETTERS PATENT.

4,941. W. Cunningham, Dundee. Ventilating apparatus. Nov. 11, 1881.

4,943. G. Tall, Brixton. Compound for preventing the escape of steam, gas, water, &c., from joints of pipes. Nov. 11, 1881.

4,949. W. F. Padwick, Redhill. Insuring a supply of water in cisterns, pipes, &c., during frost. Nov. 11, 1881.

4,953. H. W. Gates, Brighton. Ventilator for chimneys. Nov. 12, 1881.

4,963. J. L. Hancock, Dalston. Ovens, kitcheners, and gas cooking-stoves. Nov. 12, 1881.

5,003. H. Barron & H. Raimes, Kilburn. Water-closets. Nov. 15, 1881.

5,018. W. T. Sugg, Westminster. Gas cooking apparatus. Nov. 16, 1881.

5,023. T. G. Messenger, Loughborough. Charging water-closet syphons, &c. Nov. 16, 1881.

5,027. E. R. Hollands, Newington. Open stove or fire-grates. Nov. 16, 1881.

5,030. W. B. Shorland, Manchester. Knobs or handles for locks, latches, &c. Nov. 17, 1881.

5,033. B. O'Neill, London. Manufacture of artificial marble, &c. Nov. 17, 1881.

5,039. T. Beddoe, Bermondsey. Disinfecting water-closets, urinals, &c. Nov. 17, 1881.

5,040. J. B. Potter, Yeovil. Stoves and fireplaces. Nov. 17, 1881.

NOTICES TO PROCEED

have been given by the following applicants, on the dates named.

Nov. 15, 1881.

3,079. J. Cornforth and E. T. Burton, Birmingham. Open fire-grates. July 14, 1881.

4,188. G. Hatton, Southport. Spanish sunblinds. Sept. 29, 1881.

* Compiled by Hart & Co., patent agents, 29, New Bridge-street, E.C.

Nov. 18, 1881.

3,515. J. W. Gibbs, Liverpool. Downcast ventilating cowls. Aug. 13, 1881.

3,778. W. Leggott, Bradford. Apparatus for actuating window-sashes. Aug. 30, 1881.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending November 19, 1881.

1,530. J. C. J. Smith, Northfleet. Manufacturer of cement.

This is an improvement on Patent No. 1,583 of 1872, in completing the thorough drying of the slip by the time that the dry-slip in the kiln has been converted into clinker. In the drying-chamber are baffle-plates, so arranged that the heated gases from the charged kiln traverse the drying-chamber in close contact with the surface of the slip. April 7, 1881. Price 6d.

1,555. J. G. Tongue, London. Treating and preparing bituminous substances.

The bituminous substance is heated, and finely-crushed carbon or ground coke is thrown into the mass and well stirred. It is then still further heated for a period of ten hours. The preparation can then be either cast in moulds or used for surfacing roadways, &c., in a liquid state. (Com. by H. Handhahn, Waldau, Prussia.) April 9, 1881. Price 6d.

1,566. H. J. Allison, London. Clips for securing slates or tiles on roofs.

This clip is formed of metal, and consists of two parallel branches of unequal length, which clasp the purlin. At the top of the longer branch a space is arranged for the slates or tiles. (Com. by J. J. B. Celier, Nevers, France.) (*Pro. Pro.*) April 11, 1881. Price 2d.

1,576. W. E. Gedge, London. Indicating apparatus or slide-bolt for doors of water-closets, &c.

A plate is connected with the inside bolt, which shows through an aperture in the door and indicates when any one is in. (Com. by J. François, Lyons.) April 11, 1881. Price 6d.

1,616. F. A. Lawrance, Stevenage. Sash-bars.

These bars are formed of two pieces of metal. The cross-section of the lower part is the shape of a double fluked anchor, the shank of which is enlarged to form a ring. The upper part fits over this ring, and the two edges rest on and hold in position the glass that rests on the flukes below. April 13, 1881. Price 4d.

1,618. G. E. Wilson, Leeds. Latches and locks.

To enable the latch to be disengaged by pulling the knob instead of turning it, a projecting piece is fitted on the knob-spindle, which engages a cam on the bolt. A spring is used to force the bolt back again when this projecting piece allows it to move. April 13, 1881. Price 6d.

1,641. J. H. Blum, Bienne, Switzerland Liquid meter.

This consists of a hollow cock, which has two compartments, the capacities of which are known. They are alternately filled and emptied. Various modifications are shown with and without counting mechanism. April 14, 1881. Price 8d.

1,646. H. P. Holt, Leeds. Sanitary appliances for buildings.

Each building has only one connexion with the drain, in which connexion are two traps. The first trap forms a grease-box which has holes, and is made to lift out for cleaning purposes; the second trap is an inverted box, with its open edges dipping into the cavity over which it is fixed. The closets are flushed by syphons, which are brought into action either by a piston moving in a cylinder to withdraw the air, or by a smaller syphon worked by the door or the seat. April 14, 1881. Price 6d.

THE POLLUTION OF THE SOIL BY INTERMENTS.

SIR,—I have read with much satisfaction the article in a recent number of your journal, entitled "The Soil and its Influence on Human Health," being the substance of a lecture delivered by Dr. Pettenkofer, of Salzburg, before the German Society of Natural Philosophers and Physicians. "As the influence of the soil," according to the lecturer, "showed itself most clearly in the case of epidemic diseases," it can scarcely be controverted that much of the infection which occurs in London is, in a great measure, attributable to the presence of over-crowded cemeteries. As the body must be decomposed and its elements distributed among Nature's great reservoirs of material,—earth, air, and water,—it is of paramount importance that the repositories of the departed should be situated at safe distances from dense populations.

The *Times* not long since treated of the serious peril to health, and even life, arising from the deleterious atmosphere of large towns. That epidemics, in themselves preventible, swell the bills of mortality, is a fact testified to by eminent authorities. "In the ignorance of the sufferers," remarks the leading journal, "consists their helplessness. They sicken, and, indeed, they die, but they cannot prove it, and cannot even describe the causation. When people know

more of the air they are breathing, they will be able to protect themselves." A report of the French Academy of Medicine attributes the diphtheritic disease that at one time raged in the vicinity of Père-la-Chaise, Montmartre, and Montparnasse to the putrid emanations from these seething burial-places. The re-appearance of the plague at Modara, in 1828, is alleged to have arisen from an excavation made in some ground, where the victims of the plague had been interred three centuries previously. The virulence of the cholera in London during 1854 was augmented owing to excavations having been made for sewers in the sites where the victims of the great plague were buried. And Mr. Simon has warned the authorities of what is likely to happen again if sanitary preventives be not adopted.

Were there no suitable provision at hand to meet the mortuary wants of a large and growing community like that of London, it would be sad indeed. Fortunately, however, there exists the spacious London Necropolis at Woking, with its excellent soil, and its salubrious site, so convenient to the metropolis. This cemetery, as Mr. Seymour Haden pointed out in his published letters, is amply sufficient to meet the prospective annual mortality of London for a long time to come, and this without disturbing a single body for at least ten years, or crowding a number of corpses into one grave, as is the custom in other places. The "pit-system" of burial is highly objectionable, especially on sanitary grounds, inasmuch as it tends to poison the soil and infect air and water. HYGIENE.

TESTING TRAPS.

SIR,—As one of the committee present at the experiments carried out at Messrs. Pullen's, on Saturday, the 19th ult., will you kindly allow me to call the attention of your readers to one of the conditions under which those experiments were carried out, viz.,—the unusual depth of drop between the valve and water-line, 13½ in.? Having during the past three years carried out many hundreds of experiments with closet-traps, I am in a position to say that a more unfair test could not be applied, for while it is rather an advantage to the "Helmet," it is a very great disadvantage to the round ℧ and the "Eclipse."

Feeling, from my knowledge of this matter, that the true merits of the various traps are not yet fairly before the public, I now challenge Mr. Davies, and, provided that the Messrs. Pullen will grant the use of their scaffolding and apparatus for the purpose, I will undertake to prove before a committee,—

1. That the Helmet-trap is not to be relied upon unless protected by soil-pipe ventilation.

2. That a ℧ or half ℧ trap can, when properly ventilated, be made perfectly safe, when fixed beneath a valve-closet.

3. That a ventilated ℧-trap can be fixed beneath a valve-closet with any length of drop, and will hold its seal against the most severe attacks to which it can be subjected.

4. That a ventilated ℧-trap, fixed with its outer leg upon the top of 45 ft. of soil-pipe, is perfectly safe, either under a valve or a direct-action closet.

DANIEL EMPTAGE, S.E.

*** Since the above was in type we have received several other letters protesting against the mode in which these experiments were conducted and the deductions made, especially from Mr. John Smeaton and Mr. Hellyer. It is unnecessary to print them. Mr. Buchan has also written.

POSITION OF THE SPHINXES.

SIR,—The reference in your recent issue to the Obelisk has, I hope, set many thinking why there should be any hesitation on the part of the Metropolitan Board of Works as to the position of the sphinxes at the base of Cleopatra's Needle, and what authority can be given for the sphinxes being placed facing the Obelisk, as if meditating how their tail companion had found his way hither.

The idea of the Trafalgar-square lions being placed to face Nelson's Column would of itself be meaningless, to say nothing of the want of dignity as a result. It would, of course, have proved a miserable failure. No better precedent can be given than the Landseer lions, and the symmetry and *entourage* of Cleopatra's Needle require that it should be followed.

The custom, moreover, by the ancients, of placing their sphinxes as guards to their palaces and temples, surely dictates that the position should be towards the approach, to boldly face the foe, and not to appear to crouch and skulk away with their tails between their legs. Such a notion is unworthy an Egyptian sphinx,—a combination of the noblest qualities,—intelligence and power, the man and the lion.

Let us consider for one moment the effect in that marvellous avenue of sphinxes between Luxor and Carnac (a distance over 6,500 ft. in length), if all their tails, instead of their heads, were turned towards their royal master and conqueror, as the trophies of victory were being conveyed with stately march to yon sacred temple. Would the sphinxes, under such circumstances, have added much to the glory of the scene? H. H. BRIDGMAN.

CEMENT FOR KILNS.

SIR,—May I be allowed to ask, through the medium of your columns, if Portland cement would be a suitable material to use as mortar for building a brick-kiln, and if so, what would be the best sand to mix with it, and in what proportion?

From some small experiments I have made in repairing kilns, I am inclined to think favourably of it, and, before using it on a larger scale, desire to know what has been the experience of others. RICHARD R. NORRIS.

DISTRICT SURVEYORS.

SIR,—I am glad to find public attention is called to district surveyors and their duties.

There can be no doubt that the 37th section of the Act is not interpreted in its true spirit by some at least of the gentlemen who hold the office, and it is a direct source of grievance to many professional men that a public officer of the Metropolitan Board of Works should also act in connexion with cases in his district on behalf of the leaseholder and occasionally the freeholder. It is in the smaller transactions, such as dilapidations, repairs, letting of land after some dangerous (?) buildings have been removed by his order, &c., that the temptation occurs to blink at the 37th section. A. C.

STAINED GLASS.

London.—A window has just been erected at St. George's Church, Tufnell Park, to the memory of the late Rev. W. McCall, the first vicar. It is by Messrs. Burlinson & Grylls, and is a very good window; colour subdued and the drawing good.

East Berghelt.—A large stained-glass window has been fixed by Messrs. Lavers, Barraud, & Westlake in the north wall of the church, alongside another window dedicated to the Hughes family, and erected by the same lady,—Miss Gratiana Maria Hughes. The window is in remembrance of the Rev. Sir Richard Hughes, bart., and of his wife. The subjects consist of the "Martyrdom of St. Stephen," the "Conversion of St. Paul," "Paul and Silas singing Hymns in Prison," "The Angel appearing to St. Paul on board ship when he was wrecked," "Abraham and Sarah," the "Virgin Mary and Joseph," "Baptism," "Our Lord taking little Children up in His Arms and blessing them," "The Marriage in Cana of Galilee," "The Lord's Supper," and "Christ ordaining the Twelve Apostles." At the top of the window our Lord is represented delivering His "Apostolical Commission" to His disciples before His ascension,—"Feed my Sheep."

King's Heath, near Birmingham.—A three-light Munich stained-glass window, by Messrs. Mayer & Co., representing the "Ascension," "Christ in the Temple," and "Our Lord Blessing Children," has just been presented to King's Heath Church, near Birmingham, by Mr. F. Everitt, in memory of his son, a likeness of whom is introduced in the latter light.

VARIORUM.

THE seventh volume of "The Proceedings of the Association of Municipal and Sanitary Engineers and Surveyors" (E. & F. N. Spon) is a useful little book for those concerned in the matters of which it treats. It includes the opinions of practical men on practical subjects, and should assist in bringing about the prevalence of correct views. It is edited by Mr. Thos. Cole.——Foremost amongst a little heap on our table of shilling books for Christmas comes "The Belgravia Annual" (Chatto & Windus). It commences with an interesting story by Mr. Wilkie Collins, "Your Money or Your Life," and there are many others to match, with the usual run of illustrations. It is a good shillingsworth for the lovers of mystery.——The illustrations of "Yule Tide, Christmas number for 1881," which are numerous and good, include, moreover, one of the best chromo-lithographic reproductions that have yet been given with a serial of the kind, "Young Mother Hubbard," after G. D. Leslie, R.A. The letter-press, too, seems quite up to the average. It is published by Letts, Son, & Co.——"Thirteen at Dinner, and What Came of It," Arrowsmith's Christmas Annual, 1881, claims to be the first thing of the kind that has been produced in the provinces, and we can honestly say it is very well done, both from a literary and pictorial point of view. Arrowsmith's address is Bristol. ——For quantity of matter and number of illustrations the Christmas number of "Harper's Magazine" (Sampson Low) stands first of its kind, and some of both is very good. We are bound to confess, nevertheless, that we have found some of the letter-press dull.

The Big Bell for St. Paul's.—We are told that the casting of the new bell for St. Paul's Cathedral has just been completed at the works of Messrs. J. M. Taylor & Sons, Loughborough. When it is dug out, within the next day or two, it will weigh no less than 17½ tons. It will be the largest bell in the kingdom, if not in Europe. The process of conveying the new bell to London will be one of great difficulty, says our informant. Common-sense asks why the bell was cast so far away?

Miscellanea.

St. Martin's School of Art, Long-acre. At the distribution of prizes last week, Mr. Val Prinsep, A.R.A., who presided, addressed the students, and in the course of his observations he advised them to visit the different picture-galleries in London, and, when there, to ask themselves what the artist meant to express when he painted the picture. And the same thing applied to sculpture. Beauty was, no doubt, everywhere, and it was one of the great functions of art; but as art was not born in man, but was a matter of education, so also was the idea of beauty. It seemed likely, he said, that art would rise again with redoubled success. True art was a mixture of art and nature. Art by itself would not do, neither would nature by itself; the two combined were necessary. He warned them against being led away by enthusiasm and over-estimating the value of a work of art executed by themselves. They were apt to admire things that struck them as original, but which were only eccentric. "Eccentricity was not genius" was a precept he would impress upon them; nay, he would have it written in letters of gold on the walls of every art-school in England, where the students seemed more influenced by peculiarity than the Frenchman or the German. Lately we had heard much of the "æsthetic." Æstheticism was in possession of the stage and in the mouths of all. Æsthetics might be seen in our streets, clad in sad greens and sickly yellows, with long or unkempt hair and shaky legs. The word came from the Greek, and originally meant "sentiment, or the pleasures derived from the senses." The greatest geniuses had been the simplest men, and it was these great men who might be called æsthetes, professors of the science of the beautiful, expounders of the beauties of nature. Let them, then, be true followers of æstheticism. When such a knowledge of art, such a profusion of the beautiful, got thus spread, art would prosper and find very much more scope on which to exercise its civilising power.

Warning to Tenants of Old Houses.—At the Cambridge County Court, the case of St. Peter's College *v.* Irwin and Mills was tried before Mr. Bagshawe, Q.C., and a jury. It was an action brought by the Master and Fellows of St. Peter's College to recover of the defendants the sum of 50*l.* or the return of an ancient piece of carving. The defendant Irwin was the occupier of a public-house at Cambridge belonging to the College, and in the tap-room over the fire-place was an ancient piece of carved woodwork, supposed to be upwards of 300 years old, and which it was believed at one time formed part of the old College library. The defendant Irwin was a sub-tenant of the lessee, and it was proved that he and Mills about the 15th of August last removed the carving and substituted in its place ordinary woodwork. The defendant Mills took it away and endeavoured to sell it, and, according to his evidence, on his failing to find a customer, it was chopped up and burnt. It was undoubtedly part of the freehold. The Judge directed the jury that the article, not being produced, on the authority of the leading case of "Armory *v.* Delamire" they must presume it to be of great value, and, after a short deliberation, they assessed its value at 40*l.*, that sum to be reduced to 40*s.* on the return of the carving, which, it was alleged, had not been destroyed.

Disinfecting Dens.—Dr. Domett-Stone, speaking of recent deaths from sewer-gas, says, many lives might be saved and fevers averted if our parish authorities would instruct their sanitary inspectors to see that disinfectants are copiously and frequently used. Probably the most effective, and assuredly the cheapest, costing less than one farthing a gallon, would be found to be a solution of chloride of lead, so strongly recommended by the late Dr. Goolden, of St. Thomas's Hospital, as the most simple, the most powerful and economical agent for eliminating sulphide of hydrogen from the atmosphere, as well as from all organic matter in a state of decomposition or putridity. It is prepared thus:—Half a drachm of nitrate of lead dissolved in a pint or so of boiling water, to be mixed in a pail of water, in which 2 drachms of common salt have been dissolved. A cloth, dipped into the solution, and hung up in any place where bad odours prevail, will sweeten the fœtid atmosphere instantaneously, or thrown down a sink, water-closet, or drain, or over a heap of refuse, will produce a like result.

St. Mary's R.C. Cathedral, Newcastle.—The re-opening of St. Mary's Catholic Cathedral, Clayton-street, Newcastle, after being restored and decorated was celebrated by special services. The work of restoration, which has extended over a period of three months, consisted of new flooring, newly varnished seats, and renovation of the stone work, executed by Mr. John Foggin, contractor, Newcastle, and painting and decorations by the firm of Lavers, Barraud, & Westlake, of Endell-street, London. The decorations are in the style of the fifteenth-century. The nave-roof has been painted red and buff, with decoration on the main timbers. A border in light red, on buff, runs over the arches, terminating at the top of each column with a crowned M under a small canopy. The timbers are of light red, with buff ornament, the chambers of buff and black, and the front member of rafters bear a number of *fleurs-de-lis* in gold. The panels are diapered with quatrefoils in grey, the centre of which contains a gold star and *fleur-de-lis* alternately. The walls of the chancel have borders in green over the arches, and they have been diapered with a rose and lily, each having the inscription beneath, "Ave Maria." The figures of the Blessed Virgin and St. Gabriel under canopies representing the Annunciation, have been painted by Mr. N. H. J. Westlake. There are also four figures of angels under canopies, holding scrolls. The whole of the work has been executed under the supervision of Messrs. Hansom & Dunn, architects, of London and Newcastle.

Bust of Mr. Ruskin.—A meeting was held on November 26th, in the Ruskin Drawing School, Oxford, for the purpose of presenting a marble bust of Mr. Ruskin by Mr. Boehm to the University galleries. Many of Turner's drawings and other munificent presents of Mr. Ruskin to the University were displayed in the Art School, the foundation and endowment of which are the work of the same benefactor. Dr. Acland, on behalf of the subscribers, proposed, "That the bust should be given to the Ruskin School of Art, as a lasting memorial of affection, respect, and admiration." Mr. Ruskin, he said, had founded a school in Oxford, furnished with over 800 examples of the most varied and often costly description. Henceforward the pure love of nature, the technical interpretation of it, and their relation to mind and to religion, would be taught to all coming generations through the wide foundations he had laid. This was seconded and carried. Thanks were also voted to Mr. Boehm.——Mr. Ruskin, it is said, has changed his plans with respect to the museum he has founded at Sheffield, and it is his intention to devote the remainder of his life to making it about the most complete institution of the kind in the world. He has decided to send there his unique library from Brantwood, and a portion of the books and plates have already arrived.

The Coming Health Congress at Brighton.—Rapid progress is being made in the Pavillion grounds in the construction of the iron annexe for the forthcoming Health Congress, which commences on December 13th. This annexe will consist of a main building, 200 ft. long and 40 ft. wide, running along the northern side of the lawn, at right angles to the main road through the grounds; and there will be a building in continuation of the same, 60 ft. in length by 20 ft. in width, connecting it, at right angles (parallel to the west side of the Grounds), with another building, 230 ft. long and 32 ft. wide, which will be entered from the Corn Exchange. On the south side of what is described as the "main building" (immediately south of the Dome) will be another building, joining it about the centre and ovrving (for 230 ft. in length with a width of 20 ft.) towards the grand entrance to the Pavilion itself. These buildings will all be of corrugated iron.

Royal Hibernian Academy of Arts.—At the annual meeting, held the other day, the following gentlemen were elected as officers for the year 1881-82:—President, Sir Thomas A. Jones; Professor of Painting, Mr. Augustus Burke; Professor of Soulpture, Mr. J. R. Kirk; Professor of Architecture, Mr. J. J. McCarthy; Professor of Antiquities, Mr. J. T. Gilbert, F.S.A.

The Grays Thurrock Gas Company have recently extended their works by building a 52 ft. brick and concrete tank, engine and boiler-house, oxide and purifier sheds, coal-stores, offices, photometer-house, boundary-walls, &c. The engineer was Mr. A. Williams, of Bankside, and the contractor Mr. W. J. Botterill, Cannon-street.

Sir Henry Thompson on Art.—On Wednesday in last week, Miss Thompson, daughter of Sir Henry Thompson, presented the prizes gained by the students of the City School of Art, at the School-hall in Bishopsgate-street. Sir Henry Thompson afterwards addressed the students. He spoke of the cultivation of art in connexion with ordinary work. There was, perhaps, he said, no source of wealth in this country which was so large, and at present so little tapped, as that which existed in the association of mental culture with ordinary work. The amount of increase in the value of an article was illimitable when once it had come thoroughly in contact with human brain. Art improved the position of the workman who studied it in connexion with his work. Thus, the carpenter could become a carver, the mason a sculptor. He believed that the market for artistic industrial products in this and other countries would exceed the supply, great as that was becoming; but he was not sure that there would be so great a demand for simple pictures, and he was almost appalled at the number of artists and art students at the present day. He advised those who intended to adopt the profession of painting to go to nature for their inspiration, and to copy no painter, however excellent his work might be. If they merely copied, they would never come to anything. Michelangelo and Raffaelle did much mischief unwittingly through being great, for men said, "Let us draw like Michelangelo and paint like Raffaelle," and the consequence was the deterioration of painting, by imitation, for a full century. The sources of inspiration which those great masters had gone to were neglected. He gave London high praise as offering subjects to the painter. The Thames was a mine of wealth from end to end. While looking from the Adelphi towards Westminster at sunset there was often to be seen a view equal to Venice.

An Eight Thousand Pound Blunder.—It seems that the ridiculous jealousy which prevails between the departments of some of the officers of the Corporation and the department of the Engineer to the Commission of Sewers has at length led to a very serious blunder, by which the ratepayers are to suffer to the extent of some 8,000*l.* At the last meeting of the Commissioners of Sewers, Mr. Boor moved a resolution to revoke an agreement come to at the last Court as to an arrangement to be made for acquiring the freehold interest in the ground required to widen the public way of Leadenhall-street and Gracechurch-street, and to pay to the leaseholders in respect of their interests therein an amount of 8,000*l.* The land, which was the property of the Corporation, was let to a syndicate, including, said Mr. Boor, "amongst others, a member of the Court." The City Architect was asked, but denied that any improvement was contemplated at that spot; and in due course the syndicate signed an agreement for the re-erection of the premises on the ground. This is pretty much the history of the transaction; and it comes, as Mr. Boor says, to this, that "the Corporation, through the gross laxity of one, if not of two, of their officers, had actually created interests for leaseholders before one brick was laid, for which the ratepayers were now asked to pay 8,000*l.*"—*City Press.*

St. Pancras Industrial Exhibition.—The Lord Mayor on Saturday last distributed the medals and certificates awarded in connexion with this exhibition. Mr. E. M. Close (a member of the adjudication committee) stated that 58 certificates, 39 bronze medals, 13 silver medals, and 20 special certificates had been awarded. The exhibitors who received silver medals were as follow:—Robert Dawkins, machine used in shoe-making; Ernest Alfred Sullivan, audible railway signal; W. Aumonier, carved wood panels; W. F. Jenkins, wood carving; Thos. Cusdin, ornamental brickwork; G. W. Pinfold, objects of natural history. Amateurs.—W. Donn, inlaid work; W. Hooper, oil-painting; J. S. Teape, oil-painting; H. Recknell, water-colour painting; E. Benning, pen-and-ink drawing; H. Shirley, pencil and crayon drawing; C. Eriam, patchwork quilt. At the conclusion of the distribution, the Rev. G. M. Murphy moved a vote of thanks to the adjudicators, which was seconded by Mr. C. J. Tarring, and acknowledged by Mr. White, F.S.A.

Competition: Wimbledon.—In a limited competition for Congregational church and schools, Wimbledon, the design submitted by Mr. W. D. Church, architect, of South-place, Finsbury, was chosen by the committee.

Parkes Museum: International Medical and Sanitary Exhibition.—The certificates of awards, lithographed from the original design by Mr. Cave Thomas, are now being distributed. The number of exhibitors from different parts of the United Kingdom was 414, exhibitors from abroad, 88; making a total of 502 exhibitors, o whom 258 obtained either awards of the first class or awards of merit.

Surveyors' Institution.—The next meeting will be held on Monday, December 5th, when a paper will be read by Mr. E. P. Squarey, entitled, "Land Legislation and Tenants' Improvements," and a paper by Mr. P. D. Tuckett, entitled, "The Cause of the Failure of the Agricultural Holdings Act of 1875 and the present Agitation for Protection for Tenants' Capital."

The Late Mr. Macdonald, M.P., has bequeathed to the University of Glasgow the whole of his books on the subject of mining, and also 1,000*l.* for the foundation of bursaries to be held by young men who have actually worked underground as miners.

Re-Assessment, Barnet Union.—Mr. Charles F. Jones, of Temple-chambers, Fleet-street, has been chosen by the Guardians to re-assess the rateable value of all property within this Union, comprising 24,500 acres of land, and 6,274 houses. There were forty-two candidates.

The Smithfield Club Cattle Show opens on Monday next. Report says that there has been brought together an exceptionally good collection of implements and machinery. Some of the exhibits which are of special interest to our readers we may notice in our next.

Sanitary Institute of Great Britain.—The Autumnal Congress and Exhibition is arranged to be held at Newcastle-on-Tyne, in 1882.

TENDERS

For restoration and enlargement of All Saints' Church, Crowborough, Sussex. Messrs. Whitfield & Thomas, architects. Quantities by Messrs. Evans & Deacon:—

Card & Son	£3,492 0 0
Rowles	3,293 0 0

Smokeless Heat.

THE Exhibition of Smoke-preventing Appliances at South Kensington, of which we gave some account in our last number, now presents an aspect entirely its own. Eminently and especially does it strike the visitor as a business affair. Not only is this the case with regard to the nature of the exhibits themselves, the enormous blocks of glittering coal, the metallic beauty of the samples of coke, the slow but unresting toil of the mechanical stokers, the repeated answers to the same questions, and attempts at the solution of the same problem, which have given a strong family likeness to the offspring of so many different minds, but the character of the exhibits seems reflected in the faces and behaviour of the visitors. Here you see the country clergyman earnestly studying a stove which, in his mind's eye, he has already fitted into his carefully-restored church. There it is the lecturer, the sanitary reformer, the medical man, who is chiefly bent on studying the union of the difficult aims of warming and ventilation. Through all these thronging groups of reasonably anxious faces peer the keen eyes of the salesmen, the inventors, the speculators. The glow and lustre of many of the furnaces, stoves, and gas-burners add a life to the whole scene, contrasting very forcibly, and very pleasantly (in the early part of the present week) with the keen wind, close drizzle, or clinging fog without. Whatever may spring from the exhibition, it has already established its character as an earnest and business-like scene.

It would be unjust alike to our readers and to the exhibitors to attempt to anticipate the verdicts which it will demand no small amount of care and competent skill to make the means of eliciting the best uses from this display. We mentioned in our former notice that a professional man (of whose valuable contributions to the library of the civil engineer we have had repeatedly to speak in terms of high commendation), has been appointed to superintend the trials, under the direction of the executive committee. We may be pardoned for the remark that, eminent as are some of the names on which the public are thus invited to rely, a more definite authority would perhaps have clothed the future utterances of the promoters of the exhibition if the form of a small scientific commission, charged definitively to report on the exhibits, had been adopted. Such is the mode usually employed abroad. In this country the public are beginning to fight somewhat shy of "committees"; and though it may be said that the difference between a committee and a commission is only in name, it may be replied that, even if so, it would be well to give to the public the more satisfactory name. But what we mean is something more essential. It is that the public ought to have it clearly impressed on them that no pains will be spared to bring out clearly, impartially, and scientifically the chemical, mechanical, and commercial values of the most deserving exhibits, and to do this, not only in a manner that will serve once for all, but so as to form a new chapter in the engineering history of the country.

We can imagine two men,—we may almost say the same man in two different states of mind, or of bodily health and comfort,—walking through the galleries, and summing up their impressions in two very opposite sentences. "Well," says the one on whom the weather, the tardiness of the train, or the late hour at which he went to bed on the previous night exerts a depressing influence, "what do we get from all this? Is there anything here that we did not know before,—in principle, at all events? Does any one think that London skies will be any the brighter for the lighting of so many additional fires at South Kensington?" "Well," says the other, who looks, habitually and happily, at the bright side of things, "it is really delightful to see how much intelligence has been devoted to the settlement of a great question of every-day mechanics. The way in which so many inventors have hit on the same idea shows how true that idea must be. Can there be any excuse for London remaining as black as it is? Is it not even already more free from fog than it was last year?" In fact, each of the two imaginary visitors would have uttered what was true; and if we were hard-pressed for an opinion we should say, "If England is to maintain her prosperity for another 500 years, we do not doubt that the skies of London will be purified from the noted canopy of smoke which forms the baldaquin of the royal city's seat. But we do look in a different direction from that indicated by any single exhibit that caught our eyes at South Kensington for the efficient cause." We observe, however, that Dr. Siemens has not allowed the mode of employing electricity that was present in our thoughts to escape his attention, as will be seen from p. 96 of the Catalogue, describing an appliance that we were not fortunate enough to see at work.

Generally speaking, the attempts made by the inventors whose works are here collected may be divided into two main categories, viz.:—the use of smokeless fuel, and the improved use of fuel that is not smokeless. The third category, —that of the future,—barely represented at South Kensington, though the glowing platinum wire in several of the open grates might well have suggested the thought to the inventors,—would comprise the production of heat by dynamic energy, to which we confess that we look forward as hereafter certain, however long deferred that hereafter may be.

It must not be forgotten that while we possess a greater choice of fuel than most nations, we have deliberately, or, at all events, practically made choice of the most smoke-producing for our domestic use, and also that we generally burn this in the most wasteful and extravagant manner. What we seek for in fuel is not only heat; but, it must not be forgotten, a sort of cheerful companionship, the enjoyment of which has become a part of the national character. Here, in truth, lies the knot of the smoke question. Efficiency, economy, convenience, cleanliness, readiness at a moment's call,—all these things can be produced by other means, better than by burning the best flaming coal in an open grate. But so strong is the partiality for the companionship of the fire, that waste, inconvenience, dirt, and cost are,—we were going to say cheerfully,—incurred, rather than lose the fireside charm. We are not justifying the choice,—we only say that it *is* the choice of nine persons out of ten. Of all the reasons against the open fire it seems to us that the economic one is that on which most reliance will have to be placed. But here the most convenient, instant, cleanly, and, in some respects, efficient, mode of heating is not, apparently, the most economical.

The use of smokeless fuel is, of course, a more simple solution of the problem "How to abate London smoke," than any other. Without anticipating the report of the Executive Committee, we may say that we are inclined to give the preference to the class of exhibits illustrating this principle. And we shall look with interest for the exact details of those chamber-grates in which, with the addition of a very small dose of gas, anthracite coal is burned. There are three kinds of this pseudo-gas fire,—one in which all the heat comes from the gas; asbestos, or other non-wasting material, being kept at a glow in the grate, but not really adding to the production of heat. In the second, coke is used; the heat is great, but the fire looks dull. With anthracite there is cheerful flame, great heat, and no smoke. To this point, then, we call very serious attention.

And here we have to lament that the most formidable contributor to the coal merchant's bill, viz.,—the kitchen-fire,—has not, by any means, received proper attention on the part of the exhibitors. The cheapest, the most constant, the hottest for its consumption, and, in nine points out of ten, the best, kitchen-fire known in England and Wales, is not represented at South Kensington. It is one to which, not so very long since, we called attention in these columns, speaking from long and ample personal experience,—the ball-fire of Pembrokeshire. It is easy to understand the omission. But it is as unfortunate as it is capital, and it is one that

tends very much to strengthen the tone of the remarks previously made about the difference between committee and commission. The former will probably hold themselves bound only to report on actual exhibits, even if they give the time and attention necessary for that. Now, no tradesman or commercial exhibitor is likely to exhibit the Pembrokeshire ball fire, for the simple reason that he has nothing to gain by so doing. The grate is so simple,—the whole affair is so inartificial, that there is no money to be made out of it by an exhibitor. The only chance would be for some great mining company, or owner of vast stores of culm or anthracite coal dust, to send up the balls of clay and culm ready for use. And no doubt the picturesque little Welsh woman, whose tall hat and tidy jacket excited a sympathetic feeling of which gravity forbade the expression, would soon teach the executive committee how to "stum up a ball fire." Most imperfect is the exhibition, as a guide to domestic economy, until this be done. If London servants could be induced to use the Pembrokeshire fire in the kitchen, London smoke would at once be reduced by probably one half, and London coal-merchants' bills in an almost equal proportion.

But we must not omit a caution as to the great drawback in the use of anthracite coal. To the ordinary visitor to South Kensington the evil may not be apparent; but to the miner, or the person familiar with the Carmarthenshire or Pembrokeshire district, what we mean was very vividly recalled by the exhibition. As sources of heat, what struck us as the most effective in the galleries, were certain low, plain furnaces in which pure, unmixed anthracite was burning with intense glow and steady radiation. Nothing, it might be said, could be better, say for a hall fire, or for warming some great open building. But the genial glow radiated from these simple and admirable stoves is accompanied by an insidious soothing effect, against which no precaution should be neglected. Carbonic acid gas, the choke-damp of the mines, is so freely liberated from the steadily-burning anthracite, that in a small room, with doors and windows closed, we have not the smallest doubt that one of these furnaces would very rapidly prove fatal to a slumbering or inattentive inmate. This great danger attending on the use of this beautiful fuel demands the most careful attention.

Side by side with these effective anthracite furnaces we may mention one which seems to us to combine as many of the defects of this mode of burning as could well be. Many fire-bars hid most of the flame, decrepitation was loud and constant, and a heap of unburned coal accumulated under the grate as we stood by.

Of the use of gas alone as a fuel two exhibits deserve special attention. One is, the Siemens gas-furnace, supplied with a spit made to revolve by clockwork, which is run into a sort of metal baker's oven, heated by a row of gaslights on either side. As to this the test of actual cooking must be applied before it is possible to do more than point out the neatness and cleanliness of the arrangement. The question of cost has also to be elucidated.

The other, which struck us as not only original but beautiful, is the only rival that we have seen to the open drawing-room fire. We are aware that we speak of a matter of taste, and one as to which very conflicting judgments will probably be formed. We refer to the open fireplace of curved and burnished copper, which reflects the light and heat of a row of gaslights concealed from the eye. The effect is that of a magic furnace. It is possible that the eye would tire of the steady glow, as contrasted with that constant change in which many of us feel the chief charm of the drawing-room fire to lie. But we confess that we should much like to make a fair trial of this gas-stove, and also to know its cost, as compared with the production of equal heat from coal. As to ventilation, and as to purity from dust or any product of combustion, we are disposed to give a very high rank to this fireplace. Still there is something to be inquired into concerning it.

On the subject of combustion of gas, we shall be doing great service to the public by calling attention to the simple and excellent duplex gas-burner of Thomas Heron. We were perhaps led to dwell rather longer than might have otherwise been the case on this exhibit from the fact that the inventor had gone over ground which we had recently beaten; and that an unusually courteous and intelligent agent gave such a practical demonstration of the economy of gas and of light to be effected by the simple substitution of one of these burners for one of ordinary construction, as to render it unnecessary to wait for the report of the committee.

It is well known to those who have studied the subject,—being, indeed, the secret at the bottom of Mr. Sugg's great improvements in gas-lighting,—that by the ordinary mode of burning gas we obtain not more than perhaps an eighth part of its luminiferous power. The conditions under which the full power is to be educed are, first, the supply to the flame of the proper dose of warm air for combustion, neither too much nor too little; and, secondly, the delivery of the gas to the flame at a very low pressure. As to the first of these, a closed system attains the best result in the production of light; but, on the other hand, there is a loss of light in passing through glass. As to the second, we had the disappointment to find that our own invention of a small orifice admitting the gas into a hollow burner, whence it escaped by a larger opening, had been previously patented. Of this expedient Mr. Heron makes use, but instead of one, he uses, side by side, two batswing burners placed on a sort of capsule. The double flames warm and comfort one another, and to some degree act as does a closed system, while the pressure of the gas is brought down to an economical tension. The value of the process is demonstrated by the simple plan of bringing two jets together. And the question of quantity of gas, as compared to light, is beautifully illustrated by two little gasholders, placed side by side, and connected, one with a common, and the other with a duplex burner. A simple photometer measures the intensity of the shadow; an index shows the consumption of the gas. To show that all is fair, the connexions of burners and cylinder are reversed. With a much stronger light the duplex burner consumes not more than two-thirds of the supply of an ordinary bat's wing. As to the value of the duplex burner, it is thus competent to the ordinary visitor to form an accurate opinion by the use of his own judgment, if he gives time enough to apply the perfectly conclusive tests supplied by the exhibitor.

The above are some of the remarks which struck us with reference to the use of smokeless fuel. We must reserve any that occurred to us as to the question of appliances for the better consumption of flaming coal.

CHARTOGRAPHY AND EXPLORATION OF SYRIA AND PALESTINE.

A reduced copy of the 1-in. survey of Palestine, of which we gave a notice on the 17th of July, 1880, has been recently issued. For the ordinary student this smaller map, which is on the scale of three-eighths of an inch to the mile, will probably prove more convenient than the twenty-six sheets on the larger scale. For topographical research, indeed, the 1-in. scale has long been accepted as, all things considered, the best. But research of this kind is a speciality,—almost a speciality of the surveyor or the geographer. And on a ¾-in. scale it is practicable so to mount the map, either on a roller or folded in a case, as to keep the whole country before the eye of the student, a matter almost impracticable on the larger scale. In a university or public building, indeed, the large survey may be hung on the walls, as was the map of England on those of the Museum in Jermyn-street. But admirable as is the effect of such a display at a *conversazione*, or public meeting, or the like, its utility is more questionable. It is beyond the power of the ordinary unassisted eyesight to identify names on a map so exposed. An idea of the physical outline of the country, not altogether unlike that which is obtained from a lofty mountain, may be formed from the display; but this is all. And this idea, in the case of the Holy Land, would not be very much more distinct than that to be gained by a glance at the smaller map. In those portions of extraordinary hill shading which denote the ravines and cliffs running down to the valley of the Jordan, and bordering the Dead Sea, indeed, the rules of orographic representation make the smaller map much less effective than the larger. But, on the other hand, the former is engraved; and the advantage thus given, in clearness and beauty of designation, over the photo-zincographic method adopted in order to keep the price of the large map within moderate limits of price, is very conspicuous. For any but special students the ¾-in. map, consulted with the aid of the Bible Handbook, will meet every requirement, and bring as clearly before the imagination of the student of Scripture the localities, and even the chief physical features, of the scenes in which took place the events recorded in Holy Writ, as can well be done without actual pilgrimage to Palestine.

There is one point in which the new map tends rather to awaken than to satisfy curiosity. The eastern limit of the country delineated is formed by the western shores of the Dead Sea, of the Sea of Galilee, and of the Huleh lake, and by the course of the Jordan between these expansions of its waters, and to the north of the last-named lake. The line thus traced leaves a wide margin of undelineated ground within the border of the map, to the east of the river, except at about latitude 33° 25′, where the eastward trend of the river as its channel is traced upwards to Banias, makes a little inroad in the ruled margin of the map. The arrangement on paper is as good as the physical features of the ground admit; but the force with which the blank strip of paper appeals for support for the prosecution of the survey of Eastern Syria will, we hope, be found to be irresistible. As to this, the latest quarterly report of the Palestine Exploration Fund speaks of decided progress, although the presentation of the great map to the Sultan does not seem to have induced any great desire in the mind of his Highness to facilitate the further progress of exploration. It is much to be desired that no political difficulties should be allowed to hinder the prosecution of a research which is purely scientific. Any hesitation on the part of the Porte as to the wisdom of allowing such surveys of Palestine as may be of military value to be made by European engineers would be now quite out of date. We are far from denying that such considerations might have had some weight with many statesmen as to the survey of Palestine itself,—the ancient battle-ground of Egypt and Assyria, and later of the Cross and the Crescent. But this is now done. The survey is made, and we apprehend that there can be little doubt that full military details as to the country are in the possession of at least one intelligence department in Western Europe. The survey of Eastern Syria has by no means the military value which attaches to that of Palestine, and no well-grounded military or political objection can be raised to the completion of a survey from which the Porte itself would derive important information, which would be of little or no value, in case of war, to any unfriendly power.

Another point of extreme interest in the prosecution of the survey of Eastern Syria is hinted at in the above quoted report, and no doubt will receive full, and perhaps unexpected, elucidation. This is the occurrence of megalithic remains on the sites described in the Bible as those where were to be found the descendants of the giants. The remark is not altogether new. Several trilithons were known to exist in Syria, and three of them are engraved in the *Syrie Centrale* of Comte Melchior de Vogüé. Mr. Fergusson says as to them, "What interests us most at present is the knowledge that these Syrian examples are certainly sepulchral, and their form is thus another argument in favour of Stonehenge, if any were needed." Of the sepulchral character of the cromlech, composed of four upright and one covering stone, there is the evidence of the discovery of skeletons in such monuments, in which we think the bodies were entombed in a kneeling attitude. But there may be more question as to the trilithon; and as to those holed stones by which an oath was taken to the Norse gods by persons who joined their hands through the stone. Also the menhir, which is spoken of as a memorial stone, is considered by very competent judges to be a relic of that very ancient form of nature-worship which yet lingers in India, and as to the prevalence of which, in Eastern Syria, in early times, the prophets as well as the Pentateuch speak without any hesitation. In Mr. Fergusson's map designed to illustrate the distribution of dolmens, and the probable lines of the migrations of the dolmen builders, Es Salt and Heshbon, in Syria, are named, and marked with the red shading which is employed to designate the locality of megalithic remains. What the archæologist will now look with interest to be informed about is the nature, as well as the distribution, of the megalithic remains of Moab. Do we find there the whole series of these monuments,—the menhir, or upright stone; the trilithon, which may have been an altar; the holed stone, whether on a dolmen, forming part

of a trilithon, or single; the chamber or cromlech; the kistvaen, or smaller sepulchre; the circle of stones? It cannot fail to throw much light on a very interesting portion of the prehistoric monuments of mankind to learn what and what manner of these mysterious relics are found in the kingdom of Og,—the home of the remnants of the giants, and the sacred places of the worshippers of Baal Peor.

The latest announcement made by the Committee of the Fund gives reason for expecting very much of great interest on these points. It is, of course, only proper to wait for Lieut. Conder's own announcement both of his latest discoveries and of the inference which he draws from them. The work of the last few weeks, we are told, comprises 500 square miles of survey; the examination of 200 ruins, including that of a Sassanian building near Amman, which it will probably prove instructive to compare with the wonderful edifice found by Canon Tristram at Mashita; and some 400 cromlechs. These prehistoric remains are grouped around seven distinct centres. Menhirs, or standing stones, have also been found, and stone circles in connexion with both classes of monuments. Thus, as far as architecture is concerned, the few weeks of the exploration of Moab have already produced more fruit than a much longer period spent in the often-explored region of Palestine. The connexion between, at all events, one class of megalithic building and the rites of an early idolatrous worship will be illustrated. References in the sacred text which have lost any intelligible meaning from the adherence of the translators to the pointing of the Rabbis,—which usually is conducted on the principles of obscuring anything like plain truth,—are likely to be restored to their true historic import, and the latest Syrian building era of importance, that of the Saracens, will be illustrated by the comparison of the Sassanian building above mentioned, and also of an early Moslem mosque in Amman, with the Kubbet es Sakhra at Jerusalem.

MUNICH AND VENICE.

WE hear a great deal in the present day about wall-decoration and fresco-painting; the capital of King Ludwig was, as all know, foremost in the modern revival of the great art which once flourished so brilliantly in Italy; the results of that revival have long been familiar to the student of art history. It is, therefore, with no surprise that many will learn that the experiment of open-air fresco-painting is at length practically shown to be a failure; the wall pictures in the Hofgarten arcades have long been peeling off from the wall in spite of constant repair, and the task at length has been abandoned as hopeless. As for the fate of the frescoes on the New Pinakothek it has long been sealed. A patriotic effort has, however, we learn, been made to rescue from destruction the fresco decorations of the Isarthor, representing the entry of the Emperor Ludwig into Munich after the battle of Mühldorf, the work of Bernard von Nehers; we learn from the same source that the restoration promises technically to be successful, thanks to the use of a new process discovered by a local chemist, Herr Kain, and which, according to the opinion of competent authorities, can be relied upon for its power of endurance against exposure, being washable. It is only from an artistic point of view that the restorations would appear to be open to criticism, the tones of the original,—restored already a great many years ago,—having been seriously injured, a fact not difficult for those even at a distance to realise. In spite of all this, the visitor to Munich would scarcely believe that out-of-door decoration had been condemned; whether some of the frescoes which within a year or so have been boldly used to decorate the façades of several new houses in the Bavarian capital be painted in the new material we do not know, but the artists who have so generously beautified the city have singularly flown in the face of the fate which has overtaken the works of their predecessors. It is difficult, we suppose, at a night's journey from Venice and Verona, and the many other cities of Venetia where the houses still show brilliantly the frescoes of the sixteenth century, for the Munich artists to lay aside their dream of an ideal art-capital.

In the meantime, a city whose existence once realised that dream, Venice, would seem, from the accounts that reach us from certain quarters, to be doomed. More than one wail has already gone forth, supported, of course, by Byron's muse; but the lament against improvements arises from outsiders, who complacently visit the queen of the lagoons to admire its beauty and its past, while at home they never fail to heap upon its unhappy inhabitants abuse and pity for their squalor and misery; and when some slight effort is being made to rouse again the spirit of prosperity in the once-busy canal, there come forward the critics, who beg that England shall be called upon to prevent the steps taken by the municipality to stay at least the daily downward course of their unhappy city, to decently drain its houses, and ensure a proper water-supply. The question is, indeed, a difficult one. Is Venice to sink and sink to ruin to gratify the tastes of a few *dilettanti* travellers, or is she to make some effort to show herself worthy of her glorious past? This effort the authorities are making. In the first place, we learn that the question of the water-supply is practically solved, and in two years or so we shall hear no more reports of water-famine from the Rialto; while, in addition, an artesian well is being bored. Several of the more important thoroughfares are being, or have been, asphalted, planted with trees, and provided with seats; other thoroughfares (for Venice is not all canals) have been broadened, notably the Via del 22 Marzo, where a number of new buildings have been erected, which it is to be regretted, however, do not, from all accounts, possess any very great artistic character. Perhaps the most successful architectural work of modern Venice is allowed to be, not the Palazzo Franchetti, opposite the Belli, almost universally condemned; but the Cassa di Resparmio, or Savings Bank, the work of the architect Trevisanato, and which will complete the plan of the Piazza Manin. An excellent example has been given here by the adherence to the red tone given to its façade, resembling that of so many of the old palaces of Venice and the *terra firma*.

Now that the fierce heat of the public indignation expressed at the restoration of the façade of St. Mark's has cooled down, the work is being quietly continued, though happily, it may be stated, under the direction of a commission, with the assurance regarding the competency of which we must, we suppose, rest satisfied. Conservation and not restoration is the course being pursued, much greater care being observed than previous to the European remonstrance. The external mosaics are being, or have already been, attended to, as also the bas-reliefs inserted in the façade; at present we learn, from a correspondent of the *Zeitschrift für bildende Kunst*, that the two portals on the right are hidden by the hoarding behind which it is customary in Italy for work of this nature to be executed; at this angle of the façade there are, it will be remembered, not a few columns and supports out of the perpendicular. Interiorly the work of restoration is proceeding, in the baptistery and the Cappella Zeno. Among other works in progress, we are informed that the corner of the arcade of the Doge's Palace, towards the Molo, is at length freed from the scaffolding and hoarding which have so long concealed this angle of the beautiful edifice, and the long line of the capitals of the arcade pillars, — well known to those familiar with Venice, or indeed with Mr. Ruskin's "Stones of Venice," or the studies of the late Mr. Burges, — now stands in unbroken order. A report has reached us to the effect that some changes are being effected at the base of the Campanile, in the shape of restorations to Sansovino's charming *loggietta*, but the work is, we believe and trust, confined to some necessary repairs.

Memorial of Dean Stanley.—We understand that the form of memorial which is likely to be proposed is that of a monument comprising a recumbent figure, to be executed by an eminent sculptor, and placed near the grave in King Henry's VII.'s Chapel, as nearly as possible underneath the memorial window dedicated by the Dean to the memory of his wife, Lady Augusta Stanley. It is thought to be not unlikely that the outlay necessary for a monument of the kind may be defrayed by a large number of smaller contributions, and that enough may also be collected by individual or combined subscriptions to go far to fulfil a design constantly cherished by the late Dean,—that of completing the restoration of the ancient Chapter-house by filling in the windows with stained glass.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AT the ordinary general meeting of this Institute, held on Monday evening last, Professor T. Hayter Lewis, vice-president, in the chair, the minutes of the previous meeting were read and confirmed.

Illness of the President.

The Chairman.—With respect to the health of our President, as I need scarcely say, every one here is extremely anxious to know the worst, and therefore I am commissioned by the council to explain exactly the position of matters. I deeply regret to say that our President has indeed had a very severe attack of illness. At first the symptoms were very serious, but I have the greatest possible pleasure in saying that Mr. Street is now better, and I cannot do better than read to you a letter which I have received from his son, Mr. Arthur Street, who, in answer to our latest inquiries as to his father's health, writes:—"I am happy to say that I can give a decidedly satisfactory account of his progress. He has been sickening for his illness for so many months that it is natural we should look to a rather slow recovery; still, perfect rest for a time will, no doubt, restore him to perfect health." I may add that I have seen Mr. Street, and he is now about to seek rest and change, at the suggestion of his medical advisers, abroad, —possibly he may go as far as Egypt. At all events, he will take sufficient rest, so that we may hope after due time to again see him amongst us the earnest hard-worker that he was, perfectly restored to health.

Prospective New Members.

The Secretary read the names of a great number of candidates for membership who had been approved by the council. The list included fifteen or sixteen applications to become Fellows of the Institute; nearly a hundred applications from gentlemen desirous of becoming Associates; and five applications for Honorary Associateship.

Native Buildings on the Gold Coast.

The first paper read was entitled "Notes on the Native Buildings on the Gold Coast," by Major Bale, Associate. The author observed that all native buildings on the Gold Coast and far into the interior of that part of the African continent, are constructed of materials at hand and readily adapted to the situation. At Cape Coast Castle flat roofs for catching rain-water were common, and indeed necessary, as no good water was to be had nearer than the Sweet River, six miles further off. In the town of Elmina the houses were, for the most part, thatched. The walls of the huts were of clay or "swish," kneaded and placed round upright poles obtained from the forests. Some of the clay was very ochreous, and yielded, with very little manipulation, a very good ochre. The houses or huts were built by female labourers, nearly every one of them with a baby on her back. Where cracks showed themselves in the clay walls, as they invariably did after a short time, they were puttied up with "swish." All partition walls were carried up from the ground right through the roof, dividing the roof into sections or compartments, the divisions being provided with water-channels where necessary. In elevation the native huts often have a breadth of effect almost amounting to repose and dignity. Some of the details, such as cornices (or, rather, their equivalents) were of small slack-burnt bricks, cemented together with "swish." These bricks were burnt in kilns fired with brush-wood. There was a composite class of houses, built of forest-poles tied together with monkey-ropes or withes from the forest. The natives had no idea of tying a lashing properly, but they twisted the withes when wet round the poles, and when they dried, their shrinkage held the timbers firmly together. Laths of split bamboo were tied on horizontally between the framing, and over them "swish" was floated by means of bamboo floats. Huts of this class were generally provided with window-blinds, and the door-openings were covered by means of mats made of bamboo and coarse grass. The roofs were of thatch. Sometimes they were built with gables, and sometimes provided with a chimney on the gable to carry off the smoke from the fire, which latter was simply laid on the floor of the hut. It was remarkable that some of the native buildings were almost

identical in design with the stone buildings of ancient Egypt. Most of the outer walls were built with a batter, although the overhanging cornice was omitted. The question naturally arose, Did the ancient Egyptians merely reproduce in stone and granite a style of building similar to that now to be found on the Gold Coast, just as the Greeks reproduced in marble the features of antecedent wooden buildings? Sir Gardner Wilkinson seemed to be very much of that opinion. Unfortunately, the natives of the Gold Coast, like nearly all African peoples, had no history, only traditions. They were mentioned by writers of antiquity, but were lost sight of until the Portuguese re-discovered them. The Phœnicians traded with them, and, according to Herodotus, some of them were employed in the building of Solomon's Temple. However that might be, it was extremely likely that a great deal of the gold and ivory used in the Temple came from the neighbourhood of the Gold Coast. The first European explorers of the country were the Portuguese, who built the Castle of St. George d'Elmina in 1481, and subsequently Cape Coast Castle and other castles were erected. The features of all these castles showed them to be Portuguese work. They were built wholly of random rubble-work in stone, cemented with "swish," and the surface rendered with mortar. It was from the Portuguese that the African first learnt to build in stone. The flat roof was adopted by the Portuguese and Dutch, but discontinued by some of the English, who sometimes used roofs that succumbed to the weather like umbrellas in March or April. Some of the natives had used corrugated iron roofs over mud huts! The Africans had learnt very little since the Portuguese left them. In every one of the Portuguese forts the principal apartment was devoted to the purposes of a chapel, but the Dutch, French, and English neglected this, amongst other things. The natives were now totally uninstructed in the technical arts of the European traders. None of them had the remotest idea of a truss for a roof, or the simplest notion of construction, yet, with persistent and practical teaching, they were, he thought, capable of becoming very good workmen. The late Major Home was also of the same opinion.

The Works of the late Major Mant, R.E.

Mr. R. Phené Spiers read the second paper, which was "On the Works of the late Major Mant, R.E., Fellow." Mr. Spiers observed that the architectural works designed and carried out by Major Mant were of so special and important a character that some notice of them would be of interest. Major Mant joined the service in 1857, being then about nineteen years of age. He went to India in the latter part of the year 1859, where his promotion was rapid, and where he soon began to turn his attention to the practice of architecture. He was elected a Fellow of the Institute in May last, being the first Fellow who belonged to the Royal Engineers. He designed and superintended many of the most important buildings which have been erected in India during the last twenty years. His first work was at Surat, which was in a style partaking of Gothic, but soon after this his attention appeared to have been directed to the study of the indigenous buildings of the country, and it was in a style developed by him on the basis of that of the native structures, and to which he gave the name of Hindoo-Saracenic, that his most important buildings were erected. The Town-hall at Kholapore, the High Schools at Bhownuggur and Kholapore, and the monument to the Rajah of Kholapore, were among Major Mant's works next referred to. The working drawings of some of these buildings were prepared by him in England during an extension of furlough. The secret of his mastery of the details of the style in which he worked was, that he made himself thoroughly acquainted with the workmen, his linguistic attainments being, of course, of great service to him. He engaged and trained a staff of native draughtsmen to work out his designs in detail, he, of course, being responsible for the plan and general *ensemble*. The buildings which he carried out were, as a rule, totally different, in regard to the requirements to be met, from the buildings from which he derived his inspiration with respect to style. His first buildings were so successful that he soon had an extensive practice, and he was so fortunate as to attract the attention of Sir Richard Temple, the Lieutenant-Governor of Bengal. Subsequently, when Sir Richard Temple became Governor of Bombay, Mant followed his patron to that Presidency, and about the same time designed and carried out the College at Dacca. He made two designs for the Mayo College at Ajmere in 1876, the smallest of which was being carried out, and in the same year he erected the Hospital and Library at Baroda, at a cost of 30,000*l*. In 1878 he commenced the Hospital at Kholapore. His three chief works, however, were the palace for the Gaikwar of Baroda, the palace for the Rajah of Kholapore, and the palace for the Maharajah of Durbhunga. The designs for the latter were not completed at the time of Major Mant's death. Its cost was estimated at 180,000*l*. The palace at Baroda, which was now being carried out at a cost of 200,000*l*., had a principal façade 530 ft. in length. In plan it was divided, roughly speaking, into three blocks, the central portion containing the Gaikwar's residence, the left-hand portion the Durbar and state rooms, and the right-hand portion the zenana, or ladies' part of the house. The Durbar hall was an immense apartment rising through two stories of the palace, with carriage-porch and colonnades. In construction the main walls were of brick faced with vitreous sandstone of different colours. It is proposed to use marble for the domes and principal architectural adornments. The Kholapore palace was not so large as the one just referred to, but would cost 65,000*l*., and covers an area of 100,000 square feet. In conclusion, Mr. Spiers alluded in feeling terms to the circumstances attending the sad death of Major Mant, who died by his own hand during a fit of temporary insanity.

In the discussion which followed,

The Chairman said that he was afraid there were no gentlemen present (except Major Bale) who had studied building on the Gold Coast, and if no one wished to speak on that paper he would at once call upon Major Morant to speak upon Mr. Spiers's paper.

Major Morant said he must first of all thank Mr. Spiers for his very generous notice of the life and works of his (Major Morant's) brother officer and friend. There could be no doubt, he thought, that Major Mant's buildings had been very successful, especially since he abandoned the Gothic style, which was unsuited to the country. Major Mant's greatest successes dated from the time when he adopted a style founded on the styles indigenous to the country, which styles were capable of easily lending themselves to meet modern necessities in domestic and public buildings for India. Of course the Hindoo and Mahomedan builders were more lavish of ornament then it was necessary or even desirable for a European architect of the present day to be, but Major Mant had shown that it was quite possible to preserve the feeling of the native styles even while limiting the amount of ornamentation. In considering the merits of modern works of architecture in India, it should be remembered that it was often necessary that their architects should act as builders and carry out their designs themselves, sometimes even having to make their own bricks and procure their own timber. Although this plan had its advantages, it made success more difficult of attainment. There was a great opening for architects in India, and he was quite sure that if any members of the Institute went out there they would receive as generous treatment at the hands of the Engineers as Major Mant had received at the hands of Mr. Spiers.

Sir Richard Temple said he had great pleasure in bearing testimony to Major Mant's ability as an architect, and to his good qualities as a man and a public officer. A more talented, accomplished, and conscientious Engineer officer never served in India. His career marked an important episode in the history of architecture and engineering in India. The British rulers of India inherited from their native predecessors a very fine architecture, but they went on for nearly a century building structures which, instead of having a civilising effect upon their subject populations, were most barbarous and demoralising in their results. He was glad to say, however, that during the last century we had become cognisant of our defects in this respect, and had built and were building structures which were in some degree worthy of us as a civilised power. In most of the capitals we had produced architects of eminence, amongst whom he might name Mr. Granville and Mr. Bayne at Calcutta, Mr. Chisholm at Madras, and Major Wilkins, Major Fuller, and Major Morant at Bombay. He thought that one reason why our Anglo-Indian architecture had hitherto languished was that there had been no proper technical education in architecture among the civil and military engineers who went to India. He did not say this with a view to disparage the engineers, for whose skill and scientific knowledge he had a great admiration; but artistic taste had not yet become a characteristic of the works done by the engineers as a class. Such men as Major Mant were in this respect exceptionally valuable, and therefore it was that his loss was almost irreparable. In respect of taste, imagination, and of everything that related to beauty and sublimity and to æsthetic culture, — he did not use that word in its present debased sense, but in its high and true sense, — the natives of India far surpassed us. English architects who wished to have their taste refined, their imagination lifted, and their thoughts elevated, should visit India, especially Agra, Delhi, and some other of the places mentioned by Mr. Spiers. As regarded Major Mant's works, their distinguishing merits were that whereas some of his architectural predecessors transplanted bodily to India European styles, and had especially tried to naturalise Gothic in an uncongenial soil, he endeavoured to hit upon some style which should unite the usefulness as to practical requirements which characterised European buildings, with the taste of the native style, and the style which was the outcome of those efforts he called the Hindoo-Saracenic. He seemed to have gradually arrived at that conclusion, for his earlier works partook considerably of a Gothic feeling. If he had one defect as an architect it was that he sometimes omitted to give to his buildings sufficient simplicity and grandeur. They were perhaps a little too much overlaid with details, and sometimes without any grand, striking, or dominant feature. As regarded the native architecture of India, he (the speaker) thought that all the members who could do so should take the earliest opportunity of visiting that most interesting country. There were to be seen not only one style, but many. There were the Buddhist style, the Hindoo style, the modern Hindoo style, and the Mahomedan style, which latter culminated in India under the Great Mogul, who was perhaps the greatest architectural genius who ever lived, not excepting the ancient Greeks. The buildings which he erected were still the peerless structures of the world. Whatever idea the members of the Institute might have formed of the marble structures of Europe, of Milan Cathedral and the like, they would find, if they visited India, that those buildings would pale their ineffectual beauties before the magnificent structures at Agra. He thought it a very happy augury for architecture and art in India that Major Mant's works had been brought to the notice of English architects by Mr. Spiers. Mant was a born genius, for, brought up as a civil and military engineer, he had excelled in architecture without any of the many advantages which the members of the architectural profession now enjoyed. His loss, though not, perhaps, altogether irreparable, could not be repaired, he was certain, from the resources available to the Government in India, and therefore he hoped that if the high and noble work in which Mant was engaged was to be properly carried on, the Government would go to the fountain-head and to the right source by inducing some of the best men in the Institute to go out to India.

Sir Andrew Clarke said that perhaps Major Mant's greatest work would be the College at Ajmere. When the designs for it came up to him from Major Mant, he (Sir Andrew) used the whole of his authority with the view of getting the work carried out in its integrity in accordance with the design. But the "everlasting rupee" caused him to be overruled, and the prominent feature of the design was ruthlessly struck out by the financial minister of the day. Among rising architects in India other than those already named in the course of the discussion, he might name Captain Cole, son of Sir Henry Cole. As regarded the native workmen, he did not think that much assistance was to be expected from them. So far as his investigations had led him, the Indian structures which had been so highly extolled by Sir Richard Temple were the work of European architects and workmen. Round about Agra were to be seen at the present time the tombstones of numbers of Italians who were engaged in carrying out the details of the buildings in question. He did not believe these details were the work of natives, for though the latter were very

patient and conscientious labourers when engaged to work out the designs of others, they were incapable of originating designs of their own.

Sir Joseph Fayrer said that from a hygienic point of view the buildings erected in the native style were far to be preferred to the buildings in the Gothic style which had been erected of late years.

The Chairman, in moving a vote of thanks to Major Bale and Mr. Spiers for their papers, said, with regard to the question of style, that if the English rulers of India adopted, as had been suggested, the native style for their buildings, instead of erecting the buildings they required in their own national style, they would prove an exception to the almost general rule which had prevailed amongst other great colonising nations.

THE NEW CRIMINAL TRIBUNAL IN BERLIN.

THE new buildings at Moabit, near Berlin, for the criminal tribunal, and for the detention of prisoners awaiting trial, were opened on September 16th, after having been over four years in course of construction. The total estimate was 7,000,000 marks (350,000*l.*), and the actual expenditure has been less. This result is attributed to the careful supervision of the principal architect, Herr Herrmann, and of his assistants, Herr Lorenz and Herr Reimann. The cost of construction has been less comparatively than that of any public work of magnitude recently executed in Berlin.

The architecture of the building devoted to the business of the tribunal is in a semi-circular arched style. The plinths, mouldings, and window-dressings, &c., are executed in sandstone, while the remainder of the work is in brown Lauban facing bricks. The two towers, which are on the right and left at the main front, give to the building a monumental character. Above the chief entrance it is proposed to place representations of four Prussian regents who were noted for the interest they took in judicial matters. The decorative effect of the entrance is materially heightened by allegorical statues of an appropriate character. Through the chief entrance an open gallery is reached which leads to the spacious ante-room of the building. From this branch off the different passages communicating with the offices, and from it also rises the chief staircase. In the basement (besides the apartments of the porters and house-servants), is the *depositorium*, or room in which objects of value taken from thieves (or which have been found and are supposed to have been stolen), are placed for safe-keeping.

On the ground-floor are forty-eight rooms, including six session-chambers for the magistrates, with the adjoining consulting-rooms, waiting-rooms, and messengers' offices; the president's room, ten offices for the clerks, secretaries' and advocates' rooms, &c. The first floor is devoted to the jury courts. One is a room measuring about 200 square yards, intended for ordinary occasions. A larger hall, measuring nearly 300 square yards, is not yet completed, but is being fitted up with much taste, and is to be expressly devoted to such trials as are of special interest, and are likely to attract a large attendance of the general public. Cells for prisoners awaiting their turn for trial are also on this floor, as well as the library and other offices in connexion with the procedure of the criminal tribunal. On the second floor are the rooms of the public prosecutor, the investigating judges, the accountants of the court, and heads of different other branches. In the entire building under notice there are 170 rooms. The corridors are mostly paved with Mettlach tiles, but partly with artificial granite, and have vaulted ceilings. The staircases are of fireproof construction. The general arrangement of the building is described as combining simplicity with artistic taste.

The female prison is situated in close proximity to the building of the tribunal, and contains sixty-four separate cells, as well as common rooms, for 150 prisoners. All the isolated cells and corridors have vaulted ceilings, and the staircases are fireproof. The building is constructed of ordinary bricks, and is four stories high.

The men's prison had to be constructed with a view to having as large a number of separate cells as possible, most of the inmates being not yet convicted, and, therefore, for many reasons, having to be confined separately. Thus the number of cells is 712, and there are, in addition, common rooms for 200 prisoners. There are also 40 rooms for overseers, sleeping accommodation for sixty attendants, a chapel, bath-rooms, and other offices. The building is described as being four stories high, and as consisting of five wings, which radiate from the central hall. The construction is said to be similar to that of kindred institutions, built on the cell system. From the wide corridors on the ground-floor, the gates lead right and left to the cells in each wing, access to the other stories being obtained by open ironwork galleries. There are bridges to connect the two ranges of galleries in each wing. The whole can be overlooked by the central overseer. The corridors, galleries, and central hall are lighted from above. Each cell is $4\frac{1}{2}$ yards long, $2\frac{1}{4}$ yards wide, and $3\frac{3}{4}$ yards in height, thus containing about 36 cubic yards of air. The arrangement of the cells is not materially different from that of an ordinary prison. The bed can be folded up against the wall, as also can the small table provided. A cast-iron closet, with flushing apparatus, is near the door; and the appliances for heating and ventilation complete the contents of the cells. A small number of cells of a better class are provided for use in exceptional cases, and are found in a supplementary men's prison, on the ground-floor. The infirmary, arranged for forty-one patients, is on the first floor of the same building. There are also buildings for the residence of the officials. The cooking and washing arrangements are on a large scale, but space precludes our describing these points in detail.

The liquid sewage from the entire establishment is (after disinfection) carried on by a subterranean network of drains to the river Spree, while all other accumulations are periodically removed. These measures are only regarded as temporary, as the whole building will be connected with the drainage system of Moabit as soon as the latter is completed.

The heating of the tribunal building is effected on a new system, which is described as a combination of steam and hot-water heating. The stoves in various parts of the building are constructed to hold water, and are half filled. When a valve is opened, steam is admitted into a spiral pipe, which communicates its heat to the water. The upper part of the stove is, therefore, not filled with steam until the water in the lower part is at boiling point, and when a room has been sufficiently heated the steam is shut off, and the water retains heat for hours. Thus the hot water does not circulate, but is heated in the respective rooms. As the management of the valves requires care, and those unacquainted with them might cause injury to the apparatus, they are all controlled from the basement by an engineer. Speaking-pipes communicate with the basement from the various parts of the building, and there is, therefore, no real inconvenience caused by the distance of the heat-regulating apparatus. Some of the halls are, however, heated with warm air. The prisons have hot-water pipes in each cell, and the pipes are so arranged that heating of the different parts of the building can be separately controlled. The central hall and the chapel of the men's prison are heated by warm air.

The ventilation is arranged on a practical scale. In the jury courts allowance is made for the air being renewed to the extent of 33 cubic yards per hour for each person present, even supposing the parts reserved for witnesses and for the public to be quite full. In winter the air is warmed before it reaches the halls. In the cells a renewal of air, at the rate of about 26 cubic yards per hour, takes place. Each closet has also a special ventilation-pipe.

The site occupies about 48,000 square yards, of which about 16,000 are covered by the buildings erected.

Society of Painter-Etchers.—The Exhibition of this Society for 1882, will be held in London, and will open on the 1st and close on the 30th of April next. All forms of engraving on metal, whether by the burin, the etching-needle, by mezzotint or aquatint, or by whatever other process the artist may choose as a means of original expression, are understood to be included in the term "Painter Etching," and, subject to the approval of the Council, are eligible for exhibition; whether the artist sending them be a Fellow of the Society or not. All works intended for exhibition must be forwarded (suitably framed) on or before the 5th March, 1882, to Messrs. Hogarth & Sons, 96, Mount-street, Grosvenor-square.

THE PIER TURRET, DOVER.

THE turret which has been erected by the Government at the end of the Admiralty Pier at Dover is now virtually completed. The works were commenced in June, 1879, and nothing now remains to be done except to carry out a few minor details. The whole of the work is of a most substantial character, and being the first turret constructed in England for land defences, its progress has been watched with considerable interest.

The fort is constructed at the extreme end of the pier, which has been considerably strengthened by additional granite and concrete blocks in order to procure greater solidity and resisting power, while the turret itself, which is erected above the pier,—that is, rises from the level,—is completely encased, below the embrasures, by a very thick granite wall. This extends all the way round, the entrance to the fort being constructed, as it were, in the wall, so that an observer cannot fail to be impressed with its great strength and security of appearance. Indeed, so much scientific skill has been brought to bear upon the works by Captain English and other well-known engineers, that the whole structure may be regarded as a compact machine, and it is doubted whether an enemy's vessel would ever stand a chance of escaping destruction within its range.

Such is a general outline of the works as they are seen above the pier. The underground chambers for the ammunition and the engine-room are constructed beneath the turret in the solid masonry, and are very beautifully arranged. The engine-room is situated just inside the fort, and is approached through a small manhole. It is a comparatively spacious apartment, having a depth of about 20 ft., but is somewhat irregular in its other measurements. However, there is none too much room for the large quantity of machinery which it contains. The chamber is lighted with gas, and is ventilated by means of a pair of Hodson's patent rotary engines. These, however, will probably be dispensed with later on, and the machinery connected with the ventilating apparatus worked by one of the other engines. This chamber is excavated from 4 ft. to 6 ft. below high-water mark, but the floor and sides to the depth of about 6 ft. are protected by cast-iron checker plating. In the limited space of this apartment there are not less than three distinct pairs of engines, besides those already mentioned. The turret is driven by a pair of engines 80-horse power nominal, while a pair of 16 nominal horse-power engines are provided for adjusting purposes, either of which can be connected with the gear of the turret at a moment's notice by means of a very neatly-arranged break. A pair of engines 16-horse power nominal are also provided for loading purposes. They are connected by shafting with the loading-chamber, and will be employed for raising the ammunition to the muzzle of the guns. Steam is generated in two large tubular boilers on the locomotive principle, and the whole of the machinery and turret is now set in motion every other day, a rule which is likely to be maintained for the purpose of keeping the parts in working order. The fuel is supplied through a coal-bunker in the roof at the head of the two boilers, which latter are situated in a sort of recess apart from the other machinery. Running from the north-eastern end of the chamber is a passage cut in the stonework and leading to the centre of the turret, through which the gear of the machinery passes to the loading-chamber and the fighting-deck. Through here also passes the gear of the indicators. One of these instruments is placed in the engine-room and another at the "conning" hole, where the officer in charge of the gun is stationed, and they are so beautifully arranged that they not only show to a degree the position in which the turret is required, but they also indicate the exact position into which it has been placed after it has been trained.

The ammunition-chambers are similarly excavated, but quite apart from the engine-room, and, like the latter, they, too, are approached through a manhole in the surface. After descending, the visitor traverses a somewhat circuitous passage, scarcely wide enough for two persons to pass abreast, which terminates at the chambers. There are two or three of these chambers, all communicating with each other. The total length of the whole of these excavations is about 40 ft. They are from 8 ft. to 10 ft. deep, with a width of upwards of 12 ft., are constructed in the centre of the solid masonry of

the pierhead, and are surrounded by walls of such immense thickness as to render it practically impossible for any projectile to dismantle them. The loading-chamber is on the level of the pier, and has nothing of a very interesting character about it. Several details connected with it are not yet finished.

But the most interesting part of the work consists in the turret itself. It is the first land-turret which has been constructed, and is calculated to be one of the strongest forts in the kingdom. The shield of armour-plating with which it is encased consists of alternate layers of teak and iron. It commences on the inside with a skin of teak, 1 in. in thickness; against this is a 7-in. armour-plate, and then alternate linings of four thicknesses of 1¼-in. teak, and two 7-in. armour-plates. The whole of these plates rest on a platform, and are held together by 3¼-in. bolts, fastened on the inside, the total thickness of the shield being 2 ft. 8 in. With the exception of the embrasures, or port-holes, the turret is thus completely sealed. The "fighting-deck" measures 32 ft. in diameter, and is entered through a manhole in the floor, of which there is one on either side of the chamber. Both gun-carriages are now in their positions, but there is still a considerable amount of work connected with them necessary to be done before the guns can be mounted. It is very easy to see that when the two guns are mounted there will be very little room to spare. Everything is calculated with great nicety. Just sufficient room is left for the recoil, and the roof is constructed with a double arch so as to admit of the gun being tilted to receive the charge. The framework of the roof is formed of main and cross-iron girders of great strength, which will be covered by stout iron plating, but at present the roof is only temporarily enclosed, the permanent work having been removed to admit of the reception of the gun and gun-carriages. The roof is also constructed with a bomb-proof grating over the breach of the guns to provide for the escape of any smoke emitted into the turret when they are discharged. The guns will be fired by electricity, and it is calculated that they will throw a projectile of 1,700 lb. a distance of nearly 10 miles.

Some idea of the strength and proportions of the turret may be gathered when it is stated that the total weight of iron used in its construction exceeds 550 tons, so that when the guns are mounted there will be very little short of some 800 tons of metal. Some of the armour-plates of which the shield is formed alone weighed from 14 tons to 20 tons; and yet with all this dead weight the whole fabric is set in motion at a moment's notice as though it were a mere toy.

The turret was erected by the Thames Iron-work Company.

ON THE SYMBOLISM OF THE CHURCHES OF BORNHOLM.

BY EDWARD DOBSON, M. INST. C.E.*

In a lecture I had lately the honour of giving before the Philosophical Institute of Canterbury, I pointed out that the study of ancient buildings embraced three classes of considerations, viz.:—

1. The object for which they were erected.

2. The material of which they were constructed.

3. The canon of proportion; or, to borrow a musical term, the "motive" of their design.

I propose to take up some twenty minutes of your time with a few remarks under the last of these three heads, for the purpose of pointing out the manner in which the equilateral triangle furnished the canon of proportion for the Pointed style of architecture, and in what sense this style is essentially and exceptionally Christian.

Following, again, the triple division, which seems to follow a natural law, we may class every building under some one of these heads, viz.:—

1. Buildings erected without any design at all; in fact, unprincipled, though not necessarily bad, buildings.

2. All those structures which have been designed upon some leading principle or canon of proportion, which may be either,—*a*. Utilitarian; *b*. Constructive; *c*. Scientific; *d*. Æsthetic; or *e*. Religious.

3, and lastly. There is a class sufficiently numerous in all countries, composed of buildings erected in imitation of others built upon designs the meaning of which has been lost or forgotten.

A few examples in illustration of this classification will explain my meaning, and help us to understand what is to follow.

There is an often-told story, which, however, will bear repeating, of a contractor who had successfully erected a number of buildings without working drawings or any other designs but those in his own head, who, on one occasion, found to his disgust that he had left insufficient headway for the staircase of an important public building then in course of erection by him, when he swore by all the saints in his calendar that he would never again build a staircase without first "chalking it out on the wall." This is a perfect instance of what I have just referred to as an "unprincipled" building.

Take, as the antithesis to this, the Parthenon at Athens, which, of all known buildings, is one which exhibits æsthetic design carried to its highest point of perfection. I use the term "æsthetic," because it does not seem that the elaborately worked-out scheme of design referred to had any other object than the satisfying a subtle sense of beauty. Not only is the design of this temple such that both the ground-plans and the elevations must have been most carefully worked out in detail on drawings made to a large scale; but the lines which in ordinary buildings are horizontal are in this building all curved. This is the case with the steps leading to the porticos and with the lines of the entablature. And I would call your attention to the result of this system of curved lines, viz., that the joints of the masonry were radiating and not vertical planes, so that every stone in the entablature had to be designed and cut to fit its own particular position in the structure, and could be placed nowhere else.

As an example of the utilitarian principle in design, we may instance the complicated fortifications of the French and Italian engineers, the triple series of zigzag walls which formed the defence of the old Peruvian town of Cusco, and even the walls of the time-honoured fortress of Mycenæ, which showed that even at that remote prehistoric period the principle of flank defence was understood and acted upon. So in Mediæval fortresses constructed before the use of gunpowder, the battlements are made to project before the line of the wall, carried on stone brackets, between which were apertures, through which stones, melted lead, and missiles of all descriptions could be dropped on the assailants below, thus giving a vertical, as distinguished from a flank, defence.

In modern villas, built in what is facetiously called the "Castellated" style, we often see this style of parapet imitated at considerable expense as a mere meaningless ornament, perhaps masking a 14-in. lead gutter, and overhanging a conservatory whose fair owner, as she waters her flowers, thinks of nothing less than the uses for which these parapets were originally designed.

The constructive element enters largely into the principle of design. As a general rule we find that the stone architecture of Egypt, Persia, India, and Greece is based upon wooden types which must have attained a high degree of development. Take, for example, the tombs still existing in Lycia, in Asia Minor. Although built of stone they are simply imitations of wood construction, the notching of the beams upon each other being exactly imitated as well as the round poles forming the roof, as in the Turkish hut of the present day. And it is curious to observe how universal is this ornament, it being found in Etruria and in Central America, whilst even the ceilings of the rock-cut temples of Egypt are carved in imitation of the flat palm-tree roofs of an earlier time.

Take, as another instance, the front of a rock-cut temple in India. You will see that it is simply an imitation in stone of a wooden structure, with its sloping posts and wooden purlins, and the curved bamboo roof, which was the original type of the curved roof so common in India at the present day; whilst the curious ridge ornaments on the latter are simply imitations of the curved timbers placed over the domed roof to keep down the thatch, as we see great stones put on the roofs of the Swiss châlets at the present day to keep the shingles from being blown away, and as we see in the paintings on Etruscan vases of the old Etruscan huts.

All the examples I have just referred to involve the preparation of working drawings previously to their construction. But there are ancient buildings of a simpler kind, which, although built on regular principles, might have been, and probably were, constructed without working drawings, although some system of lines must have been struck out for the purpose of obtaining the templates to which the stones were worked. There is a very interesting example of this in the building known as the Treasury of Atreus at Mycenæ. The building is circular in plan, with a porch approached by a flight of steps leading down to the level of the chamber, and a square inner chamber, of which the use is unknown, the whole plan having a very curious resemblance to that of some of the Bornholm churches, with circular naves and square chancels. The principal chamber is a dome, of which the section is an equilateral arch, of which the radius is equal to the diameter of the chamber at the floor level. You will see that every course of stones had to be cut to a different angle, and the templates were probably obtained by striking out the curves on the ground with a string, and marking on them, as the work proceeded, the heights of the several courses. There is a great deal of interest about this building, which was probably both a tomb and a treasure-house, because by its means we obtain glimpses of the meaning of early myths, which are thus brought into the borderland of true history. It was lined with either brass or bronze plates, which have been removed, leaving, however, in many places the nails by which they were fastened to the walls. This was a common mode of decoration, and we find references in the Odyssey to the "brazen walls" of the palace of Alcinous.

Going back to the early history of Argos, we find that Acrisius, king of Argos, shut up his daughter Danaë in a "subterranean apartment" or "brazen tower" (one author refers to her being deomed to a "sepulchral conch") lest she should give birth to a son who should kill his grandfather. How this precaution proved ineffectual, and the mother and child were subsequently exposed on the sea in a chest, and afterwards landed safely at "Seriphus," has nothing to do with my present subject. I merely wish to point out here that the apparent contradictions in the references to the chamber in which Danaë was confined receive a complete solution in this building, which, from its early date and position at Mycenæ, may very probably have been the actual prison of the unfortunate princess.

Referring, however, to the subsequent history of Danaë and her son Perseus, I may remark that we get a glimpse of serpent or dragon worship in the story of Andromeda, daughter of King Cephus, who was chained to a rock and exposed to a sea monster by her father, in obedience to an oracle, and afterwards rescued by Perseus, who brought her and his mother Danaë with him back to Mycenæ.

It is worthy of remark that the serpent or dragon, which is typical of the religion of the Gauls, was always a water monster, and that it had to be appeased by human victims, and we have on an ancient painted vase a representation of Latona on the seashore at Delos protecting her two children from an immense serpent. So, at the taking of Troy, one of the incidents described by Virgil in his "Eneid" is the killing of Laocoön and his sons by two enormous serpents, which swam out of the sea, and, coiling round them, destroyed them.

Let us go back for a moment to the tombs of Lycia, built as direct copies of an earlier timber construction. Following the progress of Greek art through later stages, we arrive at a period when the ornamentations, although based on timber types, had passed from the phase of direct imitation to a genuine stone style. Thus, although the design of the Classical peripteral temple is evidently based on the simple rectangular stone hut, with a flat roof of round poles, covered with earth, and supported by round posts, which, to the present day, is the ordinary barn of the Turkish peasant, yet we see in the Parthenon that the triglyphs, which may be supposed to represent the ends of the cross-beams, are mere outside ornaments, and are not even carried through to the main wall of the *cella*. In this case we have passed from the "con-

* The following discourse, delivered before the Cathedral Guild of Christchurch, Canterbury, New Zealand, we received, at the request of the writer, through the hands of Mr. G. E. Street, R.A., who thought it agreeable,—and we quite concur with him,—to find men interesting themselves there in such matters. The remarks were illustrated on delivery by a number of large drawings of the several buildings referred to. Those necessary for the comprehension of the text are repeated here on a small scale. Mr. Dobson will be remembered as author of some of the papers in Weale's Series.

structive" to the "æsthetic" principle of design.

I referred just now to a scientific principle of design. I do not here allude to buildings erected for scientific purposes, such as astronomical observatories, which from their purpose demand special constructive arrangements, or to the science displayed in the construction of ordinary buildings, but to buildings which, apart from their apparent use and method of construction, contain scientific secrets, as it were, in their proportions, as completely as the historical tablets built into the walls of the Assyrian palaces or the coins which we drop into the foundation-stone of a public building to inform posterity when it shall have become a ruin of the date of its erection. Such, for instance, appears to have been the case with the great pyramid of Gizeh, which, although apparently intended for a regal tomb, seems also to have been designed as a record of a number of geometrical and astronomical facts which are expressed in the relative proportions of its different parts. So far as I am aware, the later pyramids are simply imitations of their great predecessor, and do not display any signs of the secret knowledge possessed by the builders of the tomb of Cheops.

I am afraid you will think we are a long time in coming to the Bornholm churches, but we are "beginning to burn," as the children say, and although we seem to have gone a long way round, yet we have all the time been gathering facts which will help us to understand the special significance of the little rude structures which form the ultimate object of my remarks.

Last on my list I have placed the "religious" principle of design, and let me at once explain that in using this expression I do not refer in any way to systems of proportion which may have been adopted to render a building fitted for its religious uses, but to a system of symbolic proportions, apart from, and even opposed to, those uses.

On the principle of the old proverb, "Il faut reculer pour mieux sauter," let me make one or two remarks on the leading types of architectural form.

One of the oldest types of which we have any distinct record, is the round hut with a domed roof, formed, not by straight rafters leaning against each other, but by boughs bent round into a curve and interlaced with each other. We see this form perpetuated in the sepulchral vases of the old necropolis buried at an unknown age under the tufas of Mont Albano, near Rome. It is the type of the old British hut, the design of which is clearly traced in the sites of the early British towns of which so many examples still remain. We see it sculptured on Trajan's Column at Rome; we find it alike in the kraal of the Caffir and snow-house of the Esquimaux, in the capital of Abyssinia, and in the dome of St. Sophia. It is scarcely too much to say that we find it copied in stone in the prison of Danaë at Mycenæ, in the Baptistery at Pisa, and in the round churches of which I am presently about to speak.

But with the Classic temple, which, as I have already shown, was based upon the simple type which has been handed down to the present day in Asia Minor, another class of forms grew into use in which rectangular plans and horizontal and vertical lines predominate; and it may be said that whilst in Arabia, India, and Persia, circles, interlacing curves, and serpentine lines are still leading elements of design, modern architectural design in Western Europe is essentially rectangular in character.

With the rise of Roman power arose an attempt to blend the rectangular forms of Grecian architecture with the domed type to which we have just referred; the result of which we see in the early Christian architecture of Italy, and in the round-arched churches of Western Europe. But in all this the "motive" of design is simply constructive; till, somewhere about the end of the tenth century, there sprang up a new feature, viz., the use of the equilateral triangle as a canon of proportion, the result of which was the abandonment of the round, and the introduction of the two-centred pointed arch; and this, as I shall presently show, was based upon a "symbolic" and not a "constructive" principle, which, in many instances, must have remained to the uninitiated as much a secret as the astronomical truths supposed to have been recorded in the proportions of the Great Pyramid.

There is no lack of examples of structures of which the ground-plans are of a symbolic character. The mound-builders of North America constructed huge bas-reliefs of animals, which can only be supposed to have had some religious meaning.

The tracks of the Phœnicians in Western Europe are marked by groups of stone pillars forming circles and serpentine avenues evidently connected with serpent-worship and human sacrifices. As examples I need only remind you of Abury, in Wiltshire, and Carnac, in Brittany, both temples of serpent-worship on a gigantic scale. Quite recently Dr. Phené has discovered in the Pyrennees earthen mounds similar in construction to those of North America, but emblematic of the serpent or dragon, and the churches in the neighbourhood abound in features expressive of the subversion of a pagan faith of which the dragon had been the representative. In some cases the serpent's head is marked by a church, presumably circular, but the published report of Dr. Phené's paper is too brief to give all the details that could be wished for on the subject. As, however, Dr. Phené has undertaken to read a paper on the subject at Brussels before the Pre-historic Association, we shall, no doubt, soon be in possession of a valuable addition to our scanty knowledge of the history of serpent-worship.

Soulpture connected with serpent worship is to be found throughout France and Northern Europe, and up to the present time there is a religious festival held yearly at Tarascon-sur-Rhône, in which a dragon is led captive through the streets by a girl representing St. Martha, in front of a large body of clergy, nuns, and laity, who are preceded by banners representing the virgin treading on the serpent, and St. Martha treading the Tarasque under foot, and delivering from death a child already in its mouth.

All these things point unmistakably to serpent-worship, with its human sacrifices, having been a terrible reality.

I have dwelt somewhat longer than I should otherwise have done on serpent-worship, because I think it very probable that further researches along the route frequented by the Phœnicians between Cornwall and Marseilles may bring to light many peculiarities in the churches of those districts, where we might expect to find that the circle (which, both as an emblem of the sun, and as representing the head of the serpent, was a leading form in what are commonly known as Druidical monuments) had been [retained as a constructive form after the worship of which it was an emblem had been superseded by a different faith.

It would be interesting to trace out whether the round churches built by the Knights Templars, who were always suspected of a leaning to paganism, were really designed as Christian churches; or whether they were intended secretly to perpetuate the old pagan beliefs; but at present we do not possess sufficient published data for entering upon such an investigation.

And now, after this somewhat lengthy preface, we shall be able to understand the thoroughly unique character of the Bornholm churches which form the subject of this lecture.

I may remark, for the benefit of those whose geography is a little misty, that Bornholm is a small island in the Baltic Sea, having belonged sometimes to Norway and sometimes to Denmark, but at present under the latter power, and in earlier times was often visited by pirates, on which occasion the inhabitants retreated to their churches. I refer to this, because some of the churches appear to have been loopholed for defence, which has led to a theory of their having been built as forts, and subsequently adapted as churches, an idea which is at once dispelled by an inspection of them.

There are several modern churches which are simply rectangular barns, and offer no subject for remark, except in the primitive construction of the roofs. Whether there is no long timber in the island, out of which to cut the tie-beams, I know not; but the rafters are propped up in the centre by struts resting on rough square piers of masonry, built up in the middle of the naves, and forming what we should consider most inconvenient and unsightly obstructions. This style of roof timbering seems to have been handed down for centuries, without a thought of the possibility of a more scientific mode of construction.

The earlier churches, which I am now going to describe, have all circular naves. In some the chancels are rectangular, in others the chancel walls are curved in plan; but they are all based on a rigid system of proportion, as shown by the diagram before you. And let me remark that the principle of design is not "utilitarian," for it would be difficult to imagine a building more inconvenient, or less adapted for the services of the church, than the church of Oster Lars, of which sketches are before you. It is quite true that there is a font, a pulpit, a communion-table, and rows of seats for the congregation, but very few of the congregation can see the officiating clergyman; hearing must be a matter of considerable difficulty, and the sight of the chancel is obstructed by the tower-like pier in the centre of the nave. The principle of design is not "constructive," for there is no constructive design whatever. The walls are merely built of rough rubble, and the roof is strutted up from the tower-like pier in the centre of the nave with an utter absence of anything like skilled carpentry. The principle of design is not "æsthetic," for there is not the slightest attempt at ornament or any visible system of proportion of parts intended to give pleasure to the eye. Further, this church has not been built from working drawings any more than the unprincipled building in respect of which the contractor remarked that the next time "he would chalk his staircase out on the wall." The work has been simply set out on the ground with a line, and it is doubtful whether the mason even used a square. You will, perhaps, ask, How do we know all this? The answer is very simple. If you will look carefully at the plan of Oster Lars Church, you will see that the reveals of the door openings are not squared to the walls, as would have been the case if the builder had used a square; nor do the doorways come opposite the centre of the nave, as we should have expected, and as we see in other round churches,—for example, in St. George's, at Thessalonica, a circular church with a square chancel, built A.D. 400; but they are centred on a line cutting off a segment of the nave. This fact first gave me the clue to the secret hidden in these extraordinary buildings; but it was some years before the solution of the problem presented itself to my mind.

At the present day, when we want a coloured window for the decoration of a new church, or the repair of an old one, we send an order to a tradesman, who employs a number of artists who work simply on æsthetic principles, and whose treatment of the same subject may differ widely, according to their individual taste and their knowledge of the harmony of colours. But it was not so formerly. Even at the present day at the monastery of Mount Athos, whose monks are employed in illuminating, no such liberty is allowed. Every saint has his traditional attitude; every martyr is attired in traditional colours, from which no variation or deviation is allowed.

It is difficult to find out at what date representations of the Crucifixion began to be employed in the Christian church. (You will bear in mind that the cross is not an exclusively Christian symbol, but was employed in Egypt long before the Christian era.) But when we come across the few representations of the Holy Trinity which escaped the iconoclastic fury of the Puritans, we find that they are based on canons as rigid as those which regulate the decorative talent of the monks of Mount Athos.

Here you have a very interesting specimen from a window in St. John's Church, Micklegate, York (*see illustration*). Examine it carefully and you will see that so far from its having been designed in the picturesque style adopted by our modern glass-painters, it is simply based on a geometrical diagram, by which every part of the design is rigidly fixed. And further, if you will take a pair of compasses and experiment for yourselves, you will find that the initial radius being given, every portion of the design follows in due order.

Now turn back to the plan of Oster Lars Church and you will see that it presents a repetition of this diagram, which has been traced on the ground with a line and a couple of pegs, one as a centre, the other as a tracing point, and that the walls have been built on the lines so traced, without squaring the openings or making any attempt whatever at architectural design.

The leading points given are shown very clearly in the skeleton diagram before you. You will see that this system of intersecting lines defines,—

1. The width and length of the nave.
2. The width and length of the chancel.
3. The position of the three nave windows, which typify the wounds in our Saviour's hands and feet.
4. The position of the entrance-doors, which

are centred on a line passing through the Saviour's loins, to show that through Him we enter into life.

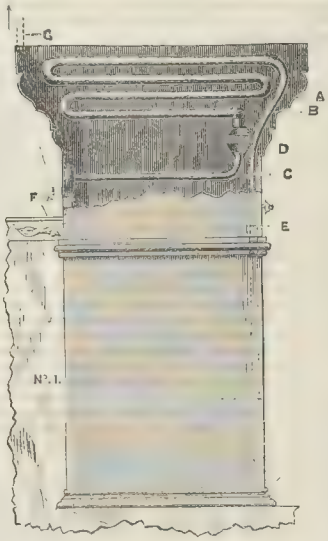
And this at once explains the peculiar position of the doorways and the reason of the reveals not being square to the face of the walls.

It is impossible to look at these plans without the conviction that it was intended in them to illustrate the well-known passage in St. Paul's epistle to the Hebrews, x. 19-22,—"Having therefore, brethren, boldness to enter into the holiest by the blood of Jesus, by a new and living way, which he hath consecrated for us, through the veil, that is to say, his flesh; and having an High Priest over the house of God; let us draw near with a true heart in full assurance of faith, having our hearts sprinkled from an evil conscience, and our bodies washed with pure water."

I have taken Oster Lars Church for illustration, because its plan is more complicated than that of the churches with square chancels, but the principle of design is the same in all. It is difficult with the few data I possess, to fix any precise date to the Bornholm churches, but I am inclined to assign them to the early part of the eleventh century.

Many years ago I was called in to advise as to the improvement of a little church at Chaldon, in Surrey, and completed the tower and spire which had been begun in the time of Elizabeth, and left unfinished either for want of funds, or want of agreement among the parochial authorities. It is an innocent-looking church, apparently twelfth-century work, with the original roof and inserted windows of later dates. (I made a complete set of drawings of the building which are not now in my possession.) Some years afterwards, when testing the proportions of the Bornholm churches, it occurred to me to strike out their lines on the plan of Chaldon Church, and, to my surprise and delight, I found that this plain, innocent-looking building was planned on identically the same system. Of this you can satisfy yourselves at a glance by examining the ground-plan of Chaldon Church, which is before you.

But further, on examining the section of the building, I found that it was also a repetition of the ground-plan diagram, the main roof being an equilateral triangle.



I have no doubt that an examination of the ground-plans of churches built about the eleventh and twelfth centuries would reveal that this system of lines, intended to symbolise a summary of Christian faith, was most extensively used. The fact appears to be proved by the examples I have just brought forward, which could not have had the slightest connexion with each other. How long this system of lines retained its original meaning, it is impossible to say, but from the date of the introduction of the equilateral arch, it will be found that the canon of proportion between breadth and length not only in churches and cathedrals, but in most buildings of any architectural design, is simply based on the relation between the base of an equilateral triangle and the perpendicular dropped on it from the opposite angle. Of this you may satisfy yourselves by inspection of the plans of the English cathedrals with a pair of compasses, and although, no doubt, this canon of proportion soon became a constructive axiom quite apart from its original symbolic meaning, it appears to me that its use in the first instance in Western Europe was entirely symbolic, and peculiarly and essentially Christian.

At a later date we find the essential proportions of the Bornholm churches repeated without a trace of symbolism. Take, for instance, the Church of San Thomaso in Limine, near Bergamo. The relative proportions of the nave and chancel are based on the double equilateral triangle. The circular wall in the centre of the nave of the Bornholm Church has developed into a circle of columns, and the whole building, both internally and externally, is highly decorative in character. But whilst the motive of the Bornholm church is simply and purely symbolic, that of the Italian church is at once "utilitarian," "constructive," and "æsthetic," and the symbolism has entirely dropped out. This is seen at once by the altered position of the doorways and the absence of the three windows marking the extremities of the cross.

And with this speculation I must close my remarks, trusting that the time devoted to the consideration of this hitherto curious chapter in the history of Christian art has not been unprofitably spent, and that the dissemination of the facts which I have brought before you may lead to further investigations, and to the determination of the question whether this system of symbolism was generally understood and acknowledged, or whether it was a secret confined to particular localities, or to special branches of the early Christian Church.

METHOD OF WARMING FRESH AIR.

Messrs. Robert Boyle & Son, ventilating engineers, of 64, Holborn Viaduct, are the inventors of a simple arrangement for warming the supply of fresh air admitted into rooms and public buildings. It consists of a miniature coil of pipe placed on the top part of a vertical tube as shown in diagram No. 1. A is the top of the tube, made of iron or zinc to render it fireproof, B the coil, C an air-burner, D shield perforated at the bottom to prevent the current of air passing up the tube affecting the flame; E, pipe to carry off the products of combustion; F, ¾ gas-pipe led from the most convenient source

to supply the air-burner; G shows gas-pipe brought down from a bracket. Diagram No. 2, H, regulating-valve in tube; J, air-hole through the wall; K, cast-iron grating; L, mouth of the pipe for carrying off the products of combustion. Dimensions of the air-shaft are 20 in. by 9 in. by 4½ in.

This plan has the advantage of being economical, and, with it, in conjunction with the air-pump ventilator, Messrs. Boyle say they will guarantee the satisfactory ventilation of any building without the slightest disagreeable draught being experienced.

MACHINERY AND APPLIANCES AT THE SMITHFIELD CLUB SHOW.

In connexion with the eighty-fourth annual Cattle Show of the Smithfield Club (which closes this Friday, the 9th inst.) a good collection of machinery and appliances has been brought together in and under the spacious galleries of the Agricultural Hall. The hall is very effectively lighted at night and during the dark hours of the day by the electric light, a large number of arc lights, on the Brush system, being suspended from the roof. The comfort and even the safety of visitors have been insured by the laying down of a new floor over the area of the hall, in lieu of the dangerously-rutted and dilapidated one of which visitors to the hall, in connexion with various exhibitions held there during the last two or three years, have had so much reason to complain. Stands 1 to 32, include the heavier exhibits, which are placed under the galleries, while Stands 33 to 221 are in the galleries.

At Stand 1, Messrs. Robey & Co., of Lincoln, show traction-engines, and some very good portable engines and boilers combined. Their patent "Robey" engine is of the horizontal type, and is placed beneath a horizontal boiler. Messrs. Wallis & Steevens, of Basingstoke (Stand 2), are exhibitors of portable steam-engines and agricultural machinery. Stand 3 is occupied by Messrs. Richard Garrett & Sons, of Leiston, who show portable steam-engines of good and simple construction, one of them fitted with Graham's "spark-arrester." This firm also exhibit a good horizontal double-cylinder engine. Messrs. R. Hornsby & Son, of Grantham (Stand 4), show a handy vertical engine and boiler combined, and an 8-horse power portable steam-engine, suitable for farmers, contractors, or builders. They also exhibit a horizontal engine of simple design and good workmanship, and a new patent narrow-gauge traction-engine. At Stand 5, Messrs. Barrows & Stewart, of Banbury, display a compact portable 3-horse power vertical engine and boiler, and a larger portable engine with horizontal boiler. Messrs. Hempsted & Co., of Grantham (Stand 7), show some compact vertical engines in conjunction with welded boilers. Stand 9 is occupied by the well-known firm of Clayton & Shuttleworth, Lincoln, who show a 6-horse power fixed horizontal engine, very compact and excellently finished, together with portable steam-engines for traction and other purposes. At Stand 13 Messrs. W. Allchin & Sons, of Northampton, have some good vertical and horizontal steam-engines on view. Messrs. J. & F. Howard, of Bedford, exhibit (Stand 16) "The Farmer's Engine," suitable for traction, steam-ploughing, and other purposes. Messrs. Aveling & Porter, of Rochester (Stand 17), show a ploughing-engine capable of use as an agricultural locomotive or traction-engine, and a convenient wagon for use with road locomotive, side-tipping, and capable of carrying 8 tons. At Stand 19, Messrs. W. & S. Eddington & Co., of Chelmsford and Queen Victoria-street, are exhibitors of portable engines of simple and good construction. Stand 22 is allotted to Messrs. E. R. & F. Turner, of Ipswich, who exhibit several of their specialities, among the foremost of which is their 8-h.-p. portable steam-engine, fitted with the Hartnell automatic expansion gear. It is now, we believe, some ten years since this engine was first introduced, and it has given proof of its title to hold a position in the very first rank of engines of its class. They also show a smaller-sized portable engine, 4-h.-p., of ordinary construction, very light and handy, yet strongly built. Their "Gippeswyk" engine is represented in two of its various forms, viz., as a horizontal fixed engine, and vertical with boiler combined, mounted upon four travelling wheels. The design of these engines is good, and the construction and finish leave nothing to be desired. Another of Messrs. Turner's leading specialities is corn-grinding mills, several of which are shown. At Stand 23, the Agricultural and General Machinery Company show Darby's broadside steam digger, which has been considerably improved since we saw it at the Kilburn Agricultural Show. Messrs. Ruston, Proctor, & Co., of Lincoln, show, at Stand 25,

some horizontal and portable engines of excellent design and workmanship. Messrs. Marshall, Sons, & Co. (Limited), Gainsborough, show, at Stand 27, some good horizontal and vertical engines. Stand 32 is occupied by Messrs. W. Crosskill & Sons, of Beverley, whose carts and wagons for agricultural and builders' purposes are well known.

Of the large number of exhibits in the galleries we can only notice a few. At Stand 37 Messrs. Piggott Brothers, of Bishopsgate-street, are among many exhibitors of tarpaulins, ropes, and other requisites for builders no less than for agriculturists. At Stand 59 Messrs. Lane & Reynolds are exhibitors of horizontal steam engines. At Stand 75, the Jeyes Sanitary Compounds Company exhibit their products as applied to domestic and agricultural purposes. One of their products is also devised for the preservation of wood, especially with a view to prevent the ravages of white ants in India and other countries. Stand 77 is occupied by Messrs. Croggon & Co., with galvanised iron and other tanks, wire netting, &c. Messrs. Reynolds & Co. (Stand 89) are also exhibitors of galvanised netting for sheep and game. Mr. John Bellamy, of Millwall (Stand 93), exhibits a variety of galvanised iron and other tanks, corn-bins, feeding-troughs, &c. Churns and other appliances for the dairy are shown at Stand 97 by Messrs. Thomas Bradford & Co. The St. Pancras Ironworks Company (Stand 99), have some excellent stable, cow-house, and piggery fittings on view. Messrs. G. W. Murray & Co., of Banff (Stand 105), show, amongst other things, wire-straining brackets for fencing, and chain-pumps. Messrs. Francis Morton & Co. (Limited), Liverpool, are exhibitors (Stand 111) of models of corrugated iron buildings for agricultural purposes, such as hay-barns, cattle-sheds, and covers for corn-ricks. Messrs. R. P. Taylor & Co., of London Bridge, are exhibitors of chaff-cutters, grindstones, and other useful appliances. At Stand 119, Mr. W. A. Gibbs, of Chingford, exhibits working models of his harvest-saving machinery, in the form of hay and corn dryers, to which we have on more than one occasion during the last two or three years called special attention. By the use of these or similar appliances a vast quantity of food for man and beast which has been lost owing to bad weather in recent years might have been saved. We note that a company is in course of formation for the purpose of making and selling Mr. Gibbs's valuable inventions. Messrs. Bayliss, Jones, & Bayliss, of Wolverhampton (Stand 122), are exhibitors of iron hurdles and fencing. Messrs. Hayes & Son, Stamford, show (Stand 125) some well-constructed carts for agricultural and other use. Messrs. Barford & Perkins, of Peterborough (Stand 133), are exhibitors of steam cultivating tackle, food-cooking apparatus for the stock-yard, grinding and grist mills, oil-cake crushers, &c. Stand 137 contains some well-made carts and wagons, exhibited by Messrs. W. Glover & Sons, of Warwick. Mr. E. S. Hindley, of Bourton, Dorset (Stand 138), has a large show of vertical engines and boilers, portable and of good construction; also a strongly-built horizontal engine. At Stand 165, Messrs. Hill & Smith, of Brierley Hill, show iron hurdles and fencing, including a new and ingenious sheep-folding hurdle and trough combined. At Stand 167, Messrs. Barnard & Lake, of Braintree, show a thatch-making machine, Messrs. Charles Powis & Co., of Gracechurch-street and Millwall (Stand 214), show horizontal and vertical engines of simple design and good construction.

Among the exhibitors in the Arcade entrance, are Messrs. Burney & Co., of Millwall, who exhibit iron tanks; Messrs. Crossley Brothers & Co., with their well-known "Otto" gas-engine; Messrs. T. Bradford & Co., of High Holborn, who show laundry machinery; Messrs. Rosher & Co., who show stable bricks, garden tiles, vases, &c.; Messrs. Hamilton & Co., who show pavement lights; and Lord de Blaquière, who shows his patent "detachable runners" for at once converting carriages into sleighs without taking off the wheels, and which seem to be well calculated to answer their purpose. The exhibits most interesting to builders in this arcade will be those of Messrs. Lewis & Lewis, of Laurence Pountney-lane; Messrs. F. W. Reynolds & Co., of Southwark; and Messrs. Henry Warr & Co., of Blomfield-street. Messrs. Lewis & Lewis exhibit a saw-bench and band-saw machine, both of which possess some good points. Messrs. F. W. Reynolds & Co. show some of the most useful of their specialities in the way of mortising and other wood-working machines, including their handy little contrivance for fitting a mortise-lock to a door after the latter is on its hinges. A new portable hoist for builders, which can be fixed in a minute or two by clamping it on to a scaffold-standard, is a very handy contrivance, and should be looked at. Messrs. Henry Warr & Co.'s exhibits include a new circular saw-bench with fixed spindle and rising and falling table; this is likely to be very much appreciated. They also show a new band-saw machine with the column and bed-plate cast in one; and the "Ord" patent silent gas-engine, a new aspirant for favour as a means of utilising gas as a motor.

The only exhibit which we need notice in the bazaar known as "St. Mary's Hall" is that of Messrs. Charles Powis & Co., who show some very good saw-benches.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of this association was held on the 30th ult. A paper was read by Mr. James Gordon, entitled "Architectural Notes in Normandy," giving some account of a sketching tour recently made by the author and two other members of the association in that part of France. Taking the order in which the towns on the line of route were visited, Mr. Gordon proceeded to describe the attractions which each presented to the architectural student, and the peculiarities of general design and detail of the various buildings. Rouen and Caen with their environs, Coutance and Mont St. Michel, came in for a larger share of notice, as being especially rich in objects of interest. Many other places visited were also described. Normandy, he thought, was, with perhaps the exception of the district round about Paris (the old "*domaine royale*"), the best field in which to study the beginnings and development of Gothic architecture, the wealth of examples affording abundant opportunities for comparison between the various periods. But, Mr. Gordon said, while the field in Normandy thus offered to the student quite an *embarras de richesses* most convenient for systematic study, it was not to be understood that the study of such monuments or such remnants of them as remained to us at home should be neglected. On the contrary, these were deserving of, and should first receive, the most careful study, for, although unfortunately for the most part only fragmentary, they were in no way inferior to the French examples. Few, if any, of the latter could be compared, as regards chaste refinement of detail, with what is left to us of the abbeys of Dryburgh or Dundrennan, not to mention others. The paper was illustrated by a number of sketches.

ARCHITECTS IN IRELAND.

LAMENTATIONS reach us from Dublin that there is little cohesion among the architects there, that the Irish Institute does little, and that the young men especially want some such organisation as the English Architectural Association. The *Irish Builder* writing on the subject says,—"Of course there are in London several circumstances favourable to the quicker growth of any professional organisation than there exist here; but if we lack a great area and population, and possess but a tithe of the wealth of the great metropolis across the Channel, yet no valid reason exists why we should not have a representation in architecture proportionate to the circumstances of the Irish capital. There are other considerations which ought to influence the architectural profession as well as other professions in this island. There is no doubt but the working of the Land Act will effect in a few short years a great change for the better in this country. There will be less emigration, population will increase faster, and native industries will receive an impetus, and be more widely distributed. This change, besides other improvements, spells building, and building cannot be rife without benefiting the architectural profession. It is the bounden duty of our architects to gather themselves together for the sake of their individual and collective interests, even if they lack a practical patriotic spirit, which we hope they do not. By a true representation they will not only help their own profession, but the interests of their country, social and industrial. Let the work of re-organisation commence with the new year, and let 1882 be signalised by a general awakening over the country."

There is good sense in this appeal, and we hope it will be listened to and acted on. Ireland needs the individual effort of every one of her right-thinking sons and daughters.

BREWERIES.

AT a meeting of the Society of Engineers, held on Monday evening, December 5th, in the Society's hall, Victoria-street, Westminster, Mr. Charles Horsley, president, in the chair, a paper was read by Mr. W. Barns Kinsey, "On Arrangement, Construction, and Machinery of Breweries." The author first stated the general principles which should govern the arrangement of the buildings and machinery; he then treated the subject of Wells and Water. A simple way of preventing contamination was to bore from the surface of the ground, lining the boring with cast-iron pipes, and suspending the pump within the boring, wells of considerable depth having been constructed in this manner. He next described the machinery used in brewing, which he divided into six sections,—namely, pumping, grinding, mashing, boiling, cooling, and fermenting and cleansing, stating that the simplest arrangement was by gravitation, the cold water or "liquor" being pumped to the top of the building into a vessel called a cold-liquor back, thence it flowed to the hot-liquor back to be heated, thence to the mash-tun to be mashed with the malt, from which the wort was run off through a perforated false bottom to the copper to be boiled with the hops, which were afterwards strained from it in the hop-back, and run on to the coolers and refrigerator to be cooled to the required temperature for fermentation. This, the most important process, was carried out in fermenting tuns, and the beer was either skimmed or cleansed. The use of attemperators, cleansing and union casks, together with yeast-presses, elevators and lifts, cask-washing apparatus, &c., were duly described and illustrated by models and diagrams. Lastly, the engines and boilers should be of ample power and of the simplest construction, the Lancashire double-flued boiler being most suitable for brewery work.

HILLCOTTE, SOUTH HAMPSTEAD.

THE new building estate at South Hampstead is rapidly being covered by houses of various descriptions, mostly erected from the designs of architects, and our illustration shows one of the smaller villa residences now being erected in a new road, called Netherall-terrace, running from Finchley-road (nearly opposite the Metropolitan Station of that name) to Hampstead. The walls are faced with red bricks, the upper portion being covered with vertical red plain tiling, and the roofs with Broseley tiles. Messrs. H. Saxon Snell & Son are the architects, and the cost will not exceed 2,000*l*.

EARLY ITALIAN PULPITS: PISTOIA.

THAT the construction and adornment of pulpits occupied considerably the sculptors of the thirteenth century is apparent in those found in Pistoia, Florence, and Pisa, and, in fact, throughout all Italy. The town of Pistoia is so seldom visited by strangers that its many intrinsically interesting works are comparatively unknown. Beginning with the most beautiful though the latest in date of those we have illustrated,—that is, one in the church of San Andrea,—and the one most celebrated in the history of art, the eye will be struck with the elegance and beauty of its form and work. The pulpit is hexagonal in form, sculptured by Giovanni Pisano. It resembles much that of the baptistery of Pisa, but the work is more delicate. Out of the great regard that the Pistoiese had for Niccola Pisano they confided the construction of their pulpit to his son Giovanni, who excelled his father in the delicacy of his work. The pulpit stands about 12 ft. high, and is about 21 ft. in circumference. It is supported on seven columns (in allusion to the mystical biblical number) of thin red marble from the Pisan mountains; four of these seem to have scarcely any support; three have their base, one on the shoulders of a man, a fifth on the back of a crouching lioness, the sixth on a lion with a horse under him; that in the centre is on a base flanked by two eagles and supported by a lion, all Scriptural allegorical figures. The Nativity of Jesus Christ, the Adoration of the Magi, the Massacre of the Innocents, Crucifixion, and Final

Judgment are the five stories sculptured on the pulpit, with endless variety of expression and design. Above 148 figures can be counted carved in relief, besides the beautifully worked angles, the figures in which are about 1 ft. 6 in in length. The execution of this work occupied about four years, between 1298 and 1301.

Pulpit in S. Michele at Groppoli.

To the famous pulpits of Pistoia, already mentioned, may be added one even anterior. Groppoli is three miles west of Pistoia. Crowe and Cavalcaselle write:—"One of the completest monuments of the twelfth century is the quadrangular pulpit of S. Michele at Groppoli, the faces of which represent, in low reliefs of soft stone, incidents from the New Testament." (The visitation, the nativity and flight into Egypt. A serpent at one of the angles supports the desk. The pulpit rests on columns, whose capitals are filled with heads of animals and monsters, and whose bases rest on the backs of lions. Of the latter, one paws a man, the other a dragon.) "A mutilated inscription may still be read, as follows:—'Hoc opus fecit fieri hoc opus [*sic*] Guiscardus . . . . pleb . . . . anno dñi Mil CLXXXXIIII.'"

Defective as those of Gruamons at San Andrea, in Pistoia, the figures of Groppoli are cut into the flat without any sort of rounding. The incidents are in the old traditional forms, but represented by one living in the infancy of art. The figures, like slender dolls, have draperies marked by rectangular or circular incisions. The flat square heads form but one plane with the neck; the limbs hang, as it were, by threads, together, the features being merely scratched on the surface.

About the close of the twelfth century, Buonamico seems to have been extensively employed at Pisa. Bas-reliefs, that may be assigned to him, on the curved cornice or frieze of the east gate of the baptistery, represent the Redeemer, the Virgin, and St. John, with apostles and angels. The same flat surface, the same forms, indicated by incisions, may be noted here as at Groppoli; and perfect identity of style with that of a tomb in the Campo Santo reveals the artist whose name is inscribed there:—"Opus quod videtis Bonusamicus fecit. P. eo orate."

We have enlarged on the Groppoli pulpit by quotations from Crowe and Cavalcaselle because this pulpit is a sort of starting-point in pulpit sculpture. There is one that is much earlier in Florence, of which a print has been made for Richa's work on churches. As to the inscription on the Groppoli pulpit, it is really dated 1193. Crowe and Cavalcaselle have made it 1194. The inscription reads thus:—"Hoc opus fecit fieri hoc opus [*sic*] Guiscardus.* Pleb. anno dñi, MI± CL⊙XXXXIII.†

Pulpit in the Church of San Bartolomeo.

The pulpit found in this church is by Guido da Como, who finished it in 1250, as is attested by an inscription carved on it. Prof. Ciampi thinks that Guido left it unfinished, and that two of the pictures, much inferior to the others, were by one called Turisiano. It is of white marble, carved with eight stories in bas relief,—six of which are in front, two on either side. It stands on three columns,—the first, on the left side, stands on a lion, having between his claws a basilisk, which he in vain attempts to crush; that on the right, on a lioness suckling her young; that in the centre rests on a man carved in white Seravazza marble.

By way of antiquity, after the pulpit of Groppoli, this ranks second among the Pistoian pulpits worthy of observation in the history of art.

Pulpit in the Church of San Giovanni, Pistoia.

This beautiful pulpit, of white marble, is found in the Church of St. John the Evangelist [*fuorci vita*] without the Walls. The name of the maker of it was disputed for some time; Vasari pronouncing it to be from the hands of a German artist, Professor Ciampi from those of a Lombard, and Morrona the work of Giovanni Pisano. Certain it is that the work is of the school of Niccolo Pisano, and it is now decided without doubt to be that of Fra Guglielmo, of Pisa, a Dominican monk, and pupil and fellow-worker with Niccolo Pisano. The pulpit is three-sided; and on the east side the picture has been cut to form an entrance into the pulpit. Ten different sacred stories are sculptured on the pulpit, with six apostles at the division of the compartments. In the front is the angel of the Apocalypse, under which was a face enamelled in gold, covered with a crystal. The pulpit stands on two columns, and is also supported by two brackets that come out from the wall behind. The figures are sculptured with exquisite art and tenderness, especially when the crowded grouping of the figures is considered. There is great resemblance to the Pisan baptistery pulpit. It was executed in 1270, restored in 1398 by Francesco da Siena, and in 1837 by Professor Stefano Ricci.

We shall give some particulars of Pistoia in an early number.

* The "Guiscardus" is omittted in Ciampi's account of the pulpit.

† The MI±, for "Mille," is often found thus on old inscriptions.

GENERAL POST OFFICE, BERLIN.

A separation of the Prussian Post Office from the German General Post Office having become necessary, in consequence of the momentous events which transformed Germany from a geographical expression into a political reality, it was soon found that a separate home was required for the new administrative branch of the German empire. The building of the General Post Office in the Leipziger Strasse, Berlin, which we illustrate in our present number, was completed a few years ago. It contains all the necessary offices of such an important department of the public service, besides library, postal museum, and official residences. The number of rooms for a staff of 170 officials is 136; the residences include twenty-seven rooms. The chief architect was Baurath Schwatlo, who was assisted by the sculptor Jungermann.

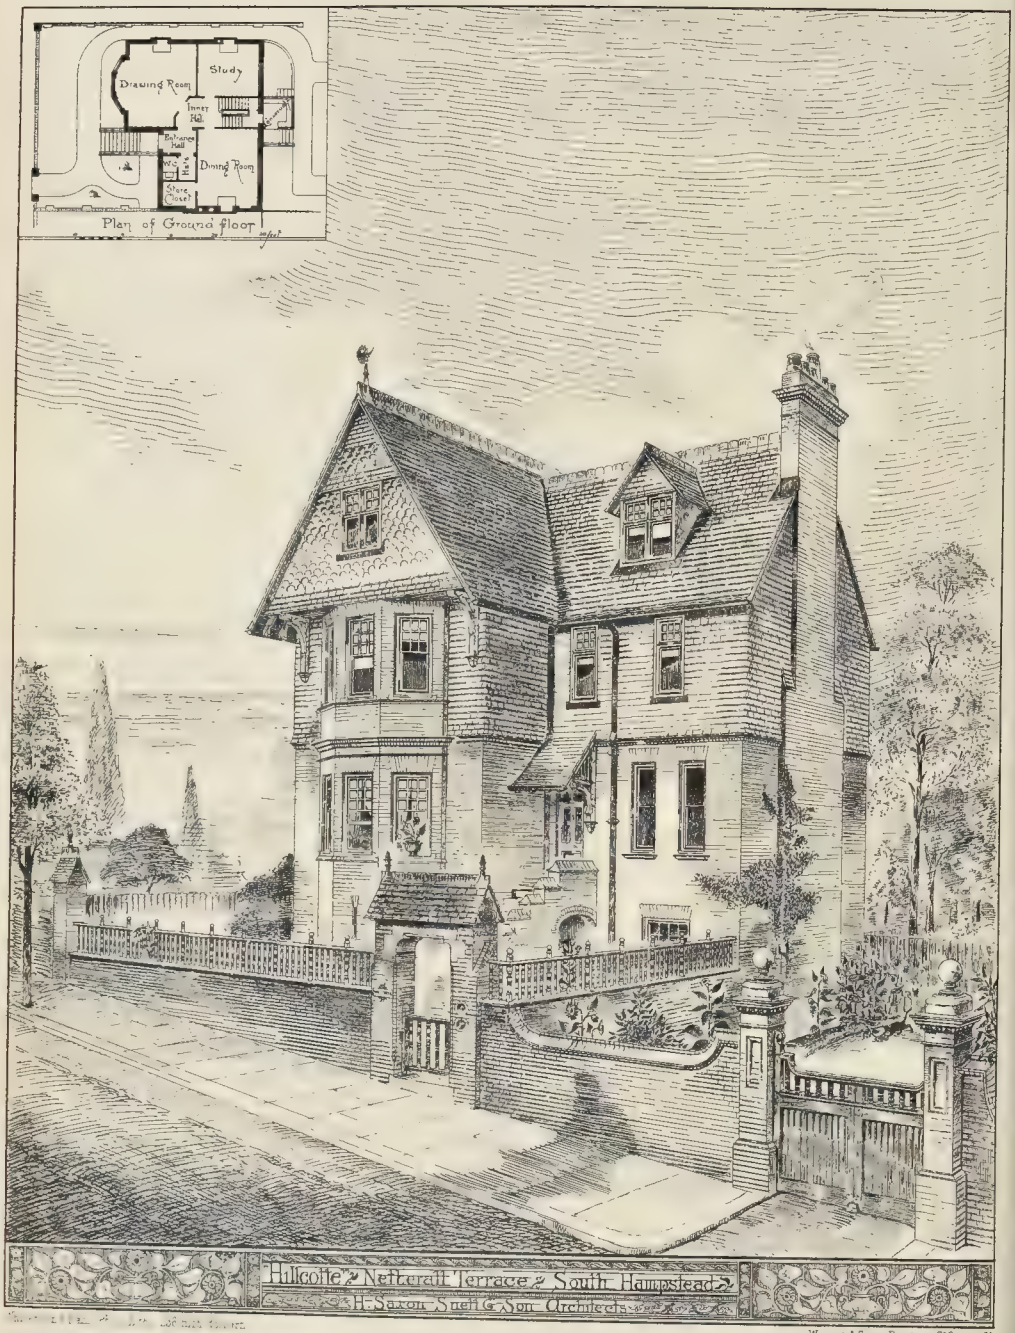
The General Post Office has its principal front in the Leipziger Strasse, and is a happy deviation from the old Prussian official rule of having official buildings as plain and barrack-like, and as ugly, as possible; a tendency which, we are glad to note, is rapidly disappearing in the new era of the resuscitated German empire. The edifice covers an area of 32,300 square feet, and has a depth, from the street front to that towards the garden, of 320 ft. It consists of a front building and two similar ranges behind at equal distances from each other, all three being joined together by wings, and thus forming two inner courts. The gardens at the back towards the Zimmerstrasse afford ample space for further extensions of the Post-office buildings, should they become desirable in course of time. The façade is in the style of Roman Renaissance. On a granite base, 18 ft. high, including the basement sinking 5 ft. below the pavement, rises the main building in three stories to a height of 67 ft. (with the attic story, 78 ft.), by a width of 117 ft. In the centre of this façade, between the two projectures jutting out 4 ft. beyond the line of the building, a broad vestibule is formed by the entrance-wall being placed back. The superincumbent weight of the upper stories is supported here by two powerful columns, monoliths of blackish-green syenite with sandstone capitals, and similar to those of the Tower of the Winds at Athens, upon which rests the entablature of grey sandstone.

The ground-story, 19 ft. high, has a somewhat heavy appearance on account of its severe simplicity. The windows are slightly pyramidal, the sides inclining towards each other at the top. The side walls of the vestibule are adorned with medallion reliefs of the Great Elector and Emperor William, the founders, respectively, of the Prussian and German post-offices, and the spandrels at both sides of the round-arched portal with high reliefs of two female figures, one in the act of reading, the other of writing. The first story, 16 ft. high, is of the Ionic order, elegantly treated; the windows in the projectures are flanked by Ionic columns in sandstone. There are nine windows altogether in this story, as well as in the upper story, which is also 16 ft. high. The columns, capitals, and window-piers of the latter are of the Corinthian order, with round-arched windows. The spandrels between them and the columns flanking the windows in the projectures are filled by allegorical figures of boys in relief, representing the field, money-order, letter, and parcel post. The pediments of the windows, adorned by lions' heads of the Farnese Palace pattern, are surmounted by an attic, the corners of the projectures of which are surmounted by four figures in sandstone, Mercury and a woman carrying a child on the left, and Neptune and a figure representing Science on the right. The material of the façade is sandstone from Segeberg and Nebra, of a warm reddish hue in various and fine shadings from yellow to flesh colour. The effect is pleasant, and harmonises well with the surroundings.

The vestibule opens on to a high vaulted lobby, running in a straight line to the portal giving on to the first court. Above it the two wings of the main staircase of black grey-spotted marble with gilded railings join into one flight of stairs. The corridors in all the stories are vaulted; the floors are all laid with Mettlach tiles. In the story above, fronting the street, the council-hall, 31 ft. long, 23 ft. wide, and 22 ft. high, is located. It is richly and appropriately adorned. Along its walls and in its niches are placed the busts of the Great Elector, Frederick the Great, Emperor William, and the Crown Prince of Germany, as well as those of men connected with the development of the German postal service, such as Franz von Taxis, Lamoral von Taxis, von Selgeburth, von Hardenberg, Nagler, Schmückert, von der Heydt, Bismarck. There are likewise inserted two tablets containing the names of 156 German post officials who fell in the Franco-German War. A frieze, painted by Professor Schütze, runs round the room, and contains historical compositions symbolising the whole development of written and postal intercourse from the oldest times to the present.

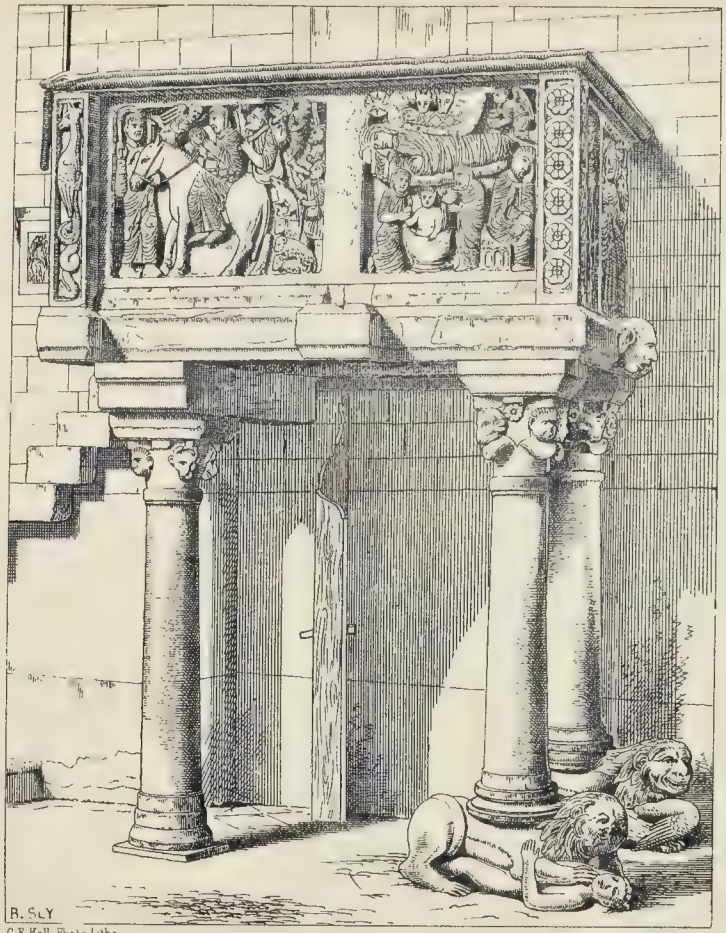
The architecture of the court buildings and their interior adornment are of much simpler and plainer nature than those of the façade; but their arrangements show that much has been done to ensure the comfort of the officials and of the families residing in the building. None of the rooms are less than 14 ft. high, and they are described as well lighted and ventilated. All the stories are provided with lavatories and closets, and water and gas are, of course, laid on throughout the building. The warming and ventilating apparatus (Hentschel's system) was supplied by the Neptune Company. There are in each room two ventilators, one for summer, the other for winter use, all the ventilating conduits opening into a shaft, which receives at the same time the chimney of the boiler. The gas-fittings for 1,200 lights were supplied and laid on by Messrs. Schäffer & Hanschner, of Berlin. The water-fittings were by Messrs. J. & A. Aird, of Berlin. An atmospheric telegraph (by Töpper & Schädel) connects all the rooms with the central offices by pipes, the total length of which is 20,664 ft. An underground cable connects the General Post Office with the Central Telegraph Office in the Französische Strasse.

The total cost, including the price of 34,050*l.* paid for the site, was 148,800*l.*



CORNER BUILDINGS AND THE LINE OF FRONT.

Sec. 75 Metropolitan Local Management Amendment Act, 1862, as applied to Corner Buildings.



This being a matter of great importance to our readers, we feel called on to say a few words on the subject. It has hitherto been customary to erect corner buildings according to the general line of frontage in one street, namely, the principal street in which such buildings are situate, and to carry the flanks of such buildings to the pathways in the side streets; and this would appear to us to be the correct reading of the Act, for, if a purchaser of a corner plot were to be expected to adhere to the general building lines in each street, his plot of ground might be useless altogether. Some person out of mere spite might erect a row of houses at the rear of such corner plot with a general building line (say, for argument) 20 ft. from the pathway, which might be the total width of the corner plot, and in such a case the whole of such corner plot would be lost to the purchaser.

There also appears to us another reason why this section should be construed in the manner we have suggested. The words of the section are "beyond the general line of buildings in any street, place, or row of houses in which the same is situate." If two general lines of buildings were intended, the words would surely have been "*street or streets, road or roads,*" &c., and the Legislature would have made some provision for compensation in such cases, otherwise great hardship would be inflicted without a remedy.

Civil and Mechanical Engineers' Society. The opening meeting of this Society was held on the 8th inst., and the president, Mr. A. T. Walmisley, Assoc. Mem. Inst. C.E., delivered an address.

TO ILLUSTRATE MR. DOBSON'S PAPER ON "SYMBOLISM."

THE NEW EXAMINATION, AND WHAT IT INVOLVES.*

Now that we have gained some idea of the object which the Examination may be understood as proposing to itself, and of the general course it is to take, the question still has to be answered, How will it turn out? A great deal depends upon the examining body. This consists of a board of not less than five or more than twelve Fellows of the Institute. The names of the members of the first board are as follow:—The president, Mr. Street, R.A.; the three vice-presidents, Mr. Hayter Lewis (Emeritus Professor), Mr. Horace Jones, and Mr. Ewan Christian; the honorary secretary, Mr. Macvicar Anderson; and Messrs. James Brooks, Arthur Cates, E. A. Grüning, E. H. Martineau, E. R. Robson, Alfred Waterhouse, A.R.A., and T. H. Watson. This board will, no doubt, feel bound to carry out the statement in the published programme:—"It is intended that at first the test shall not be severe." The examiners under the Building Act form a board of very similar constitution, and no doubt the useful work done by that board has influenced the decision to extend the present examination to a similar body. There will be some little difficulty in keeping the standard uniform, and there may be some trouble at first in getting so large a board into working order; but I am inclined to believe that a tolerably numerous examining body like this offers a safeguard to students against violent fluctuations. If from year to year new men are elected to replace the retiring members, still the majority of the board will remain from one examination to another; traditions will, to a certain extent, establish themselves; and, in all probability, a tolerably uniform standard and mode of procedure will be preserved. The first examinations will be looked forward to with great interest; and to pass on one of the earlier occasions will, no doubt, reflect credit, and even distinction, on those who do so. Very many gentlemen who might, one would have thought, have been sure of success, have preferred to enter on the old principle, but some of them will, I believe, come to regret that they had not more confidence in their own powers. It would perhaps be a wise thing if, for two or three years, the examination was, so to speak, made retrospective, that is to say, thrown open to gentlemen already Associates, so that some of those now in the body might have the opportunity of adding what will, no doubt, be a real distinction to their names. Of all the things which may be said to be involved in the new examination, nothing is so self-evident as that it must be prepared for, and that this Association possesses the means of aiding in that preparation to a very large extent. Three sorts of preparation may be very easily recognised, as all useful, in fact, necessary. First, that practical acquisition of professional knowledge, and the power to make plans and perspectives, which is gained in an office and on the works, in practice on one's own account, or as an assistant or pupil. No one must hope to pass such an examining body as that Board at Conduit-street unless he has had sufficient practical training to enable him to do all the routine work of an architect's business, and some, at least, of the exceptional work. No one could, I imagine, go up from college, or classes, or any sort of instruction that is purely theoretical, and hope to succeed, any more than a medical student could pass his examination without having walked the hospital; and it will hardly be easy for those who have never done any work on their own responsibility to master this, the practitioner's, side of the qualifications sufficiently for success. Secondly, there is theoretical knowledge of materials and construction, of history, and of what one may call the theoretical drawing, so far as the details of one style go. This must, equally with practical routine, be mastered, and for the acquisition of this, pupilage and practice neither of them supplies much opportunity. Classes and lectures, and private study, must be used with the view of learning theory. Thirdly, and by no means of least importance, there is practice in answering papers of questions, and in replying to a *viva voce* examination,—in short, the skill to use the knowledge acquired. I propose to say something on each of these three heads. First, as to what we have termed the routine of practice. The greater number of those who are likely to desire to become Associates are probably more likely to be familiar with this than to be quite safe in either of the other two branches of preparation. Sharing for some years in actual work, or in carrying out a single building of one's own, will give good opportunities for becoming familiar with an architect's work; and the only hint, perhaps, that need be given, is to suggest to gentlemen who are pupils and assistants the importance of keeping their attention awake to all that goes on within their reach. The practical subjects which are most accessible to one man will be least so to another; but, on the whole, dealing with ruinous and dangerous structures, and planning for special purposes, appear to be the two most likely to lie a little wide of the range of many architects' pupils. As to the ruinous structures, they, as I have already hinted, occur from time to time, and if a young man is on the look out for information, he may be able to learn a good deal even from a single case of this sort. As to designing, that is mainly learned by practice. Any one can exercise himself in planning if he pleases, especially now that so many prizes are open for such work. But on this part of preparation, let me point out that the recent formation of a class for the study of planning and specification writing, and the two Classes of Construction and Practice, ought to aid members of the Association very materially in their acquisition and systematising of what may be termed practical knowledge. Perhaps it would be right to add the hint that some acquaintance with iron construction will probably be expected now that we have fairly entered the last quarter of the nineteenth century. The candidate at such an examination ought, at least, to be prepared to sketch iron beams correctly, and calculate their sections, in addition to being familiar with timber, brick, and stone construction. The second part of my suggestions as to preparation for the examination referred to Theoretical Knowledge. Here, I think, there is room for a great deal of improvement in our methods of instruction, and I venture, even at the risk of giving offence, to say that much of our modern architecture has suffered in consequence of defects in this instruction. Probably the greatest service which the examinations can possibly render will be their causing many pupils and others to learn something of the history of our art, and to acquaint themselves minutely with a little bit, at any rate, of that art. My own profound impression is that a good, familiar knowledge of some of these things is of the greatest possible value to the architect, and that the question whether he shall rise or not in his profession depends upon his mastering a few things, which he does not see are likely to be immediately useful,—such, for example, as drawing the human figure, in addition to the things of which he has need at the moment. But many of the younger among us do not seem deeply penetrated with this idea, and for them it will, as I have hinted in an earlier part of the paper, turn out to be a great advantage that now something has arisen which will compel a little attention to theory, and art history and architectural study of the higher kind. This, however, is a digression; the immediate subject before us is to find out how history and the science of construction must be studied, and your committee has, very wisely,—as I, at least, who am myself an instructor, must admit,—determined that some direct instruction shall be afforded here in these subjects. You are, of course, all of you, aware that two courses of lectures, one of which is to be a kind of companion to the subjects in the Elementary Class of Design, and the other similarly to accompany the subjects in the Elementary Class of Construction, are arranged, and indeed have already begun, with every promise of success. I do not think these subjects could have been entrusted to better hands than those of Mr. Tarver and Mr. Blashill respectively, and the only thing to be regretted is, that it was not possible to make each course longer. Still, as the lectures are delivered at considerable intervals of time, as they are associated with the subjects for study in the two classes, and as it will be possible for you, if you are industrious, to carry your study of each subject further than Mr. Blashill or Mr. Tarver can, within the space of an hour's lecture, take you, these courses may enable you to acquire a very considerable amount of knowledge respecting the subjects treated of. Mr. Tarver's series includes, after his introductory lecture, all those styles (or at least the most prominent of them) which combine to connect the work of the present day with that of the most artistic nation on the face of the earth. The Greeks fixed for all time a very large part of the architecture of civilised communities. Not that we, or those who went before us, are wise if we attempt to build in Greek, but that each style has been founded on the one which preceded it, and all alike inherit from Greek originals most of their features. The Roman, we all know, was a coarse rendering of Greek art, with the addition of the arch. The Romanesque, Byzantine, Lombard, and Rhenish are all children of Rome. The Gothic styles are their immediate descendants, and the Renaissance, the last in the series of Mr. Tarver's subjects, is a return to Roman forms, animated by a modern spirit. This is the tale of architectural history, as it affects ourselves, told in a sentence, and I sincerely hope you will all hear it told far more completely in Mr. Tarver's class. Not less comprehensive is the scheme of Mr. Blashill's constructive lectures. The first two relate to the foundations and walls of a fabric, the subjects being excavator, bricklayer, and mason. The next two relate to the completion of its carcass, namely the work of the carpenter and the tiler, and they take in that of the plasterer. The remaining four take in the most important parts of the finishing of a building,—those of the joiner and ironmonger, smith, plumber, painter, and glazier. Under the head of plumbing you may be sure that you will, from Mr. Blashill, not only get some advice as to the construction of flats and gutters, and so forth, but an account of those methods to which I have already had occasion to make allusion, that modern skill has brought to bear on the sanitary condition of dwelling-houses. The plumber has heavy responsibilities upon him; not only has he in times past set fire to many a cathedral spire and roof, but in our own days his shortcomings have been followed by disease and fatality. How to deal properly with plumber's work means really the management of water-supply, of drainage, and of sanitary fittings,—in short, the protection of the inmates of a dwelling from sewer-gas. Perhaps it may not be out of place if I add the suggestion to members able to attend these courses of lectures, that they will be wise to take the opportunity this session, and not to postpone their attendance till another. The courses may possibly not be repeated; or, if repeated, they may be in a different mould. The opportunity is presented now, and is a very valuable one, and no one will regret the very moderate fee, and the very moderate sacrifice of time which attendance on both these series of lectures would involve; and even though one in the Construction course and two in the Art course are already given, that circumstance will not prevent attendance upon the remainder from being most desirable. The third point to which I drew attention was practice in examinations. It is possibly a weak point in the Architectural Association system that there is not a system of examinations connected with it. The experience of University College shows conclusively that the examination at the end of the session acts as a stimulus, and also helps the student to gain a command over his own resources and his own acquirements. And though I feel that I am more fortunate than my two friends just named, not only in having to treat substantially the same series of subjects in three times as many lectures, but also in having an examination and conspicuous prizes to point to, I cannot but see that the Association, if it chose, might do more than it is easy for University College to attempt in the way of examination-practice, if I may use such a word. No one can do full justice to what he knows in an examination, whether by papers or *viva voce*, unless he be somewhat in the habit of answering questions, and answering them, so to speak, under pressure. The members of your new History Class, and those of the Construction Class, will probably, both of them, have an opportunity of attending an examination, or perhaps more than one, and they will be wise if they all avail themselves of that opportunity when it comes, and prepare for it well beforehand. In addition to this, however, some arrangement to afford practice in answering an examination paper on architectural subjects, within a certain limit of time, and without turning to books of reference, if it could be managed, would be very serviceable to intending candidates, as tending to give them confidence, and to show to them where their weak points lie, in time to apply a remedy. Such an arrangement would be quite practicable here, and would surely be worth attempting. One measure which has been from time to time strongly advocated in this Association is cer-

* By Professor T. Roger Smith. (See p. 691, *ante*.)

tainly closely allied to the New Examination, but is not involved in it. I allude to a diploma for architects. The two things resemble one another so much that we are apt to forget how widely they differ. It is not unlikely,—at any rate, not impossible,—that the new examination may be found to afford the chief advantages of a diploma without some of its obvious disadvantages. Take, for example, the difficulty of deciding what is, and what is not, to be prohibited if a diploma is granted. The only act which could well be taken hold of is the certifying for advances or payments to a builder; and this, it is obvious, has to be done by engineers, naval architects, and many other classes of practitioners, so that a prohibition could be readily evaded. But if the result of the examination is to establish publicly that the Associates of the Institute are a body of architects in whom the public can place confidence, it may very possibly turn out that Associateship will be sought by every architect of skill sufficient to pass the examination, and will be accepted by the public as equivalent to a diploma. It may, on the other hand, very possibly pave the way for the grant of such a document. At any rate, what we have to consider to-night is not the diploma question, but the examination question. If once we recognise that, quite apart from any other measures or ulterior consequences, the examination ought to result in raising the status of architects, in procuring a better estimation of them by the public, and in rendering them more really deserving of public confidence, we surely must recognise something which we are glad to see established, and which we feel ourselves bound to support, by promoting the candidature of the best men in the Association, and by assisting them in the preparation. It must not be forgotten, in conclusion, that, like every untried measure or new departure, this examination is an experiment, and may fail. One serious, or at least possible, risk of failure seems to lie in the fact that so many young men have avoided the examination by becoming Associates under the old rule. The result may very possibly be that fewer candidates will, at first, be forthcoming than there ought to be; but I have every confidence that even if this is so, the Institute will persevere, and that the good sense of young architects will make them soon come forward in sufficient numbers. There can, in that case, be no doubt of success. Were the examinations to fail, the failure would throw us back twenty years, perhaps fifty years. On the other hand, if they succeed, we shall see established in our midst what ought, under good management, to prove a powerful agency for good. The consequences ought to be better education and greater skill. The architect's fitness for his work ought to be at once more assured and better recognised. The general estimation in which our profession is held by the public ought to be proportionably raised. Let us all, each one as he can, endeavour to contribute to this result.

In the discussion which followed,

The President (Mr. Aston Webb) said he thought all the members would agree with him in thinking that Professor Smith's paper was a most valuable and useful one. The Association was glad of that opportunity of congratulating the author upon the fact that he was now the Professor of Architecture at University College. All who intended to go in for the New Examination could not but feel that it was of great advantage to them to have the hints and advice which Professor Smith had given them with so much authority and, at the same time, with so much kindness. The partial failure of the Voluntary Examinations at the Institute tended to raise some doubts as to whether the new Obligatory Examination would be as successful as could be desired, but whatever might be its success or failure, the Association had done, was doing, and would continue to do, everything in its power to make it a grand success, feeling that if it were so it must be to the advantage of the profession. He was glad to say that there was a large number of the members of the Association who were prepared to go in for the new Examination in due course. He thought, however, that one mistake as to a point of detail had been made, and that was in its having been arranged that the first obligatory examination was to be held some time in the next spring, before the Association's special courses of lectures were over, and before the courses at the University and King's Colleges were completed. He did not know whether that arrangement could be altered now, but he certainly thought it would be desirable to postpone the first examination until much later in the year,—to the time, in fact, when it was proposed to hold the second examination. Much,—very much,—depended on the first examination being successful. Professor Smith had stated that the object which the examiners would keep before them would be to make the examination of such a character as to ensure that the men who passed should be competent to practise as soon as they had passed. If that was the case, it would add to the value of the examination, but would also add to the responsibility of the Institute.

Mr. W. A. Pite said they had been gratified at hearing the Examiners' and Professor's view of the question, but the students' view of the subject must not be lost sight of. He thought that students had been "whipped-up" to the proposed examination a good deal. They had been assured that to pass it would be to gain a very great prize, but, after all, now that the syllabus was published, it did not appear to him that those who succeeded in passing would do anything very great. It seemed to him that when a man had passed it he would not be anything extraordinary. He would only be an ordinary architect, or a decent building surveyor with a dash of art thrown in. For his own part, he was of opinion that the Examination ought to be more full,—indeed, much fuller, with regard to art,—and he should like to see 500 out of the possible 600 marks attainable devoted to art. He moved a vote of thanks to Professor Smith for his able paper.

Mr. Blashill, in seconding the motion, spoke of the services which Mr. Douglass Mathews had rendered in bringing about the examination. The passing of the Examination would be most valuable not only to those who intended practising for themselves, but to those who intended to act as assistants.

Mr. Vacher, in supporting the motion, said he hoped that those who succeeded in passing the Examination would not, if they applied to architects for employment, have their superior claims passed over, as had been done within his own experience in the case of some of those who had passed the Voluntary Examination. He hoped that the examiners would discourage eccentricity in design.

Mr. S. Steward Smith (of Reading), Mr. F. H. A. Hardcastle, and Mr. J. Douglass Mathews having each made a few observations,

Professor Roger Smith, in replying on the discussion, observed that he did not think the grounds put forward by the President were sufficient to warrant the postponement of the first Obligatory Examination. Notice had been given of what was intended for the last two years, and the programme had been published some months ago. The question had been raised whether the certificate of having passed the Examination would necessarily imply perfect fitness to practise the profession as an architect. No doubt the public would so regard it, but the Examination merely professed to ascertain the qualifications of candidates for admission into the membership of the central society of the profession. There would be less difficulty in the present tolerant age in obtaining impartial judgments on questions of art from the Examiners. "Eccentric" designs would not necessarily be rejected unless they were accompanied by marked defects in planning and construction. As to the relative proportion of marks required to be obtained by the candidates in each section, he thought, as the prospectus of the Examination was at present worded, the candidate would be entitled to pass if he obtained 300 marks, however distributed, out of the maximum of 600. Possibly the Examiners would, after a time, prescribe the minimum number of marks to be gained in each subject.

SURVEYORSHIP ITEMS.

Bridgwater.—There were ninety-nine applications for the post of borough surveyor, from which a selection of four was made, viz:—Mr. Franklin, Reading; Mr. Baker, Malden; Mr. Laffan, Croydon; and Mr. Tylecote, Halifax. These gentlemen were interviewed by the council at their meeting on the 2nd inst., and Mr. Laffan was appointed.

Finchley Local Board of Health.—Francis J. Bancroft (Highways Department, Islington Vestry) was, on Monday last, selected for the position of junior in the surveyor's office of this local board.

OUR CATHEDRALS.

Sir,—My completion this past summer of a tour (carried on at intervals over a few years) of all the English and Welsh cathedrals seemed an appropriate occasion for gathering up into a paragraph or two for the pages of your valuable journal some of those notes and queries suggested to my mind by the present condition of these interesting fabrics,—and while I am well aware that the same worth cannot attach to these comments as if they came from the pen of a more competent writer, yet, if you will kindly allow them space, I think they may prove acceptable to some of your readers, and perhaps elicit a little information.

Closely linked with the remembrance of *Bristol* is a strong feeling of commendation for the energy displayed in bringing to a completion the building of an entire nave, probably the most important work among our cathedrals which this generation has witnessed. One would like to see the three towers finished, giving a distinctive character to the exterior. There is a movement just now on foot to bring the south-west tower up to the level of its fellow; but what of the pinnacles and parapet of the tower at the crossing; where are they gone and in what manner are they to be replaced? And what hope is there of the general exterior being cleaned, which is so much needed? Is the considerable remaining cloister to be restored and rebuilt as a quadrangle?

Lincoln.—The general condition of this glorious minster at present calls loudly for attention to other parts besides the west front. The nave and transept vaultings, so beautiful in design, need cleaning, and unless the eye deceives, they are covered with plaster, which would account for the many cracks discernible. May it not have been left for the builders of our own time to complete the cloister, after first sweeping away the utterly worthless Classic addition? The interior stonework of the chapter-house does not strike one as being in a good state of preservation.

Bangor.—This little cathedral, so ungainly in days gone by, presents now a really handsome appearance within. It is a pity that the exterior is not yet adorned with a completed central tower, even if it be without that pyramid of slate shown in the design. The canopies and stalls in the choir are very effective, and a credit to the present school of wood-carving. A reredos is still wanting.

York.—A visitor to the minster, strongly impressed with the conventional preference for this particular cathedral, will probably find that its splendid exterior comes up to all his expectations. Within, a glorious ideal is presented; but how faulty are many of the details. The vaulting over the nave, for instance; the absence of any vaulting beneath the western towers,—indications that the complete realisation of the original conception is still left to a future day.

Rochester.—Much has been done in the choir and transepts, with happy results. It is a pity for the hands of the restorer to be stayed just at this stage. Most of the eastern gables want correspondingly high-pitched roofs, and Mr. Cottingham's tower at the crossing may have to be improved away. So much the better. It is stated that a new central tower is seriously contemplated. One of worthy design would largely contribute to make this building what it certainly is not at present,—externally pleasing.

St. David's.—The many who have not made a pilgrimage to this rather inaccessible little city, but yet feel an interest in the ancient fabric, which is the finest and largest of the Welsh cathedrals, will be glad to hear of repairing works successfully carried through, not a bit too soon. Much, of course, still remains untouched. How far it may have been an advantage to take out the great west window, in the Debased Perpendicular style, to be replaced by modern Norman lights as a memorial to Bishop Thirlwall, is a question on which there will be two opinions. As to the fittings, it is lamentable to come across fragments of the old organ lying about which have been in the same position for years, and to learn that funds are not forthcoming to rebuild it or erect a new one. Fortunately no other cathedral in England and Wales is without an organ.

Salisbury.—Generally speaking, it will be matter for congratulation that the works of restoration have left this cathedral in, to say the least, a state of good repair. No one is

likely to regret the removal of very poor stall-work and canopies from the choir; but *apropos* of the present handsome stalls, are they not to have canopies? Salisbury, from the peculiar lightness of its architecture, and on account of its numerous windows, strikes one as being a particularly cold cathedral, and a row of delicately-carved canopies would give a warmer aspect to the choir. It is to be hoped the double organ will be supplied with cases before long, or treated after the same system of decoration as the instrument at Durham.

Chichester.—Part of the design of the reredos has still to be carried out. Here, again, the question must be asked, how long the very prominent skeleton of the organ is to remain unclothed? And what a pleasing feature this might be made in its pendent position from the north wall of the choir,—a counterpart to that at Ely.

Chester.—After such a transformation as has been carried out here, it may seem too much to expect further effort just now; but the condition of the south transept externally cannot fail to be a general eyesore, and the completion of the south-west tower would greatly improve the effect of the west front.

Gloucester. — The organ surmounting the screen, and which is so conspicuous looking down the nave, is an incongruous, if not ugly, object here, with its three uprights with flattened heads. Something of the lightness of design adopted for the case at Lincoln might be an improvement. Others have suggested dividing the organ; but, would this cathedral look well with an almost unbroken vista, considering the contrast between nave and choir?

Hereford.—Mr. Wyatt's feeble west front is surely doomed for some future day, and perhaps the present generation may live to see a western tower in its place, as in years gone by. It may be remembered that the subject was revived at the last triennial festival in this city.

The general impression left on the mind after a ramble among the cathedrals is that there are very many comparatively trifling works, finishing touches, which through long years have still remained unaccomplished. Is there not some want of energy now-a-days in persevering to the end of great undertakings? How disappointing it is to revisit some grand minster after a long absence, and find still the unchiselled blocks or the temporary fittings; and how lamentably common it now seems to be to leave off at the first stage of a tower, so that for half a century or more it becomes a by-word that "these men began to build, and were not able to finish." Of course the excuse is the pecuniary difficulty; but let it once be realised that this is a *public*, and not exclusively *church*, work, and English money will not be far behind English spirit in the common cause. Art is, in its many forms, more cultivated now than in the past; and whatever may be said in disparagement of "Victorian Gothic," still there is no doubt that this age has, to a large degree, been imbued with the genuine feeling of the old cathedral builders. Now is the time, then, for fresh effort, before the capricious fashions in art-taste dictate the special worship of some other style in architecture, and our children, perchance, turn out to be as bad "Gothic" distorters as were their grand-parents. But a little reverent care, a season of patient labour, and we shall be able to leave to posterity, in unimpaired splendour, those cathedrals which are such an ornament to our country, while we may with affection and with pardonable pride inscribe upon their walls the legend that I yesterday read over a porch in Wimborne Minster:—"Our holy and our beautiful house in which our fathers worshipped."

D. JOHN D. CONNER.

THE INTERNATIONAL EXHIBITION OF SMOKE-PREVENTING APPLIANCES.

THIS Exhibition has now been open for more than a week, and is in fairly complete order, although a blank space here and there shows that some would-be exhibitors are either very dilatory or very unfortunate in not being able to take up the positions allotted to them. We have authority for stating that the executive committee will be glad to entertain proposals for receiving and exhibiting (even if only during the last week of the Exhibition) any novelties in the way of inventions or processes which come strictly within the scope of the exhibition, the object of the committee being to elicit information on the subject of smoke-prevention and fuel-economising. We are glad to learn that the attendance of visitors has so far been very good, and in excess of anticipations. The fact may be usefully noted that the Exhibition will remain open every week-day until further notice from 10 a.m. to 10 p.m. We trust that it will be largely visited by our readers, especially by architects, builders, and manufacturers. We have no doubt whatever that in the attainment of the ends which the promoters of the Smoke Abatement Exhibition desiderate, not only will health be promoted, but fortunes will be made by those who succeed in perfecting, and saved by those who adopt, stoves and furnaces which shall not only consume their own smoke, but which shall be far more effective, in proportion to the heating power stored in the fuel, than are most of the appliances in common use at the present day.

We take this opportunity of mentioning one or two exhibits in addition to those already referred to. Messrs. Rosser & Russell (Block XVIII.) exhibit the "Leopold" reversible or revolving grate, which consists of a circular cage or fuel basket revolving on a pivot. It is fitted with two hinged gratings, so that whichever grating is uppermost can be opened for the admission of fresh fuel, which by a half-revolution of the basket will be brought under the lighted fuel so as to consume the smoke and gases evolved from the fresh fuel. This firm also show their warm-air ventilating grate, and a cooking-range, hot-closet, and heating apparatus. Mr. Thomas Goodchild, F.R.I.B.A., exhibits, at the north end of the eastern arcade, a full-size drawing of his "Economic" stove, patented by him, we understand, in 1857, but the patent of which he allowed to lapse. It is strikingly like another stove more recently patented, and shown in another part of the Exhibition. At the north end of the western arcade Messrs. Mintons exhibit a drawing showing plan and section of patent smokeless pottery ovens, which appear to be not only admirably adapted for preventing smoke, but for keeping the temperature easily under control. We mentioned last week that the conservatory is illuminated by the Siemens gas-burners. A description of this ingenious invention would not be intelligible in few words unless accompanied by a section, but we may say that it is based upon the principle of the regenerative gas furnaces almost universally used in the smelting districts, and known to all as the Siemens furnaces. It is claimed that from this burner can be obtained with equal facility and economy lights varying from 30 to 1,000 candle-power, but it is in contemplation to construct both larger and smaller sizes.

THE FALL OF A HOUSE AT MAIDA VALE.

IN regard to this casualty, reported by us three weeks ago (see p. 650, *ante*), the Building Act Committee of the Metropolitan Board of Works presented the following report at the meeting of the Board on the 2nd inst.:—

"The Board on Friday last referred to your committee a letter from Mr. G. Lushington, Home Office, dated 17th of November, 1881, with a letter from Mr. T. H. J. Shadwell, relative to the fall of a half-finished house and shop in Clifton-road, Maida-vale. Your committee have received from your Superintending Architect a report upon the subject, prepared in pursuance of the resolution of the Board, and also a report from Mr. Horace Gundry, the District Surveyor for Paddington. The house in question was the westernmost of a block of four in course of erection on the north side of Clifton-road, and it fell suddenly between five and six o'clock on the afternoon of Saturday, the 12th ult. The bricks were of fair quality, and the mortar, which was composed of lime and brick-rubbish mixed in a pug-mill, as required by the Board's By-law, was hard, but deficient in grit. It appears that a kind of dumb well was formed on the site to receive the surface-water, and that a drain was taken from this well to the sewer in Clifton-road. The mouth of this drain was about 3 ft. from the south-west angle of the fallen house, and was below the level of the concrete under the party-wall. Your Superintending Architect is of opinion that the fall of the house is not to be attributed to the use of improper materials or defective workmanship, but that the accident was occasioned by the excavation for the drain at the south-west angle of the house, the water collecting in which so saturated the soil as to cause it to subside under the weight of the south quoin of the party-wall, and the slipping or failure of this quoin brought down the house. Your committee, therefore, recommend that the Home Secretary be informed in accordance with the foregoing report, and that they be authorised to consider the advisability of inserting a clause in the proposed Bill for the amendment of the Building Act, requiring all drains to houses to be laid in before the walls are commenced, and the junctions made and the excavations filled in to the satisfaction of the District Surveyor; and a further clause requiring, in the case of quoins of party-walls and piers carrying heavy weights, that the depth and width of the concrete be increased beyond the dimensions set out in the Metropolis Management and Building Acts, 1878."

The report (which bears out the remarks we have already made) was adopted without discussion, on the formal motion of Mr. Ebenezer Saunders, chairman of the committee.

ALHAMBRA THEATRE, LEICESTER-SQUARE.

SPEAKING, last week, of the re-opening of this well-known building, we said the dome was to be illuminated by the electric light, and that we would report on the effect. Certainly the effect was very striking. In place of the dark and dingy void heretofore seen on looking up, the dome now presents the aspect of a bright blue sky, "fretted with golden fires." The light consists of four of Siemens's arc lights, the dynamo-machine of which is driven by one of Tangye's steam-engines. These lights are enclosed in a stained-glass lantern, which produces a jewelled effect, and sends a warm light down on the auditorium, whilst the pure white light which is thrown upwards on the glittering surface of the dome, is diffused by reflection throughout the building.

The coloured decorations throughout have been renewed with good taste. The principal structural works which have been undertaken consist of the widening of the proscenium, the improvement of the accesses and staircases to the stalls, and an examination and strengthening of the main timbers and supports of the building. The width of the old proscenium had been limited by two of the iron columns supporting the main roof, but these have now been removed, and new and more substantial columns, carrying a deep iron girder under the base of the dome, have been substituted. The operation was an extremely delicate one, and required a profusion of solid shoring over the stage, which, together with the forest of scaffolding raised for the painting of the dome, produced to those who knew the building a most peculiar appearance. We may hereafter be able to describe and illustrate this operation. The result of this alteration has been to widen the proscenium, structurally, some 10 ft., but, unfortunately, for want of time, the benefit of this is not yet apparent to the public, and the old proscenium screen has been left in position until a new one, more in accordance with the style of the house, can be prepared. The floor of the stalls has been raised slightly, and the next improvement should be the lowering of the floor of the orchestra so that the popular and portly conductor, Mr. Jacobi, and sundry bass viols, may no longer intervene between the spectators and the actors. The works to the stage have included the completion of a fire-proof concrete screen between the stage and the auditorium.

Advantage was taken of the closing of the house thoroughly to overhaul the whole of the construction, and the directors called in a civil engineer, Professor Kennedy, of University College, to consult with their architects on the subject. The result has been that considerable works for the strengthening of the dome have been done, and means taken to ensure the safety of the fabric.

All the works were done by the contractor, Mr. Brass, of Old-street, St. Luke's, with the assistance of his foreman, Mr. Jones, for the constructional work; and his sub-contractor, Mr. W. Homann, for the decoration. The upholstery and carpeting have been supplied by Messrs. Tyler & Son. The stained glass lantern for the electric light was manufactured by Messrs. Pitman & Son. The contract was completed within the time agreed upon, the men working day and night in alternate gangs, and the whole of the works were done from the designs and under the superintendence of

Messrs. Perry & Reed, of 9, John-street, Adelphi, the architects to the theatre.

The house was re-opened on Saturday last, the 3rd inst., with the spectacular opera "Black Crook," produced with great splendour and complete success.

UNDERGROUND DWELLINGS IN LONDON.

At the meeting of the Metropolitan Board of Works, on the 2nd inst., the Building Act Committee brought up the following report:—

"In pursuance of the Board's resolution of the 11th of November, your committee have considered the question of the duties of District Surveyors under section 103 of the 18 & 19 Vict., cap. 120, in reference to rooms in the basements of buildings used as dwellings. From a report presented to your committee by your Solicitor and Superintending Architect, it appears that each District Surveyor is bound to report to the Board, and also to the District Board or Vestry, in the months of June and December in every year, and at all other times when required so to do by the Board or Vestry, any room of a house in his district the surface of the floor of which is more than 3 ft. below the surface of the footway of the adjoining street, and any cellar, where such room or cellar is or has been occupied separately as a dwelling, which does not comply with the requirements contained in the 103rd section of the said Act. Your committee recommend that a letter be sent to each District Surveyor by the Clerk, informing him thereof, and asking why returns have not been made to the Board as required by the Act, and requiring returns to be made in the present month of December, and in future in June and December of each year."

Mr. J. Ebenezer Saunders, chairman of the committee, in moving the adoption of the report, said it was most important, in the interest of public health, that the District Surveyors should do their duty with regard to this matter.

Mr. Edwards, as representing Marylebone, coincided. In his parish recent revelations had shown that in streets where one would have little expected to find them, underground dwellings existed.

The report was adopted.

We think it right to observe that the District Surveyors are not the proper body to carry out this requirement; their duties are structural,—not matters of police. Moreover, the Act does not give them power to enter at such times as would be necessary to prove occupancy.

PATENT RECORD.*

APPLICATIONS FOR LETTERS PATENT.

5,055. J. A. Davie, Ebbw-vale. Preparation and combination of materials for bricks, tiles, slabs, &c. Nov. 18, 1881.

5,064. E. Homan, Turnham-green. Construction of fire-proof floors. Nov. 19, 1881.

5,067. W. S. Welton, London. Appliances for economising fuel and consuming smoke. Nov. 19, 1881.

5,077. H. H. Banyard, London. Water-meters. (Com. by W. Germutz, Vienna.) Nov. 21, 1881.

5,091. H. Defty, Middlesbrough. Generating heat by gas or oils for heating buildings. Nov. 22, 1881.

5,095. W. R. Lake, London. Manufacture of bricks. (Com. by W. W. Potts, Bridgeport, U.S.A.) Nov. 22, 1881.

5,111. J. R. Hargreaves, Haslingden. Hot-water fittings in houses. Nov. 23, 1881.

5,118. H. J. Haddan, Kensington. Construction of roads and pavements. (Com. by J. J. Salvat, Morceux, France.) Nov. 23, 1881.

5,142. L. A. Groth, London. Apparatus for warming or heating. (Com. by C. Östlund, Stockholm.) Nov. 24, 1881.

NOTICES TO PROCEED

have been given by the following applicants, on the dates named.

Nov. 22, 1881.

3,116. G. Furness and J. Robertshaw, Manchester. Appliances for raising, holding, or lowering blinds. July 18, 1881.

3,156. T. E. Parker, Battersea. Open fireplaces, &c. July 20, 1881.

3,183. W. Cunnington and W. Cunnington, jun., Chelsea. Decoration of paper-hangings, &c. July 21, 1881.

3,223. T. Barnby, Birmingham. Folding or camp furniture. July 23, 1881.

3,303. J. H. Johnson, London. Manufacture of artificial stone and marble, &c. (Com. by La Société Anonyme de Certado, Paris.) July 28, 1881.

3,746. E. Kaulbach, London. Apparatus for consuming coal, &c., for heating purposes. Aug. 27, 1881.

Nov. 25, 1881.

3,170. R. R. Gibbs, Liverpool. Apparatus for cooling, cleansing, and purifying air. July 21, 1881.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending November 26, 1881.

1,671. G. H. Flood & D. Young, London. Apparatus for regulating and controlling the flow of liquids.

This is an improvement on Patent No. 2,468 of 1880, in applying the wedge to valve-cocks and ball-valves. (*Pro. Pro.*) April 16, 1881. Price 2d.

1,680. A. Tyson, Ulverston. Hot-bed frames or conservatories.

The roof is cover-glazed and formed in two parts, jointed in the middle. The gable ends are hinged frames, to fold down out of the way when the top cover is let down flat, and to stand up when the cover is to form a slanting roof. These are all secured by hooks, &c. April 16, 1881. Price 4d.

1,682. L. Wall, Islington. Apparatus for regulating supply of water to water-closets.

This is an oscillating receiver, which is placed in the tank and filled through a ball-valve. The receiver is hopper-shaped, and when full it tilts over and discharges its contents, at the same time closing the ball-valve. When empty it returns to its place and is again filled. April 16, 1881. Price 6d.

1,714. C. R. Stevens, Lewisham. Apparatus for heating, cooking, &c.

For supplying hot water to baths, &c., a boiler is used with two flues, through which the heated gases from the burner beneath pass up and down before they escape to the flue-pipe. The heated water, therefore, ascends a flow-pipe into the tank above, from which it again descends through the return-pipe until it is all duly heated. This invention also includes a boiler for creating steam for blast purposes for cooking, &c.; a gas-regulator for the heating apparatus, and tanks for circulating water-heaters, the bottom and sides whereof are held together by channel-iron. April 20, 1881. Price 8d.

1,747. W. R. Lake, London. Castors for chairs, tables, &c.

These castors are rendered elastic or yielding by a spiral spring placed round the stem so that the table, &c., is always in a level position, even if the floor is uneven. (Com. by A. F. Maachain, Geneva.) (*Pro. Pro.*) April 22, 1881. Price 2d.

1,756. G. Walker, Birmingham. Fastenings for windows.

A spring catch-piece is applied to the upper bar of the lower sash, so that when the fastening arm on the lower bar of the upper sash is turned, it slips past the free end of the catch-piece and is thereby firmly locked. (*Pro. Pro.*) April 23, 1881. Price 2d.

1,757. A. M. Taylor, Lenzie. Safety-valve plugs for water heaters or boilers.

These are specially applicable to kitchen boilers. The plug is made with a passage through it and is screwed into a hole in the boiler shell. The passage is closed by a valve with an internal spindle, on the inner end of which a sprig is placed. April 23, 1881. Price 6d.

1,817. W. E. Gedge, Westminster. Artificial stone.

The stone is made of sand and lime or cement, set with a solution of shellac, glue, or borax, &c., and it has a facing of porcelain to prevent porosity. Wires are imbedded in the body of the stone, whereby the blocks may be bound together or to the beams in the building. Plates of metal, rubber, or felt, &c., are interposed between the stones to prevent access of moisture. (Com. by G. Boden, Atlantic City, U.S.A.) April 27, 1881. Price 6d.

* Compiled by Hart & Co., patent agents, 28, New Bridge-street, E.C.

BUILDING STONES OF SCOTLAND.

Sir,—I have read in the *Builder* a paper read by Mr. Gowans, under the above heading, with great interest; and as he lays considerable stress on the Carmyllie Railway and the Auld Wind Mill, it behoves me to take a little wind out of this old wind-mill, and blow it a little more to the north-east. No doubt Messrs. Gowans and Mitchell did a great deal of good to the Carmyllie district in connexion with the Earl of Dalhousie, to whom the quarries belonged, and no doubt a greater trade by all the difference he has mentioned is carried on there now than was forty-five years ago, being the extent of my own memory; but the question is, have the machines or the railway contributed most to the development of the quarries? There was a time, a little beyond my memory, say just fifty years ago, when there was not a stone-planing machine in Forfarshire, but there was a gentleman, Mr. Fullarton Lindsey Carnegie, who engaged the son of a loom and shuttle maker to come from Arbroath to his estate at Leysmill to fit up and work circular saws for cutting up timber, and in this capacity he invented the Forfarshire stone-planing machine, and opened the far-famed Leysmill Quarries, and by the support of the said Mr. Carnegie assisted to carry out the Arbroath and Forfar railway, and had wagons and horses ready when the last rail was laid to carry on traffic betwixt Leysmill and Arbroath for months before the first locomotive (Victoria) was ready. And I may here mention that the first machine was made about the year 1833; and about that time, or a little after, the late Sir Wm. Cubitt, and many others, came from London to see them at work, and their report was so favourable that shortly after machines were sent to Valencia to plane the slate flags there, and to Lord Morley's estate near Plymouth, to Sweden and Belgium, also to Yorkshire; but in no case, except the slate, has there been found beds of flags that can be planed by these machines so well as those of Forfarshire, and before the opening of the railway to Arbroath there were six machines in operation, planing 1,000 ft. super. per day. And after this railway was started slabs were carted from Carmyllie four miles, and from the Forfar quarries ten miles, either to supply the great demand upon the Leysmill quarry-owner, or they were planed at the rate of 3*l.* 8*s.* 6*d.* per 1,000 ft.

But these were still early days, when the country was not prepared all at once to receive those improvements, any more than it was for the great feat of naval architecture of Brunel: so, under the superintendence of the inventor,—my late father, James Hunter,—the Leysmill Quarries went on in prosperity, while surrounding quarries were slack, owing to the want of machinery; and the first planing-machines erected in Carmyllie district were two, which had been sent to London to a Mr. Braithwaite to work, under licence, in a given circle with St. Paul's as its centre, but the agreement not being properly carried out, they were recovered, and erected at Carmyllie some seven or eight years before Mr. Gowans made the railway, and to this date these particular planing-machines have not been improved upon. But the inventor introduced a method of throwing over the tools at the end of each stroke, so as to preserve a cutting-edge when working on such as Yorkshire flags; and the same arrangement has since been introduced by Messrs. Coulter & Harpers. Next come the sawing and moulding machines referred to. These were entirely my invention, and they have been used broadcast all over Forfarshire, and although I have learned that a late Arbroath firm actually charged a royalty on these machines in my name to the extent of 50*l.* and 100*l.* each, yet I never received one penny out of the Forfarshire quarries, although I had four patents, all of which are being worked upon amongst those quarries.

And now, having stated a few facts as to what has taken place, I should like to look forward as to what may take place in another fifty years. There is a large deposit of very fine pavement under Turin Hill, and there is a railway station at its base, and this rock could be reached by a short tunnel from behind this station, cutting through to the back of the rock, which lies at a dip; a strong conglomerate lies over it, so that a reasonably-sized roof or chamber can be opened. But mining has not been attempted to win the flag-rock of Forfarshire, with or without the aid of machinery. But considering it has given birth to such mechanical men as James Carmichael, Dundee, inventor of the fan-blast; Mr. Bell, parish minister of Carmyllie, the reaping-machine; Alexander Shanks, Arbroath, the lawn-mower; James Hunter, Leysmill, the stone planing and boring machines, it would not be too much to expect that one will yet turn up to convert Turin Hill into a machine mole's nest, and Clocksbriggs into another Carmyllie.

Geo. Hunter.

The Wood Trade.—Messrs. James Smith & Co., of Liverpool, say, in their wood circular and prices current:—"The arrivals since our last have been 61 vessels, 49,225 tons, against 140 vessels, 103,867 tons in corresponding period last year; and 37 vessels, 15,193 tons in 1879. The demand for the month has been somewhat checked by the advance in prices of most articles, and the continued firmness of holders, who are strengthened considerably by the moderate stocks, small import, and the large number of casualties caused by the late gales. Trade generally throughout the country is better, but the prevailing complaint is that prices do not improve as quickly as was expected. If shipments are kept moderate, a fair business may be realised during the winter. Money continues firm, and the bank-rate is unchanged, ruling at five per cent. Freights continue favourable to importers."

THE INSTITUTE OF PAINTERS IN WATER-COLOURS.

The two principal Water-Colour Exhibitions held the private views of their Winter Collections on the same day, as usual (Saturday last), but we have only space this week for a notice of one of them. We made no secret, in speaking of the last of the Institute's exhibitions, that we looked on their position as critical. The Winter Exhibition, considered that it is frankly what these winter exhibitions originally professed to be in both cases, one of sketches and studies, is more encouraging again, and contains some good things: some also of the peculiar trick-painting which certain members practised *ad nauseam*, is much less frequent or prominent. The Institute has lost by death, since its last exhibition, a member whose drawings were always pretty prominent there, Mr. Augustus Bouvier, whose very French-looking nymphs, dancing or posing always with the same mannered and coquettish grace, may have had their admirers, who must now look their last on these damsels. We say polite things to ladies at parting, even when they have been dull, and we will endeavour to make no exception in regard to these *demoiselles* of the late Mr. Bouvier's creation who now simper before us for the last time. *Valete, puellæ!*

The times are gone when Mr. J. D. Linton sent his most thoughtful work to this gallery, where his genius became known to those who can appreciate superb colouring and execution, and a dignified and thoughtful style. His strength has been expended elsewhere of late, and his one contribution, as has been the case since then, is rather a study of a costumed figure than a picture, in the sense of those he used to send. It is called "The Earl of Leicester" (217), a three-quarter length figure in a hawking costume of buff, but decorated with richly jewelled appendages, holding a hawk on his wrist. The drawing might have any other name, but the refined and delicate features are of sufficiently *recherché* type to suit the idea of the Earl of Leicester, and it is finished with exquisite softness and delicacy. Mr. C. H. Staniland, in "H.R.H." (25), suggests the idea that he has been influenced by the style of Mr. Linton in some respects, mostly in regard to colour and the general scope of the picture; it may also be called a costumed figure, that of a little child dressed in rich and long robes in which warm amber predominates, and with a ponderous wig of dark hair placed on her head, from beneath which her own blond hair shows. The face is pretty and infantile, and there is a playful effectiveness about the whole. Mr. C. Green's "Cup and Ball" (212) and "Yours Devotedly" (289) can claim to have little more interest than what belongs to lay figures well posed and clothed in effective dresses which are well painted. Miss Mary L. Gow's "An Invitation" (179) belongs to a different order of work; there is much character in the figure of the girl who writes the letter, to whom an old bookcase with its motley contents forms a carefully-studied background. Mr. G. Clausen's "An Interior" (225) is a very clever slightly-executed study, both in regard to the figure and the surroundings. Mr. Towneley Green's "Autumn" (185), a figure in mourning seated in a landscape, has a very pleasing feeling, and that careful and refined drawing of the figure which distinguishes his work; "The Young Housekeeper" (301) shows similar qualities in a portrayal of a very different scene and subject.

Among the landscapes there are many pleasant bits. Mr. E. J. Gregory's "A Calm on the Medway" (13) is a bit of soft sunlight and colour recalling to us some of Cotman's effects. Mr. Whymper's "Passing Storm" (29) is fine in the cloud effect, but wants force in the foreground. Mr. Wimperis's "Low Tide" (53) is a fine little study in the school of David Cox, and Mr. Collier's larger sketch, "Stacking Peat" (195), is as free and powerful a thing, in the same fine school, as one could wish to see. In another manner two or three studies of Mr. Mark Fisher's, especially "Meadow Land" (115), are equally redolent of the breath of nature and of the qualities of the best water-colour art. Mr. Fullylove sends three works in three different styles, all equally good. There is the picturesque of English village buildings in "Cottages in Leicestershire" (54), and the picturesque of palace gardens in "An Italian Garden" (221), and that of grandiose internal architecture in "Siena Cathedral" (286); and it is gratifying to see that this able artist, though he found a new source of effect in painting trim gardens and their lofty hedges, is not going to make this a mere receipt for constant repetition.

Among various small things, two fruit pieces by Mr. John Sherrin, "A Bough of Gooseberries" (267) and "A Bough of Plums" (310), show careful study and no little brilliancy of colour and execution. Some works there are which ought not to be on the walls of any exhibition, and one or two large works with good names which we may conclude are not painted recently or for this exhibition.

AS TO BUILDING OPERATIONS DURING THE NIGHT.

WEBB *v.* BARKER AND WHITEHEAD.

This was an action before Vice Chancellor Hall, in the Court of Chancery, for an injunction to restrain defendants from causing a nuisance to plaintiff by the noise of building operations during the night.

Mr. Eddis, Q.C., and Mr. A. C. Eddis, appeared for the plaintiff, and Mr. Graham Hastings, Q.C., and Mr. Warmington for the defendants.

The defendants are drapers, carrying on business at 75 to 93, High-street, Kensington, and the plaintiff is a provision merchant carrying on business on the property adjoining at 73, High-street, the upper part of his house being occupied for dwelling purposes.

The evidence was to the effect that the defendants were making certain alterations to their premises, and that the builder's workmen employed by them not only worked all day, but during the night, causing such an intolerable noise that persons residing in the house of the plaintiff were unable to sleep.

Defendants' counsel submitted that it was not the practice of the Court to grant an injunction to restrain a mere temporary nuisance. Plans prepared by Mr. Josiah Houle, the defendants' architect, were produced in Court showing the nature of the works, and numerous affidavits of a conflicting character on both sides were read, and after a lengthened inquiry the following decision was given by the Vice-Chancellor.

"The first question is as to the jurisdiction of the Court to grant such an Injunction as that granted in this case. I think that there is jurisdiction to do so under the circumstances existing. It has been said the Court must look at the matter in a reasonable point of view. I do look at it, I hope, in a reasonable point of view, and so looking at it I find that this alleged complaint which I consider to be a nuisance, is doing that which interferes with the comfortable, reasonable, and ordinary enjoyment of the plaintiff's property, and it is unreasonable for the defendants to so act. That interference, and that unreasonable interference being, doing the work during the night time, I do not consider that the plaintiff having this property, consisting in part of a dwelling-house, is bound to submit to the defendants carrying on the works in question during the time ordinarily devoted to sleeping, that is, during the night. It is for that reason the injunction was limited to the hours specified, that is, between eight o'clock p.m. and six o'clock a.m. It is said that this work is only temporary, and for a short time. As regards that I am not satisfied at all, and it does not appear how long this work is going to be continued. I hold that such an interference with the plaintiff's comfort at night times is that of which the plaintiff has a right to complain, and would have a right to complain if this case were now being heard upon the hearing of the action, and that the intermediate injury between the application and the hearing is shown to be of such a character that there ought to be the intermediate relief by an interlocutory injunction.

The next question is, whether, in point of fact, the case is made out? As to that, I think the evidence is plain that there was an interference with the plaintiff's comfortable enjoyment of his dwelling. I may say that I think the evidence of Mr. Goddard, the evidence of the governess, and the evidence of the servants, are amply sufficient to satisfy me that there has been an interference. That being so, I consider the interim order was right. It only remains to deal with the motion for committal. As to that, it is really attempted to get rid of the effect of that motion by saying "We have done nothing wrong." True it is there may have been a noise, as to which you may perhaps say "There is no evidence establishing the noise after the date of the injunction." I am satisfied upon the evidence that on the 18th there was a making of noise such as was intended to be enjoined in High-street, because I consider that the work at the place it was done being and among other things the putting up of an iron door between two portions of the entire building, after it was reconstructed, was, within the meaning of the injunction, making a noise, which was interdicted in the defendant's premises in Kensington, within the meaning of the order, and therefore the defendants must pay the costs of that motion to commit."

A New Exhibition.—The Sportsman's Exhibition is to be opened at the Agricultural Hall, London, on February 9th, and is to comprise every requisite in connexion with Coaching and Driving, Hunting and Riding, Shooting, Yachting, Fishing, Fencing, Athletics, Bicycling, Archery, and games and amusements of all kinds. The idea is a good one.

LONDON ARCHITECTS WITH PROVINCIAL WORK.

Sir,—London architects who have work in the provinces are very hard upon us poor local builders in either not giving quantities, or giving them prepared by a London, and (to us) a perfectly unknown, quantity surveyor, while it is notorious that quantities by a local surveyor are always understood better, and we have more confidence in them, which saves cost to the clients. I will give an example to illustrate what I mean.

The Government recently advertised for tenders for building a post-office in Yorkshire, but no quantities were supplied, and I employed a local quantity surveyor to measure up the work. I did not get the job, yet I had to pay him, although he admits that he has got the quantities out for four contractors (including myself), and that one of his clients is the successful contractor, and he has added 2 per cent. on the amount of the contract to pay the surveyor, who must have made 5 or 6 per cent. on the cost of the job. It would have been nearly as bad if a London surveyor had been engaged, as we should have to get a local surveyor to explain the architectural terms they employ into our local phraseology.

I particularly object to London quantities when the work is erected by subscription. I was recently solicited to subscribe towards building a chancel to our church, but I found that a London architect was employed, and that the quantities would be prepared by a London surveyor, and that if I tendered I should have to pay at least 1*l.* 1*s.* to a local surveyor to interpret the items in the quantities. I, therefore, refused to subscribe; and shall not tender for that or any other work unless quantities that we can understand are supplied, or unless an allowance is made for tenders.

I inclose my card, but wish to remain,

A Successful Builder.

CLERKS OF WORKS.

Sir,—The suggestion thrown out by one who signs himself a "Clerk of Works," for the formation of a society to be called "The Clerks of Works and Builders' Foremen's Association," will meet with approval and support by a large body of men; but if this age is one of progress, as your correspondent assures us, then we may hope the day will not be far off when architects will select their clerks of works from the rank of properly trained and qualified men, who are able to carry out their works in the spirit in which they are designed, and in every other respect fit to be their deputies and members of their profession, as they are in France, Germany, Austria, and other countries. Architects who have travelled abroad and visited buildings in progress, such as the cathedrals at Cologne, Mainz, St. Stephen's at Vienna, the law-courts there, the opera-houses at Dresden, Paris, &c., and met the clerks of works there, must be aware of the difference. It is only surprising that affairs have been allowed to remain unchallenged, all the more as architects have been only too anxious to raise the standard of their profession by proper training, examinations' diplomas, and other devices.

An Old Clerk of Works.

LEAD POISONING.

Sir,—In your notice of Mr. Belgrand's pamphlet, laid by Dr. Saunders before the London Commissioners of Sewers, you very properly call attention to the evidence in England of evil results caused by drinking water, of a certain composition, which had passed through leaden pipes. I believe that in Berlin lead is the only metal that will withstand the destructive force of the water, whilst iron is corroded and eaten through in the course of two or three years. But what I wished chiefly to call attention to is the fact, as I believe it to be, that whilst the greatest danger may arise from the decomposition of lead in stagnant service-pipes and stagnant cisterns, according to the nature of the water and the duration of its period of change and flow, there is not the slightest danger of any sort to be feared from the flow of water through any number of miles of leaden pipes so that it be always flowing.

William White, F.S.A.

THE CASTLE HILL, GAINSBOROUGH.

Sir,—I observe in the *Builder* (p. 662) a note upon "the Castle Hill, Gainsborough." The property belongs to Sir Hickman B. Bacon, premier baronet. He is wintering in Madeira, and will probably not see your number of the 26th ult.; but I can say, on his behalf, that nothing would give him greater satisfaction than that a careful survey and examination of the earthworks should be made. The earthworks, being partly within the park, cannot be open to every passer-by; but Sir Hickman would certainly be the first to come forward and meet any proposal that might be made for an examination and survey. Somers Clarke, Jun.

COMPETITION FOR BOARD-SCHOOLS FOR BARROW-IN-FURNESS AND ROOSE.

Sir,—The letter in your issue of the 19th of November, signed A.B., having reference to the above competition, is calculated to mislead.

The Board did decide in favour of Mr. Holtom for the Island-road Schools. They afterwards invited Mr. Holtom, of Dewsbury, Messrs. T. & W. Bennett, of Manchester, and Mr. Cox, of Kendal, to submit designs in limited competition for Roose.

In consequence of Mr. Cox's designs not complying with the instructions, the competition lay between Mr. Holtom and Messrs. Bennett, each obtaining an equal number of votes. The chairman would not give the casting-vote (having already done so on a former occasion against Mr. Bennett); eventually it was decided to refer the matter to Sir James Ramsden, whose award was in favour of Mr. Holtom. C. D.

DISCOLOURED WATER.

Sir,—Will any of your readers tell me why my supply of water should be discoloured by rust or some similar substance? The water is obtained from a pond about half a mile away, where it is quite limpid; it first runs through a rough filter, composed of gravel and charcoal, into a small reservoir, and is thence carried in iron pipes to my residence; it is usually unfit for washing or cooking purposes unless filtered. I believe that the water supply to towns is carried in iron pipes, and I have not heard of the same complaint.

Any explanation or cure that may be suggested will be thankfully received by

A Lover of Clean Water.

TESTING TRAPS.

Sir,—Whilst on the one hand I have not the least desire to be either severe upon, or offensive to, your correspondent, Mr. Eastgate, I am compelled to respond to his letter in somewhat positive terms, and I think that perhaps the most simple and decisive way that I can do it is to ask him a series of questions, tending to assist his memory and at the same time show him where he is in error. I will proceed in this wise:—

Did he ever go to Messrs. Pullen & Son's and, after examining the scaffold, fitting of the traps, &c., in reply to a question from Mr. Pullen, express himself to the effect that all was fair and just? If he has forgotten this circumstance, I have not, as I was present and heard the conversation.

Did he, after this, rush into print and assert quite the contrary, viz.,—that there was "a space of 18 in. between the plug in the basin and the water-line in the trap"?

Does he remember that, after this, on the 19th of November, I met him at Messrs. Pullen & Son's and distinctly showed him that it momentumed out at 6-in. drop, and that he measured the distance with his 2-foot rule, and acknowledged his error?

Does he remember that he wrote to a contemporary and acknowledged he had made a mistake; but even then (in spite of its having been proved before his eyes and in accordance with his own measurement to be only 6 in.) asserting it was 14 in., thereby virtually stealing 8 in.?

Does he know that Mr. Buchan has also measured this same, and attested to its being only 6 in. instead of 18 in., when it momentumed out?

Does he remember that he wrote, saying:—"Beneath a valve-closet was the safest place to fix a round U trap, and that it will there hold its seal secure"? Your practical readers will, of course, know that the shortest distance between a valve-closet valve and the water-line in a U or half O-trap, is 10 in., so that I am giving him an advantage of at least 4 in. in my tests. Does he know that Mr. Hellyer has written these words:—"The reason why Beard & Dent's U or half O-trap is unsuited for fixing under a valve-closet is, that the contents are easily knocked out; it is safe enough to use under the 'Artisan' and wash-out kind of water-closets. The 4-in. patent cast-trap is faulty in form, for its rise to its outlet is much too easy"? By this last it will be plain to everybody that the manufacturer of this trap agrees with me that it is faulty, and yet Mr. E. will persist in contradiction.

Again, your correspondent attacks me on the point of ventilation. I would ask him if he can ever remember my having depreciated its advantages, and does he not know that I have always advocated ventilation as something imperative in sanitation? *De facto*, I consider good ventilation and good trapping the only true key-notes to effectual sanitation.

Mr. E. boldly asserts that "the O trap proper has not been introduced at all into these experiments. I understood Mr Davies to say that he had not tested it." Now, I will beg his memory. I most distinctly told Mr. E., in the presence of three other persons, that I had tried the real O-trap, and that it was one of Doulton & Bois's patent make, when he replied he always made his pattern trap from one of the same.

In reply to his assertion as to the want of fairness, has not Mr. Buchan, writing to the press, used these words:—"In regard to the mode of conducting the experiments, I consider such fair enough for the purpose,—it is, in fact, more useful than trying them with the water running into the basin all the time the basin is being emptied, for although generally the case, in practice it does not always happen"? In this I must agree with Mr. Buchan.

This is not the first time that Mr. Eastgate has challenged the truth of my articles and reports, but as this challenge is put in definite form, I must tell that gentleman that when he is prepared to produce either certificates or indentures (as I am) that he is a civil engineer and plumber (or I will be liberal and let him off with one), I shall be prepared to respond to his challenge, and not till then, any more than would a physician meet a chemist in consultation as a physician.

P. J. Davies, Hon. Mem. A.S.P.

VARIORUM.

A third edition has been published of the "Description of the Chemical Laboratories at the Owens College, Manchester," by Mr. H. E. Roscoe, F.R.S., from the plans of Mr. Waterhouse, A.R.A. (Cornish, Manchester). It includes details of the fittings.——The "Lectures on Architecture," delivered at the Royal Academy by the late E. M. Barry, R.A., have been published by Mr. Murray, and will have attention at our hands in due course.——We may say the same as to a beautiful book, "Raphael, his Life, Works, and Times," just now issued by Chapman & Hall. This is from the French of Eugène Muntz, and is edited by Mr. Walter Armstrong.——Part 7 of "English Etchings" (Reeves, Fleet-street), includes an effective view in the old Cock Tavern, Fleet-street, and two landscapes. The subjects are well printed on good paper, and will hereafter make a nice book.——Speaking of the newly-built quarter of Ismaileeyah, Cairo, "Egypt, Descriptive and Picturesque," says,—"It has throughout a European aspect, and sprang into life with astonishing rapidity, for the Viceroy gave the building land for nothing to every one who pledged himself to build within a year and a half a house worth at least 1,200*l*. In order to plan wide thoroughfares, the example set by Baron Haussmann in Paris was only too closely followed. Whole quarters of the city were demolished to make way for new ones, handsomer, in the modern European style. The lamentation of the lovers of antiquity over this impious proceeding are only too well justified; but certainly the city has gained in healthiness and pleasantness as much as it lost in venerable and picturesque character, particularly by the construction of very good new aqueducts in the place of the old ones, which were insufficient, by the opening of new canals, and by the abundant planting of umbrageous trees. The most complete transformation was in the Ezbekeeyeh-square. Stately buildings,—some really magnificent,—and among them a theatre, the largest hotels, several Consulates, and the Cairo Bourse, handsome private houses and splendid shops, surround it on every side, and the public garden in the middle is one of the loveliest in the world. One that has more quickly sprung into life and perfection certainly nowhere exists. In the quiet early morning hours the visitor may enjoy a solitary walk under the broad shade of its spreading trees; charmed with the beauty of the shrubs that border the well-kept paths, the growth of every zone; in the afternoon he mixes here with the crowd, listening to the finest compositions of European musicians performed by the Egyptian band,—not forgetting to admire the vegetation that surrounds him, to look into the artificial grottos, and to walk round the large basin in the middle of the garden; and he will find it difficult to believe the fact, when he is assured that this park, now fully grown, was not planned till 1870, by Barilet, the chief gardener of the city of Paris, now lately dead. It is unnecessary to say that such a city as Cairo now is is lighted with gas, and no one who has seen the Ezbekeeyeh lighted up with its 2,500 jets in their coloured tulip-shaped glasses can ever forget that wonderful scene."——From the *Leisure Hour* we obtain the following interesting sketch of "Student Life at Athens":—"Modern Athens is strong in students. Not only do many youths pass through the lower schools and gymnasium up to the University, but the University, being the centre of learning, not for Athens only, but for all the Greek race whether still under Turkish rule or no, and offering an education nearly free to all, attracts to it ambitious young men from Thessaly, Epirus, the Ægean Islands, and Constantinople itself. Hither they come penniless, but athirst after knowledge, take menial situations,—every family has its man-servant, for it is not the custom of the poorest girl to go about alone,—and thus they earn board, lodging, and clothing while they pursue their studies and attend the university lectures. Education, indeed, is a drug in Modern Athens; there is a plethora of educated men. A story is told of a traveller who asked a member of the Government, to whom he had brought a letter of introduction, where he could find a trustworthy Greek attendant to wait upon him and act as guide and interpreter. To his astonishment the minister replied, 'Why not employ my brother? He is just what you need. He is a graduate of the university, speaks several languages, is a civil and obliging fellow, and is anxious for a situation.' There are hosts of graduates looking out for Government appointments, and ready meantime to turn a penny by any employment, however humble. The high esteem in which education is held, the large proportion of public funds devoted to it, and the eagerness with which it is sought and acquired, are among the most striking features of New Greece. The people manifest a natural and instinctive love of learning for its own sake, and apart from its commercial value. The learned professions are accessible to all, and they are overstocked. Literary men abound, and find employment as newspaper writers and *soi-disant* politicians. A practical Englishman would call many of these men 'spoiled artisans.' And, indeed, it is a matter of regret that practical science is not more generally encouraged. But the Greeks have few mechanical tendencies; they are thinkers rather than workers; the brain is their implement rather than the hand. It is to be hoped that the enlargement of their territory, demanding new roads, new bridges, new railways, new harbours, and public works, will stimulate the pursuit of engineering and other mechanical arts."——*The Bibliographer*, a journal devoted to book-lore, is the title of a new monthly serial (Elliot Stock) which promises to supply a want. It will include articles on the public and private libraries of the world, lives of celebrated collectors, a retrospective review of rare, curious, and important books, reminiscences of bibliographers, booksellers, and printers, papers on American bibliography, the history of catalogues and of libraries, marginalia of eminent men, keys to the characters in certain famous books, and many other subjects. The first number is well got up.——The ninth edition of "The Railway and Commercial Gazetteer of England, Scotland, and Wales," now before us, contains a complete list, arranged in alphabetical order, of every town, village, parish, and place in Great Britain,—over 36,000,—and indicates directly the distance from London to each, including the most obscure hamlet, showing also the post offices, money-order offices, telegraph offices, wherever they exist, in addition to the line of railway and nearest station.

Miscellanea.

Fulham Infirmary.—At last week's meeting the Board considered the question of selecting plans for the new infirmary. Mr. Storey proposed that the authors of five other plans other than those recommended by Mr. Carrey, the architect appointed for that purpose, be called before the Board to explain their plans. This was seconded. Mr. Froy moved as an amendment that no other envelopes containing designs for the new infirmary be opened, nor the names of the authors be made known until the Board had decided what plan they should select. This was also seconded, but on being put to the vote was negatived, and Mr. Storey's motion was put and lost. Mr. Froy proposed that the plan recommended by Mr. Carroy be adopted, which was seconded. Mr. Rogers proposed the acceptance of a plan the cost of construction from which would be 26,000*l*. After discussion, Mr. Froy's motion was carried. The cost of the building, according to a selected plan, would be about 40,000*l*.

The American Institute of Architects.—The fifteenth annual session of the American Institute of Architects began in Washington on the 16th of November, about fifty members in attendance. The session was mainly devoted to listening to an address entitled "Washington and the Capitol at the Beginning of the Present Century," delivered by Mr. John H. B. Latrobe, of Baltimore, whose father built the Capitol. The address was listened to with the deepest attention.

Ely Palace Chapel.—Another mural painting has just been added to the walls of this chapel in further illustration of English Church History. The subject (treated in oils) is the Martyrdom of St. Alban. The artists, as before, are Messrs. Powell Bros., Park-square, Leeds.

"An Eight Thousand Pound Blunder." In reference to the paragraph quoted by us last week from the *City Press*, it is right to say that at the last meeting of the Court of Common Council, the City Architect, Mr. Horace Jones, in reply to a member of the Court, said, with regard to professional intercourse between the Sewers Office and his own office he could only say that he had no trouble, and was always received by the Engineer with the greatest courtesy and politeness. He did not often go up the stairs himself, but his clerk was always answered with civility, and sometimes the Engineer paid him the honour of a personal visit, and gave him such information and assistance as he might require at his hands. Some twelve or eighteen months ago the Court directed a street to be made from Leadenhall-street to the market. It was necessary for the drainage of the market to put in a sewer, and he understood from inquiry at the Sewers Office that the sewer at that point was only some 14 ft. or 15 ft. deep, but that it was under consideration whether the sewer should be taken eastward up to St. Mary-axe. He had no hesitation whatever in putting himself in communication with the Engineer, who suggested that he should make an application to the Commission to adopt an 18 ft. sewer, and that was afterwards executed. During their conversation he asked if anything was likely to be done with regard to Leadenhall-street, between the new street and the corner of Gracechurch-street. Unofficially it was clearly imported into his mind that there was no likelihood of that, because it was the wrong side of the way. He had had a large plan made, and any one looking at it would see if he drew a straight line from the corner of Cornhill to the corner of the street eastward of the new street up to the market, that the land belonging to the Corporation was in a hollow south of that, whereas if the parallel line were to be carried out on the north side, it would show a very large lump on the north side, and he could never have thought they would suggest the south side instead of the north.

The Brighton Health Congress and Exhibition.—The Exhibition will be opened on Monday afternoon by the Earl of Chichester. The Congress, over which Dr. Richardson, F.R.S., presides, will be opened on Tuesday evening by the delivery of his inaugural address. The sittings of the Congress will be continued every day till Friday. The Congress will be composed of three sections. The first, presided over by Mr. Edwin Chadwick, C.B., relates to the Health of Towns; the second, presided over by Mr. J. R. Hollond, M.A., M.P., relates to Food; and the third, presided over by Dr. Alfred Carpenter, relates to Domestic Health. There will be introductory presidential addresses in each section.

Scaffold Accident: Caution.—An accident occurred at the Phœnix Foundry, Dunfermline, in this way. Six men were standing on a tempory scaffold, 18 ft. high, erected for the purpose of taking down a brick wall which was damaged by the late storm. The bricks were placed on the scaffold as they were removed, and the result was that owing to their weight a cross support broke and the entire structure came down with a terrific crash. All the men were dreadfully injured.

The O'Connell Memorial.—The national memorial statue to Daniel O'Connell, which has been in hand for many years, is now completed, and the colossal bronze casting will leave the foundry of Messrs. Drew & Co., Thames Ditton, shortly for erection in Sackville-street, Dublin. The cost of the memorial is 12,500*l*. The design was by the late J. H. Foley, R.A., and the work has been executed by Mr. Thomas Brock. The memorial will stand at a height of 45 ft. from the roadway.

A New Clock has just been erected in the town-hall at Bilston, Staffordshire. It shows the time upon three dials, each 5 ft. 6 in. across, which are of a new construction; all the figures are burnt upon white opal glass, and the gas by which they are illuminated is turned up and down automatically. All the wheels are of gun-metal, with their teeth machine-cut. The work has been executed by Messrs. Smith, Midland Clock Works, Derby.

Martin's White Lead Company.—This company, as noticed in our advertising columns, has been formed to carry on the manufacture of white-lead. It is claimed that the process, said to be perfected after many experiments, renders the material innocuous, both in its manufacture and use.

Sanitary Institute of Great Britain.—The opening meeting for session 1881-82 was held on Wednesday evening, when the inaugural address was delivered by Dr. Alfred Carpenter. Mr. E. White Wallis, the secretary, read the report of the adjudicators, Dr. B. W. Richardson and Dr. Farr, upon the essays sent in in competition for the Wyatt-Edgell Prize of 200*l*. The subject of the essays was "The range of hereditary tendencies of health and disease," and the successful competitor was declared to be Mr. George Gaskoin, of 7, Westbourne-park. In his address, Dr. Carpenter, in answer to opposition from other existing bodies, argued that there was no antagonism between the Institute and the bodies in question. It had been said that the Institute was antagonistic to the Social Science Association, but he contended that it was the legal offspring of that Association, being the natural result of the teachings of social science. He denied that there was any reason for the antagonism of some members of the Institute of British Architects, and also of some of the surveyors and engineers, pointing out that the Institute in no way proposed to educate and examine men so as to fit them for any of those professions. He urged that there was an important reason why the Institute should be recognised and even supported by the bodies referred to, as neither of them would trouble itself to provide an education, and a test of its appropriation, to the local surveyors in small districts and the sanitary inspectors of the whole of the kingdom.

A Reredos has recently been completed for Frisby Church, near Leicester, by Messrs. Jones & Willis, of Birmingham and London. The reredos proper is of alabaster, and has three panels, the centre one with the figure of our Lord in Glory; the outer panels have carved cusped trefoils, with red marble columns to support caps. The side-wings are of hand-painted tiles.

American Courtesy.—By the last mail it has been notified to Mr. Harry Hems, the sculptor, that he has been elected an Associate of the Society of the Sons of St. George at Philadelphia. This society was founded in A.D. 1771, and is therefore one of the oldest as well as one of the most honourable, in America. Mr. Hems, it may be remembered, was awarded a medal at the Centennial Exhibition of 1876.

The Royal Windsor Tapestry Works.—In connexion with the Royal Windsor Tapestry Works, a central hall and twelve cottages, intended as residences for the *employés*, are about to be erected at a cost of 6,000*l*. on the Crown lands opposite the factory at Old Windsor.

The Export of Deals from Montreal to the United Kingdom during the season of 1881 just closed stood at 38 cargoes, containing 21,838,287 ft. against 19,781,885 ft. in 1880, showing an increase of 2,056,402 ft. when the one year is compared with the other.

The Worshipful Company of Carpenters, at a recent meeting of the court, voted the sum of 1,000*l*. towards the building fund of the City and Guilds of London Institute for the Advancement of Technical Education.

A New Deaf and Dumb Institute, in connexion with the Smyllum Orphanage, Lanark, will shortly be commenced. It has been designed by Messrs. Pugin & Pugin, of Westminster.

Leadenhall Market.—The new Leadenhall-market is, it appears, to be opened on the 15th of December.

TENDERS

For the erection of new premises for the Birkbeck Scientific and Literary Institution, Chancery-lane. Messrs. Fowler & Hill, architects. Quantities supplied:—

	Portland.	Bath.
W. Bangs & Co.	£19,749	£18,709
Higgs & Hill	19,180	18,940
D. Rock	19,476	18,488
W. J. Beale	19,237	18,537
G. H. & A. Bywater	18,974	18,003
Kirk & Randal	18,571	17,620
J. Taylor	18,497	17,517
Pack Bros.	16,250	17,220
J. Bull & Sons	18,220	17,500
J. Mowlem & Co.	17,960	17,282
W. & D. McGregor	17,905	17,263
W. Crockett	17,778	17,400
E. Vaughan	17,739	16,878
Perry & Co.	17,607	16,817
M. Manley	17,603	17,226
J. T. Chappell	17,165	16,590
B. E. Nightingale*	17,045	16,161

* Accepted.

For infants' school, &c., in the rear of Mission Hall, St. Anne's-road, Stamford hill. Mr. Wm. Jesse F. Scott, architect:—

Shurmur (accepted).

For two new warehouses, Lilypot-lane, City. Mr. W. Wimble, architect:—

Hoare	£3,475	0	0
Hall, Bedall, & Co.	3,114	0	0
Ramsay	3,080	0	0
Brass	2,983	0	0
McLachlan & Sons	2,979	0	0
Faulkner	2,975	0	0
Ashby & Horner	2,945	0	0
Morter	2,873	0	0
Croaker	2,820	0	0

For repairs, &c., to No. 39, Welbeck-street. Messrs. Sandall & Corderoy, architects:—

Williams & Son	£577	0	0
McLachlan & Sons	522	0	0
Burningham	425	0	0
Higgs	392	0	0

For further alterations and additions at Lyndhurst-road Hotel, Hants, for Messrs. Hine Bros. Mr. W. H. Mitchell, architect:—

Stevens & Sons	£1,044	0	0
J. Dyer	958	0	0
Brinton & Born	885	0	0
J. W. Rowland	833	0	0
J. Crook (accepted)	797	0	0

For laying tennis-court and skating-rink with Limmer asphalte, Woolston, Southampton, for Mr. W. Garton:—Bradshaw & Co., Queen Victoria-street (accepted).

For the erection of a large newspaper kiosque in Broad-street, Leek, for Mr. Sam. Rider. Messrs. Sugden & Son, architects:—

For the whole.

Bromage	£135	0	0

Brickwork, &c.

Grave	99	0	0
Hall	75	0	0
Knowles (accepted)	66	0	0

Woodwork.

J. Hudson	95	10	0
Tomkinson	63	0	0
Bisley & Morris	61	15	0
Hall	60	0	0
Mackrell	59	10	0
James Hudson	55	0	0
Tatton	50	5	0
H. Carding (accepted)	38	10	0

Plumbing, &c.

W. Carding	23	0	0
Stevenson	20	11	0
T. Johnson (accepted)	19	5	6

For works in New-road, Stoke-next-Guildford, for Mr. John Cable. Messrs. Peak, Lunn, & Peak, architects. Quantities supplied:—

	Pair of Houses.	Stable.
Thos. Swayne, Guildford	£1,750 0	£335 10
Wm. Swayne, Guildford	1,664 10	200 10
Pearce & Clark, Guildford	1,535 0	195 0
Garnett & Mills, Guildford	1,530 0	190 18
Martin, Wells, & Co., Aldershot	1,471 6	193 10
Strudwick, Guildford	1,448 10	199 10
Mitchell Bros., Shalford	1,425 0	185 0
Pink, Milford	1,390 0	171 0
Smith & Sons,* Guildford	1,301 0	178 6

* Accepted.

For new class-room at the Board School, Alfold, Surrey. Messrs. Peak, Lunn, & Peak, architects:—

Foreman, Cranleigh	£270	0	0
Ayling, Wisborough Green	213	0	0
Stevens, Plaistow	164	0	0
Underwood, Dunsfold	154	0	0
Spooner, Alfold Bars (accepted)	148	0	0

For new conservatory, Great Eaton, Witley, for Mr. F. E. Eastwood. Messrs. Peak, Lunn, & Peak, architects:—

Martin, Wells, & Co.,* Aldershot	£312	4	6

* Accepted.

For hot-water service at house, stable, and greenhouses, Witley, for Mr. F. E. Eastwood. Messrs. Peak, Lunn, & Peak, architects:—

Rosser & Russell, Charing-cross, in conjunction with Martin, Wells, & Co., Aldershot (accepted)	£433	11	6

For new stabling, "Woodcote," Ashley Park, Walton-on-Thames. Messrs. Peak, Lunn, & Peak, architects. Quantities supplied:—

Martin, Wells, & Co., Aldershot	£396	0	0
Faulkner,* Walton-on-Thames	349	0	0

* Accepted.

For the erection of a villa residence at Robin Hood-lane, Sutton, for Mr. S. R. Nye. Mr. J. Keal, architect:—

J. B. Potter	£580	0	0
H. Keal	540	0	0
J. Arney (accepted)	523	0	0
H. Winter	510	0	0

For alterations to the Green Man, Leytonstone, for Mr. A. S. Anglise. Mr. J. G. Needham, architect:—

Jackson & Todd	£515	0	0
Walker	475	0	0
Skipper	475	0	0
Marr	449	0	0
Hawkings (accepted)	433	0	0

For building new baths in the rear of 574, Mile-end-road, for Mr. Bluemell. Mr. C. Legg, architect. Quantities by Mr. W. Hawker:—

Parish	£625	0	0
Hawkings	579	0	0
Judd	487	0	0

For the erection of a pair of villa residences, South Park, Wimbledon. Mr. Fred. C. Notley, architect:—E. & E. Smith, Balham (accepted)... £1,375 0 0

For new works for the Bedford Ironworks Company. Messrs. Usher & Anthony, architects. Quantities supplied :—

Higgs & Hill, London	£8,980	0	0
S. & W. Pattinson, Sleaford	6,978	0	0
Wood & Son, Leicester	6,624	0	0
Warton & Walker, Bedford	6,392	0	0
Harrison, Bedford	6,370	0	0
Adams, Bedford	6,261	0	0
Potter, Bedford	6,100	0	0
Claridge, Banbury	6,050	0	0
Edey & Wade, St. Neot's	6,000	0	0
S. Foster, Kempston (accepted)	5,987	0	0

For boundary-walls, fences, gates, and the laying out of a new cemetery, at Potton, Beds., for the Potton Burial Board. Messrs. Usher & Anthony, architects :—

Edey & Wade, St. Neot's	£462	17	0
S. Foster, Kempston	331	0	0
Bartle, Potton	289	10	0
Woodman, Potton	266	0	0
Burnage, Potton (accepted)	283	5	0

For vagrant wards, Market Rasen. Messrs. Bellamy & Hardy, architect :—

Chris. Wallis, Caistor	£1,552	4	3
Nightingale & Danby, Grimsby	1,480	17	7
Walter & Heusman, Horncastle	1,423	0	0
Jolland Chapman, Grimsby	1,421	4	0
G. Dent, Brigg	1,370	0	0
T. Wilson, E. Markham	1,369	0	0
C. Sanderson, Market Rasen	1,266	0	0
Malam & Freeman, Market Rasen	1,254	13	1
T. H. W. & H. Wallis, Spalding	1,239	0	0
C. Kendal, Market Rasen	1,236	15	0
J. Harrison, Market Rasen	1,210	0	0
Chas. Brownlow,* Market Rasen	1,209	11	0

* Accepted.

For new hall and offices in the Southwark Bridge-road, for the Bricklayers' Society. Messrs. A. & C. Harston, architects :—

Brass	£5,110	0	0
Wall Bros.	5,050	0	0
Goodman	4,480	0	0
Hall, Beddall, & Co.	4,445	0	0
Kilby	4,400	0	0
Shurmur	4,085	0	0
Crockett	3,840	0	0

For alterations and additions at the King's Head public-house, Buckingham Palace-road, for Messrs. Watney & Co. Mr. C. W. Bovis, architect. Quantities supplied :—

Clarke & Bracey	£1,225	0	0
Hockley	1,218	0	0
Wilks Bros.	1,183	0	0
Anley	1,180	0	0
Axford	1,175	0	0
Spencer & Co.	1,115	0	0
Finnegar	888	0	0

For alterations and additions to the Duke of Clarence public-house, Rotherfield-street, Essex-road. Mr. George W. Fisher, architect :—

S. Row	£306	0	0
J. Clinch	298	0	0
Dearing & Son	285	0	0
Styles	269	0	0

For draining and making up roads at Strode-street, Denham-road, and Hummer-lane, Egham. Mr. P. J. Byrne, surveyor :—

Squelch*	£303	10	0
Baigent	259	16	0
A. L. Oadest (drains only)	112	0	0

* Accepted for roads. † Accepted.

For four shops, Windsor, for Mr. G. H. Long, J.P. :—

J. Norris	£792	0	0
W. Willis	718	0	0
W. Woodbridge	680	0	0
H. Gray	630	0	0
McQuhae	627	0	0
F. Akery	605	0	0
W. P. Reavell (accepted)	592	0	0

For alteration and additions to the Jolly Farmers, Staines, for Mr. J. F. Harris. Messrs. Low & Birch, architects :—

J. Higgs, London (accepted).

For alterations and extension of premises, The Grange, Bermondsey, for Messrs. Samuel Barrow & Brother. Messrs. Elkington & Son, architects. Quantities by the Architects :—

Buller	£475	0	0
Wells	383	0	0
Eldridge & Gee (accepted)	348	0	0

For alteration and addition to No. 64, Aldermanbury, for Mr. G. L. Turney. Mr. A. Peebles, architect :—

Colls & Sons	£1,340	0	0
J. & J. Greenwood	1,275	0	0
Downs & Co.	1,175	0	0
C. Goad	1,153	0	0
Bird	1,011	5	5

For alterations and additions to No. 10, Lower Seymour-street, W., for Mr. Batt. Mr. Sancton Wood, architect :—

F. Sanden, New-street	£1,355	0	0
Stimpson & Co., Brompton	1,310	0	0
J. Higgs, Upper Park-place, N.W.	1,195	0	0

For alterations and additions to the Sarata Oil Works, Rotherhithe New-road, for Mr. Sterry. Mr. E. Saunders, architect :—

J. Higgs (accepted).

For further works in the erection of stores, cellars, &c., for Messrs. Wright Bros., at their new brewery, Leeds. Messrs. Davison, Inskipp, & Mackenzie, architects :—

Boothman & Son	£915	0	0
Irwin & Co. (accepted)	855	0	0

For alterations to entrance gates and raising boundary-wall at Homerton Hospital, for the Managers of the Metropolitan Asylums District Board. Mr. John Walker, architect :—

Shurmur (accepted).

All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication.

We are compelled to decline pointing out books and giving addresses.

Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS TRADE, AND GENERAL ADVERTISEMENTS

Six lines (about fifty words) or under ..... 4s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

Terms for series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under ..... 2s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

REPLIES TO ADVERTISEMENTS,
Addressed Box ——, Office of "The Builder,"
Cannot be forwarded, but *must* in all cases be *called for*, and the Office Receipt produced.

THE CHARGE FOR A BOX IS AS UNDER :—
For "Situations Wanted" Advertisements ..... 3d. per Week.
For all other Advertisements ..... 6d. per Week

PREPAYMENT IS ABSOLUTELY NECESSARY.

*** Stamps *must not* be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, King-street, Covent-garden, W.C. to

DOUGLAS FOURDRINIER, Publisher,
Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied *direct* from the Office to residents in any part of the United Kingdom at the rate of 18s. per annum, *prepaid*. Remittances payable to DOUGLAS FOURDRINIER, Publisher, 46, Catherine-street, W.C.

Best Bath Stone.
WESTWOOD GROUND,
Box Ground, Combe Down,
Corsham Down,
And Farleigh Down.
RANDELL, SAUNDERS, & CO., Limited,
Corsham, Wilts. [Advt.

Box Ground Stone
Is the best for use in all exposed positions, being a well-known and tried weather stone.
50,000 feet cube in stock.
PICTOR & SONS,
Box, Wilts. [Advt.

Doulting Freestone and Ham Hill Stone of best quality, in blocks, or prepared ready for fixing. An inspection of the Doulting Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK, Norton-sub-Hamdon, Ilminster, Somerset. — Agent, Mr. E. WILLIAMS, 73, Charlotte-street, Portland-place, W. [Advt.

Doulting Stone and Ham Hill Stone, of best quality. Prices and Estimates, including delivery to any Station, on application to Staple & Hann, Quarrymen, Stoke-sub-Hamden, Ilminster. Agent, Mr. E. CRICKMAY, Langbourn-chambers, 17, Fenchurch-street, E.C. [Advt.

CHAPPUIS' PATENTS FOR REFLECTING LIGHT.
DAYLIGHT REFLECTORS OF EVERY DESCRIPTION,
ALSO
ARTIFICIAL LIGHT REFLECTORS.

WHY BURN GAS?—CHAPPUIS' REFLECTORS DIFFUSE DAYLIGHT.—They are exclusively adopted by and fitted at Buckingham Palace, all H.M. Government Offices, Houses of Parliament, H.M. First Commissioner of Works, the Metropolitan Board of Works, British Museum, South Kensington Museum, Royal Institution, Guildhall Museum, on board H.M. Ships, also Railway Companies' Offices, Hospitals, Institutions, Banks, Insurance Offices, Manufactories, Private Houses and generally from Noblemen's Mansions to Artisans' Workshops. 30,000 in use in London alone. Patronised by leading Architects, Engineers, Contractors, &c., &c.

N.B.—For Prospectuses and Diagrams, address Stamped Envelope to

P. E. CHAPPUIS, Patentee and Manufacturer, 69, FLEET-STREET, LONDON.

NOTICE.—The POLYGONAL REFLECTOR (Latest Patent) FOR ARTISTIC and PICTURE GALLERIES.
Its construction allows of the angle of light being readily altered so as to reflect in any desirable direction.

The Builder.

Further Cogitations at the Smoke Abatement Exhibition.

THE primary distinction between apparatus for the use of smokeless fuel, and apparatus for the improved combustion of flaming coal, not having been adopted for the classification of the exhibits at South Kensington, or, indeed, for that matter, by the exhibitors themselves, the inquirer has to range over the whole length of the galleries twice, or with a double purpose. The distinction, however, is one of which the importance becomes more obvious at every turn. And while it is to the use of smokeless fuel that we have to look with the greatest confidence for the future, more especially as regards the dynamic production of heat, it is to any practical improvement in the means of burning ordinary bituminous coal that the attention of nine out of ten visitors to the exhibition will in the first place be chiefly turned. But inventors seem to be so generally aware of the probability that the use of anthracite is likely to follow an acquaintance with its advantages, that most of the grates and fireplaces that are constructed with the view of consuming smoke are described as being also adapted, or readily adaptable, for the consumption of non-bituminous coal.

As to this, there is a primary difficulty, the disregard of which has led, and must continue to lead, to failure and loss of time. The quantity of unburned fuel that escapes from the combustion of flaming coal in the form of smoke is, to a very great extent, dependent on the skill and care of the stoker, or lighter and watcher of the fire. Costly and ingenious as are some of the designs for "mechanical stokers," there is no possibility yet shown of superseding the human element. If house fires and furnaces were required to burn on day and night without intermission or alteration of intensity, something might be said, perhaps, in favour of a really automatic supply of fuel. But this condition rarely, if ever, exists. More heat is required at one time than at another. The skill of the fire-maker is always in request, whether he feed and regulate the flame directly, or whether he superintends more or less cumbrous arrangements for the purpose. Thus the prime element of the problem,—the presence of the perfect stoker,—which may be said, in most cases, to afford the practical solution of the difficulty,—is one which no inventor can supply. In very many cases it is little more than loss of time to attempt to do the work of care, skill, judgment, and watchfulness by the substitution of mechanical appliances.

Another difficulty underlies the practical application of the principle which, in one guise or another, makes its appearance in so many of the contrivances which, on the assurance of their inventors, we are invited to accept as preventive of the escape of smoke. This is the conduction of the smoke-laden current that arises from the fire through descending or ascending flues, in such a manner as to pass a second time through the incandescent fuel, or over the flame, in order to consume the carbon driven off as dust,—or, in plain terms,—the smoke. Our recollection of this fallacy extends for a long period of time,—back to the invention of the Arnott stove, and the lecture on the same by the inventor, Dr. Arnott, at the Royal Institution. In many of the stoves or flues that come under this category a very admirable effect might be produced if the current of air would take the exact course shown on the diagrams. But there is, unfortunately, some doubt on this point. When a short cut can be taken by the air, which is almost invariably the case, the elastic fluid may obstinately refuse to take the longer course which presents so many advantages to the consumer. In point of fact, a circulation is assumed, as invariable, which is very rarely found to exist. Different plans for mixing regulated doses of warm air with the fuel in course of combustion will, no doubt, receive due attention in the reports of the executive committee. But in each and all of these cases the services of the competent stoker are usually a *sine qud non*. And then the question arises,—will not the competent stoker produces a good and as thorough a combustion, with as little loss of unburned carbon in the form of smoke, by a simple, well-proportioned furnace and flue, as by the most complicated arrangement of smoke passages?

What may, however, be effected by a branch flue, or double chimney, is very admirably shown by the powerful and beautiful lamps with which, under the title of Regenerative Gasburner, Messrs. Siemens illuminate the conservatory on the Exhibition premises. Here are up-draught and down-draught, perfectly distinct, each performing its proper function, and that with the result of extracting a very considerable part of the theoretic luminous effect of the gas burned. But it must be remembered that the conditions under which this is effected are altogether different from those of the domestic fire. No gradation is required. The lamp may be lighted, or unlighted; but is not required to give varying light. In the stove more heat is required at one time than at another. And further, in the Siemens lamp, the action is at once visible. It is intended to be steady and unchecked, and if any fault should occur, attention would at once be called to it by the failure of light. And this steady, evident action of the apparatus is insured by the use of distilled fuel; that is to say, of gas. In the use of bituminous coal in the ordinary fire the two processes of distillation and combustion are to some extent combined. What the inventor seeks, is so to arrange the order, or the local position, of the two actions, as first to vapourise and then to burn. With every new addition of fuel the action is disturbed and complicated. We do not say that it is impracticable to overcome the difficulty. But we do say that the simplest manner in which it can be overcome is by separating the two processes; and that it would be very difficult to do this more effectually than it is done by the gasworks.

One ingenious method of meeting this difficulty deserves both notice and admiration, although we must wait for practical evidence before we can form a conclusive opinion how far the object has been attained. Previous endeavours have failed. The principle adopted is to feed the fire from below, instead of by putting fuel on the top, the object being to pass the roughly-distilled product of the heated and igniting coal through the clear body of the fire. In the reversible grates, the fire-basket is made into a complete cage, and swings on pivots. Thus there is a door to the cage both above and below. The upper door is opened to put in fresh coal, and then closed, and the position of the basket reversed. The fresh coal is thus put undermost, and the fire burns downwards. The idea is ingenious, and the public will await with interest the report of the committee on the action of the grate. But when we remember the way in which the introduction of what was probably the best lamp invented before the Moderator was absolutely blocked by the impossibility of making the servants who trimmed it reverse it for a few seconds during the operation, we cannot but point out that to expect the ordinary domestic to reverse a grate by the use of a poker as a lever each time that coals are put on, is to be sanguine rather than guided by experience. Another smoke-consuming kitchen-grate is fed at the bottom by a feeder, in the shape of a hoe. It struck us that there was a want of neatness in these underfed fires; and though we are desirous not to anticipate a well-considered verdict, we cannot too strongly point out that the difference between the ease with which an instructed person whose business it is to show an invention, can perform a simple though unusual operation, and the manner in which the same action would be performed by the legion of assistants who come under the orders of housemaid, cook, or groom of the chambers, is likely to be very wide.

Distinct from the endeavour to economise heat by the combustion of smoke and smoke-laden gases, are those inventions that attempt the same object by radiating the greater part of the caloric produced by combustion into a room, instead of sending it up through the chimney. In other words, the close stove in various shapes forms a separate class of exhibits. It is well known that in Austria, Belgium, and other parts

of the Continent great economy of heat is obtained by the use of the close stove. In some of these contrivances a small quantity of fuel is consumed freely for a short time, and the stove is then closed, sufficient heat being produced to radiate through the day, a more or less sluggish combustion being generally maintained. It should be remembered, however, that both the architecture of the houses and the habits of the people where these stoves are commonly used are in accordance with the requirements of the method. The rooms are generally much more lofty than with us, and the effect of a stove-warmed room on a person unaccustomed to its atmosphere is often very painful. We are slow to recommend a substitution of the stove even for the wasteful, but healthy, open fire. Among the stoves which are exhibited, however, it would be difficult to speak in too high terms of the artistic merits of Lönholdt's anthracite stove, from the foundries of Gebr. Buderus, at Hessen. We do not recommend the introduction into a sitting-room of the "Parlour Stove," however applicable it might perhaps be found in a hall, because of the dose of carbonic acid gas which must certainly be evolved by the combustion of the anthracite. But as a handsome piece of furniture especially as to the details of the castings, this stove may be thought to justify the Diploma of Honour awarded to it at the International Exhibition of Patented Articles at Frankfort-on-the-Main.

At the same time, we are far from recommending the use of iron stoves for the dwelling. If stoves are to be employed, there are very strong reasons in favour of the use of earthenware rather than metal for their material. And here, as in so many other appliances for the purposes of domestic health and comfort, Messrs. Doulton, of Lambeth, come to the fore. We are by no means implicit believers in testimonials; but it must be admitted that the testimonials printed in favour of Doulton's radiating tile-stoves are such as to make out a very good *primâ facie* case in their favour in places where a stove is admissible. The advantage claimed for the use of fireclay as the material for a stove is due to the extraordinary facility of this substance for rapidly absorbing heat, and of gradually radiating the same in such a manner as to produce and maintain for a great length of time an equal temperature. A stove burning for twelve hours will continue, Messrs. Doulton say, to warm a room for several hours after the fire is out. These results cannot be obtained with iron stoves, as the metal absorbs the heat so rapidly as to become over-heated, while it allows it to escape too rapidly to maintain an even temperature. The frequent ill-effect of the iron stove, in what is called "burning the air,"—as to the chemistry of which we do not at the moment propose to speak, but as to the ill-effects of which, even in the case of pipes heated by steam, we can speak from painful personal experience,—is absent, the inventors say, from the fireclay stove. We cannot speak from personal experience in England of rooms warmed by clay stoves; but we know quite enough of the difference of behaviour of iron and of fireclay to admit that there is much probability in the statement of Messrs. Doulton. The list of the exhibits of Messrs. Doulton on page 11 of the Descriptive Catalogue refers to an advertisement which we do not find in our copy of the work. The exhibits mentioned are: Portable radiating fire-stoves, with ventilating tile-shaft; down-draught radiating tile-stove, for centre of a room; large tile-stove for public buildings; and fittings and decorations of ornamental Doulton ware for the adornment of open fireplaces.

There are many other contrivances of more or less ingenuity on describing which we feel tempted to linger. But it is our wish to afford to our readers not merely the amusement of a spare half-hour, but advice which they will find it of value to follow. And, therefore, when, by the exertions of a few earnest and thankworthy men, a visible result of the exhortations which have been so frequent, and of such long standing, in our columns, to make a scientific study of the subject of domestic combustion is before us, we hold it better to wait for the outcome of the experiments now in progress, than to give any hasty, and necessarily imperfect, judgment. One thing struck us which should not be overlooked. As far as we can gather, there is no plan proposed for the combustion of bituminous coal, which claims absolutely to prevent smoke *while the fire is being lighted*. But it is precisely at this time that the great production of smoke takes place. Apart from those factory chimneys, the regulations affecting which are enumerated on page 2 of the Catalogue of the Exhibition, the chimneys of every great town are for the most part only intermittent producers of smoke. From a bright, well-made fire, burned under a chimney of adequate height,—for height is the main cause of draught in a chimney,—steady combustion usually allows but little unburnt fuel to escape in visible form. It is when the fire is just lighted, when it is made up, in the case of the kitchen fire, for dinner, or when half a bushel of slack coal is shot into the grate by a slatternly servant, that visible smoke escapes from the chimney. In such a case as the revolving grate, there is a direct effort to meet the difficulty of putting on coal. But the difficulty of lighting is here untouched. And although we are far from saying that there is not a constant hourly contribution to the smoky canopy of London,—as, indeed, out of a million fires, from 700 to 1,000 must be fed every minute of the day, for one time of feeding alone, yet the morning production of the smoke-cloud which first blackens the fog, is the chief cause of the pollution of the London atmosphere. And this morning pollution, as well as the intermitting contributions to it which occur whenever the fire is fed, we have the most serious doubts whether any contrivance will materially diminish, so long as bituminous coal is burned undistilled in our houses.

We trust that the attention of the committee will be distinctly directed to this point. We have no desire to speak dogmatically upon it. But it seems to us that, before endeavouring, at great pains and cost of time, to award the palm among various contrivances for the consumption, or the prevention of the formation of, smoke from bituminous coal, it would be well to allow science to utter a warning voice. If it is possible to say that, "by invention A, or by the better development of invention A, it is practicable so to burn ordinary coal that no smoke will be produced in lighting or in mending the fire by an ordinary servant, or by a person ignorant or careless of the principles of combustion," then a great boon will have been given to the metropolis, and no time or pains should be spared to make the truth universally known. But if it be, on the other hand, the case, that all that can be said is, "By the careful use of invention A, by an educated and skilful person, very little smoke will be produced except just when the fire is being lighted, or roughly mended," it will be well that this also should be distinctly told. For then, it may be added, it is idle to expect much abatement in London smoke except from the compulsory use of smokeless fuel.

Another point deserves careful attention on the part of those who have to present the public with the digested outcome of the examination of the various appliances exhibited at South Kensington. The prevention of smoke, important as that object becomes in the case of crowded cities, is really but a small part of the improvement possible in domestic combustion. The subject of the economic use of heat is one which the present century has seen pass from the dominion of rough practice to that of definite science. It is not so many years since we had any idea of what heat really is. The remarkable phenomenon of latent heat was known to the steam engineer for a long time before he discovered what was either the meaning or the cause of the loss of thermometric elevation, when the invisible energy was doing mechanical work. We think that we can state without fear of contradiction that it is to that Nestor of European engineers and inventors, John Ericssen, K.V., the father of the ironclad monitors, that the world owes the first serious, sustained, and successful attempt to catch,—or as he called it, to regenerate,—the heat which, having done its work, or, at all events, having done work, was on its escape into the free atmosphere. We can personally remember the efforts of Ericssen in this direction as far back as the year 1835. He had at that time constructed a caloric engine of considerable size; and on the principle then first introduced into mechanics, is based that small caloric engine which is at the present moment so great a boon to the man who requires small, manageable, and cheap motive power. We have before now mentioned the splendid work in which, under the modest title of "Contributions to the Centennial Exhibition," Capt. Ericssen has given a brief compendium of the labours and inventions of half a century. His locomotive, the Novelty, it should be remembered, far exceeded any competitor in the trials at Rainhill,—failing to obtain the prize only by accident. We think that the committee would at once render a graceful tribute to one of the pioneers of all, or nearly all, important improvements in combustion, and secure a valuable addition to the outcome of their labours, if they were to invite from this honoured veteran an expression of his opinion on the primary question which we have above indicated. "Is it practicable to burn bituminous coal for ordinary purposes without smoke?" The value of determining this preliminary question would be this, that the whole force of the great army of inventors would be thus guided in that direction in which success is really to be attained. But in the meantime it must be remembered that there are not a few inventions at South Kensington of which the main, and the successfully pursued, object, is the economy of heat. As to this, a special report, or branch of report, should be prepared. Supposing it to be the outcome of the best scientific consideration that the only reliable mode of avoiding smoke is to consume smokeless fuel, the exhibition, however it answers as to smoke, will be anything but a failure, if it affords to the architect full light on those appliances by which heat, however produced, is best to be utilised for domestic comfort.

We are assured that the doors of the exhibition are by no means as yet inexorably closed against fresh exhibits. A second edition of the catalogue is in course of preparation, containing more information than is furnished by the first. In this we shall expect to find some statement as to the prizes to be awarded, and as to the principles on which the awards are to be given. Dr. Siemens, we understand, has offered a prize of 100 guineas. A like amount, divided into two sums, is named as a lady's prize for the best domestic open grate, and the best kitchener. There is a medal offered by the Society of Arts, and 50*l.* is contributed for prizes by the Manchester Association for Controlling the Escape of Noxious Vapours. It is anticipated that one of the Royal family will consent to give the prizes to the successful competitors. In its actual condition the exhibition must be regarded rather as a comprehensive invitation for all persons who have any improvements to suggest as to consumption of fuel to show them, than as a special inquiry into the means of abating smoke. It is obvious that there will be much room for heart-burning if it is not made plain as soon as possible for what prizes are to be offered, and by what means they are to be earned.

THE MUNICIPAL GOVERNMENT OF PARIS.

At a moment when the voice of public opinion is claiming in many quarters what is understood by a reform in the municipal government of London, and when the subject promises shortly to engross the attention of our rulers, it may not, perhaps, be considered inopportune to lay before our readers a sketch of the administrative system by means of which the city of Paris is regulated in a manner which justly excites some admiration. Paris, as the capital of a great country, as a city containing over two millions of inhabitants, and possessing at the same time all that peculiar character which we are accustomed to expect,—and are justified in the present day in expecting,—from a great centre, offers, it will be readily admitted, a model in the simplicity and effectiveness of its organisation. Paris, again, being known to so many Englishmen and Londoners, affords that further advantage that the results obtained by the administrative system in vogue on the banks of the Seine are comparatively familiar to every one who has visited the French capital. A central and undoubtedly united administration, such as is urged as necessary for London, exists in full force in Paris. While, at the same time, each individual portion of the capital finds its interests amply attended to by the central administration, the whole capital is benefited by the united action of its self-elected rulers, who take into consideration the innumerable, varied, and necessary questions, the satisfactory arrangement of which constitutes what is understood by a well-organised community.

The contrast afforded between the Paris of to-day and the Paris of thirty or forty years ago, with its narrow, ill-kept, ill-smelling streets,—readers of "Pelham" will recall one of that hero's unhappy accidents in the streets of the Paris of pre-Haussmannic days,—singularly shows what, under a central system of municipal

government, is possible in a modern city. Only, indeed, by a thorough organisation could such results have been attained in Paris, and only, let it be remarked, by the united action of corporation and ratepayers. Paris stands to show us what a great city may be made under a few years of management of intelligent and earnest rulers. There have, it is true, been conditions under which the Paris municipal authorities have been peculiarly assisted in their task. We well remember a late editor of *Punch*, — Shirley Brooks,—on a return from Paris jokingly regretting that London could not be placed for a short time under the control of a despot; but what better or more potent despot should our great city find to work its improvements than its own inhabitants, who, as ratepayers, have it in their power to effect the utmost that a governmental despot has been able to carry out on the banks of the Seine? But can it be justly said that the thorough system by which the huge network of drains in Paris is kept, the water and gas supply ensured, the broad streets watered and swept each day, the houses daily cleared of their dust and refuse, the trees planted, the seats distributed, the "squares" and parks tended and beautified, the statues erected, the police, the fire-brigade, the omnibus and other services of locomotion controlled, &c., can it, we repeat, be justly said that the systematic organisation of all this is the work of despotic influence? To that influence Paris may be said really alone to owe its broad streets and boulevards ruthlessly cut through whole neighbourhoods; the rest is the work, practically, of the ratepayers in the persons of those whom they have elected to represent their interests. Should this be the case, it would go far to prove the truth of the accusation that Londoners do not, as ratepayers, sufficiently interest themselves in parochial affairs; but be this belief unfounded or not, there still remains the want with us of an organised system such as our neighbours have to thank for the comfortable and cleanly management of their model capital.

Foreigners, to use that somewhat vague term in its ordinary and generally-accepted sense, have been always credited by us with a genius for organisation, and, indeed, in comparison with ourselves the reputation is merited; but France, above all other countries, has always received the first place as the home of organisation. Inquiring English travellers are astonished to find the comparative simplicity of the administration by means of which a large country is managed, in a manner so different from our own system. The broad divisions into *départements, arrondissements, cantons*, and, *communes*, and the various officials, mayors, &c., who regulate the whole, are soon mastered, and for one part of the country it is the same as for every other. Paris, however, let it be remembered, though regarded administratively as a large *commune* or parish, is, from its huge population, submitted to a government slightly differing from that of other towns throughout France. Its administration is practically confided to two magistrates, the Prefect of the Seine and the Prefect of Police, both important political posts nominated by the Government in power. Municipally the Prefect of the Seine is a prefect like the other prefects of the departments of France; but, at the same time, he is Mayor of Paris, not, it is true, like the other mayors, elected to that post, but by the nomination of the *parent* Government. With this difference, important as it is, the prefect-mayor possesses the same powers as an ordinary mayor, it being, however, remembered that the special police measures remain in the hands of the Prefect of Police, who thus takes upon himself, in the limits determined by the law, a certain share of the functions of the mayor of Paris. Paris is, in fact, administered by two mayors, independent of each other in their duties, and their admin tration is supervised and controlled by a Municipal Council, composed of eighty members elected from each of the eighty "quarters" of the city. The mayors of the twenty "arrondissements" of Paris,—there are four "quartiers" in each,—are in reality only auxiliaries of the central mayoralty, which sits, with the Municipal Council (at present) at the Tuileries, the Hôtel de Ville,—the Mansion House of Paris,—not yet being ready to receive them* The mayors of the "arrondissements" are local delegates of the mayor of Paris, and were it not for the gratuitous nature of their functions they might be called *employés* of the City Government. Their mayoralties are only branch establishments of the central service, for the convenience of the public; the Municipal Council only having to do with the twenty "arrondissements" of the capital in the voting of their share of the budget, or in the regulation and control of their expenses.*

Since 1871 the Municipal Council of Paris has been elected every three years. Its members, it must be borne in mind, can in no way be considered as administrators; their sole action, indeed, is confined to the power of tightening at need the purse-strings, and in this manner controlling the administration. The relations between the Municipal Council and the central mayoralty entrusted with the government of the city may be said to consist in the following:—The central mayoralty prepares the items of the annual budget, and submits each article to the examination and vote of the Council. In this budget, in addition to the relation of the expense and receipts, there are invariably a certain number of proposals; these are each and all subject to the approval of the Council. All loans, improvements, public works, and such like, can only be proceeded with on an entire agreement between the administration and the Council. On its side, the Council can take the initiative, suggesting to the administration any schemes it may be desirous to see carried out; but in case of non-compliance, the Council have no appeal; the administration and the Council, in fact, reserve each to the other the right of veto, a position which, it is true, occasionally, where mutual concessions are not made, leads to troublesome delay.

For the examination of the budget, the Municipal Council divides its eighty members, as far as possible in accordance with the capacities of each, into seven ordinary commissions, in addition to which there exist seven other special commissions.

The first commission, that appointed to inquire into the *finances*, deals, as may be imagined, entirely with figures; the loans, taxes, rates, *octroi*, or town dues, &c. The second commission is entrusted with the affairs of the central mayoralty (*la mairie centrale*); the *mairies d'arrondissement*; what is understood in France by the *état civil*, comprising the duties assigned in England to the Registrar-General of births, deaths, and marriages; the conduct of what, again, in English we have no adequate expression to explain, the *pompes funèbres* (the duties of the undertaker being entirely monopolised in Paris by this branch of the municipality); the cemeteries, the recruiting of the army, the general management of the church in its varied relations to the corporation. This commission takes upon itself, in addition to these duties, the examination of the municipal libraries, the archives, and the municipal museum now installed at the Hôtel Carnavalet, answering, to a certain extent, to our Guildhall Library.

The third commission,—the *Commission de la voirie de Paris*,† as it is termed,—studies by the reports made to it by the administration, the plans of all proposed new thoroughfares, and the public roads generally, the naming of the streets,—managed in Paris with a consideration, alas! unknown to Londoners,—the paving, sweeping, lighting, and maintenance of the roads. All questions of indemnity for damages are submitted to this commission which likewise has to deal with the omnibus, tramway, and cab traffic of the capital, in its relations with the Corporation.

The fourth commission is entrusted with the "public instruction" and the organisation of charity (*assistance publique*), the communal or parish schools, with instruction in drawing and singing, apprentices' certificates, bursaries in the "lycées" and colleges. Here, again, it may be remarked that the whole scholastic system throughout France is based on an organisation such as we may well envy our neighbours. In the matter of charity organisation this commission has, it may be imagined, a wide field for its labours; among its numerous duties may be mentioned that of an inspection and control,—in its relations with the charity budget,—of the Mont de Piété, the Government in France, as in Italy and Belgium, being the public pawnbroker, the Mont de Piété being one more of those admirable and charitable institutions, the want of which with us and in America has often been regretted. It may be mentioned that this fourth commission has recently named two special commissioners, one entrusted with the preparation and establishment of new scholastic institutions, the other to study the important question of technical instruction.

The fifth commission is called upon to consider the architectural and other artistic adornments of the capital. The squares, parks, walks, plantations, the Bois de Boulogne and Vincennes, the renting of those numerous little establishments, kiosks for the sale of journals, &c., that form so characteri-tic a feature in Parisian street life, the *urinoirs*,—a point admirably considered on the banks of the Seine, where lately have been erected an even greater convenience to the public, and known as *châlets de nécessité*, a hundred of which, architectural features with their polished marble exteriors, have been scattered over the capital. To these duties we must add the commission's consideration of all public notices, and play-bills, these latter not allowed, as with us, to cover every vacant boarding, but neatly posted every morning by a body of special *employés*, on to a number of "columns" as they are called, placed in every thoroughfare for the purpose. Under the consideration of this commission come also the several municipal theatres, and the very important annual item of "encouragement" (by commissions and purchase) "of the fine arts." The management of all public fêtes and ceremonies rests also with this commission, but since the last Great Exhibition a special *commission des fêtes* has been appointed.

The sixth commission, of "drains and water," examines all the various and complicated details of these two most important factors in modern existence; the commission has constantly under examination the water supply from its various sources, as also the navigation, maintenance, and improvement of the canals belonging to the City.

The seventh commission is entrusted with all questions relative to what is understood by the "Domaine de la Ville," the bonded warehouses, the markets, the *abattoirs*, or slaughter-houses, weights and measures, legal difficulties, &c. In addition, the commission has to examine the budget of the Prefect of Police, the pensions to retired *employés*, policemen, and firemen. There remain to mention three special commissions, one entrusted with the organisation of the labours of the Municipal Council; the second examines the important question of unhealthy dwellings; the third has been nominated to examine and report on the annual budget. These special commissions are all temporary, while the ordinary commissions may be said to be permanent.*

Such, roughly stated, is the system of organisation by means of which Paris is ruled, and, let it be remarked, without complaint on the part of the public; ratepayers exercise, indeed, their right to grumble at the expenses laid upon them, but the system enables a strict watch to be placed on the employment of all sums, and every Parisian knows that without expenditure little can be expected, as the American proverb, recently quoted in these pages, has it, "Nothing for nothing, and very little for a dollar." It is not in Paris as it is in New York, governed also by a central municipality; the accounts of the wholesale peculation on the part of the rulers of the "Empire City," which from time to time have reached Europe, must not be dwelt upon ill-naturedly; New York must still be regarded as an experiment,—an experiment, however, the success of which who can deny? The circumstances of the extraordinary growth of the city in a new country must be taken into account. In this matter of misappropriation or misuse of municipal funds it will not be found, we suspect, that a central form of government affords more, rather less, facilities than any other system of city rule. In the case of the municipality of Paris it can, we believe, be shown that enormous as is the annual budget of the French capital,

* When the Hôtel de Ville was burnt by the Communists, the Prefect and his staff moved into the Palace of the Luxembourg; but when the Government was transferred from Versailles to Paris, the Senate requiring the Luxembourg, the Prefect again crossed the Seine to his present quarters in the Tuileries.

* In the preparation of this paper we owe much of our information to the excellent little rate-payers' manual, "Paris Municipal," by M. Lemereux, (Paris, 1879).

† The word *voirie* in French administrative language has two acceptations. In the first it comprises everything relating to the public way (*voie*) and the buildings erected on it. The second is applied alone to those establishments to which is carried, and where is manipulated, the sewage of the capital.

* The Municipal Council also, excepting certain vacations, corresponding to those of the law courts, is permanent; the second Municipal Council (after the existing Government was formed in 1871), elected at the end of 1874, renewed in 1878, held in the three years 250 meetings, its commissions no less than 926. During this time it deliberated on no less than 8,143 affairs.

far exceeding eight millions sterling to two millions of inhabitants, in no modern city are the contributions of the ratepayers so skilfully laid out with a view to that important commercial consideration of a proper return for the outlay.

Having thus sketched the outline of the Paris municipal system, we may find occasion at some future time to deal more specially with the items and management of the expenditure of the annual budget.

LAND TENURE AND TOWN BUILDINGS.

There can be no question at all that the subject of the tenure of the land in England is rapidly becoming the burning question of the day. Much as we hear about the matter of compensation to agricultural tenants for improvements and other things very closely connected with the agricultural interest, yet no person who discusses the subject of agricultural distress in all its bearings fails to touch upon the question of the tenure of English land. More works than one of considerable merit which have recently appeared in the publishers' lists, have dealt wholly with the subject of the reform of tenure of English land, notably Mr. Brodrick's "English Land and English Landlords," a work which is of the utmost value at the present day. But the question is one which has as much interest for dwellers in towns as for those in the country, and architects and builders may fairly claim to be very interested parties. We can scarcely suppose that any one who will regard the subject of land tenure in England candidly and calmly, and without letting political feelings get the better of him, can hesitate in desiring to see the tenure of land made as free as possible. By free land we mean property which the owner can dispose of how and when he likes. At the present time, very large portions,—indeed, the larger proportion,—of our houses belong to a few families, and are in strict settlement. It is quite true that building leases have been granted to builders and others, who again have leased the houses which they have erected, but the freehold houses in our towns are few compared to the great mass of leasehold houses. Now, we may say at once that assuming settlements and the tieing up of land put an end to, it would be Quixotic to suppose that all the leasehold tenants of towns would suddenly become freeholders. There can be no question, on the other hand, that freedom of land would gradually tend to cause the spread of our houses among many owners, and would prevent the great mass of leasehold premises from springing up, which are a consequence of the present system. Into the moral, social, and political merits of the existing system of life tenancies and changes which characterises our land system we do not propose now to enter. Those who desire to see the *pros* and *cons*, will find them discussed in the work of the Warden of Merton College, to which we have referred in Mr. Kay's "Free Trade in Land," Mr. Kinnear's "Principles of Property in Land," an article in the current number of the *British Quarterly Review* on the "Tenure and Transfer of Land," and in various other books and journals.

Let us consider, however, how our towns are affected by the absence of freedom in our land tenure, and would be likely to be by a reform of the existing system. Every Englishman's house is said to be his castle, and that saying means more than most people think. A man who owns a thing absolutely will spend more money on it than he will if he is only a temporary possessor. In these days he has not to fortify it against outward human enemies, but against the invisible foes whom sanitary reformers have long been fighting. We do not for a moment doubt that if the occupiers of town houses were also the absolute owners, the cause of sanitary science would advance at double its present rate. If a person knows that he can be sure of being in the same house forty years hence, or that his representatives will be, or that he or his representatives will be receiving rent in respect of it, he will not hesitate to improve it. Mere seven, fourteen, or twenty years' leases are not enough, for town tenants do not, like agricultural tenants, reap the fruit of their improvements in hard cash; they do so in increased comforts, in greater security against disease, in mental satisfaction at perceiving more graceful shapes or colours. The agricultural tenant who at the end of a twenty-one years' lease, in consequence of having drained fifty acres, has received largely increased crops, has paid back the capital, and received a handsome interest on it, is fully recompensed. But the man who has had his house well ventilated, and raised it an extra story, at the end of twenty-one years has by no means reaped the full fruits of his outlay. Therefore, it is pretty evident that if freehold tenures were more common in our towns, the sanitary and the ornamental character of our houses would increase with much greater rapidity than at present. We will give an example of the way in which the system of leases acts to the detriment of the beauty of our houses. The whole of the east side of Cadogan-place belongs to Lord Cadogan as ground landlord. Fresh leases are, we believe, granted on condition that the tenants spend a certain sum on their houses, and, among other things, raise them one story, and hide the honest red brick by a ghastly winding-sheet of stucco, and place on the top a heavy balustrade. Now harmony is one thing, but monotony is another, and by the time the whole of the east side of Cadogan-place becomes of the same character, it will show to the stranger a long line of dreadful and monotonous ugliness. But, if many of these houses belonged absolutely to their owners, can any one doubt that we should see houses worthy the situation? In that long line of habitations there is not one in which, externally at any rate, the skill of the architect is expended; but, given an absolute owner, he would undoubtedly call in the services of an architect to improve and enlarge his dwelling. We give an instance such as this because it is what may be called practical in its character, and nothing is so telling to an English mind as a hard fact. And the matter may be put in another form, by asking the question, can freedom of ownership deteriorate the aspect of our towns? Any one of observation and experience will answer at once that it cannot, and therefore it must, whatever effect it may produce, work for good. Consequently we think there can be no doubt that, were freedom of ownership to become more common, houses would be much more largely occupied and owned by the same person, and would consequently be more substantially built, would be the subject of many more improvements, and would be more pleasing to a cultivated eye and taste, and consequently that the reform of our land system will tend to make our houses more healthy and more beautiful.

It is sometimes said that if land becomes so easily saleable, rich people will buy it. But even if a rich man does buy a number of houses, he cannot live for ever, and it is quite certain that in time the property will, partially or wholly, come into the market again. But we do not believe that the millionaire will amass property in the towns to any large extent when, as we hope, freedom of ownership shall be the characteristic of our land tenure. A man will only be too glad to invest his money in his habitation if he can sell it when he wishes or leave it to his children, and experience shows that the probabilities are in favour of occupiers purchasing their habitations, and so by degrees we should find our towns owned by a number of persons absolutely, and not occupied by tenants whose great aim and object is to spend as little on their houses as is consistent with comfort and average healthfulness. Consequently, also, freedom of ownership in our towns appears likely to be an incentive to thrift since many a man will try to save money in order that his house may become really his castle. We observed before that the mind of the architect is not visible in the present "monotonizing," if we may coin a word, of Cadogan-place; and this leads us to point out that freedom of ownership by enabling and inducing owners to improve their houses or to build them for themselves would improve the architectural profession throughout England. It would improve business and give greater scope for individuality and taste because at the present day in our towns the architect, considering the number of houses, has comparatively little work. If a nobleman, or a rich merchant, wishes to build a palatial mansion he calls in an architect, but, given an ordinary row of medium-sized houses, the builder takes care to dispense if possible with the services of an architect. Moreover, freedom of ownership would give more employment to builders and scope to a good class of work, the order would not be for "something that will last out my lease," or "just do for my time," but something that will last long and well. Regarding, therefore, all the interests which are connected with our towns, their healthiness and their beauty, the thriftiness and comfort of their inhabitants, a reform of our land system promises beneficially to effect all and each of these. There is nothing to be said in favour of the great London estates of the Grosvenors, Bedfords, and others. All those, therefore, who dwell in our large towns, who earn their livelihood in them, whether as architects or builders, should do what they can to bring about greater freedom of ownership in this country, irrespective of political opinions.

ROYAL SOCIETY OF PAINTERS IN WATER-COLOURS.

The Winter Exhibition of this Society, which opened last week, may be fairly called a remarkable one, when we consider that the exhibition held at this season does not profess to be the principal one of the year. Although some of the greatest names in English water-colour art, which now belong to the past, remain still unsurpassed, and perhaps in some qualities unequalled, there has probably been no period in which such an amount of really fine work, so varied in character and interest, could be got together in a single winter exhibition of "sketches and studies," and the favourable impression which a first view of the present exhibition suggested to us, is only increased by more detailed examination.

Looking first at some of the figure subjects, which are, as usual, the least numerous class, we may direct attention to Mr. Walter Duncan's fine work, rather a finished drawing than a study, representing "Imogen before the Cave of Belarius" (136). We recognised in this painter's earlier exhibits, some seasons back, the evidence of unusual power and expression in dealing with ideal figure subjects. In some more recent exhibitions we have been disappointed in not finding in his works all that he had led us to expect; but the "Imogen," which is his principal contribution this year, is more equal to what we have previously seen from his hand. Combined with very fine drawing and colour there is the higher power of intellectually realising the subject; and after all the pretty and characterless Imogens one has found in exhibitions, it is a relief to see a figure which really seems to embody the poet's idea of the person and the situation. Doubt and hesitation are expressed in the whole attitude of the figure, in the expression of the somewhat care-worn, though beautiful face, and the nerveless grasp of the hand on the unaccustomed weapon. The painter has not forgotten that Imogen, though a lovely and delicately-nurtured princess, is here in the position of one who has undergone much mental agony and bodily fatigue and exposure, and he tells this story plainly in her countenance. We may contrast the work in some senses with Mr. Tadema's "Pandora" (334), a half-length of a red-haired Roman girl, of the type which he has often repeated, who holds a bronze casket. Here the interest is in the rich and delicate colouring of the figure and the accessories, and the completely antique feeling of the whole. The drawing appears to us curiously defective for so masterly a painter. The line of the back is stiff and straight, and the forearm seems out of proportion with the upper part of the limb. The intellectual interest of the figure is *nil*. To call it "Pandora" is an absurd reduction of a great poetic legend to the plainest prose.

Among other figure subjects Mr. H. Wallis sends a very interesting series in which he has turned his studies of the topography and architecture of Venice, and of ancient Venetian costume, to account in a variety of scenes illustrative of the "Merchant of Venice." We have "Portia and Nerissa at Belmont" (69), seated in a richly-marbled interior hearing the message of the "fore-spurrer" who comes before his lord; Portia is one of the Venetian blonde women so well known to us on the canvases of Titian and Bordone, Nerissa a dark girl of evidently inferior social standing; but in this case the character of the figures is not much made out, it is rather a sketch of interior effect. "Shylock, Jessica, and Launcelot" (111) is more distinctly characteristic; the idea of Jessica is very good, she is a pretty little doll of a girl with plenty of mischief in her; she appears again, perhaps to better advantage, in "Jessica and Launcelot" (156), where she has just received the letter from Master Launcelot

The latter is in both scenes a little too respectable-looking and deficient in the comic element. A monochrome study, "Antonio, Bassanio, Gratiano, and Lorenzo" (125), where the two latter are taking their leave (in the first scene), is an admirable realisation of the scene, and of the contrast between the volatile young gentlemen who are making their bow, and the staid and dignified Antonio. "Bassanio unfolding his Plans to Antonio" (235), also a monochrome, is very good. In "Portia and Nerissa on the Morning of the Trial" (11), the interest is again rather in the scene, the representation of the gondola and the gondoliers of the period, than in the character of the figures; the artist seems to have been rather afraid of Portia and Nerissa, and has evaded any very precise delineation of their characters. But there is matter enough in these studies for two or three capital pictures from that perennially interesting and charming drama, some of which we hope will be forthcoming before long. Mr. Wallis seems to be making the subject his own.

Mrs. Allingham continues to exhibit in her various cottage children the power she has of giving interest and beauty to simple figures from English rural life, without imparting to them any character inconsistent with simple and unpretentious every-day life. The "noble peasant" who has been thrust upon us rather pertinaciously by one or two contemporary painters (following the lead of Frederick Walker) has no place in Mrs. Allingham's scenes. We have that sweetness of expression which is really to be found in good specimens of English cottage girls and cottage children, but nothing is exaggerated. The face of the child at "Granny's Gate" (325), and that of the girl "Knitting" (345), are charming specimens of natural unconscious sweetness of expression. "Washing" (370) represents a more matured figure, equally natural. One of the most charming of this lady's works this year is one in which the figures are subordinate, "Cottage at Grayswood" (314), a country lane scene before the gate of a cottage which is nearly buried in a mass of summer foliage, from amid which tall sunflowers glitter; the finish of every detail on so small a scale, down to the cat playing before the gate, is as complete as the total effect. Mrs. Angell, another lady member who reflects the highest credit on the Society, is as perfect as ever in her studies of flowers and birds: in the drawing of two "Foreign Birds" (320) we can fancy that we could lift the feathers with our fingers. Among the lady's several flower-paintings it would be difficult to say that any one is better than the others.

Among the landscapes there are a large number of beautiful drawings and sketches. Mr. Alfred Hunt contributes only one, unfortunately, a rich misty evening view of Durham, remarkable even among Mr. Hunt's works for the manner in which the uncertainty of form and outline produced by mist is given, combined with real certainty and careful indication of all the points of the landscape. Mr. Hunt's misty pictures are almost like nature in this way; as you look into them forms come out through the mist which are not noticeable at first glance. Whether the prevalent tone of warm brown is not a little more like a painter's effect than an effect of nature may be open to question, but this, like so many others of Mr. Hunt's works, has the effect of making us forget that we are looking only at pigments on a flat surface to an extent which few other landscape-painters achieve. In this respect another work in the room is rather remarkable, Mr. J. W. North's "Season of Mist and Mellow Fruitfulness" (31), an autumn landscape with an intertangled foreground of foliage. We have before expressed a doubt whether this gifted artist was not in danger of over-working a receipt for effect which he has invented for himself, and the present work is open to the charge of mannerism, when compared with what has preceded it; but a drawing more full of the real glitter of light, and in which we are more able to forget paint, it would perhaps be difficult to find; it is certainly a brilliant effort. An increased power in the realisation of brilliant and glowing effects of light on foliage seems to have been attained by an old and valued member, Mr. Naftel, whose previously rather quiet and even prosaic drawings are replaced this winter by some studies in which very brilliant and beautiful effects are realised, and a peculiarly delicate harmonious tone pervades the whole. Among these "Bettws-y-Coed Village" (205) and "Golden Leaves" (250) are particularly excellent. The new member, Mr. Wilmot Pilsbury, gives indications that his line of work is less restricted than his first set of exhibits led one to suppose. In his "Worcestershire Hop-pickers" (177) the interest is chiefly in the figures, which, though a little deficient in variety of character and expression, are thoroughly well executed, and lead us to suppose that we may look for good work in subjects of this class from their author. In his landscape, "Wheatfield" (91) Mr. Pilsbury's work still strikes us as deficient in breadth and atmospheric effect; in a smaller drawing, "Corner of a Farmyard" (210) there is some fine work, though this would hardly have been done unless Mr. Boyce had shown the way first. Mr. Albert Goodwin contributes, among other things, two works of rather peculiar *motif*; one of these, "The Invincible Armada" (123), represents the decaying timbers and skeletons of sundry ships left bare on a shoal, and showing dark against a stormy, dull red twilight; it is a work of considerable poetic feeling. "Waiting for the Express to pass" (55) is a powerful sketch of a night effect at a roadside railway station, a waiting train filling the air with smoke and steam, the scene being only fitfully illuminated by the porter's lamp and the lights in the carriages.

Among larger works, Mr. Basil Bradley's "Getting in the Barley—a Coming Storm" (96) conveys finely the idea of the moment when the first premonitory gusts in advance of a thunderstorm are felt, and the figures of men, women, and horses are effectively grouped. The same artist, in "A Study in Rotten Row" (240) has attempted to repeat his splendid success of last exhibition in drawing a lady on horseback, not quite so successfully, though the figure is a very spirited one: the horse seems a little long in the loins. Mr. Clarence Whaite's large work, "The Harvest Moon" (68) is unquestionably powerful, but it is not nature; and perhaps the latter criticism might apply equally to Miss Montalba's large drawing, "Coming into Port, a Sirocco Day, Venice" (227), in which, in the endeavour after the silvery effect which this artist is so fond of, the colour is so faint and so capriciously concentrated on certain parts of the craft only, that it is almost difficult to say at first sight whether it is meant for a coloured picture or a monochrome study. Among the landscapes which are pure and unaffected transcripts of nature, two by Mr. Cuthbert Rigby should be noticed, "The Old Furnace" (294), and "Evening" (208); both represent the character of some special locality where low, heavy, stone-built cottages are planted among somewhat barren hills; in feeling and in realising a special character in landscape they seem perfect. Mr. J. Parker's various little studies of bits of French coast towns are excellent specimens of street architecture sketches, especially "La Lieutenance, Honfleur" (36); and architectural interest of another kind is shown in Mr. G. Andrews's drawing of the Girgenti Temples (17), and in Mr. Carl Haag's general view of "Baalbeck" (164). Mr. Herbert Marshall has made a fine study of "Rotherbithe" (26), and Mr. Otto Weber one of "Greenhithe" (207), with his favourite cattle reposing on the marshy ground adjoining the river; Mr. Marshall's "Durham" (251) should also be looked at,—an interesting contrast to Mr. Hunt's before named.

Among miscellaneous subjects may be mentioned a study, apparently for fresco decoration, by Mr. Marks, entitled "Welcome! the Arrival of the Guests" (200), a good specimen of this artist's peculiar humour in the adaptation of old-world figures to modern subjects: the same artist contributes some characteristic studies of heads (266, 274) representing various types in modern life. Mr. J. D. Watson exhibits two figures under the title of "A Warm Reception" (281), which are very clever, and analogous in humour to Mr. Marks's productions; and there is a fine figure quite in Mr. Watson's own style under the title of "The Student" (315). Mr. E. Buckman's "Cobwebs" (326), an interior of a hayloft with a figure reading by the light of a much-cobwebbed window, should be looked at; it is a very original thing. Mr. A. H. Marsh sends two figure-studies, one of which, "Driftwood" (128), is very pathetic, and has the materials of a fine work in it. Mr. Brittan Willis's "Slight Study from Nature" (115) and "Highland Cattle" (395) are very good specimens of cattle studies; nor must we forget Mr. F. Tayler's "Waiting for the Hounds" (27), which contains as good a study of a horse as one could wish to see. Our list by no means exhausts the good points of this admirable exhibition.

SIR F. LEIGHTON ON ART.

THE President of the Royal Academy, in his address last Saturday, on the occasion of delivering the prizes to the successful students of the year, took opportunity to deal with one of the most important considerations which can be entered into in reference to the objects of art and the conditions under which artistic work is to be carried out. What, he proposed as his theme, is the relation of art to morals and religion? It is only in a period when art is not exercising her highest activity, when she is somewhat fettered in her powers and doubtful in her aims, that such a question would be raised at all, and the fact that the President of the leading body of artists brought it prominently forward and devoted so much time to its consideration on such an occasion, must, we fear, be regarded as in one sense a proof that art is hardly in so healthy a condition at present as Sir F. Leighton evidently wished his hearers to infer that it was. In great periods of artistic production, whether in sculpture or painting or music, the great question is how best to master the difficulties of the art and evolve the most complete productions possible. It is not then the question, to what end do we do this or that in art, but how can we do it best? and the mere achievement is an end in itself. It is, however, of no use to ignore the fact that we are at present in the midst of many "obstinate questionings" about art; no one who takes the wide view of the subject in relation to contemporary thought and manners which Sir F Leighton might be expected to take, can ignore their existence; and he may have done good service to some hesitating minds by his review of the position, and the tolerably decisive answers which he gave to some of the heresies, as we may call them, of the day in reference to the *raison d'être* of art.

In regard to what may be termed the religious view of art, every one must be aware that this has been very strongly urged of late years, though we should divide the art-religionists into two types, which Sir. F. Leighton did not distinguish, but which we think are strongly marked. The one is the church party, represented mainly by some enthusiastic amateurs, who proclaim art to be *ancilla Domini*, the "handmaid of the Lord," and regard the furnishing of ecclesiastical decoration and ecclesiastical paintings as the chief and most noble end of art. The other is the much larger class, of whom Mr. Ruskin and some of the once so-called pre-Raffaellite brethren are the most prominent leaders, who are not specially ecclesiastical in their leanings, but who very decidedly proclaim that the end of art is to inculcate moral truths, and that without that end it is but elaborate trifling. Sir F. Leighton, in alluding to the lengths to which this moral and religious, or we might even say ascetic, view of art, had been carried, mentioned that he had met with the idea, among some of the German painters, that even a love of rich colour was a sensuous and to some extent immoral indulgence of the lower part of the artist nature, arguing a depraved taste. It is a curious contrast that in England, so far from our having adopted any such extreme view as this, the love of rich colour has usually been very predominant in the theory and practice of the "moral" school of artists in this country. But the idea that art must have a moral end is nevertheless very strongly urged by certain of our artists, and with the more effect that it falls in precisely with some of the predominating traits of English character, especially English middle-class character. The sensitiveness to beauty for its own sake is not prominent in the English national character. The idea of moral duty and responsibility is, on the other hand, very strong in our national character, with which therefore the moral theory of art precisely falls in. A large proportion of English people would entirely sympathise with an artist who should proclaim that his works were all produced with a distinctly moral aim, although such a proclamation would in reality be no more reasonable or valuable than Artemus Ward's advertisement of his "highly moral waxworks."

The arguments brought forward in favour of this view of art as a moral agent are of two different kinds. The one involves the assertion that, as a matter of historical fact, art has been

greatest when pervaded mainly by a religious motive. The answer to this is simply, we do not see or feel this alleged superiority, and the world at large has decided in the same sense. Sir F. Leighton brought forward, as a kind of *reductio ad absurdum* of this part of the moral argument, the example of the Spanish school of painting which flourished under the most direct influence of the ecclesiastical idea, the school of which Morales and Luis de Vargas are examples, and asked who would claim for these men, valuable as in some sense they were, a place alongside Velasquez, "the most mundane of painters, and Shaksperian almost in the width of his mental objectivity"? The argument drawn from the growth of painting in Italy he admitted to be "more specious," and in reference to it the President drew attention again to the precise nature of the position taken up by the moral and religious school, the promulgators of the "didactic theory": "it is, that the moral edification of man being the highest duty of art, those productions of art will take the highest rank which teach, with sincerity and of a definite purpose, the greatest number of moral truths, and that the painter who (the artistic gift being, of course, postulated) aims most constantly at the promulgation of these truths will produce the greatest works. You will at once feel that these assumptions, if accepted without reservation, sap at the roots of all free criticism, practically substituting for it a foregone conclusion. A critic who approaches a work of art under their influence will instinctively gauge it in accordance with them. . . . . Now if, on a review of Italian art from its rise to its zenith, we ask ourselves which works have by the consent of the vast majority of the intelligent been pronounced the most mature and perfect, we shall not find that verdict harmonising with one which should be built up on the axioms of the didactic theory; we shall, on the contrary, find that the evolution of art in Italy, an evolution singularly organic and continuous, bears no ratio, unless it be an inverse ratio, to the religious life and development amid which it ran its course." It is useless for moral enthusiasts in favour of the religious view of art to protest the contrary, to say that they find more true greatness in the art of Cimabúé than in that of Titian, for the verdict of the vast majority of educated minds has fully decided to the contrary, and in such controversies, which admit not of mathematical argument, *Vox populi vox Dei*, though in a rather different sense to that in which the proverb is generally used, is the ultimate test. The progress from the phase when Italian painting was under the dominion of the ecclesiastical idea to that of its fuller and freer life, is very well indicated in Browning's famous poem, "Fra Filippo Lippi," where the clever but scapegrace painter tells his audience how the monks were scandalised at his painting men and women just as he saw them, instead of painting things to edification. The whole poem makes a very good commentary on some portions of Sir F. Leighton's address.

But apart from the historical aspect of the matter, it is perfectly true, as Sir F. Leighton observed, that this idea of a high moral and didactic end in art appeals with great force to many serious and earnest minds. He made a very good reply to that view of the subject in reminding his hearers that one effect of the adoption of such a view of art must be to remove from among the category of the arts one of the most beautiful, that of music. Scarcely any one has ever pretended that music can in any manner represent moral ideas, and it would certainly be difficult to see how an argument which would shut the mouth of one art altogether can be logically applied to another. The answer is, not that ethical truths and ethical teaching are of inferior importance to art, but simply that art is not the medium for the advocacy of ethical truths. The President pointed out (and in these pre-eminently scientific days the illustration is especially effective) that precisely the same limitation applied to science; that science is not concerned with reading moral and religious lessons, but simply with investigating nature. That moral deduction may be drawn from or suggested by great scientific discoveries may be true, but it is not the business of the man of science to draw them; it is his business only to find out and promulgate scientific truth. In like manner, the artist who makes it his end to promulgate ethical truth is employing a very roundabout means to that end,—speech or writing would answer the purpose much more directly; and he is at the same time liable to fall short in what is the legitimate province of art, the promotion of intellectual enjoyment.

There is, however, we may be allowed to add, one sense in which an artist may be said to exercise indirectly a moral influence through his art, and that in a sense quite in keeping with the application of his mind to the legitimate objects of art. What we mean to imply is this, that in proportion as the artist gives his best and most strenuous endeavours to the perfecting of his art, and gives evidence in all his work of serious thought and study, in so far will his works, in addition to the pleasure which they afford, exercise a healthy and bracing influence on the minds of those who contemplate them,—an influence which at least predisposes the mind to moral energy and effort: while a slackly and carelessly studied art, however "religious" the subjects may be with which it deals, has an enervating effect on other minds. It would not be difficult to call to mind instances of this not far from home: examples of great "religious" paintings which the public are exhorted to go and see for the quickening of their religious sympathies, and which represent false, hasty, flashy, and therefore, in a sense, immoral art, produced hastily to win a cheap applause. All such art has its bad effect in the long run, just as all art which bears the stamp of serious artistic purpose and endeavour after the best that can be done, carries a moral with it, though not in the same sense that the didactic school of critics mean by moral teaching. This point might have been a little more brought out in the President's address, which, nevertheless, was an excellent contribution to the consideration of the important subject with which it dealt.

"BARNACLES."

This was the title of a paper read before the Architectural Association on the 9th inst. by Mr. Cole A. Adams. After some introductory remarks, in which the various meanings of the words "barnacle" and "barnacles" were quoted, the author proceeded to speak of the "barnacle" as a shell-fish, observing that no matter what subject the "barnacle" attacked, he invariably "went to the bottom of it," with a persistency and method which were very highly to be commended to, among other people, architectural students, whom he advised to cultivate the habit of mastering one subject of their studies at a time, as the pursuit of such a course would give a breadth and power to the mind. The difficulties which beset the modern architect who aspired to hold a high position in his profession were Herculean. In those ages when the art was a living one, and when it was natural to build in one style, with all the life and surroundings in harmony with it, the task of designing must have been an easier one, comparatively speaking. No question of "style" would arise; doubtless there were schools of thought, and variety of design, but it ran in the same direction, and was, so to speak, academical, governed by fixed laws and principles. At the present time what chaos reigned, what confusion of styles! The student looking abroad in these days was bewildered, and needed, in fact, to put on "barnacles" to assist his mental vision. Sorrowfully, perhaps, he looked back nearly half a century to the time when men saw that Gothic was fair to look upon, and enthusiastically took up its study. He might smile at much that was done, but he could not but love those who had gone for the faith they had. Now the great Gothic wave had spent itself,—had done its appointed work,—and a restless nineteenth century craves for other food. It was to be regretted that a certain amount of indifferentism had sprung up in the profession, and that men were pandering to a taste and working in a style,—or no style,—in which belief was wanting. Architecture, chiefly in civil and domestic buildings, had caught a kind of scarlet fever, and entered upon a phase of its history which might be called "the red and rubbed brick era." For ecclesiastical work Gothic still claimed the largest share, and we possessed buildings which showed an extraordinary advance upon what was done only a few years back. The works alluded to (those of acknowledged masters of the art of architecture) were distinguished by greater breadth and less fussiness. The details of a cathedral were not stuck upon a parish church; large wall surfaces were left to tell their own tale,—to suggest repose and to heighten features and detail,—the latter more sparingly applied. Adverting to the "Queen Anne" style, Mr. Adams observed that there was much that was lovable about it, and when its features and characteristics were duly kept within bounds, great piquancy of effect might be gained, and dignity also. Unfortunately, in the rage for novelty, men had overlooked or forgotten the lesson which the modern Gothic masters had learnt. Sketch-book detail again made its appearance,—frequently without rhyme or reason,—and buildings were stuck about with the most extraordinary-looking "barnacles,"—memorial-tablet detail, porches stopped off at the bed-mould of the cornice, and pilasters like Sir Frederick Leighton's description of Cleopatra's Needle in its new home: "emphasing nothing, by nothing emphasised." Wide openings covered with flat arches, so thin that they could not hold themselves up alone, and which had, for their own support, as well as for the weight they should carry, concealed iron girders; ironwork painted and made to look like woodwork, so as to escape the Building Act; these and other eccentricities too numerous to mention were "barnacles" so persistent and parasitical in their growth that they eat into the very life of architecture, and bring its practitioners into ridicule. These things were done by men who knew better, and it was to such work that many students looked up, finding it to be fashionable. Was this the kind of work that would make the student honest and truthful in what he did? Could it be reconciled with the motto of the Association, "Design with Beauty, Build in Truth"? One great lesson to be learnt from "barnacles" was that "Unity is strength." Architects had too long failed to recognise and act upon that lesson, although a notable instance of the power for good resulting from its recognition was seen in the Architectural Association itself. After some further remarks under this head, Mr. Adams proceeded as follows:—

It would seem to be the tendency of modern times to subdivide labour, and more and more we see that specialism is spreading. In all other professions we note this sub-division of labour, and there are signs, not to be disregarded, in our own. Church restoration and church building are for the most part in the hands of comparatively few men; this is more notably the case when the church to be restored or built is in the hands of a committee, and many a man, probably every bit as competent, is set on one side because Mr. Somebodyelse has been fortunate enough to be better known as a church restorer or builder. Again, in school, workhouse, and hospital building, in sanitary engineering,—alas! here as a profession we have ourselves to blame,—much that would come to us we have as a body turned from as beneath our serious notice. This work and much else has drifted into other channels, and is no longer thought by the public to belong to the profession of architects. Does it not, therefore, behove us to be looking well into this matter, and if specialism is to be the modern order of things, for a young man to consider carefully where his particular bent may lie, and then to turn his special attention in that direction, after carefully weighing his future prospects, if he has any, of getting work? To do this, there can be no doubt that a general study of his profession will be the wisest course to pursue; but, with a definite aim before him, he will cultivate more assiduously that particular study which will fit him for the place he desires to succeed in, and, taking a leaf out of the book of the young barnacle, will devote all his energies to getting a firm grip of it, going beneath the surface and making himself master of the situation. Doubtless, perhaps without knowing it, most men follow their particular hobby in work. I only speak of those who are really in earnest about it, and who mean to succeed; but if in the future this sub-division of work is to be a recognised feature, then it will not be wise to neglect the signs of the times. Specialism, I suppose, of all kinds, has a tendency to become cramping to the intellect, and somewhat tyrannical in its effects; on the other hand, in the liberal and mechanical arts, we do find and must recognise that men whose whole time and energies are devoted to special branches, in painting and sculpture, or the making of particular machines or articles of manufacture, attain a precision and accuracy which are very remarkable, and seemingly only attainable by such a system. In Medicine and Surgery, we see essentially this system of specialism; and in our sister profession of engineering, we

have its members devoting themselves to separate and distinct subjects, and obtaining in each the most marvellous results, for

"These are the works of the age, the marvels of men and of mind."

But architecture, which is as old as the hills, is more conservative. Most of us hitherto, in practice, lay ourselves open for each and every thing that may come in the way. But our masters, the public, are becoming more critical; art education is telling its tale, and clients look about for themselves, look with discriminating eye before they decide upon whom they will employ, and often choose the man who has given special evidence of his capacity to meet the requirements which they need. Do we not ourselves use this discretion? Formerly we went to the general medical practitioner for every ailment, but now if it is within our means we go to the man whose reputation lies in healing the eye, the liver, the lungs, the brain, rheumatism, gout, and the many other ailments flesh is heir to; and then in surgery how many are the divisions? Certainly here the system seems to work well; certain it is that the public think so too, and it would be useless for the medical profession to disregard the facts or fight against it. So far from doing that, we find that general practitioners rather encourage it, and when in difficulty consult the specialists, and send their patients to them for advice, and act with them in consultation. No jealousy exists, and science is undobtedly advanced by the powers of the mind being devoted to the mastering of one subject.

Engineering, too, as we have noticed, includes branches too numerous to mention. It would seem, then, only natural in the order of things, that in our own profession we shall see the same barnacle action taking place, for your barnacle is a specialist too. If with the spread of knowledge, of science, and of art we are to hold our place before the world, it must be as men proficient in what we undertake. So numerous now are the various works that the architect is thought to include, and be master of, that it is simply impossible in the time at his disposal that he can be a proficient in all of them. Work of every kind and description connected with architecture is daily, one may almost say, being filched from us, and men and companies are started for doing that which would be better done by architects who, trained in youth to the profession, elected a particular branch or branches to practise in. Our work is frequently done by men who have only a slight acquaintance with the art and science of architecture, and professional architects too often get the blame. If, instead of this, special branches were taken up by men educated as architects on a broader basis, I think we should see much the same result as exists in the medical and other professions, and we should have a class of specialists who could be called in in consultation by their professional brethren as necessity arose. In alluding to this subject, it must be borne in mind that such remarks apply more particularly to the city we live in, and other large cities, but we cannot look abroad without seeing how this tendency to head centres is a feature of the age.

The advantages to be gained by this system would seem to be this. The profession of architecture would stand better in the eyes of the public by the proficiency of men in i's various branches; work connected with building, &c., instead of drifting into other quarters, and being done by men who have little or no knowledge of architecture, would be kept in the profession and be looked upon as belonging to it. A slight acquaintance with the work of outside specialists is enough to show how hideous they can make the work they touch, and how in their desire, and a worthy one it is, to make their own work successful, they utterly disregard all considerations of the claims of art. They are, it is to be feared, too often glad to show that architects know nothing about the particular branch they take up. But already the public is alarmed at the cost of sanitary reform initiated more particularly by these specialists, and the accounts we hear of the cost involved are sometimes startling. Now we have this matter a good deal in our own hands, and much else, such as warming, ventilation, &c. A general knowledge, at all events, of principles and practice, is essential to every practitioner, but if we had more men like those who read papers and spoke upon the subject of sanitation, &c., last session, we should be able in any difficulty, with the consent of our clients, or on our own behalf, as the case might be, to call in one of these gentlemen to advise. Now, there would be nothing *infra dig.* in such a course, for, as we have seen, it is so in other professions. A feeling of *esprit de corps* would animate the consulting and consulted architect, and the advice would be given with a knowledge of the whole case and all its difficulties, both working in the same interests for the benefit of the client. Again, in special matters of construction, design, decoration, and what not, the same system could be adopted more than it is now, to the great gain of the public and the profession. And the esteem of the former would be increased, if our employers found that we contained in our ranks all the elements for meeting whatever question arose without going to outsiders for information, and involving them in large extra expenses thereby.

There are barnacles and barnacles. Some spend their lives at home, others are great travellers,—visit many countries, cross many waters,—but beyond sustaining the life that is in them, apparently gain little advantages from this mode of spending their lives. The moral that we may draw from this is that there are students and students. Some, from necessity or inclination, stay at home, and some are fortunate enough to be able to travel and visit many countries. The pursuit of the beautiful is a necessary study for all who aspire to the highest qualifications of an architect, to be, before and above all else, an *artist*; but, to make use of his studies, he should not only be a sketcher of what will look pretty in his sketch-book, but should observe the object upon which his attention is turned, and try and discover in it what was the motive of the man who executed the work, the materials of which it is composed, the colour which charms, and how this pleasurable effect of colour is produced, whether solely from the kindly hand of time, or intentionally. Then the plan,—generally one of the most important factors,—the mode of construction, the height from the ground and from where viewed and intended to be viewed. Now, all this necessarily takes a long time, and nineteenth-century rush so pervades our modern system that few will take this trouble. To pursue such a course of study will not fill the sketch-book, and is too irksome. I think we often place too much importance upon the sketch-book as a show-book. I remember, some years ago, when seeking employment, showing my sketches to a very distinguished architect. He was kind enough to compliment me upon them, but added, "I should better like to see them loaded with figures." There is no doubt, I think, of the wisdom of such a course. Your drawings will not look pretty, but you will have facts to correct fancies, and I think no one who adopts this course regrets it. You see some pretty little piece of architecture, sketch it, gloat over it, and show it to your friends as something very choice. Years after you wish to refer to it; then, may be, your recollection of its plan, situation and construction, the materials of which it was composed, are gone from you. Now, had all this been noted down and measured, the system, though laborious and sometimes a drudgery, would have been the means of impressing it upon your mind, and your drawing would have been of greater use. Of course, many do this, and so great is the importance of such a course of study known to be by those qualified to judge, that the prizes for sketching old work are mainly based upon the principles I have enumerated. I believe a favourite maxim of the late Mr. William Burges was "Sketch and measure, measure and sketch," short and to the point, like most of the clever things he said. Some may think it unnecessary to call attention to what every student knows, but my own observation is that though students may know it, the system is not so universally practised; and that the neglect of this thorough way of sketching is the cause of a great deal of weak and senseless detail in modern building. Rushing through towns and cities making pretty sketches is a very charming amusement, but if it is to be of real architectural value to yourself and others, beyond the ephemeral pleasure of looking at pretty drawings, no other way is of use than the one touched upon. The rambling method will leave the student a travelled barnacle, with little real professional gain. The habit of thoughtfully working out one subject, and mastering it, is worth a bookful of "bits": it conduces to an increase of reasoning power by going to the root of the matter, which, when we are at work upon designs for our own buildings, gives method and reason for what is produced. It seems to me an absolute necessity in early years to pursue this system, as experience is gained, the student learns to discriminate and to jot down all the salient points of his study, and to economise labour upon it, but only after many years of toil and a peculiar faculty which some possess above others for grasping the essential, and showing only what is absolutely necessary to express this to yourself and others. Mr. E. W. Godwin's method of sketching old work may be quoted and pointed to as illustrating my meaning. Another useful way of making foreign travel of real use is the habit of keeping a concise and careful diary. It is, of course, rather irksome, but of the great advantage of so doing there can be little doubt; and when daylight gives over, and the student returns to his quarters of an evening, he would find plenty of occupation, and a pleasant way of passing what is often a very weary time. This occupation must greatly advance a student's general education; it teaches him to express his thoughts and ideas intelligibly, practising him in composition, and gives a habit of observation and a facility of expression which in after years will be of enormous advantage in writing reports for committees, papers to be read before such bodies as ours, and, may be, books to be published. Work to be done on the spot, whether sketching or writing, is conducive to habits of accuracy, and is of a value hardly possible to exaggerate.

Let us now consider "barnacles" in their nature of parasites, of which they are a species. The practice of architecture is not free from parasitical growth, and its progress is often impeded by it. In our day one great danger has arisen from the excessive prominence given to draughtsmanship and perspective drawing. The art of photo-lithography, whereby the actual handwork of the artist can be reproduced in fac-simile, has been an immense gain; its cheapness offers great advantages, and men have not been slow to seize them. The development of pen-and-ink drawings has largely fostered the production, and we have in our profession some exceedingly clever masters of the art. The professional journals have almost universally adopted photo-lithography for their illustrations. Most men like to see their works in print, and the facilities now offered for achieving this are so numerous, the demand so great, that it is not surprising that a large supply has followed. Now, valuable and useful as all this is, it is to be feared,—and you will remember that Professor Kerr warned us against the danger,—that young men, seeing the ease with which they can get their works thus copied, devote the greater part of their time to making pretty drawings, and obtaining excellence in the mechanical and artistic use of the pen, and this, it is to be feared, to the exclusion of more useful studies in the art and science of their profession. To be a good draughtsman is to possess a power which will stand the student in good stead, but if it tempts him to make pretty sketches and design elevations and details, which will not work, are not constructive, or are not the outcome of that primary necessity of all good architecture,—a well and carefully considered plan,—then such work is not true architecture, but a parasite. The study of such drawing is, of course, fascinating, and it is no wonder that the artist may in the pursuit of it, lose sight of the drier part of his work, which demands that he must give an intelligible reason for his design, and that it shall above all else be truthful. We are too apt, so critical have we become now-a-days in this matter of draughtsmanship, to lay too much stress upon the drawing and too little upon the design as a whole; and so important is this felt to be, that there has sprung up a class of specialists who undertake this class of work, and who can design elevations by the yard and make impossible perspectives, and if by chance we see works so represented carried into execution, we hardly recognise them. Useful, too, as perspective drawing is, the same tendency to exaggerate its use and to deceive is very noticeable.

One of the greatest encouragements to showy drawings has been the competition system, of which we have heard and do hear so much. The man who goes in to win a competition knows perfectly well that his chances of success generally lie in producing a fine set of drawings. It is not, therefore, much wonder that this should beget a race of draughtsmen-architects who know how to tickle the fancies of the Dog-

berries and their companions by designs for buildings which cannot possibly be executed for the money as designed, and which, if chosen, have to go through the mill and be ground down and thinned. The competition system, as too generally practised, has favoured the barnacle growth to an alarming extent, and the good ship Architecture has been much hindered in her course in consequence. Happily, much of this evil has been remedied, and it is, fortunately, becoming the custom to call in a professional assessor to advise committees. So much has been said on this subject, that I will not weary you now with any remarks upon it. Many of us are looking forward with some interest to see what the Council of the Royal Institute of British Architects are going to do in the matter of the memorial presented to them last year, followed by the report of the committee specially formed for the purpose of formulating a scheme for the better conduct of competitions. The matter is one of serious importance to the profession, and the barnacle cohesion given to the memorial was a proof of the interest taken in the matter, and how keenly men felt the injustice of the system as generally carried out. If the appointment of a professional assessor is the *sine quâ non* of all respectable architects consenting to join in a public competition, the death-blow will be given to the profession and calling of paper architects; these barnacles may be knocked off, and architecture, once relieved from this incubus, speed more easily on her way. No one in his senses is sanguine enough to suppose that the appointment of a professional assessor is the panacea for all the evils of the system, but fair play is a jewel, and every man who knows his work and loves uprightness will feel that in the hands of a man of honour and skill, his design will be judged, as far as fallible human nature can judge, on its fair merits.

Barnacles, you have observed, attach themselves to an object on the underside of it: are, in fact, out of sight, so that one does not notice them. If you will take the trouble to look you find them, or you may "nose them" if their habitation has become stranded high and dry. This habit of the barnacles brings me to another part of my subject to which they must render me their services as an illustration. Foundations, timbering, drainage, sanitary appliances, gas and water pipes, bell-wires, &c., are out of sight, often below the surface, and veritably it may be said of many an unsavoury smell, "You shall nose him as you go up the stairs into the lobby." Now we have heard so much about sanitation in all its branches, that I have not the slightest intention of entering into its mysteries; my only object in alluding to it now is to impress upon students the positive necessity of making themselves acquainted with the subject of sanitation. Immense progress has been made in this science of late years, but it is too much the fashion among enthusiastic young architects to ignore this branch of their work. Well, at first sight it is unsavoury, dull, and dry, and perhaps much of it is nasty. It is not a high art, but you must come down from the sky and lower the tilt of your æsthetic nose; the neglect of the study, and mastering of its rudiments at least, will beget a growth of barnacles, which will assuredly impede your progress to the shores of success. A few years back, and most men left all this seemingly unpleasant work to the builder or clerk of the works. Science, with her powerful "barnacles" on, has peeped into the hidden mysteries of health and impediments to health, has found out causes against which Medicine is powerless, and, looking deeper into causes, has discovered that they arise, almost invariably, from neglect of nature's laws, and that the seeds of disease and death are frequently to be found sown in the houses we live in. The note of alarm has been raised, daylight has flooded in upon the hidden horrors, and they have been revealed in all their bare hideousness. We know now that death is often taken into the home, and sewer gas,—that deadly upas-tree,—is responsible for more misery and disease than most of us have any idea of at all. I say we know this *now*, and it is simply criminal in any of us who are called upon to design buildings if we neglect the warning. Make yourselves masters of your art; but, neglect this, leave it to others to do in a kind of haphazard way, and you will most assuredly find that the opportunities of displaying your designing powers will be limited to paper and to your own offices. Nowadays most men are alive to this important subject. "Be sure you see to the drains," is over and over again the remark that you are met with by your clients. You will come across men thoroughly up in the principles of modern sanitation. You will, at the outset of a job, be asked what you advise; how you propose dealing with this problem, this or that soil, this or that system. If you answer, "My dear sir, you surely don't expect *me* to go into such matters; that matter is for the clerk of the works or the builder," then all I can say is, you will fall a great many degrees in the opinion of your clients; you will harm the profession to which you should be proud to belong; you will give cause for the remarks one so often has thrown in one's face, that architects are impracticable people, and do not know their work. This and much else has drifted from the profession, because we have hitherto too much neglected it, and a race of sanitary engineers has sprung up to do it instead. To ignore this class of work is so very foolish. Suppose a young architect, just established in practice. He must not expect to be building mansions all at once; he is called in for some small alterations, some revision of the drainage system is needed. If he can undertake this, and achieve success in it with careful thought and still more careful superintendence, he will win the confidence of his employer, and add to his chances of procuring more work. Now, supposing he adheres to the idea of the fine arts being the exclusive *rôle* of the architect, and that his soul is not to be worried by such "unconsidered trifles" as drains; the probabilities are he will disgust his employer, who will politely but firmly get rid of him on the first opportunity, and thus a chance of success, a step upon the ladder, has been lost, and with the ever-increasing number of aspirants for fame, you cannot afford to lose one single opportunity of winning your way. Clients are right in making us careful; the lives of those nearest and dearest to them may lie in our hands, and they will not be clean if, through carelessness and wilful neglect of what is now patent to any inquirer, we neglect the warning and go on blindly disregarding all the lessons of the past.

A paper treating of impediments to the progress of architecture would hardly be complete without some allusion to that great feature of modern times, speculative building. Here, barnacles of every kind and degree congregate, and, unchecked, hinder and impede all true progress. Naturalists tell us that the young barnacle is cyclopean, and makes use of his one eye to find a resting-place, and, pouncing down upon the first favourable one, there establishes himself. And then, quickly and with wondrous growth and fertility, shell houses gather all around him, until he has covered every available space with his progeny. Is not the speculative builder similar somewhat in his habits? His one idea is gain; he fixes his eye steadily upon some favourable spot, attaches himself to it with a firm grip, and then quickly covers the land with his creations, gathers to himself a whole host of other barnacles, until we no longer recognise the land he has covered. A parasite of the parasites is speculative building as too generally practised. It would be most unfair to gibbet thus all speculative builders. Some are men of high honour, to whom we owe a debt of gratitude. They are the pioneers of civilisation, who give fair money's worth; I only allude to the disreputable class of speculative builders who prey upon an ignorant public. They are not all to blame. Feeding upon them in their turn are the owners of the land they settle upon, who exact terms which are a premium upon dishonesty. Then, again, there are lawyers, and, it is to be feared, surveyors too, of a certain class, who fasten upon the unfortunate builders and suck them nearly dry; and, lastly, a greedy public, who grind them down to the lowest farthing. The blame is all round, I fear, and architects in their professional capacity can do little to remedy the evil. They are seldom consulted, beyond occasionally supplying plans, and except in the better class of speculative building, never in superintending the carrying out of them.

I must not try your patience any longer; doubtless other and better applications of the parable could be found. We might consider the barnacle as a species of goose or duck, and apply the *simile* without difficulty to much that is passing around us in the architectural world; for, verily, we see a great deal of goosedom, quacks, quackery, and quackdom, no end, to touch in detail upon which would carry us far into the night; but, like *Caliban* in the "Tempest," I must exclaim, "I will have none on't; we shall lose our time, and all be turn'd to barnacles." I am afraid that much that I have put down here is "bald, disjointed chat," but the paper has been written at odd times. In venturing to offer advice, and to point out what I consider the right road to success, I feel very much like a sign-post, but you will be generous enough to accord to me right motives, and to believe that under the fanciful title of "Barnacles" I have endeavoured to be of some service to you in raising the warning voice, and in inculcating truths which may stand you in good stead in the profession you have chosen. I know I have taken great liberties with my *simile*, employing it alike for men and things, but I trust you have been able to see my meaning, and that it will not be necessary to assist your mental vision with the use of "barnacles," which, Nuttall informs us, is an old name for a pair of spectacles.

We reserve our report of the discussion until next week.

FULHAM UNION INFIRMARY COMPETITION.

We have already mentioned that the Fulham Board of Guardians had had under their consideration the selection of a plan from among several which were submitted in competition for the proposed new infirmary, and had finally agreed to a motion to adopt the plan recommended by Mr. Currey, who has been assisting the Board with his professional advice on the subject. The drawings which have been submitted have been on view during part of the present week in a room in the Fulham Union Workhouse. Anything like a detailed examination and comparison of the plans, has, however, hardly been possible, owing to the small scale of the drawings, the height at which many of them are placed, and the very bad light in the recent state of the London atmosphere. We have only been able to give a glance at two or three of the sets which have been most prominently put forward in the discussion. Most of the competitors appear to have adopted the pavilion plan, with connecting corridors, which, in one shape or another, is now pretty well regarded as a *sine quâ non* in such cases. The distinctions between the various plans run therefore principally into matters of detail in the arrangement of the smaller accessory departments, such as entrances and business rooms, and the situation of the day-rooms in reference to the wards. The plan marked "Experience" in a circle (there is another also signed "Experience") is the one recommended for adoption, and which, from the report of the last meeting of the Board, we presume must be considered as adopted. The sick wards run nearly north and south out of the main corridor, with windows on the east and west sides, two beds between each window on each side, making thirty-two beds per ward, the number which it is understood was stipulated for. The bath-rooms and w.c.'s in connexion with each ward are reached by a passage across the end of the ward opening out of it, the bath-room opening from one end of this passage, and the w.c.'s from the other end. So far the plan is satisfactory, but some other parts of the arrangement are not so good. The day-rooms for each ward open from the other side of the passage opposite to the ward doors. We approve of isolating the day-room from the sick ward, but we consider it rather a clumsy arrangement to drive the main passage of the interior traffic of the building between them; it would have been better to have given the sick ward and the day-room a lobby common to both, which would have sufficiently broken the communication without crossing the main corridor. The day-rooms, which seem rather small, are planned in a good shape for getting the advantage of varied directions of sunlight, but the placing of the room for stores on one side of the small lobby entering on the day-room, and the water-closet immediately opposite, can hardly be called a good one; a small lobby does intervene between the water-closet and the entrance-lobby, but it is an unlighted and unventilated one as far as the plans show, and the author seems to have overlooked the fact that a lobby of discommunication in such a position is not of much value unless it can have a window opening to the external air. The reception-rooms for new patients would certainly have been more satisfactory if the necessary bath had been arranged in a small second room or recess,

instead of standing in the middle of the floor of the reception-room. In the main entrance arrangements the author seems to have been led away by the desire for symmetry of arrangement on paper which is often a stumbling-block in planning. Thus we find the matron's office on one side of the wide central entrance, and her sitting-room on the other side; the two should certainly have been *en suite*, for comfort and convenience. The porter's department is divided on each side of the outer entrance in a similar manner. Some of these details would be susceptible of rearrangement, which ought to be insisted on if this plan is actually carried out. Otherwise we do not find fault with the selection in the main. The elevations are neat and suitable for the purpose, and the effort seems to have been made to render them agreeable in appearance so far as a rigid attention to economy would admit of, and in this respect these drawings are about the most successful of the sets. Those marked "Simplicity," which have also received a premium, deal pretty fairly with the problem, but present nothing for special comment. The other set of plans marked "Experience" provide for the planning of the day-rooms partially *en suite* with the wards, in the way we have suggested above, but the light at one end of these rooms only is insufficient to make a cheerful room. The set marked "Hôtel Dieu" is better planned in regard to the accessories and entrances than any other we were able to examine, but the wards do not present the required accommodation as to number of beds, and the system of making the day-room practically a passage to the ward, which opens directly out of it, cannot be commended. There is, however, a good deal of ability shown in this set of plans, and the author has made a praiseworthy endeavour to give some little variety and character to the exterior of the building.

We understand that one or two sets of plans were thrown out in consequence of the employment of distinctive colouring in the floors and walls of the plans, contrary to the stipulation that no colour should be employed. We should be the last to suggest that the conditions of a competition should be treated with laxity, which always gives rise to unfairness towards those who have scrupulously observed them; but at the same time, we may point out, with a view to the regulation of future competitions, that it is a very unnecessary and illogical proceeding to word the conditions so as to disqualify a competitor on account of what is really a means of rendering plans more clear and intelligible. The idea, which is now frequently acted upon, of excluding coloured drawings from competitions, arose in the first instance from a desire to prevent competitors from attempting to impose on the committees or the judges by making effective and *ad captandum* views of the supposed effect of the building when completed, which might have the effect of drawing off the attention from the practical qualities of the plan by mere feats of picturesque draughtsmanship. But the distinction of different parts of a plan by different colours is quite another thing; it is only a simple practical way of making the grouping of a plan more immediately intelligible; it represents no picturesque effect, but is only a mechanical means of clearer delineation. The condition insisted on should be that no colour should be used on elevations and perspectives. It is absurd to disqualify a plan, if good in itself, merely because the author has shaded his walls in red or brown instead of in black. If the conditions have been so worded, no doubt they should be adhered to: that is the only safe rule of right in the case, but they ought not to be so worded, as it may result in disqualifying a competitor merely for having taken more than ordinary pains to render his plans clear to the eye, which is in itself a merit.

The Guardians deserve our applause for the manner in which they have conducted the competition. They called in a professional referee, and they accepted his decision.

Liverpool Engineering Society. — The usual fortnightly meeting, being the last of the session, was held on Wednesday evening last week, at the Royal Institution, Mr. A. Holt, M. Inst. C.E., president, in the chair. After the election of officers for the ensuing session and some other business, the retiring president in his address gave a paper on "The Proposed Elevated Railway along the Liverpool Docks."

JOTTINGS FROM GERMANY.

The Exchange in Berlin. — The *National Zeitung* calls attention to the building erected for the Exchange in Berlin, as being likely to perpetuate during many generations the fame of the late Herr Hitzig, the architect. The marble pillars of the interior, which serve as supports to the galleries, are described as being well in keeping with the magnificent columns and pilasters of the façade. The floor of the exchange-room was constructed, it appears, according to the plans of a subordinate; and it is noticed that in this particular the skill and taste shown in the other features of the central hall has been absent. The flooring being of wood, clouds of dust arise shortly after the business of the day has begun. The ventilation is said to be insufficient, and not of a nature to prevent the dust from being inhaled by those in the hall. The noxious effects of this arrangement are said to be well known. As some additions are now about to be made to the building, the journal we have quoted urges the laying down of tiles instead of the wooden flooring referred to.

Workmen's Schools.—The establishment of a technical school for workmen engaged in the iron trade, at Bochum, is approved by the German Press as being a step towards meeting a general want. The *Kölnische Zeitung* remarks that technical schools of a high class are abundant, while workmen have had but little opportunity (as far as the iron trade is concerned) of acquiring that description of knowledge required by foremen, &c., and which cannot be gained with any amount of practice in such a definite way as to enable a man to direct the carrying out with exactness of various metallurgical processes incident to the daily work of the craft. It is also remarked with justice that this class of instruction resembles the training which a well-tutored non-commissioned officer has received, and the fact that the German Government has of late years devoted particular attention to that branch of military organisation is adduced in proof of the necessity for the establishment in other iron districts of schools on the same plan as that of Bochum.

The institution in question has in a measure grown out of the local commercial school, and in its general plan is similar to the School of Mining in that town, the president of which, Dr. Schulz, has drawn up the programme of the new establishment, for which a director has apparently not yet been appointed. The mining industry allows of an arrangement by means of which students at the school can work in the pits for a part of the day, and thus support themselves during their period of study. This system does not prevail in the iron trade, and, consequently, provision has to be made for the maintenance of scholars attending the new establishment. To meet this charge the Government will, for twelve years, give a grant of 700*l.* per annum, the remainder of the cost being defrayed by the municipality.

There is to be a preparatory course lasting six months, after which the student takes up one of the sections of the advanced course, which lasts a year. The latter is divided into metallurgical and constructive branches. The former deals with the manufacture of iron, and the latter with machinery of all kinds, mechanical drawing, &c.

Monumental Architecture. — The monument lately erected at Munich by Professor Halbig for the Wagner family, is favourably noticed in the German press. From a foundation of syenite there rises on a simply-formed stand a bust of the deceased, in Carrara marble. A mourning female form (also in Carrara marble) leans towards the bust, around the base of which a garland of roses is thrown, the left hand of the figure being so arranged as to hold flowing drapery. A veil is thrown over the head, and droops over the neck. Opposite this figure, and completing the group, is a richly-adorned candelabra, standing on a light and gracefully-designed column, and with a burning flame symbolic of life. An imposing semicircular arch of syenite, with richly-gilt Byzantine ornamentation, forms the background. The whole is crowned by a beautifully-executed crucifix, in gilded bronze, in which the expression of the Saviour's countenance is described as being strikingly affecting.

A monumental fountain has been erected at Hanover, from the plans of Professor Hase, the figures having been designed by Professor Engelhard. The lower basin is 9 ft. 3 in. in diameter, from the middle of which rises an octagonal column, with projecting leaf capital, supporting a second basin of 4 ft. 6 in. diameter. A frieze surrounds the upper border of the latter, in which eight lions' heads serve as outlets for the water. The octagonal column here becomes quadrangular. The work is surmounted by two allegorical figures representing horticulture and fishing, above which rises a column, at the summit of which is a tabernacle, from which springs a flag-staff, with the arms of Hanover. The basement is of sandstone, and the rest of the work of bronze. The casting is by Gladenbeck, of Berlin, and the effect produced by the colour is as if the fountain had been standing for centuries in the position it now occupies, between the Marktkirche and the Rathhaus.

ART-STUDENTS' HOME.

On Wednesday, the 7th, the Baroness and Mr. Burdett Coutts entertained, at their house in Stratton-street, the young ladies who occupy the Art Students' Home in Brunswick-square, and invited many friends who are interested in art matters to meet them. The art-treasures of the house and some excellent conjuring after supper made the evening too short for the very happy guests. The Home in question, formed in two very good houses in Brunswick-square, was established by the Baroness Burdett Coutts for the purpose of providing students attending art-classes, &c., in London, the comforts and advantages of home and family life, under specified regulations, and the advice and presence of an experienced lady resident, and seems to answer its purpose admirably.

The Home contains, in addition to drawing and dining rooms, good rooms for study. The charge for board and residence inclusive, per term, is at the rate of 21*s.* a week, or for students occupying separate bed-rooms 30*s.* a week. In a few special cases selected by the committee, a reduction from these charges is made. Mrs. Malone is the Lady Resident, and Mr. Thos. Henry Wyatt, a name that will commend itself to many of our readers, is the hon. treasurer. The advantages of this Home have been so well appreciated by the students of Queen-square that it seems desirable that the advantages such homes afford should be extended to localities where other art or training schools exist,—notably in South Kensington. Only, in such a quarter, unless Government or the Commissioners assisted, it would probably be found impracticable to start them satisfactorily. It is to be hoped, however, an endeavour will be made.

STREET ARCHITECTURE IN SUNDERLAND.

The erection, by Mr. John Coates, cabinet-maker and upholsterer, Sunderland, of a handsome new warehouse at the corner of Fawcett-street and Borough-road, and immediately opposite the new Museum and Library, affords another illustration of the enterprise of local tradesmen. The new edifice, which is all but completed, is in the Classical style, modified to suit the character of other important buildings in the immediate vicinity. The material used is ashlar, from Alnwick quarries. The frontage measures 31 ft. in Fawcett-street and 86 ft. in Borough-road. The more prominent exterior features are that the ground-floor windows, of which in all there are nine, are separated by columns, each alternate one having carved or moulded caps. From these latter spring the heads of the windows, having panelled key-stones. Over the windows on the ground-floor runs a cornice separating them from the windows above, and from this cornice spring pilasters dividing the upper surfaces into bays. Both on the first and second floor each bay contains two round-headed windows, with keystones of the same character as those below. From the top of the pilasters and over the windows rises an elliptical arch. The exterior surface of the building is relieved from plainness by four bow-windows, two on either side of the building, supported on ornamental bases, and encircled with carved balusters. Above the elliptical arches of the higher windows runs the moulded cornice. A prominent feature in the structure is the square tower crowning the south-west corner. This tower has two circular windows on either side, and is surmounted by an ornamental finial. There are two entrances to the building, one being in Fawcett-street and the

other in Borough-road. In the interior the arrangements and facilities for carrying on an extensive business have been carefully studied. The dimensions of the shop on the ground-floor are 57 ft. 6 in. by 34 ft. A sliding wrought-iron partition, which is fireproof, separates the front shop from the finishing department in the rear.

The structure, which was commenced in May last, has been built under the supervision of and from plans drawn by Messrs. J. & T. Tillman, the contractors for the whole of the work being Messrs. Hirst.

Another new warehouse, which is all but completed, is that of Mr. Robert Farrow, oil and paint merchant. The site is in William-street, immediately off High-street, and the structure, which is three stories high, and built of brick, is of a plain but substantial character. The offices are entered from the front street, on the ground-floor, while the main warehouse extends to the back of William-street. The cellars, which are well lighted and ventilated, run beneath the whole area of the building. Above the offices, which extend the full width of the site in William-street, are three warerooms approached from the main warehouse. The latter is entered from the backs of William-street and High-street, where facilities will be afforded for taking wagons in a tramway, and thus loading from the ground-floor, which is so constructed as to be on a level with an ordinary wagon. A hoist for the purpose of loading and receiving goods will also be fitted at the end of the tramway, and this will be of sufficient size and weight-carrying capacity to convey goods of the greatest bulk or weight necessary in the several departments of the trade. The ground and first floors are constructed with rolled iron girders and concrete arched floors, supported on metal columns, every precaution having been taken to provide for the support of the heavy weights which will be placed upon the floors. The second-floor will be appropriated to the storage of the lighter class of goods. The several floors are approached by step-ladders leading from one story to another. All the doors from each floor of the warehouse, and also the main entrance, are protected by iron rolling shutters, the latter together with the hoist having been supplied by Messrs. Bunnett & Co., of Leeds. The building will be filled with all necessary oil-tanks, gantries, &c., to ensure the speedy and efficient despatch of business. The architect is Mr. W. Milburn, jun., of Fawcett-street, and the contractor Mr. T. P. Shaftoe, of Holmside.

THE FIRE AT THE RING THEATRE IN VIENNA.

This ill-fated theatre was quite a modern structure. It was only opened on the 17th of January, 1874, the first piece represented being Rossini's "Barber of Seville." It was built by a joint-stock company, and was intended for the performance of a class of operatic plays which, for various reasons, were unsuitable to the boards of the Grand Imperial Opera. The theatre accordingly bore the name of the Comic Opera. It was erected in the year 1873. The architect was Emil von Förster, a member of the Vienna Architectural Society. The cost was nearly 90,000*l*. It was built to accommodate 1,760 spectators. The parterre contained twenty-three boxes and 330 chairs. The first tier contained twenty-five boxes, the second twenty, while the third and fourth tiers consisted of galleries.

The edifice on the exterior exercised on the spectator a most charming effect. This was due to the rich decoration of the façade with pieces of sculpture, paintings, and gildings. The arrangement of the interior, however, by no means satisfied the requirements of such a house in regard to free access and free egress. The area upon which it was built was comparatively limited, being only 1,760 square mètres. Moreover, of this limited space the best use was not made, inasmuch as extensive refreshment-rooms and *foyers* were built on the first floor. Hence it was not possible to allot more than a limited amount of space to the passages and staircases. From the opening of the theatre complaints had been made by the public that the approaches to the pit and to the *parterre* boxes were through the first floor, and that it was only possible to reach those parts of the house by passing through a number of doors, through the wardrobe-room, and down a winding staircase. Owing to this complicated arrangement it was of constant occurrence that the spectators, on leaving the house after the performance, could not find their way out. It is not surprising, therefore, that many occupants of these portions of the theatre should have fallen victims to the late disastrous fire. But it was amongst the spectators in the third and fourth galleries that the principal sacrifice of life took place. No doubt if, when the gas went out, the oil-lamps which, according to the regulations issued since the catastrophe in the Nice Opera-house in March last, ought to have been burning on the staircases and passages had been lighted, many of the victims would have been saved, but the construction of the approaches to the uppermost parts of the house was radically defective, and it appears doubtful whether under such circumstances the loss of life could have been very materially diminished.

The architect contends that if the fire-blind had been lowered at the right time the loss of life would have been avoided. Unfortunately, however, the required steps never are taken on such occasions.

Mr. Alexander Aird, writing to us from Berlin, says,—"Mr. Fölsch, who is preparing a supplement to his work on 'Fires in Theatres' (reviewed by you April, 1878), tells me that the theatres totally destroyed by fire numbered,—

Between	1850	and 1860	 60
,,	1860	,, 1870	 100
,,	1870	,, 1880	 190

And that the terrible case of the Ring Theatre in Vienna is the *twenty-eighth* theatre totally destroyed by fire in the year 1881."

PLASTER.

The third of the series of Cantor lectures, at the Society of Arts, by Mr. Thomas Bolas, F.C.S. (which are on the "Industrial Uses of the Calcium Compounds"), was delivered on Monday, December 5th. After treating with sulphate of lime and its occurrence in Nature, the lecturer mentioned the various qualities and species of gypsum and alabaster, and proceeded to describe plaster of Paris, its preparation and uses. The fireproof concrete of Messrs. Dennett & Ingle, prepared from highly-calcined gypsum, was shown, and favourably commented upon.

The lecturer also passed round a sample of "Super-super" plaster, manufactured by Messrs. Bellman & Ivey, of Wigmore-street, and called attention to its extremely fine character. The application of plaster in the form of Scagliola marble, as manufactured by the same firm, was explained, and the specimens shown (in which the material was applied to columns, pilasters, wall-linings, and pedestals for statuary) were much admired on account of their high polish and admirable representation of the marbles.

After referring to some of the physical and chemical aspects of the setting of plaster, the lecturer mentioned the use of the material in moulding, stereotyping, and other processes.

REDDITCH AND HEADLESS CROSS DRAINAGE.

The drainage works of this district, for which tenders were invited in the *Builder* some time since, have just been completed under the Local Board.

The sewage from Redditch is conveyed by a system of brick and pipe sewers to precipitating-tanks outside the lower portion of the district, where the solid matter is precipitated and the effluent water passes over 4 acres of fitting ground. This ground is laid in terraces and drained, 25 ft. apart and 5 ft. deep; the filtered sewage-water passes off through these drains into the stream bounding the property. The tanks are placed at such a level that a large area of land in the valley below is commanded for broad irrigation purposes.

The sewage of Headless Cross is taken by a separate system to tanks at the extreme end of this part of the district and will be utilised by irrigation also. Flushing tanks are constructed at the ends of the sewers, fitted with Messrs. Bowes, Scott, & Read's Automatic Flushing Syphon for passing periodical flushes of water through the sewers.

The works have been carried out by Mr. G. Law, contractor, of Kidderminster, at a cost of 8,500*l*., which is within the engineers' estimate, and the works have been completed within the nine months allowed under the contract. Messrs. Gotto & Beesley, of Westminster, are the engineers, and the works have been superintended by Mr. Baylis, the Town Surveyor.

HOUSES AT WALMER, KENT, FOR MR. ALEXANDER TOD.

Walmer is a favourite select seaside place, possessing an unequalled sea view, overlooking the Downs, with their ever-varying panorama of shipping. Though its situation is unique and pleasing, its architecture has been devoid of interest. The houses which were not of wood could boast of but 9-in. walls, covered with cement. Private and lodging houses are much in demand, and Mr. Alexander Tod is now erecting several blocks of houses. Our illustration shows one of the blocks, which is an attempt to improve the existing state of things, and erect houses for the accommodation of visitors which, while picturesque, are well drained and ventilated.

In the house illustrated the lower story is of red bricks. The half-timber work is painted a cream-white, and produces a cheerful contrast with the panels, which are pebble-dashed. The pebbles for dashing have been collected from the sea-shore. The roofs are covered with red tiles. The sills and general dressings are of concrete, which has been cast on the spot.

Mr. Tod has not had any contract. Mr. Robert Redman, the clerk of the works, employed labour. Mr. William Webb acted as foreman of carpenters; Mr. G. Harvey, as foreman of plasterers; and Mr. Pulling, of painting, glazing, and decorative work. The facing bricks are of a dark red colour, made by Mr. C. Richardson, at Teynham.

Messrs. Frost Bros., of Deal, are doing the gas, water, and bell fittings. The baths and stoves are by Messrs. Steven Bros. and Messrs. T. Potter, of London. Mr. Finnis, of Dover, supplied the timber; and Messrs. White Bros., of London, the cement. The tiles are from the works of Messrs. S. & G. Collier, of Reading. The hip-and-valley tiles are purposely made, and work with the tile courses. The angle hanging-tiles are also purposely made to overlap the front angles of the dormers and gables, and thus prevent the wet driving in between the tile-hanging and the woodwork of the windows.

The houses are being erected from the designs and under the personal superintendence of Mr. James Neale, F.S.A., of London.

The eastern block is just completed, and the western block is roofed in and glazed. The central house was existing. It has been thoroughly recast.

BRIGHTON STREET ARCHITECTURE.

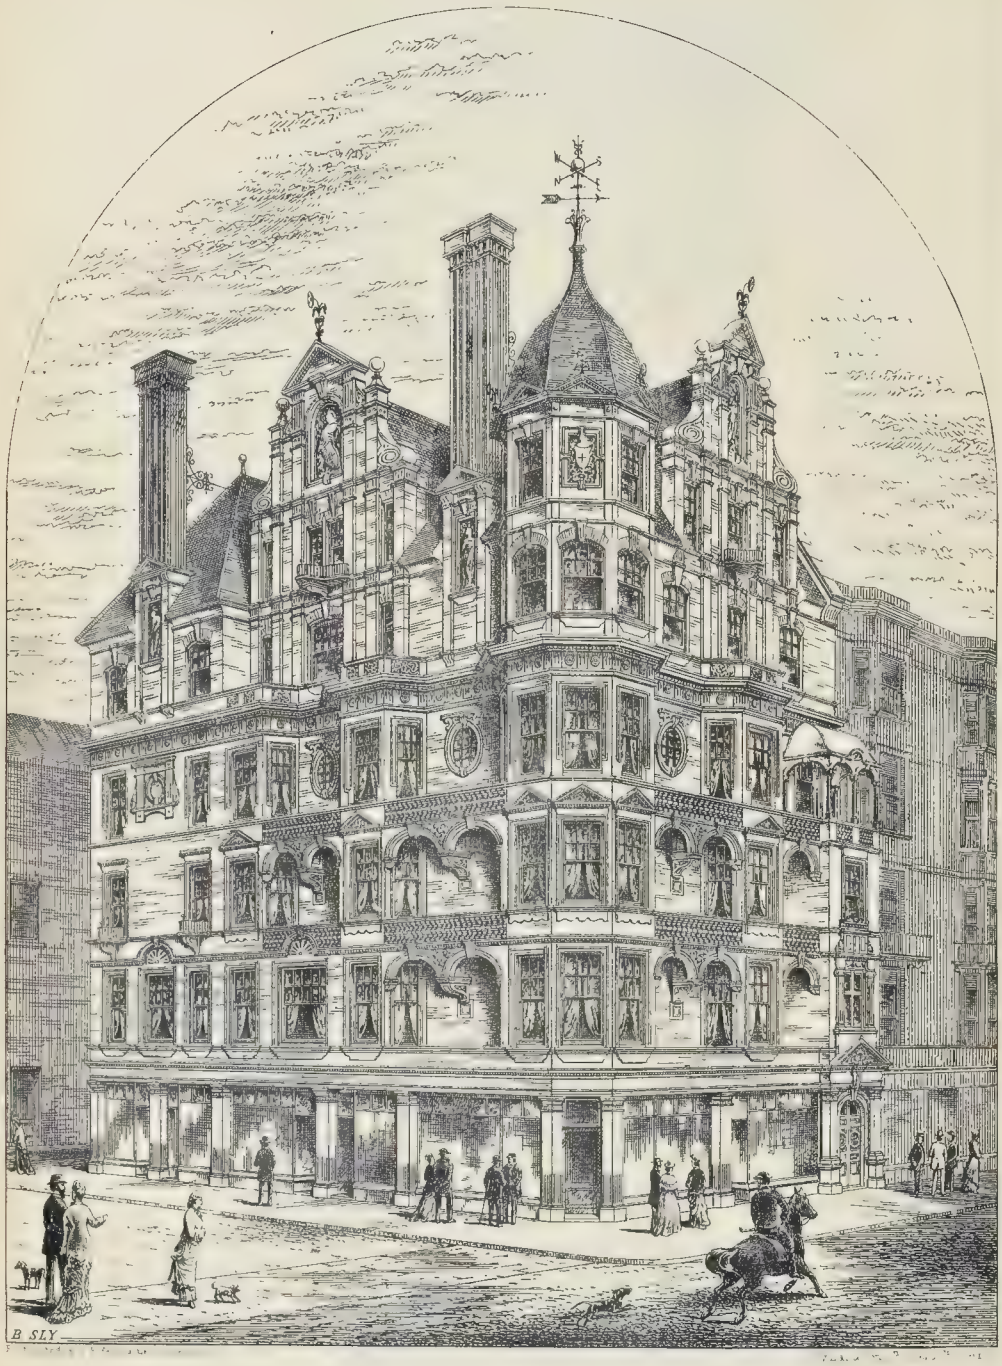
PREMISES CORNER OF WEST STREET AND THE KING'S ROAD.

This building is being erected for Mr. Alderman Nottage, of the City of London, and is situated at the south-east corner of West-street and the King's-road. It provides the following accommodation:—A sub-basement, 26 ft. below the footway, arranged for wine-stores; a basement, forming offices to the shops over; seven shops, with offices, and fifty-one rooms over for the purposes of a private hotel, the entrance to which is from the King's-road. There is also a good back entrance from South-street. There will be three hydraulic lifts,—one for passengers, one for luggage, and one for dinners, &c.

The kitchen and offices are on the topmost floor, fronting to South-street. There will be two wide stone staircases from the basement to the top floor.

The whole of the interior fittings, including windows, doors and their dressings, skirtings, and so forth, will be of oak, wax polished.

The rooms and staircases will be ventilated, and the staircases and passages warmed from the basement.



The exterior is in the Queen Anne style, the dressings and facings being of terra cotta, in two shades of red, manufactured by the Tamar Terra Cotta Company.

The total cost, inclusive of site, but exclusive of furniture and fittings, will be about 42,000*l*. Messrs. Lainson & Son are the architects.

The Council of the Royal School of Art Needle-work has, with the special approval of Her Royal Highness the Princess Louise, forwarded to the Art Furnishers' Alliance, 157, New Bond-street, a magnificent assortment of art needle-work for exhibition during the Christmas vacation.

CANNING COLLEGE, LUCKNOW.—Designed by Tika Ram, in the Office of the Engineer-in-Chief, Rajputana State Railway.

BANK AT BLACKPOOL, LANCASHIRE.—Messrs. Mills & Murgatroyd, Architects.

CANNING COLLEGE, LUCKNOW.—*Plan of Ground Floor.*

BANK AT BLACKPOOL, LANCASHIRE.

THESE premises are being erected for the purposes of a branch bank at the great Lancashire watering-place, for the Manchester and County Bank (Limited). As there is no residence attached, the architects, Messrs. Mills & Murgatroyd, of Manchester, have sought to gain effect by height and by breadth of treatment. The exterior is faced with Longridge stone; the plinth, window-string, and door-casing being of polished Bessbrook granite. The windows are of exceptional size, and will be glazed with polished plate-glass in ornamental metal frames set in the stonework. The interior will be finished, so far as the joinery is concerned, with pitch pine. A panelled wall lining of that material, with cornice will be carried round the walls for a height of 7 ft. 6 in., concealing the entrances to the strong room, cellar stairs, private office, &c.; the walls above that will be panelled in plaster, and the ceiling will also be in pitch pine worked up with a hexagonal shape, so as to conceal the want of rectangularity in the site. The basement will be occupied by clerks' lavatories, spare book-rooms, &c. The main frontage is 45 ft. long, and the height to the top of the main cornice, 36 ft. Messrs. Cooper & Tullis, of Preston, are the contractors for the whole of the work; the Albion Sawmill Company, of Fleetwood, executing the joiner's work for them.

CANNING COLLEGE, LUCKNOW.

THE paper read at the Royal Institute of British Architects last Monday, and the important discussion which followed, have made the buildings lately erected in India the subject of conversation during the week in many quarters. We take the opportunity to give a view and plan of one of them, completed not very long ago,—the Canning College, in Lucknow. This building, named in honour of the late Lord Canning, was built at the expense of the Talukdars of Oudh as a place of education for their sons and for the sons of other high-class natives.

The foundation-stone was laid on the 13th of November, 1867, by Sir John Lawrence, the then Governor-General; the usual coins, &c., were placed in the stone, which is situated under the floor of the tower on the west side of the front portico. The design first accepted in 1866 was subsequently rejected, and fresh designs were invited. The design ultimately accepted and carried out was prepared by Tika Ram, head draughtsman in the office of the Engineer-in-Chief, Rajputana State Railway. The main features of the design have been adhered to, but owing to the designer not having supplied detailed working drawings, and from other causes, many alterations have been made in the construction.

The accommodation provided consists of an examination-hall, 95 ft. by 45 ft. (the original length having been reduced by 5 ft. to allow of the east end wall being thickened to act as an efficient abutment to the elliptical portion of the arched roof), a library, 51 ft. 6 in. by 29 ft., and two rooms, 24 ft. 9 in. by 23 ft. 6 in., for the principal and office; on the east of the examination-hall there are two rooms, 22 ft. 6 in. by 24 ft. 9 in., for native professors and graduates, and two rooms, 23 ft. by 24 ft. 9 in., one for European professors, the other for a class-room; on the north side of the central corridor, there are seven class-rooms, two 29 ft. 4 in. by 35 ft. 6 in., one 29 ft. 1 in. by 35 ft. 6 in., and four 25 ft. 5½ in. by 35 ft. 6 in.; there are also two corner rooms, 11 ft. by 11 ft., and two 13 ft. by 13 ft., and two small octagonal rooms in the front towers. The work was completed in 1879.

The soil on which the building stands was found to consist of some 2 ft. of rubbish, the remains of the former old buildings, and below that of sand; the foundations throughout the building are carried down to a depth of 8 ft.; the lower 7 ft., consist of concrete composed of sixty-five parts of brick ballast, twenty-one parts of surkhi, and fourteen parts of kankar lime, the lime for this and the whole of the work being burned on the spot. The concrete, after being thoroughly mixed on the platform, was spread in 6-inch layers, and rammed with ordinary iron rammers till quite hard. The brickwork is set in English bond, in mortar composed of equal parts of fresh kanker lime and surkhi.

The plinth is 4 ft. 6 in. high, and inverts are given under the arches of the examination-hall to equalise the pressure on the foundations. On the top of the plinth a damp-course of asphalte, $\frac{3}{8}$ in. thick, was laid.

The superstructure, which, with the exceptions hereafter mentioned, is entirely of brickwork, was carried up evenly throughout the whole building, and kept thoroughly wet until completed.

The roofs of the upper and lower verandahs and corridors consist of segmental arches of 9 ft. span and 2 ft. 6 in. versine; the span of the arch is made less than the width of the verandah by bringing the arch forward on to the cornice; the arches are 9 in. thick, and the spandrels, up to the level of the extrados, are filled in with concrete composed as for foundations; the thrust of the arch is taken by wrought-iron bars, each 3 in. by $\frac{3}{8}$ in., tied together at 8 ft. intervals by bolts 1 in. in diameter.

The roofs of the library and all rooms except the examination-hall and turrets, are of brick arches, turned between girders; the arches are 4½ in. thick at the crown, and 9 in. at the haunches; the spandrels up to the level of the top of the girders are filled in with concrete composed as for foundations, and the whole of the outer roofs are covered with a layer of "terrace," having a good slope outwards; the finished thickness of terrace averages 4½ in., and is composed of four parts brick-ballast and coarse surkhi, and one of fresh lime; these materials were thoroughly mixed and spread on the roof to the required thickness, then beaten till quite hard; a layer of fine mortar mixed with gur was then given, and the whole surface finished off by being well rubbed over with castor-oil.

The girders for these roofs are entirely of wrought-iron, and were made on the spot. For the library and three largest class-rooms they are 2 ft. deep, with webs ¼ in. thick and flanges of double 4 in. by 4 in. by ¾ in. ⌊-irons; for other rooms they are 2 ft. deep, with webs ¼ in. thick, and flanges of double 3 in. by 3 in. by ¼ in. ⌊-irons; for small porches they are 15 in. deep, with ¼ in. webs, and flanges of double 2 in. by 2 in. by ¼ in. ⌊-irons; the girders are designed so that the load on them induces a strain on the flanges of

less than five tons per square inch of effective section: where necessary to withstand the thrust of end arches, as in porches, &c., bars were built into the walls and secured to the nearest girder by iron bolts. The girders, bolts, and all ironwork, received two coats of paint before being fixed in position.

The library roof in the original design was arched, and caused a very unsightly projection in the line of the front parapet. The alteration from a single arch to arches between girders, while improving the appearance of the front elevation, necessitated some provision for lighting in place of the end circular lights; this is given by a skylight, 21 ft. 9 in. by 6 ft., placed in the centre of the library roof. To take the thrust of the roof arches at the ends of the space left for skylight, strut girders are given between the four centre main girders, with webs ½ in. thick and flanges on one side only of 4 in. by 4 in. by ⅜ in. L-iron; these are riveted to main girders by L-irons 3½ in. by 3½ in. by ⅜ in. Round the top of the rectangular space thus formed and bolted to the top flanges of girders is a sill of sal-wood, 8 in. by 4 in., into which the uprights of skylight are fixed; the sides and ends of skylight have glazed sashes working on pivots. The roof, which is curved, is covered with 1 in. planks tongued and grooved, and painted with three coats of oil-paint, and over this corrugated iron carried well out over ends and sides. The inside of skylight and wells formed by main and strut girders are painted a dead white, and a very good light has been secured.

The roof of the examination-hall has been made elliptical throughout, the span of plain portion being 45 ft. and of ribs 43 ft. 6 in.; these latter are disposed in pairs immediately over Corinthian pilasters. The east end of the roof, which is elliptical in plan, is domed to meet the straight portion. The whole of the arching springs at a height of 31 ft. 6 in. above floor-level, and has a versine of 15 ft. The thickness of plain portions of roof is 1 ft. 2½ in. at crown, increased to 1 ft. 10½ in. at haunches; where the ribs occur these dimensions are increased by 9 in.

The arch was built on a Hindustani centre, supported by pillars of brick-in-mud, placed about 8 ft. apart; the exterior of centre was worked roughly to shape and finished with lime-mortar, the true shape being obtained by use of templets made for the purpose; the arch was built in lengths of 15 ft., so that each joint comes between a pair of ribs. The whole roof was built and keyed in fifteen days. There was some little delay in getting the backing up to the required height, and the centreing was not wholly struck until some time after. Levels taken at 10 ft. intervals along the top of arch just after keying up and after centres were wholly struck, showed the maximum settlement to be 0·1 ft. and minimum 0·05 ft., the mean being $\frac{1}{16}$ in. In the straight portion of the roof the thrust is taken by 4 in. by 4 in. by ⅜ in. L-irons, placed 6 ft. above springing and connected by tie-rods 1¼ in. diameter, placed 7 ft. 6 in. apart. The spandrels are filled with concrete as for foundations, and a 3 in. layer of terrace is given over the whole.

The floors throughout the building are of Mirzapore stone slabs, set in 2 in. of lime-mortar over brick rubbish carefully rammed.

The central rectangular and corner turrets have Mirzapore stone pillars and lintels; the arches between the pillars are cut in 4 in. stones, which are let 2 in. into both pillars and lintels; the joints are set in fine lime-mortar, and the lintel stones are held firmly together by iron cramps run in with sulphur; the pillar-bases and caps are secured by vertical iron dowels, also run in with sulphur. The roofs and work above lintels is entirely of first-class brickwork; in rectangular turret the roof is a semicircular arch, 1 ft. 2 in. thick, and the corner turrets are domed thrust-bands of 4 in. by ⅜ in. iron, being built in at a height of 2 ft. 6 in. above springing; round these corner turrets there are projecting balconies supported on stone brackets 2 in. thick; these brackets project 4 ft., and are built 2 ft. into the wall. There is no weight on the portion built in except the stone flagging, so, to prevent any chance of tilting, an iron rod, ¾ in. diameter, was passed through them all at the centre of their depth, and at a distance of 1 ft. 6 in. in from the face of the wall: this rod is embedded in brickwork, which comes up flush with the tops of the brackets.

The two small turrets in front and the four minarets are entirely in brickwork.

The projecting windows in the front corner towers are carried by brick corbels, and a capping sill of stone, 6 in. thick cut, to the shape of the window on the outside and carried through, so as to be flush with inside face of wall.

The whole building inside and out, except the interior of the examination-hall, is plastered with a thin coat of sand plaster, composed of one part stone lime, one part kankar lime, and two parts clean Goomtee sand, ground together in a mortar-mill and laid on in the usual manner. All mouldings and ornamental work were executed in brickwork as closely as possible to the finished shape, so as to reduce the thickness of plaster to a minimum.

The exterior of the building and interior of end and back verandahs and porches are left of natural colour of the plaster, the ornamental work having a ground of pale neutral tint; the class and other rooms except examination-hall, are coloured light blue, the roofs and cornices being white; the central corridor, lower front verandah, and both upper verandahs are entirely white, so as to throw as much light as possible into the examination-hall, which receives its light through them.

The examination-hall is plastered throughout with white plaster polished to imitate marble; the rough coat is composed of equal parts of surkhi and fresh kankar lime, this is covered with a thin coat composed of white lime and powdered Jubbulpore soap-stone worked in and rubbed up to a fine polish.

The upper verandahs are reached by two spiral staircases formed in the east end wall of examination-hall; they are 9 ft. in diameter, with a newel 1 ft. 6 in. in diameter, giving a clear width of step of 3 ft. 9 in. The centre width of tread is 1 ft. 2½ in., and rise 8 in. The steps and risers are of Mirzapore stone, the former 4 in. thick with a moulded nosing, the latter 2 in.; the south staircase is continued up to the roof of the examination-hall, its outlet being covered by an arched roof, which is carried up spirally from a point 1 ft. 6 in. below roof level, the staircase door opens on to the roof behind the turret on the east side of front portico, which hides it from the front, while it is hidden from the east by the parapet which at this point is 4 ft. 6 in. high.

The doors and windows throughout the building are of teak, fixed in teak chowkuts; these latter are not built into the walls, but fitted accurately to the openings in the brickwork and secured by screws to dovetailed bricks of sal wood, which were, after being soaked in tar, built into the walls. In addition to the glazed or panel doors, all outer doorways are fitted with teak Venetians.

The arches in room over front porch, and also the front doors of upper front verandah, are fitted with ornamental cast-iron railings with teak top and bottom rails.

Ventilation is provided in examination-hall by holes left at the soffit of the arch between each pair of ribs; it is provided in a similar manner for the long verandahs and corridors, and in rooms by openings in the ends of roof arches, which are carried up the end walls. All openings are covered by suitable caps to prevent the entrance of rain.

Polished brass finials are given to turrets, minarets, and the projecting windows of corner towers.

There is no woodwork in the whole building except the doors, chowkuts, and library skylight.

The general effect of the exterior must be regarded as very poor. The style, as the designer stated, is in harmony with the surrounding buildings of the Kaiser Bagh, — a bad standard.

The total cost of the building was Rs. 1,73,299, or Rs. 5 per square foot of plinth area. It was almost exactly two years in construction.

THE ST. GOTHARD TUNNEL.

It is stated in the foreign press that the service of trains through the Gothard Tunnel, commencing on the 1st of January, will include three daily communications from the Swiss to the Italian side. Two of these will be in connexion with through-trains from Lucerne to Milan. The saving of time will, according to present arrangements, be about four or five hours, as compared with the mountain route hitherto traversed, the journey from Lucerne to Milan being arranged to take about twenty-two hours.

SANITARY AND DOMESTIC EXHIBITION AT BRIGHTON.

On Monday afternoon last the "Domestic and Scientific Exhibition," in connexion with the Health Congress which has been held at Brighton during the present week, was formally opened by the Right Hon. the Earl of Chichester, Lord-Lieutenant of the county of Sussex, who presided over a large and influential meeting held under the dome of the Royal Pavilion.

The Earl of Chichester said that while he was very glad to see the great interest which was being most deservedly taken in all matters that concerned the health of towns and cities, he was afraid that some persons who lived in towns thought that a country gentleman's house smelt of nothing but violets and wallflowers. He was sorry to say that, in his experience, he had found many country mansions and parsonage-houses pervaded by as foul odours as any that existed in the courts and alleys of some towns, and supplied very often with worse water than was procurable in towns. It was satisfactory to note that great progress had been made during recent years in all that concerned the adoption of securities for health. Since the time when all England was on its knees praying for the recovery of the Prince of Wales, the sanitary condition of dwellings had been more closely looked into, and a great many discoveries of latent sources of disease had been made, and very much had been done in providing for the better sewerage and water-supply of towns. He did not think that the inhabitants of Brighton had anything to complain of with regard to their water-supply, and the authorities had made a very magnificent main sewer, which he trusted would be so managed as to be no nuisance to the inhabitants. In ancient Rome there was a goddess who presided over drains, and if the mayor could only persuade some fair lady to preside over the *cloaca maxima* of Brighton, so as to secure the inhabitants against any unpleasant exhalations from it, he would immortalise his name. He trusted that the exhibition which they had met to open, exemplifying as it did the application of scientific principles to the preservation of health, would be of great benefit not only to the town, but to the nation at large.

The Mayor of Brighton (Mr. W. H. Hallett), having explained in detail the circumstances which had led to the proposal for holding a health congress in the town, supplemented by an exhibition of sanitary and domestic appliances, said that he thought the health congress would be one of the most successful gatherings of the kind ever held, for up to that time,— which was some thirty hours before the congress would commence, — 773 persons had taken tickets. The merit of originating the exhibition, which he thought would be pronounced by everybody who saw it to be a very good one, was due to Councillor Hamilton, who had been indefatigable in its organisation.

The Right Hon. the Speaker said that perhaps he might be allowed to tender himself as a witness to the fact that one of the best prescriptions for health was hard work. The age in which we lived had been very properly called the age of great cities. London was a gigantic city, having a population which was increasing in a most prodigious manner, as, indeed, might be said of the population of the country at large, the increase being at the rate of about a thousand souls per day. That increase was mainly in the great cities and towns, and it therefore behoved the authorities of the great cities and towns to see that the health of the population was maintained, because if it were not maintained the people would degenerate in stamina and become dwarfed both in body and mind. He was very glad to think that Brighton was setting a good example to other towns, but although much had been done to maintain the health of Brighton, much more remained to be done. He was old enough to remember Brighton when it was very little more than a large village; now it was an immense town. As it grew in numbers and extent evils came upon it which should be promptly dealt with. He observed very frequently hanging over the town a smoke-cloud. That was likely to become a very serious matter for the people of Brighton to deal with, and he should be glad to think that one result of the conference and exhibition would be that it should lead them to grapple with the smoke nuisance. The larger the town became, the worse would be the nuisance, which in London was becoming intolerable. There was another

matter which he might be permitted to advert to. In all large towns and cities open spaces for the circulation of air and for the enjoyment of the citizens were very essential. He had heard a whisper about a park for Brighton. He did not know what the authorities of the town proposed to do with regard to the proposal, but he trusted that the congress would give the subject a lift.

Mr. Hollond, M.P., having made a few remarks, the Earl of Chichester, accompanied by the Bishop of Chichester, the Mayor of Brighton, Dr. Richardson, Mr. Hollond, Sir Henry Cole, Mr. Edwin Chadwick, Mr. Hamilton, and other gentlemen who occupied the platform, followed by the remainder of the large audience, adjourned to the Exhibition, which is a very large and good one, occupying, not only the Corn Exchange, but an extensive range of corrugated iron buildings in the Pavilion grounds. These temporary buildings have been erected by Mr. J. Charlton Humphreys, of the Ludgate Station Roofing Works, New Bridge-street, in rather less than three weeks. This, from the extent and position of the buildings, is certainly a feat in construction. In order not to interfere with the Pavilion grounds, which have a very undulating surface, the buildings are carried on wooden sleeper walls extending to a height of from 6 in. to between 5 ft. and 6 ft. above the surface of the ground. The two main buildings (which are connected together and with the Corn Exchange by two or three smaller structures) measure, the one 200 ft. in length by 40 ft. in width by 25 ft. in height to apex of roof trusses (which are of timber), and the other 280 ft. in length by 32 ft. in width, by 14 ft. to the apex. Longitudinal sleepers 9 in. by 4 in. carry the joists, 7 in. by 2½ in., the flooring being of 8 in. by 2 in. planks.* The buildings are illuminated by the electric light, two systems being employed, viz., the "Brush" and the British Electric Light Company's system, the engines and dynamo-electric machines being located in one of the temporary iron buildings, which also include a small hospital room, in which beds and other appliances used in hospital wards are shown by some five or six London hospitals.

The Exhibition is divided into eight classes, including Food Products, Labour-saving and Educational Appliances, House Sanitation, Electricity as applied to lighting and other purposes, Decorative Art, Horological and Meteorological Instruments, and a loan collection of works of art from South Kensington. In Classes III. and IV., House Sanitation (including ventilating and heating, drainage, baths, water and other closets and fittings, filters, and plans and models of cottages and industrial dwellings), there is a very good display of useful appliances, including a few novelties; while in Class VI., Decorative Art, are several exhibits well worthy of attention. The catalogue is very imperfect in some respects, and as the classification adopted is not strictly adhered to, we propose to notice such of the exhibits as are of more especial interest to our readers in the order in which the stands are numbered, beginning in the Corn Exchange with Stand 34, where Messrs. Hannington & Sons, of Brighton, exhibit a well-made suite of drawing-room furniture, including chimney-piece, made of rosewood, and in the style of Louis Seize. At Stand 35, Mr. Russell R. Perry, of Brighton, has a very good display of muralis, raised flock, and imitation stamped leather, velvet, and silk wall-papers, most of the latter very rich in effect, and of French design and manufacture. They are also exhibitors of parquetry for floors and dados. Messrs. Sendall & Son, of Brighton (Stand 36), exhibit a number of specimens of painted imitations of woods and marbles. These include some of the best work of the kind we have ever seen. Messrs. W. Woollams & Co., of London, are exhibitors at Stand 37 of artistic wall-papers and dado decorations in great variety, all characterised by excellence of design and free from arsenical compounds. At Stand 68, Mr. H. J. Lanchester, architect, exhibits drawings showing the application of his patent waterproof facing bricks for use in exposed situations. They are stated to have been largely used in buildings on the South Coast, and to be made of the same material (terra-cotta) as used at the new Natural History Museum, South Kensington. Stands 69, 72, 74, 75, 76, 77, and 81 are devoted to architectural drawings, exhibited respectively by Messrs. Scott & Hyde, Mr. J. G. Gibbins, Messrs. Holford, Clayton, & Black, Mr. J. Pitt Bayly, Mr. Thomas W. Cutler, Mr. Somers Clarke, jun., and Mr. Rowland Plumbe. The domestic interiors shown by Mr. Cutler and Mr. Plumbe are very pleasing. Mr. Cutler also shows a set of drawings of the Princess Alice Memorial Cottage Hospital proposed to be erected at Eastbourne. Messrs. Lainson & Son exhibit drawings of the Royal Alexandra Hospital for Sick Children, Brighton. Stand 105 is that of Mr. George Alfred Rogers, of Maddox-street, Oxford-street, who displays some excellent specimens of wood carving. At Stand 107, Messrs. J. Rooke & Sons, of Brighton, exhibit a sculptured memorial cross in Sicilian marble, and some terra-cotta panels and capitals. Stand 108 is occupied by Messrs. Doulton & Co., who make a good display of Lambeth art pottery, in its varieties known as Doulton Ware, Lambeth Faïence, Impasto, Silicon, &c. They also exhibit some specimens of tile decorations. Stand 116 is that of the Albissima Paint Company, of whose sanitary paint we have on a former occasion spoken in terms of commendation. At Stand 117, Messrs. C. Feldwicke & Sons, of Brighton, are exhibitors of Chippendale and other furniture. Stand 124 is occupied by Messrs. Howard & Son, of Berners-street, with their parquet flooring. At Stand 133a the Mayor of Brighton (Mr. W. H. Hallett) is stated by the catalogue to exhibit "an effective and inexpensive apparatus for the softening of water from chalk, for domestic use," but we did not see it in the exhibition. At Stand 134, Mr. W. Botting is an exhibitor of a wash-out closet, and Dr. Churchill's "self-ventilating 'Disjuncta' closet." The North of England School Furnishing Company, Darlington, show Dr. Roth's adjustable seats and desks for school purposes, and, among other useful and convenient appliances, the "Kensington Art Table," very handy for drawing. Mr. Christopher Hill, Brighton (Stand 164), shows his patent arch fire-bars as applied to steam boiler-furnaces, and a kitchener with a set of patent inclined fire-bars. Messrs. Thomas Bradford & Co. (Stand 167) are exhibitors of washing-machines and other laundry appliances and fittings, and they also exhibit plans of large laundries fitted up by them. At Stand 171, Messrs. Barford & Perkins, of Peterborough, exhibit their steam-cooking apparatus, as used at workhouses and other large institutions. Messrs. Frederick Edwards & Son, of Great Marlborough-street, London, show, at Stand 172, their smoke-consuming slow-combustion grates, and a kitchener. Gas stoves and fittings are shown in great abundance by, among other firms, Messrs. W. Sugg & Co. (Stand 175), who exhibit some well-designed brass chandeliers and brackets in the "Queen Anne" and other modes. At Stand 177, Messrs. Doulton & Co. show their radiating tile slow-combustion warm-air stoves, and they have on view a good assortment of architectural and sanitary pottery. Among the latter class of goods we may direct attention to their new patent joint for stoneware drain-pipes. This joint is not on the spigot and socket principle. Each length of pipe is alike at both ends, which are ground quite smooth and true by machinery, and butt against each other when laid. About 1 in. from each end of each pipe a collar or fillet is moulded on the exterior of the pipe, so that when the ground edges of the ends of the pipes are brought together a space or hollow of about 2 in. in width by 1 in. in depth is left between the collar of one pipe and that of the pipe next to it, the ground butt-joint being in the middle of this space. The pipes are laid with the ground surfaces well together in stoneware chairs made for the purpose, in which they are keyed or wedged up, and the hollows of the chairs filled up with liquid Portland cement, the space on the upper half of the pipes between the collars or fillets being also filled in with cement. It is claimed that this method of laying stoneware drain-pipes secures an absolutely watertight and immovable joint. This firm also exhibit their automatic flushing-tank, their patent tank filter, and Mr. Bailey-Denton's aërating water-filter, besides lavatories, water-closets, and sanitary fittings of all kinds. Visitors to Messrs. Doulton's stand should look at Cutler & Chapman's patent syphon-action water-waste-preventing cistern, in which the syphon is set in action by the pneumatic action of bellows placed beneath the seat of the closet, and connected with the handle or pull. Messrs. C. G. Reed & Son, of Brighton (Stand 183), show stoves and grates of all kinds, including the "Wharncliffe" and slow-combustion stoves of Messrs. Steel & Garland, for whom Messrs. Reed are agents. At Stand 184, Mr. J. H. Gardner, of West Brighton, has a large display of chimney-pieces, stoves, grates, kitcheners, sanitary pottery, brick and tile goods, and other materials constituting the stock-in-trade of a builders' general merchant. Mr. Uriah Clark, of Hellingly, Sussex, shows at Stand 185, a variety of fancy ridge tiles and finials, besides terra-cotta and stoneware goods. Messrs. Henry Sharp, Jones & Co., of Poole, Dorset, exhibit (Stand 186), their rock-concrete tubes of large size for the construction of main sewers, and they show that these pipes are capable of being cut into for the purpose of connecting house-drains with them. Among the stoneware goods shown by this firm we may name their double-trapped and other gullies, and their soil-pipe disconnector. At Stand 187, Messrs. R. & N. Norman, of Burgess Hill, Sussex, are exhibitors of red facing and moulded bricks, paving bricks, tiles, cresting, and other goods of the kind. Messrs. Hayward Bros. & Eckstein, of Union-street, Borough (Stand 188), exhibit their patent semi-prismatic pavement and floor-lights and safety coal-hole plates. At the next Stand, 189, Messrs. Charles Drake & Co. (Limited), of Battersea, exhibit some very good things in their marble-concrete, including a bath, some steps and pavement, and a chimney-piece. Messrs. Sherwood & Streeter, of Brighton (Stand 190), exhibit the Antiseptic Company's simple appliance for deodorising pan and other closets. At Stand 192 Mr. T. H. Tuxford, of Brighton, exhibits ⊐-traps of improved form, and a wash-out closet-basin and trap combined, in one piece of earthenware, with outlet at the front. Messrs. Hodges, Butler, & Dale, of East Greenwich (Stand 194) show their "Imperial" silicated stone in some of its varied applications; for instance, they show sinks, baths, egg-shaped and cylindrical pipes of large dimensions for sewers, and paving, all made of this useful material. At Stand 196 Mr. Alfred Bedborough, architect, London, shows the patent "Imperial" sash-window. By lowering the top sash of the window a free vertical current of air is introduced into the apartment between the glass of the top and bottom sashes. This is effected by the frame and sashes being made so much higher than the window opening. Thus, the head of the frame will be 12 in. (more or less as desired) above the soffit of the window opening. The top sash is, therefore, constructed in height (say) 12 in. longer than the bottom sash. The sashes, though constructed as ordinary sliding-sashes, are capable of being opened on centres and inclined to any required angle so as to be cleaned from the inside. Messrs. John Bazley White & Bros., of London, exhibit (Stand 197) samples of Portland cement. The Eureka Concrete Company, of Leeds (Stand 198), show culverts, lintels, steps, sinks, and fireproof flooring made of their material. Dr. P. Hinckes Bird, of London (Stand 200), shows three models of his unpatented costless method of ventilation, the details of which we published in the *Builder* some years ago. Dr. Hinckes Bird's method of securing draughtless ventilation with the use of common window-sashes is worthy of the attention of visitors to the exhibition, as it is exceedingly simple and can be adopted by anybody. At Stand 204, Messrs. S. & E. Ransome & Co., of London, exhibit their patent solutions for the prevention of damp walls, and for preventing the decay of stone. The Water Reform Company (Limited), of London, show (Stand 205) Atkins's patent rotary filter (described by us some time ago), together with drawings illustrating their process for the softening and purification of water. The Ladies' Sanitary Association, of 22, Berners-street, Oxford-street, display at Stand 206 a number of their useful little sanitary tracts and publications. At Stand 214, Messrs. C. Kite & Co. exhibit their patent "Albert" chimney-caps and their exhaust ventilators for cow-houses, stables, &c., which have been extensively used in London. At Stand 217 Messrs. Banner Bros. & Co., of London, exhibit drawings and models fully illustrating their system of sanitation, the merits of which are so well known to our readers that we need only mention it. Messrs. Robert Boyle & Son, of London and Glasgow (Stand 219), show their well-known air-pump ventilators in various forms and sizes, from those of the small cowl to those of the large *flèche* or turret of architectural character. At Stand 225, Messrs. Hay-

* As announced in our advertising columns, these buildings are to be sold by Messrs. Horne & Eversfield at the close of the exhibition.

ward Tyler & Co., of London, show their new patent "full-flush valveless closet," of which we have spoken well on a previous occasion. Stand 226 is occupied by Messrs. Thos. Waller & Co., of Fish-street-hill and Southwark, who show hydraulic and other dinner-lifts; grilling and other cooking apparatus; a 9 ft. 6 in. cooking-range, with three boilers and two ovens, all heated by one small fire; a very useful steam-chest, and other appliances needed in the kitchens of large hotels, club-houses, &c. A welded iron boiler shown at this stand is a *tour de force* in its way. Messrs. Waller's patent ventilated water-closet should be looked at. At Stand 230 Mr. F. G. Underhay exhibits valve-closets and water-fittings in variety, and of excellent manufacture. His registered lavatory basin-valve is simple and good, and discharges very quickly. Another good thing shown at this stand is Law & Underhay's patent double-cylinder water-meter. It consists of two pistons working in two cylinders, which pistons give motion to two cranks fixed at right angles to each other at opposite extremities of the same shaft. The fluid to be measured is admitted successively to the upper and lower extremities of the cylinders by a rotary valve upon the crank shaft. The pressure of the fluid gives motion to the piston, causing the crank shaft to revolve continuously in one direction, and the quantity of fluid which passes is registered by a counting apparatus, which exhibits the number of revolutions made by the crank shaft, each revolution discharging a quantity of water equal to four times the contents of the cylinder. The meter is, in fact, constructed on the principle of a double-acting steam-engine, and is capable of being used as a motor. At Stand 232, Mr. George Jennings, of Stangate, has some interesting exhibits, including a new system of speaking-tubes, in which a branch tube from any room in a house can be led into a main or trunk tube (just as gas-pipes can be carried up and branched off anywhere), and made to "speak" in any other room, an ingenious arrangement of valves worked by electricity rendering it possible to shut off all other portions of the system of tubing from the portion through which it is desired to speak. Mr. Jennings shows water-closets and fittings, and his tip-up lavatories,—the latter greatly improved by the use of trunnions, which allow of the basin being instantly removed for the purpose of cleansing the space beneath it. Mr. Jennings also exhibits a new quick-filling water-waste-preventing cistern. At Stand 236, Mr. D. T. Bostel, of Brighton, shows his "Excelsior" wash-out closet, and, among many other things, Holt's patent automatic flushing-cisterns, which should be looked at by visitors. At Stand 242, Messrs. Meakin & Co., of Baker-street, show their sash-fasteners and openers. Among other exhibitors are the Improved Industrial Dwellings Company and the Artisans', Labourers', and General Dwellings Company, who exhibit plans of some of their buildings erected in London. It is stated that the number of dwellings erected by the first-named company is 4,135, accommodating about 20,000 inhabitants, at an expenditure, to date, of 745,000*l.*

The exhibition, as at present arranged, will remain open until Wednesday next, the 21st.

THE SEED-TIME OF HEALTH.*

In the depths of the night, in a climate where night is short; in the midst of that short interval, when even the gods are supposed to rest; when the sun-god himself has withdrawn from the earth, and the sun sees not the deeds of men, some men and women of the earth, in solemn silence, bring something forth from home. If they should speak, there would flow from the lips of those people a language so beautiful, so perfect, so expressive, that though the listening ear were foreign to it and understood it not, it would be held listening. But there is not a sound. If these people could be seen in their fair stature and build of body, draped in their loose garments, the eye, like the ear, would be vanquished. Such incomparable beauty! Should a sculptor want a model for a work he would leave for all time, he would find it in them: should a painter want a face for his perfected art, he would find it in them; should a poet want the theme for a song on living beauty, he would find his inspiration in them; should a physician want a text for a discourse on the types of health and sanity, he would find it in those types of beauty. In those faces, which actually live to this hour in marble more precious than gold, there would be seen, if they were unveiled from this awful stillness and darkness of the night, two living passions, engraved in life through expression of the soul, resigned grief and sublime fear. What has happened can never be recalled, and grief, therefore, is chastened by reason; but what has happened is so unnatural, so wrong, that reason, in its turn, is sublimed to fear. It is so terrible, none must look on it; if the sun-god, source of of light and life, should see it, he might hide his face and punish all the races of mankind. Well may there sit on every face the chaste beauty of resignation and sublimity of fear!

What can have happened?

There is something that is being carried tenderly, awfully! It is a casket, small and light. It might be a cradle or a cot supporting some object of tender solicitude. A child! yes, a child in all its childish wealth, its golden tresses on its pillow, its features divinely fair and spiritual, its limbs the ideal of grace. Surely in the dead of this night it sleeps, and they are taking it to some golden coast, where in the morning it will greet the sun, lave in the azure sea, listen to the shell picked up by the shore for the mysterious music, and bask in pleasure. Alas! no. As the earth is now dead and silent, its soul of sun withdrawn, so is the soul of that human lovely form; and as the earth is proceeding to enter once more the eternal fire that at once animates and destroys it, so this child of earth is being carried to the pyre.

Beyond expression terrible this event, that they, the bearers and followers, should be so ignorant as to let such beaming beauty die. Had it lived its course, played its mortal part, and like the ripe grain fallen fairly under the sickle of the Immortal Reaper, then, though a thousand suns had shone, the event had been natural, honourable. Then this ceremonial had been public as the day. Tears might have moistened the eye of the lookers-on, but there would be no shame; the deeds of the dead might be themes of honour, or fame, or joy; but shame, no trace of it. The shame is now; the shame that must be hidden in darkness of darkness, as a crime against knowledge, and love, and family, and country, and time! the shame that life in its earliest dawn should be let go, and run no Olympian game, and sing no song, and tell no history, and plant no work of art, and hold no standard, and fulfil no task of duty! They veil themselves from the truth that they may awake as from a deathly dream. Let them pass from us also as a dream.

Yet the dream is true, for I have embodied in these sentences an idea of mankind in that period of human history when, as by a miracle, the human soul burst into the flame which to this day is our great source of intellectual light; the flame that in its own home went out, but from which, while it burned, all the world lighted a torch and carried it away.

While the sculptor of to-day still strikes a light from the dead of that period of intellectual glory, from the very marble into which its fervid life was infused for ever, let us who deal with actual life strike a light from the sentiment regarding the young who fell as they were rising from the drowsy torpor of infancy into the waking dreams of adolescence, instead of passing in natural course through manhood or womanhood, towards maturity, towards drowsy decline.

These wise people knew that life ought to be a perpetual feast. They not only knew the fact, they acted up to it. They were equally well aware that a long and perfect life could alone be attained by perfection of life at its opening, in the seed-time of health. To die at that time was, therefore, an offence against natural rule, against reason, against sentiment. The knowledge of such an event was death to the brain, death to the heart. In this seed-time of health the life was to be made, the life that was to be in truth a life worth living. Animals beneath men, that are worthy of going through their appointed time, and of being made both useful and beautiful, must have their seed-time of health. Shall their human masters be less cared for? If the masters are to be mere slaves, yes; and then it were a pity and a danger; for they who have no respect for life and beauty, who drag through existence and grow weary of it, are to be trusted neither with life, beauty, nor fame.

In the history of great truths derived from the Hellenic wise times, there is not one truth so great as this, and not one so completely missed. It is the secret that was lost. In our day we have lost it so severely that it might never have been in existence for aught we seem to care. The key to all we would have, the key to the gates of health and happiness, has been lost as if it had never been found.

In point of health our children in these times, proud as we are of these times, are our reproach. Where is there a healthy child? I have never seen one. I might search through the length and breadth of the island, I could not find one. You may put before me a child in all its innocence. It has done no wrong that it should suffer; it may show to the unskilled mind no trace of disease; and yet I know that if I or any skilled observer were to look into the history of the life in question it cannot be found intrinsically sound. It will have to battle with future dangers sufficient for the soundest to meet; but it is not itself free from dangers other than those that are prospective and avoidable. It is sure to have some inherited failure, and too likely some that will help to increase the independent risks that lie before it. So our children under five years are expected to die in what may almost be called a definite proportion. He is a fortunate man who, having four children born to him, retains three alive. Later on, for a short time, the danger is reduced; with adolescence it recurs. Again it retreats, but with such failure all along the line, that one-third of the allotted life, the life that would be were it planted in sound health, is only attained.

And for this we have no shame. The sun, the moon, and all the stars may witness our miseries, and we may grieve, but we have no shame. There is an assembly of learned men which I sometimes visit, an assembly of earnest men who are bent on understanding to the full these human failures from health. These men spare no pains, and to gain a spark of light will labour like miners in a mine. When last I visited them a puny feeble spark of life was in their presence undergoing their searching yet kindly scrutiny. Except that it cried a little and laughed a little in changing mood, this spark of life might have been considered a pathological specimen, and in truth it was discussed as such. No one there had a thought of that small life developing into wholesome life and passing through its natural term; not one was there who did not know that the chances of bare life were impossible, and that nothing could be done to save it. The intent was to study the pathology, and fix that by name. They said, when their technical language was translated, this child is suffering from the error, some would say the sin, of its parents. How deep did this error go? In what strange forms did it appear? How singular that the nervous system, once impressed with the poison of that error, should impress another nervous system, and so modify the nutrition of the organism to which it belonged as to cause false nutrition of internal organs and of the very bones themselves! In a whisper one of the learned expressed to another one the pity "that such a specimen of humanity should ever have been born, to breathe and take notice, and smile, and cry, and love, and suffer, and die, and we able to do nothing for it except hope for the relief that should end in the earliest death."

I belong to a committee which takes under its care another class of sad childhood. The members of this community pass before us deaf and mute. We try to give them the power of intelligent converse by laborious and artificial means, and we do some good; but the train of sufferers passes by, and we know that full half are mute from the undeveloped brain; that they are practically lost to life. It is not that the one sense is lost, and thereby the means of expression by intelligible language; it is not even that the nervous organisation which ministers to intelligence is low: it is that these deficiencies are some of the outward signs of a general deterioration of body, and that there is scarcely a structure which the eye of science would recognise as moulded in health.

Passing from the sphere of general observation, from modified to destroyed vitality, I find more startling facts at hand. A short unpretending essay reached me not long ago, in which the writer, who in his too great modesty conceals his name, epitomises the facts he has collected

* From the inaugural address delivered before the Health Congress at Brighton, on the 13th of December, by Dr. Benj. W. Richardson, president.

respecting the attainment of maturity in peoples of different nations. He tells us that of ten children born in Norway a little over seven reached their twentieth year; that in England and in the United States of America somewhat less than seven reach that stage; that in France only five reach it; and in Ireland less than five. He tells us that in Norway, out of 10,000 born, rather more than one out of three reaches the age of seventy; in England one out of four; in the United States, if both sexes be computed, less than one out of four; in France, less than one out of eight; and in Ireland, less than one out of eleven. And, he adds this significant computation, based on what may be called the commercial view of the vital question. "In producing dead machinery the cost of all that is broken in the making is charged to the cost of that which is completed. If we estimate by this same rule the cost of rearing children to manhood, if we calculate up the number of years lived by those who fell, with the years of those who passed successfully to manhood, there would be found between the two extremes presented in Norway and Ireland,—both, be it observed, unnatural,—a loss of 120 per cent. greater in the first year of life, 75 per cent. greater in the first four years of life, and 120 per cent. greater in the years between the fifth and the twentieth, in Ireland than in Norway. In Norway the average length of life of the effective population is thirty-nine and rather more than a half years; in England, thirty-five and a half years; in France, not quite thirty-three years; and in Ireland, not quite twenty-nine years. Thus, again, comparing the best with the worst of a scale of vitality in which both are bad, in Norway, the proportion of the population that reaches twenty survives nearly forty years, or four-fifths of the effective period, to contribute to the wealth of the community; while in Ireland the same proportion survives less than twenty-nine years, or considerably under three-fifths of the effective period.

When we are sitting in the family circle, and are speaking of families that lie within our cognisance, we estimate in the most natural way the happiness of the families by the health they represent. We may thoughtlessly speak of other standards of measurement. We may for a moment dwell on the riches of the house; on the luxuries that are to be seen in it; on the influence which the owners of it might or do exercise in the social sphere, and such like sentiments. But, after all, these rest on health as the basis of the happiness. If one out of every two of the offspring of the favoured house have died, if some who have not died are mute to the world, or otherwise stricken, we soon fall into more thoughtful mood, and say that even this rich home is not a possible home for happy life. Pleasures there may be, happiness there cannot be.

How much worse the estimate of a family in which, together with the vital failures, there is the lack of all that is necessary to make the burthen of life endurable. The favoured in health and means wonder, when they think of it, how such unfavoured endure the life they live. In that sentiment no maudlin canker lies; it is as hard and as free from poetry as a mathematical problem; and for that reason a sentiment that, above every other, is persistently preserved.

What is true of family circles is equally true of nations. Rest, quiet of nations, repose for cultivation of refined arts and sciences, happiness derived from healthy and vigorous minds and intended for healthy, vigorous, and wholesome purposes, there cannot be, when one in two of life can only reach maturity with a survival of three-fifths of effective population. In such a national family there is persistent mourning. It sits for ever in gloom; the blinds of its home are always drawn. It broods, it attributes, as all heart-stricken mourners do, the loss it has sustained to every imaginable and unimaginable cause. It thinks with incoherency; speaks now with hysteric grief, then with hysteric rage, and acts the same. In a word, it follows natural law. State physicians tender their remedies for such families of nations and call themselves curers, as if that could be cured which is Nature pursuing her merciless course towards her merciful dispensations, in correction of those who have outraged her.

I have named this discourse "The Seed-time of Health," and in the sentences foregone I have tried to strike a contrast, and thereby to give to sanitation a broader meaning as a practical science than is commonly connected with it as a system of details respecting ventilators, sewer-traps, and the like.

I want to point to health as the all in all to man; the gate of health leading to the truly good in politics, art, science, letters,—ay, and religion, not less than the least of everything. The strain of my argument is, that unless we make the early life of our children a seed-time of health; unless we, from the root of life, so change the conditions which now exist, all our other measures are practically valueless.

At this moment we have not, as a nation, got this notion set in our minds in such degree as even to accept it, basic as it is, as worthy of serious thought. We have no shame when our young fail and die. Grief we have, fond memories we have; but shame, none. We bury our young as if the act were natural, and erect memorials of it. We read obituaries of the young dead; we read the terrible obituaries of the registrars-general; we discuss in congresses like these the cost of young life; but the shame of the Greek touches us not. The knowledge of the troubles which flow from the lack of the shame reaches us not.

One bright Sunday morning I was in Dublin, in the Phœnix Park. A great crowd formed a vast ring, to the borders of which I made my way. A wrestling match! Men of different counties wrestling in deathly earnest, the lookers-on intent to terror. On not a face in that multitude, barring the faces of some four or five Cockneys, who had a car all to themselves, and grinned as foolishly as they chattered and chaffed, was there so much as a smile. The victors were approved, but not cheered. If this be sport, I felt, it is the strangest I ever knew since I read of Christian trying to be merry in the Castle of Giant Despair. In that same day I traversed the city to see authority armed to the teeth in utterly joyless open places. I visited an exhibition of pictures to experience the same sense of all-pervading oppression. I followed a crowd, and found myself one of another multitude going out of the city, until we reached a place where the members of that multitude were burying their dead; and as they swept by, the train of young dead that was carried in the sight of the sun to sleep in that resting-place was to me as appalling as it was revealing. It was like lightning in persistent discharge. Peace, progress, content, happiness, with this discharge of fearful facts in view! A fable! "As is the earthy," says the priest, "such are they also that are earthy"; and I knew that I had never understood the saying before.

It struck me for the first time as I witnessed this painful phenomenon that with so much young death there could no more be health in the body politic than in the body corporeal. We sanitarians are, however, only bound to treat of that which belongs to our own labours, and acknowledging the perils incident to early life, and it may be even recognising the shame of them, have before us the question of their prevention from its health side alone.

STEAM HEATING FOR TOWNS AND VILLAGES.

THE combination system of heating was described by Captain Galton, at the Society of Arts, on the 7th of December.

The reader said,—Mr. Holly, in the system of combined steam heating which is about to be described, has devised an arrangement of pipes, which he terms the atmospheric radiator, to enable the temperature of the pipes to be regulated. In the combination system of steam heating, the steam, when once it enters the house, becomes the property of the occupier of the house, and the condensed water does not return to the boiler; the steam for the radiators is taken out of the flow-pipe through a valve, regulated by a thermostat, so arranged as to open and close the valves, admitting steam to the radiators; this thermostat may be adjusted to operate to within ten degrees of temperature, so that the heat of a room may be automatically maintained at about the temperature desired. The steam is admitted at the top of the radiator, through the valves, in such quantity as is desired, the bottom being open; the amount of steam admitted is determined by the temperature which it is desired to maintain, and by the amount of radiating surface. Thus, if a moderate temperature is required, a little steam will be admitted to the upper portion of the tubes. The heat from this small quantity of steam will be rapidly diffused by the surface of the radiator through the air of the room, and the inlet valve can be so adjusted as to control the amount of steam admitted; by this means the temperature of the room may be maintained at any required degree. The advantages claimed for these radiators are economy of manufacture, and ease of graduating to all weather; they may be made of tin, or galvanised iron, of any required height and design. The steam and water of condensation give off all their heat, and there being no valve in the return-pipe, and no pressure, there is no cracking and spluttering noise, as in pressure radiators. The steam, after it has passed into these radiators, cools down and becomes water, and passes entirely away from the steam-pipes, to be applied to such other purposes as the house-owner desires, as will presently be explained. Thus, in the ordinary system of heating by steam, in use in houses in the United States, the steam circulates continually from the boiler to the radiator, and returns as condensed water to the boiler; whereas, in the combination system the steam does not circulate back to the boiler, but, after it has passed into the house, passes away as water. That is to say, the steam in this system is taken from a steam main, laid through the streets, just as gas or water is taken from a main, and the heat from the steam is consumed in the houses in such a manner as the owner of the house thinks fit. The following is the general arrangement of the system:—The boilers are placed in a convenient central situation. The results given by Mr. Holly of a series of experiments on several boilers in use by him, show that, at Lockport, he evaporated, on an average, from 6 lb. to 9·5 lb. of water per pound of coal; this, of course, is a matter greatly depending on the quality of the fuel. Mr. Holly speaks in high terms of the Murphy smokeless furnaces, with regard to which he says:—"The perfect combustion and consequent total abolition of smoke from bituminous coal, and relative economy in the production of steam, are not the only points of superiority, as its cleanliness, ease of management, and saving of labour, are almost equally important. The stoking of the boiler resolves itself merely into dumping the coal from cars into the bin above the fire-box in front of the boiler, and occasionally pulling it towards the feed. A little engine carries it into the coking-chamber, dumps it at the proper time on the grate-bars, and by means of levers moving the shake-bars to and fro, slowly clears the bars of ashes. The doors are never opened, and one attendant, without a fireman's skill, will manage a battery of six boilers worked by the same power." This arrangement of furnace appears to have some resemblance to the McDougall furnace in the Smoke Abatement Exhibition. From the boiler, the steam passes into the main-pipes and lateral or branch-pipes. These have been made of lap-welded wrought iron steam-pipes. They vary in size according to the duty they have to perform. The largest yet laid is stated to be 12 in. diameter. The maximum steam pressure would be 100 lb. per square inch; but the pipes are made to resist strains many times in excess of the maximum pressure to which they can be subjected, and they are carefully tested.

It is essential to guard against the condensation, for, unless steam can be transmitted to considerable distances without too great loss by condensation, all devices to use it in buildings, however ingenious, would, of course, be useless. Condensation being caused by the radiation of heat from the pipes, the object is to arrest the radiation, that is, to keep in the heat by inclosing the pipes in the best non-conducting material that is attainable and cheap enough. In order to effect this, the pipe is wound about, first, with asbestos, followed by hair felting, porous paper, manilla paper, finally thin strips of wood laid on lengthwise, and the whole fastened together by a copper wire wound spirally over all. This is thrust into a wooden log, bored to leave an intervening air-chamber between the pipe and the wood, and of sufficient size to leave from 3 in. to 5 in. of wood covering. The elasticity of the wrappings permits the free expansion and contraction of the pipe, irrespective of the wood log, which is securely anchored and made immovable. The whole is placed in a trench a short distance below the surface, without regard to frost. At the bottom of the trench is laid an earthen tile-drain, to carry off any earth moisture; and in order further to insure the continuous dryness of the wood log

enclosing the pipe, if desired, 1½-in. plank is fastened around the log, leaving an air space, and the whole is daubed with coal tar, and covered with earth. Pipes prepared in the manner described have been tested, and it is stated that these tests show that condensation can be reduced to a point that renders the general transmission of steam not only practicable, but profitable; that is to say, that the loss of heat by condensation is under 2¼ per cent. The only actual experiment of which particulars are given, does not furnish so high a result; this experiment was on 1,600 ft. of 3-in pipe, laid on a descending grade of about 1 in 250, the lower end trapped for water, the steam pressure constantly maintained at 20 lb. at both ends, during twelve hours; and the water of condensation, carefully weighed, amounting to 82 lb. per hour; i.e., about ·068 lb. of water per square foot of surface of pipe; that is, 66 units of heat per square foot per hour, or 52 units per foot run. The loss of heat from uncovered steam pipes, with steam of 40 lb. to 60 lb. pressure, may be assumed, probably, at something between 320 and 380 units of heat per square foot of surface, partly dependent upon the outside temperature. The Holly boilers in this experiment are stated to have evaporated 9 lb. of water per pound of coal. Therefore the extra coal required to keep up the loss from condensation amounted to 9 lb. of coal, or at the rate of 30 lb. of coal per hour per mile of 3-in. pipe. The actual amount of condensation in large pipes is greater than in small pipes, but the relative percentage per square foot of surface less than in small pipes. It is stated that from experiments and practice, verified in fifteen cities, the most economical pressure to be maintained in the mains, is from 40 lb. to 60 lb., although in some cities 70 lb. have been used. Experience with large mains is yet limited. The experience of Detroit demonstrates the fact that 60 lb. pressure could be maintained in four miles of 10-in. and 6-in. pipe, against the drafts for power and heat along the line.

In order to counteract the difficulty arising from the expansion and contraction of the pipes, which are subject to extremes of temperature, varying from, say 39° Fahrenheit, and the temperature of steam at, say 60 lb. pressure, i.e., 307° Fahrenheit, a junction and service box are used. These are placed at convenient intervals along the line, of 100 ft. to 200 ft. The arriving-pipe from the boilers is inserted in the service-box, by means of a nickle-plated extension, or telescopic joint, made steam-tight by passing through a stuffing-box. The departing-pipe is immovably attached to the box, so that one end of each 100 ft. of pipe is fast, and the other movable, affording free play to the expansion and contraction. All service-pipes are taken from the junction-box, which is securely bolted to the masonry and anchored to the pipes. The bottom of the box being placed lower than the pipes, all water of condensation is carried forward, and deposited in it; the arrangements for the escape of the condensed water from the steam-pipes will be described presently. At each point of consumption there is a cut-off, under the control of the consumers. The supply-pipes from the mains to the houses are 1¼ in. in diameter, and within each house ¾ in. pipes are used. In addition to the cut-off tap from the main, under the control of the consumer, there is a pressure valve or regulator, by means of which the pressure of steam is reduced, and the supply to the building regulated automatically. This is accomplished by two diaphragms of rubber packing, acted upon by weighted levers, and moving two slide-valves. The first valve is weighted to 10 lb., and the second to 5 lb., or 2 lb. if required. When the steam arrives at the first valve of the regulator, it is under a pressure of 60 lb.; on passing through the first reducing valve, the pressure is reduced to 10 lb.; it is then passed through a second reducing valve, and the pressure lowered to 5 or 3 lb.; thence it passes at this uniform pressure through a meter placed above the regulator, for measuring the amount of steam which passes into each house. Unfortunately, I am not in possession of a drawing or description of these regulating valves or of this meter sufficiently clear to enable me to explain their action in detail.

The distribution of heat in the apartments is by means of the radiators before mentioned, which are of the ordinary shape, consisting of inch-pipes about 22 in. long, placed vertically, either in a circle or in a double row, and connected together top and bottom. The action of these, in enabling the heat to be regulated, has already been explained. The steam, in passing these radiators, becomes condensed into water at 212°. The heat then remaining and the water may both be utilised. In order to effect this, it is conducted in protected pipes, from all parts of the building where steam has been used, back into the basement, through a specially-devised trap. Here it may be used as warm water, or it may be used for warming fresh air; in this case it is passed into coils of pipes set in a brick chamber; into this chamber cold air is admitted from outside of the building, as in the air-furnace, and coming in contact with the coils of pipes containing the hot water, abstracts the remaining heat, and passes up through the registers into the rooms above, as warm, pure air, while the water, now cold, passes into the tank, for future use if required.

We select the observations of two of the speakers who afterwards commented on the system.

Mr. J. A. Coleman said he had had the honour of reading a paper before the Society of Arts as far back as February, 1875, on a similar subject; and when he visited America a year or two ago he went to see Mr. Holly's system and examined it very thoroughly. A company having several mills in one enclosure would not think of putting a battery of boilers in each, but would collect them at a central point and distribute the steam; it was equally practicable to distribute the steam to a whole town. As to the lack of ventilation ascribed to the system of steam heating, that was a matter for each individual to arrange for himself; some did not provide it, but others had the radiators in the basement, with air conduits from the street, and the fresh air thus warmed was conducted into the rooms above, and this was a much superior plan. The fresh air which was always coming in had to go out again, and thus ventilation was provided for. It was apparent that the economy of this system must be very great, if the one question of condensation in the pipes was settled; and that had been very fully settled. Fifteen or twenty years ago steam was carried 800 ft. or 900 ft. in pipes placed on posts in the open air, and protected in a very simple way; and large steam-engines were driven by the steam passing through the pipe. Mr. Holly showed him his method of covering the pipes, which differed somewhat from that suggested in the paper he had referred to, which was to enclose them in any good non-conductor, such as sawdust, and lay them in brick conduits, so that they might be got at without tearing up the streets, and with a waste-water pipe at the bottom of the conduit, to return the water to the boiler where practicable. Mr. Holly told him, two years ago, that in a mile of pipe he lost less than four per cent. by condensation, which was quite insignificant; but even that figure seemed to be now reduced. With regard to the cost of heating buildings, the figures quoted would hardly convey a true idea to an English mind, because there were no winters here such as they had in America. Last winter was considered very severe in England, but in America it would have been considered very ordinary winter weather. When investigating this subject, he took a large building like A. T. Stewart's in New York, treated it as a box containing so many cubic feet, found what the coal and engineering bills were, and distributing the amount over the cubic capacity, found that the cost averaged by the then existing methods from ·87 to 1·3 cents per cubic foot per annum; while under the system he proposed the cost was reduced, to speak roughly, by about 50 per cent. He remembered open fires in America in his boyhood, and they were always a nuisance, from the dirt and dust they created; it was the same in a lesser degree where an open furnace in the basement was used for warming the building. The saving of labour, and the advantage of being able at any time of the night, if you were ill, by simply turning on a cock, to get the heat you required in a few minutes, must be apparent at a glance. Mr. Holly told him that the difference in the wear and tear of furniture was already very appreciable. If gas-works had to be put up in every private house, gas would be almost too expensive to use, but when gas was manufactured on a large scale the result was, that even with all the progress of electricity, up to the present time, it continued to be a very profitable branch of manufacture. The same principle applied to steam. When he took out his first patent, the patent authorities at Washington told him that the system of heating cities by the use of steam ranked next to the introduction of gas and water. The idea of the whole system which had been floating in his mind for years, took definite form on the night of the Boston fire. His first idea had been to devise a system for protection against fire, and the importance of that subject might excuse him saying a word or two upon it. Both there and in America, buildings had grown out of the reach of the fire apparatus, on account of their height being such, that however powerful the fire-engines, the hose would not stand the required pressure. The consequence was, he adopted for warehouses a system of iron sprinklers, such as are in use in large mills. The sprinklers were connected with a main water pipe in the street. An improvement had since been made on this system by fixing pipes on the ceiling having caps every 10 ft. in length. These pipes remained full of water; a heat of 160° would release the caps, and the pressure of water from a tank on the roof would throw a spray over 100 square feet. If the fire extended farther, another cap would be released, and give an additional shower, and it was only in very severe cases that recourse had to be made to the mains in the street. As they could not depend in all cases on the city fire-engines, the collection of boilers in a central place for supplying steam, gave the power, ready at any time, to work the auxiliary pumps.

Dr. Siemens, who was in the chair, in proposing a vote of thanks to Capt. Douglas Galton, said this question was not a new one in the abstract, for heating by steam had been carried out to his knowledge forty years ago. But there was a novelty in the proposal to generate steam in large volumes, at high pressure, at certain centres; and to send it at that high pressure for miles under the streets. It was also perhaps a novelty to divide steam by regulating and stopping valves, and supply it to individual houses, so that it might be used for the various purposes mentioned. The great question which presented itself was, would such a pipe be trustworthy; could it be laid and maintained for this purpose without danger and without trouble. The paper described an elaborate method of insulating the pipe to prevent excessive loss by radiation, and, from the figures given, it seemed to have been very successful; but it appeared to him doubtful whether, in our streets, a pipe so swelled out by insulators, and logs of wood, and planks, could be laid. The space below our streets was already so fully occupied, that the establishment of such pipes would present very great difficulties. As Sir Frederick Bramwell remarked, if they wanted to bring heat into houses, there was another means already established, and in full operation; and from a little calculation he had just made, he found that a cubic foot of coal-gas brought with it about 750 heat units, which would be about the same amount as would be supplied by 3¾ cubic feet of steam, at a pressure of six atmospheres. The question, therefore, would reduce itself to this, whether the one pipe or the other could be maintained with the least expense. He, for one, must adhere, for the present, to the opinion that it would be easier to supply gas than steam. The paper spoke of various modes in which steam heat could be used, and the radiator was alluded to, but he did not think that apparatus was very happily named. A steam-heated surface in a room no doubt radiated heat, but not under the same conditions as a fire-place. Probably, nine-tenths of the heat given off from that hot surface would be given off to circulating currents of air, which would pass again and again through this radiator, and a very small portion would pass by radiation into the room. The rays from such a low source of heat would hardly be felt, as radiant heat, at any sensible distance from the source. Now, he looked upon an open fire-place not only as a thing endeared to them by long habit, but he attributed to it very high sanitary qualities. The open fire-place communicated absolutely no heat to the air of the room, because air being a perfectly transparent medium, the rays of heat passed clean through it. It gave heat only by heating the walls, ceilings, and furniture; and here was the great advantage of the open fire. If the air in the room were hotter than the walls, condensation would take place on them, and mildew and fermentation of various kinds would be engendered, whereas, if the air were cooler than the walls, the latter must be absolutely dry. That was the great advantage of the open fire, and it endeared it to them, though many did not know exactly where and how the comfort arose. The

Americans were very ingenious, but he would not take their word with regard to the comfort of their rooms; when he was there he suffered severely from the closeness of the atmosphere of the dwellings, and when he travelled at night in the sleeping-cars he was obliged to get up four or five times and step out on the foot-board to get thoroughly cool. The only explanation he could offer was that the attendants were black men, whose standard seemed to be the interior of Africa. But although he could not agree absolutely with the proposal, yet the question of doing away with the smoke and nuisance which now resulted from open fire-places was so important, that any suggestion, backed by a considerable amount of experience, was welcome; and Captain Galton well deserved their thanks for the able manner in which he had brought the subject forward.

BATHS AT WINDSOR.

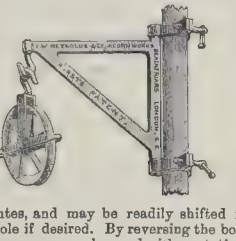
A SWIMMING-BATH, for the use of the students at Beaumont College, has just been completed at a cost of 3,500*l.*, from the designs of Messrs. Byrne & Crombie, architects, of Windsor and London. The site, which adjoins the College, is 60 ft. above the level of the Thames, and some 510 yards distant from it, necessitating the water being pumped and forced up to the bath. This is effected by a 10-horse-power engine and steam pump placed 500 yards from a well at the entrance to the college grounds, and forced thence a further distance of about 200 yards through the supply-pipe of a No. 5 pulsometer, supplied by the Pulsometer Company, of Queen Victoria-street. Connected with this is an upright boiler, 4 ft. 6 in. diameter, and 11 ft. high, which heats the water in the bath at the same time.

The bath-house internally is 80 ft. wide and 25 ft. high; the swimming-basin is 66 ft. long, 30 ft. wide, with a depth at one end of 4 ft., increasing to 7 ft. at the other end. The basin itself is formed of cement concrete, 3 ft. thick sides, and 18 in. thick bottom, 4 parts gravel and 1 part cement, rendered inside 1½ in. thick with Portland cement, and again lined with Cliff's white glazed bricks and ornamental pattern borders. The internal walls are rendered in Keene's cement, with a dado, 6 ft. high, of Minton's glazed white tiles, with figured strings top and bottom.

The roof, which is built of a very light construction, is of wrought iron, from the firm of Messrs. Davis Bros., Wolverhampton. The sky-light, which runs the whole length of the building, being glazed on Helliwell's patent system.

Two sides of the bath are provided with dressing-boxes, thirty-two in number, with cloak-pins and seats, &c., for each bather. The whole of the external woodwork is stained in two shades, and varnished, the moulded cornice being stencilled.

Special arrangements have been made for ventilating and preventing the condensation of vapour from the bath. The basin itself, containing 50,000 gallons, can be easily emptied in about two hours by an overflow-pipe, which allows the water to pass over a filter-bed, and thence purified into a watercourse in the grounds of the College.



Messrs. A. L. Oades & Sons, of Egham, were the general contractors, Mr. Ventom being clerk of works.

FALL OF A CHURCH BELL.

A REMARKABLE accident, fortunately unattended by loss of life, happened on November 24th in St. Augustine's Church, Vienna. The great bell, named "Ferdinand," fell suddenly while it was being rung for vespers. In its fall it crashed through the staircase and the massive iron works of the church clock. The bell, which weighs 57 cwt., was hung in 1854 in the newly-erected tower of the church, but could not be used until 1863, the tower being too small for it. The bell is usually rung by the verger and the bellringer, sometimes assisted by boys. On the day of the accident three of the latter were present. The two men and the boys stood quite near the bell, pulling the two ropes by which the bell is swung. Soon after the first few pulls the bell began to creak, then was seen to part from the beam and to remain thus suspended for a few seconds, and then fell, its fall being arrested just below the clockwork, where it got jammed between the massive oak beams of the stairs. Though all this happened within a few seconds, the persons in the belfry did not lose their presence of mind. Two of the boys and the bellringer rushed down the stairs, and found safety in the windows below the clock. The verger and the boy nearest the bell jumped into wall niches close by, the bell almost touching them in its descent. Only when the bell was perfectly at rest, the verger and the boy, who happened to be his son, tried to leave their dangerous place of refuge, but found the way barred by stones and crushed beams, as well as by the bell itself. It was only owing to the fact that at the moment of the catastrophe they had not let go of the rope that they were able, holding fast by it, to perform the dangerous descent. Only one of the boys was hurt, who, in rushing down the stairs, fell, and suffered a compound fracture of the shin bone. The commission which was at once appointed to report on the accident ordered the speedy erection of a scaffold under the tower, to intercept a possible further downward movement of the bell. After its completion, the work of reinstating the bell in its former position will be proceeded with. The catastrophe is at present ascribed to a gradual loosening of the screws which secured the bell to the beam. The tower is not in danger, but it appears to be overweighted, for, besides the fallen bell, there are four more in the tower, the weight of which is together 60 cwt., thus making the total burden 6 tons.

A NEW SCAFFOLD HOIST.

THE invention illustrated below was exhibited at the Smithfield Club Show. A block and fall would even more generally be used for raising building materials if there were not so much difficulty in finding a suitable fixing for it. This difficulty is overcome by Hurst's Patent Scaffold Crane, which can be fixed to any sized pole in a

few minutes, and may be readily shifted from pole to pole if desired. By reversing the bottom collar, the crane may be used either stationary or swinging. The one exhibited was made to lift 2 cwt., but we understand they can be made to any size desired. F. W. Reynolds & Co., of Edward-street, Blackfriars, have secured the sole right to make and sell these cranes, which will probably soon come into general use.

"DEVELOPING SOUTHAMPTON."

I HAVE read the article on Southampton in your paper with some interest, and I take this opportunity to offer some further information thereon.

The paving of some of the footways with blue brick in lieu of stone has effected a saving in the first cost, and enabled the Corporation to extend their operations; but upon the question of blue brick *v.* Caithness stone there is some difference of opinion. The blue brick can be laid at about half the price of Caithness stone, and, therefore, has the preference; but the general appearance, is a main thoroughfare, is certainly not equal to the stone.

The Corporation have put in force the well-known section 150 of the Public Health Act, and the new roads in Portsmouth have been made up by the Borough Surveyor in default of the owners so doing; but we do not consider these new roads "street improvements," they are the natural outcome of the growth of towns.

As regards street improvements, such as removing projections, widening streets, and removing courts and alleys, there is much to be done in the old part of the town, but I hope the day is not far distant when important works in this respect will be carried out.

The new bridge over the South-Western Railway is an important work, as it gives uninterrupted communication between the east and west of the town, and closes two dangerous level crossings close to the terminus and adjoining the station-yard. This bridge is carried by iron girders over the railway, and also over Hartley-street adjoining. The approaches are of considerable length, the greater portion being formed of elliptical arches in red brick. The width between the parapets is 50 ft., and the worst gradient 1 in 30. As the western approaches cross the Cattle Market, a partial reconstruction thereof will be necessary.

The works have been designed by the company's engineer, Mr. William Jacomb, and are being carried out under the superintendence of Mr. J. Drage, on behalf of the company, and of myself on behalf of the Corporation, by Messrs. Joseph Ball & Sons, the contractors.

Southampton has long been in want of better railway accommodation between the North and West of England; and the inhabitants have made determined efforts to remedy this defect, but hitherto without success; there is now, however, some prospect of their hopes being realised.

The Didcot, Newbury, and Southampton Railway Company propose to carry out important works in the borough. Two stations are to be provided, one at Bargate-street, near the centre of the town, and the other at the Royal Pier. The Bargate-street Station will be the chief, and to give a good approach thereto from the High-street, the company propose to widen Bargate-street to 60 ft., and to take down several houses on the west of the old Bargate, so as to form a circus on that side. In addition to this there is a project to remove the corresponding houses on the east side, so as to leave the Bargate in the centre. If they be carried out, it will be a most important improvement of the High-street.

The proposed 60 ft. roadway across the western bay will give a new route to and from the pier, and enable the local authorities to extend their tramways from the Town Quay, carry out jetties, and enlarge to a considerable extent their quay frontage.

The South Western Railway Company have also not been idle; they have deposited plans showing new railways and land reclamation on practically the same lines as the Didcot and Newbury Company. The new street to the Bargate being nearly the same, and the land proposed to be reclaimed being about fifty acres.

In addition to these two companies, there is the Swindon, Marlborough, and Andover Railway Company, who desire to enter Southampton over the South-Western system from Andover. The two first-mentioned companies having adopted the same scheme, and the spirited action of the Local Authorities, will, I hope, convince Parliament of the necessity for better railway accommodation at this important port.

As regards the Southampton harbour, will you permit me, as engineer for the scheme, to add to your remarks a few details of the work?

It is proposed to construct a double line of tramways from the boundary of the Commissioners' property on the western shore to the Town Quay, and to duplicate the present lines to the Southampton Docks; to widen the Royal Pier, and to carry a double line of tramway to the Pontoon, thus providing every facility for increased traffic from the north and west to the Isle of Wight; to reclaim the foreshore east of the Royal Pier for a width of 80 yards, and to erect a new quay wall; to further extend the Quay seaward into deep water for 120 yards; to construct a new quay or jetty 135 yards in length; to erect new warehouses; to provide for dredging the harbour, erecting lights, and for other works.

I think the above summary will show that the Local Authorities are doing all they can to improve and extend the works committed to their charge.

JAMES LEMON, M. Inst. C.E.,
Consulting Engineer, Southampton.

Soane Museum, Lincoln's Inn-fields.—The trustees held their quarterly meeting on Thursday, the 8th inst. Professor Donaldson, Mr. David Mocatta, and Mr. Alan Cole, were present; also Professor W. H. Flower, F.R.S., who attended for the first time after his recent nomination by the Royal Society as the trustee to succeed the late Sir Philip Egerton. Mr. Wild, the curator, reported that the number of visitors to the museum during the present year had been 3,737, and that he was preparing a new edition of the Handbook, illustrated with many additional engravings.

ANCIENT SURREY.

Sir,—In Tymms's "Home Circuit," the cave of Ludlow's Hole, excavated A.D. 1216 as a reservoir for Waverley Abbey, is described, p. 138. Also, Hind Hill, 923 ft. high, described in W. Cobbett's "Rural Rides," with the cavity of the Devil's Punch Bowl, and mentioned in the tale of "Nicholas Nickleby." The manor-houses at Cheam and Clapton; Tooting Church, with its round tower; Tandridge Priory, *temp.* Richard I.; Benbury Camp at Wimbledon, A.D. 568, are described. Reference is made to the "plant about the thickness of a bullrush, with a top like asparagus, shooting up nearly to the surface of the earth, above which it never appears, and when the corpse is consumed, the plant dies away."

This observation has been made in Send and other churchyards, where the soil is light red sand. The fact was noticed by John Aubrey in his "History of Surrey." In *Notes and Queries*, sec. 5, vol. 5, 1876, pp. 169-297, it is suggested by two writers that it may be a species of *Equisetum Telmateya*. In vol. 13 of the *Penny Magazine* are views of Farnham Castle, of Nonsuch House, of Chertsey, and of Croydon Church and Palace, also of a mill near Waddon, and of Beddington Church. In the *Saturday Magazine*, vol. 14, information is contained as to Elias Ashmole; in vol. 19, as to Kingston-on-Thames; and Guildford Castle, vol. 6.

In the British Museum Library, Add. MSS., Nos. 6,735, f. 120, 122, and No. 6,746, f. 15, are the curious collections of R. Symons; No. 24,004-5, various views in Surrey; No. 25,712, Add. MS., Surrey in the nineteenth century; No. 4,704 MS. describes the ancient Surrey tenures, such as Borough English at Dorking. In a volume of excursions, 8vo., Longmans & Co., A.D. 1822, there are views of old buildings in Surrey, Lambeth Palace, &c., which are described. This is one of several similar topographical volumes descriptive of England.

In "Select Topography," by W. E. Trotter, 1830, are engravings of Richmond, Dorking, Leatherhead, Walton-on-Thames, Shepperton,—in Saxon, "Sceapheard-ton," a habitation of shepherds. In Carter's folio views, B.M. Lib. Add., are views of Farnham and Guildford Castles, with the chapel on the hill, and several at Oatlands House, restored in the nineteenth century. Waverley Abbey, also, is noticed.

In his "History of the Protestant Reformation," W. Cobbett described abbeys at Aldbury (*temp.* Richard I.), Barmondsey (1089), Chertsey (666), Lingfield (*temp.* Henry VI.), Merton (1116), Newington (1551), Reigate, founded by William de Warren, Earl of Surrey; Shene (1414), Southwark, St. Mary Overy and Overy Hospital (1228); also Tandridge or Tanregge (*temp.* Richard I.), Waverley (1128). In his "Rural Rides," also, this author described places in Surrey. The house at Farnham where he was born is, I believe, extant, being the Jolly Farmer Inn.

In Howitt's "Visits," vol. i., Wolsey's Tower at Esher is engraved (p. 245).—that is, the Gate-house. The mansion of Bishop Waynflete, extant 1673, in Aubrey's time, is destroyed. At Apscourt, near Molesey, are, or were recently, the traditional remains of Wolsey's house, said to derive its name from A.P.S., the three letters in Archiepiscopus. Near Walton the old mansion of Ashley Park is attributed to him. Richard Symmes's "Surrey Collections" were given to Mr. W. Bray, in 1813, by the Earl of Onslow (see Add. MSS. 6,167, B.M. Lib.), being tolerably legible, chiefly Latin contracted. Mr. Symmes was the town-clerk of Guildford (22 Charles II.) 1670. He died in 1680. The Add. MSS., 11,573, are the notes of Mr. Tyton in Surrey. The Add. MSS., 11,571, contain also notes of Surrey in large and small folio. In John Aubrey's "Surrey," 1673, five vols., 1719, with his portrait, it is stated that Baynards, near Cranley, was built by Sir G. Moore, A.D. 1577. It is engraved in Hone's Year Book, pp. 930 938, with a description. Wotton Church, p. 313, and Banstead Church, p. 352, with its leaning spire, and Dorking Church, are described. In the *Gentleman's Magazine*, vol. lix., p. 1 (1789), Weston House is engraved. In vol. lxxi. is Oatlands, and Winchester Palace, Southwark, is in vol. xviii., part 2, which I described in the *Builder*, No. 1765. In Neale's "Views of Seats," second series, 1826, vol. iii., are views, with a description, of Albury, Clandon, Deepdene (three views), Ockham, Roehampton House, and Shalford. In the first series are views (vol. iv.) of Ashley Park, Ashstead, near Epsom; Beechworth, Claremont, and Farnham Castles; Ham House, 1821; Loseley, 1562-68,—the hall being 42 ft. long and 25 ft. 2 in. wide; the Oaks, near Epsom; the Rookery, near Dorking; Shirley and Selsdon, near Croydon, with Sanderstead, are engraved. In Nash's "English Mansions," folio 1869, Beddington Hall, Sutton Place, and Loseley are engraved. Sutton is described as "a splendid specimen of the enriched brickwork of the time of Henry VIII., built about A.D. 1530, being red brick with chequer work of black brick." Beddington was rebuilt about 1609, except the hall. At Loseley there is stated to be a portrait of Sir W. Moore, the founder. Aubrey mentioned, at Titsey, near Ewell, a large old mansion near the church; a copper coin of Constantine the Great was found there. At Crowhurst Place, near Lingfield, was the ancient residence of the Gainsford family before the Norman conquest. This old timber house was moated. The hall was open to the top, and the windows were full of escutcheons. It was sold in 1706, valued at 400*l.* yearly. At Guildford, the almshouse, of brick, quadrangular,—a noble tower, having at the entrance four small turrets over the gate, founded by Archbishop Abbot,—is described by Aubrey, who stated "Lothesley, a seat of the Moores," is about the time of Henry VII., with its armoury and antique furniture. He alluded to the plan of the shepherds at Epsom hurling stones from a half-horn at the top of a pole to keep their sheep on the Downs within bounds. Mr. Aubrey mentioned a camp of twelve acres on Walton-hill, that is St. George's-hill. He was informed by Ashmole that the old current of the Thames is here changed, and the part of Middlesex over against this place was divided formerly from Surrey, about A.D. 1450. W. Lilly, whose tomb is in Walton Church, practised as a M.D. at Hersham, under a Lambeth degree. In 1652 he bought his house for 950*l.*, and bequeathed it to a son of Sir Bulstrode Whitlocke. Oatlands Aubrey described as "a very fair house." In 1673, a brick wall encompassed ten acres of ground. Only a few parts of the house remained then, and, ere long, it was destroyed. C. C.

THE DUMBIEDYKES.

There is a district in the neighbourhood of Edinburgh, within the Parliamentary borough now-a-days, which we had recently occasion to visit in connexion with the opening of a new church. A few jottings we made at the time may be of service to some of our readers. It is, of course, unnecessary to quote Sir Walter Scott, who, in his celebrated novel, the "Heart of Mid-Lothian," gives some prominence to the admirer of Jeanie Deans, the Laird of Dumbiedikes.

The Dumbiedykes is simply *Scotice*, or, rather, old Anglo-Saxon, for the "dumb-walls," *i.e.*, the locality of the walls of a former Institution for the Dumb; or, in other words, the old building which may still be seen at the foot of Brown-street. It was once the palace gardens of Holyrood, but within the recollection of old inhabitants it was devoted to the useful occupation of market gardens.

At this moment it is by far the most densely-crowded district in Edinburgh, forming an adjunct to the overgrown and, at one time, suburban parish of St. Cuthbert. In the space of probably half a mile it contains a population of over 19,000, a circumstance of itself deserving of study. How this population has been provided with houses, and the character of these houses, are not unknown to our readers; in point of fact, the district has been the scene of two or three of the highest and most successful efforts to provide houses on a large scale, and at a moderate rent, to the working classes of Edinburgh, which is somewhat curious. The origin we will briefly explain.

Five-and-twenty years ago the Government needed a site for a new post-office in Edinburgh, and selected that of the old Theatre Royal in Princes-street; no doubt, one of the most central and commanding situations in the whole city. We remember the old theatre very well. Siddons, Scott, Mackay, Murray, the elder Kean, Macready, were all *débutants*. In fact, the old Theatre Royal was as celebrated as Drury Lane. The carcass of the old theatre, together with the surrounding buildings called Shakspeare-square, were purchased by the late Mr. Robert Hunt, an opulent builder in Edinburgh, for a mere trifle. As the cry for workmen's houses was then at its height, he bethought him of utilising this waste ground at the Dumbiedykes; and we are bound to report that his perception was good. He accordingly *leased*,—or, as it is called in Scotland, *feued*,—the whole line of frontier facing the Queen's Park, and thereupon turned the old stones of Shakspeare-square into humble yet commodious and comfortable houses with three rooms, fitted with good fire-grates, good gasfittings, good water-supply, and excellent water-closets.

The houses filled with tenants at once. A demand arose. The demand was quickly enough followed by the supply, which grew so much that in another year or two the waste ground in the whole district was built upon. But the ground was of the nature of a heavy slope facing the Park, and of a different formation.

The Iron Church was set up about ten years ago by one of the best preachers, Mr. Ferguson; and on the 29th of May, 1880, the foundation-stone of the present church was laid by Lord Rosslyn, Commissioner of the General Assembly, with Masonic honours. The new church was opened on Sunday, the 13th of November. The style is Early English. The building has a graceful spire, and a solid and substantial substructure, good interior (plain, but substantial), a covered timber ceiling, nicely proportioned, with galleries supported by handsome brackets tastefully decorated. The architects are Messrs. Thornton & Shiells.

THE NEW SYSTEM OF COMPETITIONS.

Sir,—Now that the preliminary drawings for the Glasgow Municipal Buildings have been sent in, it may be well, in the interests of future competitors, to consider the working of the amended scheme for public competitions, more especially as there seems to be a disposition to make the regulations for this one into a model for others of a similar kind, and even for those of much smaller magnitude.

It will probably be a surprise to the assessors to find what a mass of labour their instructions have entailed upon those who have conscientiously striven to follow their leading, and it is very desirable they should realise this, in order that they may, in every possible manner, lighten the labour of those who are chosen for the second round in this competition. It cannot be necessary to require much more from them, as the drawings already sent in comprise a plan of each of the four floors, four elevations, two sections, and a view. These are of themselves almost, if not quite, sufficient to decide upon, and any further drawings required ought only, in common fairness, to be such as to test the capability of the selected men.

Any attempt to exact complete sets of plans, &c., to an eighth scale, would involve a vast amount of labour, which in nine out of the ten, would be unnecessary and useless, and for which the remuneration proposed would be quite insufficient. In fact, one-tenth scale would be ample for any such purpose, the reduction from one-sixteenth to one-twentieth having proved of little advantage, the latter scale requiring considerable accuracy and precision in drawing.

In any future regulations of this kind it is most important that the labour should be minimised in the first trial of skill. Except for buildings of unusually great importance, two or three drawings to a small scale, with option of being drawn in pencil, would be quite sufficient to enable a qualified architect to select the best for further development. Observer.

Timber Yards in the Metropolis.—At the meeting of the Metropolitan Board of Works on the 9th inst., the draft of the proposed New Metropolitan Bridges and Management Bill was under discussion. Exception was taken to the clause which proposes to impose new conditions and restrictions as to the size and position of timber stacks, and it was urged that persistence with the clause would endanger the whole Bill, owing to the powerful opposition of the timber trade, whose interests are greatly affected by the clause. On its being put to the vote that the clause be retained in the Bill, 12 members voted for it and 13 against it. A division being demanded and taken, the votes on either side were equal,—15 to 15,—whereupon the Chairman of the Board gave his casting-vote in favour of the retention of the clause, which was, therefore, left part of the Bill.

THE NOMENCLATURE OF COLOURS.

Sir,—It is of great importance that a correct understanding should exist as to what a certain word or name represents as regards a given colour.

For some time past I have noticed that the stainers (*i. e.*, the natural colour ground in oil or water) of various firms differ considerably. I have taken yellow ochre, raw sienna, burnt sienna, Venetian red, Indian red, raw umber, burnt umber, in a certain quantity, from three good firms, have mixed them with a regular proportion of four to one good old white lead, and found the result most conflicting and contradictory; in fact, for example, the stainer of one firm called yellow ochre appears in the case of another firm to be raw sienna, and raw sienna in another firm to be the Venetian red of a third. Now, this is of importance to the client wanting the best character of work, to the architect intending to obtain it, and to the decorator desiring to execute the same. But in matters of colour where is the standard? Would it not be within the province of the Painter-Stainers Company to attempt the solution of the matter by getting a standard fixed as to what the name of each colour represents?

It does not follow that firms would supply to that standard,—that would be a question of price and commercial dealing,—but an admitted standard for reference would be of practical value to both architect and decorator. I trust you will give your valuable aid to the solving of this every-day difficulty.

Stephen S. Phillips.

WOODS.

Sir,—A good many erroneous impressions prevail respecting timber. We always had an idea, in common with others, that walnut was a very rich and expensive description of wood. Probably auctioneers' catalogues of eligible and tasteful furniture had the effect of heightening that idea. We learn, however, from a specialist in the trade that English walnut is almost valueless, the Italian walnut being that alone for which there is any demand in the market. Many antiquaries formerly contended that the wood generally used in the construction of houses anterior to the Great Fire was chestnut, but in the vast majority of cases this was the common oak. The famous woods formerly round Sittingbourne, of Spanish chestnut, favoured the popular idea that it was indigenous to England.

A. B. C.

THE STYLE FOR A NEW CATHEDRAL.

Sir,—You have already noticed, without approving, that in last month's number of the *Nineteenth Century* Canon Venables urges very forcibly the adoption of Sir Christopher Wren's first design for St. Paul's Cathedral for the proposed Cathedral of Liverpool, and while agreeing with him that this would be doing honour to our greatest Renaissance architect, yet I wish to point out a few fallacies with which the Canon supports his argument.

In the first place, he banishes altogether the Byzantine architecture as an appropriate one for Christian churches. The fact is, however, that the style of St. Sophia is the grandest and most perfect yet conceived for the purpose of Christian worship, and in no way could Liverpool show better her common sense and independence of prejudice and conventionalism than by erecting her new cathedral in this, rather than in the Gothic, Roman, or any other style.

On the other hand, it is, I think, presuming too far to take it for granted that the Gothic is universally allowed to be the only style suitable for a modern church. It is true that a great reaction in favour of our ancient architecture has followed from the insipid and tasteless buildings with which we were for so long overrun under the name of Italian; but there is little doubt that this has been carried too far, and that the countless churches built all over the country are more suitable for Roman Catholic worship than the altered requirements of the Protestant religion. In building our dwelling-houses, though we may still keep our own beautiful pointed arch and various other things which our forefathers before the outbreak of the destructive "Classical" mania had patiently and carefully evolved for us, we still find it necessary to adapt and modify considerably to suit modern requirements very many features of Gothic architecture as it was left us by the sixteenth-century builders, and it is, therefore, pedantic and inconsistent not to do the same as regards churches.

It is a very good thing, no doubt, to vary the monotony by introducing different improvements, or even specimens of entirely diverse styles, from other countries, and England, like many other nations all over the world, owes some of her most splendid efforts of genius, and most picturesque elements, to the adaptation of Renaissance features. But mere mechanical copyism or indefinite multiplication, whether of Corinthian capitals or Gothic arches, without any reasoning adjustment to advancing necessities or play for individual talent, is death to all art, and not, in fact, architecture at all; and dread of the stereotyped jumble of bits taken at random from Gothic edifices, or the inevitable wearisome rows of imitation Greek columns (which, with the chimney-pot hat, appear to be making the tour of the globe), that will arise if either of these "styles" is decided upon, makes us ready to fall back on a really noble and original design, even if somewhat stale, of a talented artist like Wren.

The only other arrangement from which we might expect anything better can scarcely be hoped for, namely, that an opportunity should be given for the embodiment of a new development appropriate to present uses, and which, though on the basis of Gothic, should combine the structural fitness of the Byzantine style, and avail itself of the various mechanical and æsthetic improvements suggested by modern science.

Evacustes.

EMBLEM OF THE TRINITY.

Sir,—In the *Builder* for December 10, in an illustration pertaining to Mr. Dobson's lecture upon "Symbolism," is given a representation of the Holy Trinity, as shown in some stained glass at St. John's Church, Micklegate, York. It is fourteenth-century work.

It may be passingly interesting to record that an almost precisely similar embodification of the Trinity exists at Black Abbey, in Kilkenny. It is carved in, if I remember rightly, alabaster, and bears the date, at the foot of the cross, of A.D. 1264. Its proportions are exactly the same. The Eternal Father, however, at Black Abbey is crowned, and holds both hands, not one only, up in the act of blessing. Further, the dove, instead of being at the left side of our Lord's head, in the Irish example, is immediately above it. In both examples our Lord is crowned with thorns, and altogether the general affinity between the two is remarkably great.

Harry Hems.

HOMES OF THE LONDON POOR.

Sir,—In your issue of the 26th ult., under the above heading, is a report of an inquest, which shows what dwellings the humble toilers in London have to take up with. The man being a music printer was possibly like many other printers working in London offices, excluded from the workmens' train in consequence of his hours,—eight a.m. till eight p.m.,—and therefore obliged to live near his work. There are at this time many printers living in the courts of Fleet-street, whose children are employed as machine-boys in printing, bookfolders, &c. It is plain that workmen's trains do not suit printers, although more of them have been dislodged than any other class by the City improvements and railways. Printing having been so long and extensively carried on in the City their case is deserving of notice.

Perhaps it may be asked why such uncomcomfortable rooms are taken. To this I would answer, the supply does not appear equal to the demand; and again, cheapness has to be considered, for all have not constant work; and last, but not least, the Assessment Committee, with their professional valuer, have a great desire to increase the annual value of houses, because it is an easy way to raise the local taxes, which tends to increase the rent of rooms, neglect of house repairs, &c.

H.

The Parish Church of Blythburg, Norfolk, has been closed by order of the Bishop of Norwich, on account of the dangerous condition of its fine hammer-beam roof. The church is called one of the best examples of semi-Flemish thirteenth-century architecture, but it is altogether in a very dilapidated condition.

SAFETY FROM FIRE OR PANIC IN PLACES OF PUBLIC ASSEMBLY.

Sir,—Terrible experience, of which history is silent, may have taught the architects of Greece and Rome; for the ruins of ancient theatres and amphitheatres are perfect models in material and construction for ensuring the safety of great assemblies from the dangers of fire or panic.

But even if we had unlimited funds at our command, our climate would not permit of a series of stone benches rising tier above tier under the open sky. Still, although we cannot have solid structures of stone or brick throughout, more might be so built,—at least, the proscenium should be of plastered brick.

The spectacular demands of the modern stage require artificial lights, inflammable dresses, and scenery that increase the danger from fire; and the knowledge of this by the audience makes them ready to be panic-stricken at the slightest alarm.

The progress of a fire in a theatre is now so rapid that it would be almost impossible to increase the means of egress to such an extent as to assure the safety of the audience that way. A person thoroughly acquainted with the place, and having a clear way, unable to escape from an empty house, has perished in the flames when a fire broke out.

It is in the means of instantly quenching a fire, that we must look for safety. Hitherto all means such as iron screens, extincteurs, firemen (so called) in the house, have proved miserable failures. The work requires to be done at a moment's notice by some one free himself from personal danger, and, consequently, panic, or the turmoil of a surrounding panic. In the first place, there ought to be water-pipes to shower a flood of water upon any or every part of the house on the turning of one or more levers; these should be in a chamber, from the window of which every part of the house is discernible, without any direct communication with it. This chamber should have a separate means of exit, so that the man in charge shall have no reason to be anxious for his personal safety.

The man ought to be a tried member of the Fire Brigade, appointed to the post by the police authorities, and altogether independent of the manager of the theatre. He ought to be visited by the inspector of police for the district, who ought to report any irregularity.

The apparatus ought to be frequently tested by the police, when, of course, hose would be attached to carry the water off without injury to the house.

The lessees, if taxed for the maintenance of such a system, and therefore disposed to grumble, may remember that a fear of fire is never altogether absent from the minds of the audience, and that possibly such a fear may keep many from attending a theatre.

G. Chapman.

BODY-SNATCHING.

Sir,—The recent startling revival, on both sides of the Atlantic,—in the United States and Scotland,—of what was presumably a lost art,—that of the resurrection-man,—may permit the suggestion to some that wherever such distressful disturbance, from motives of revenge or motives of cupidity, is in any degree presumable, the simple, short, and inexpensive expedient of lining the grave all round with a few feet of cement concrete (rapidly hardening like rock, unaffected by moisture, and enduring as embalment) would at least so protract the nefarious and ghastly operation as to render prevention a matter of certainty in precise ratio to the thickness of the enclosure.

E. L. Tarbuck.

ANTHRACITE.

Sir,—May we be allowed to call attention to a portion of your leader last week *re* anthracite coal for domestic purposes, which appears to have attracted considerable attention, and has been quoted in several of the daily papers?

We would point out that all coals give off carbonic acid gas, and that anthracite requires a good draught to burn at all; this draught is more than sufficient to carry off the carbonic acid and other gases that may be generated; in other words, carbonic acid gas cannot be produced from anthracite coal without sufficient draught to carry it off.

Your description corresponding with one exhibits, we have had numerous inquiries at the Exhibition; these we are easily able to satisfy, but as your statement, unqualified, is likely to mislead the general public, we would ask you to insert this letter.

Anthracite coals are burnt almost entirely in Carmarthenshire and Pembrokeshire.

Arcnd. Smith & Stevens.

CORNER BUILDINGS AND THE LINE OF FRONT.

Sec. 75, Metropolitan Local Management Amendment Act, 1862, as applied to Corner Buildings.)

Sir,—I have read the paragraph on this subject in the *Builder* (p. 724), with the greatest interest, and while I entirely agree with what appears to me to be the commonsense view there expressed, I have reason to remember that this reading of the Act is certainly not universally accepted.

As Surveyor to the "Rolls Estate," I have frequently had much difficulty and annoyance in connexion with this question; and as my experience may possibly be of interest to your readers, I venture to state a case which appears to me to be much to the point.

In 1870 I let a corner piece of ground on a building lease, this ground having a frontage in the St. James's-road (Bermondsey), and a side frontage in the Rolls-road. The side frontage of the opposite house extended to the footpath, and the general line of frontage in this road is very irregular, although the houses immediately adjoining were set back 10 ft. No question arose as to the front building line in the St. James's-road, but the Bermondsey Vestry took proceedings to compel the builder to set back the side frontage to a line, fixed by the Architect of the Metropolitan Board on the application of the Vestry, extending from the side frontage of the house on the opposite side of the St. James's-road (forming the angle of the Rolls-road) to the houses adjoining the plot in question in the Rolls-road, thus setting back the side frontage from 5 ft. 6 in. at the St. James's-road end to 9 ft. 2 in. at the back. The freeholder spared neither trouble nor expense in contesting the question before the magistrates, but the decision was given against him, and, in pursuance of the order then made, the Vestry demolished so much of the house as was erected in front of the frontage line as laid down by the Metropolitan Board.

The magistrate refused to grant a case, and the rule *nisi* granted by the Court of Queen's Bench, calling upon the magistrate and the Vestry to show cause why the former should not state a case, was argued, and discharged with costs against the applicant.

The house frontage was reduced from 20 ft. to 14 ft. 6 in., and the freeholder was obliged to purchase the lessee's interest, as he could not allow him to be the sufferer.

A more recent case (1879) bearing upon this question is that of the Prince Imperial public-house, in the Rotherhithe New-road, the side frontage of which, in the Rolls-road, the Bermondsey Vestry compelled the freeholder to keep back 5 ft. from the footpath.

R. J. Dickins.

PUMPING WATER FROM ADJOINING OWNERS' PREMISES.

KNIGHT *v.* MOWLEM.

This was an ex-parte application of the plaintiffs, before Mr. Justice Chitty in the Chancery Division, for an injunction to restrain the defendants from pumping water to the detriment of plaintiffs' buildings.

Messrs. John Knight & Sons, the well-known soap manufacturers, had erected at the cost of 50,000*l.*, large soap works at Silvertown. Within the last ten days Messrs. Mowlem, the large contractors, who are about to erect some buildings immediately adjoining, have been preparing the foundations, which they are draining by means of powerful steam pumps, which are kept going night and day, Sundays included. The immediate foundation is clay, but the sub-soil is peat. The effect of the pumping is that the water is not only drawn from the defendants' foundations, but from the plaintiffs' as well, and a dangerous settlement is taking place, and the "stuff house" has already given way. Application was made to the defendants to cease their operations, but this they declined to do. In anticipation, therefore, of still further danger being incurred if the pumping was continued till Monday, the plaintiffs applied for an injunction to compel the instant stopping of the pumping.

Mr. Eimer, Q.C., and Mr. Oswald appeared for the plaintiffs.

Mr. Justice Chitty, on the authority of the case of Chasemore *v.* Richards, which decided that where water was not running in known channels it might be abstracted, refused to grant an injunction *ex parte*, but gave leave to serve notice of motion on the defendants for Tuesday last.

THE MONUMENTS IN ST. PAUL'S CATHEDRAL.

Considering the large sum about to be spent upon what some consider an unnecessary addition to the bells already existing in the Cathedral, may I not ask who is responsible for the present disgraceful condition of the noble and beautiful marble monuments there? I have personally witnessed the state these beautiful productions, from some of our finest sculptors, have been in now for the last ten or twelve months. So thickly are they covered over with dirt and dust that it would take a considerable amount of time and labour to restore them to anything like the natural colour of the marble.

R. P.

Fall of Houses at Limehouse.—About a quarter to five o'clock on Tuesday evening two houses, Nos. 20 and 22, North-street, Limehouse, which have been for a considerable time uninhabited, owing, it is said, to their dilapidated condition, suddenly fell, with a loud crash, into the street. It is stated that some children were playing inside the houses, and were also looking for firewood, when one of their number began to pull at one of the window-sashes. This suddenly gave way, and the walls and ceilings followed, burying the children and nearly suffocating them with the clouds of dust. Six children were injured by the fall of the buildings.

CHURCH-BUILDING NEWS.

Warminster.—Christ Church, which has been closed for some weeks for extensive alterations, was re-opened a few days since. The west gallery, which formerly blocked up what were considered two of the best windows of the church, has been pulled down, and the old lobbies beneath have also been taken away. The ceiling has been removed, leaving only a lofty open-timbered roof, and adding greatly to the general effect of the building. Two rows of Bath-stone arcades have been thrown up to support the edifice, making a lofty and well-proportioned nave with aisles. The chancel-arch has been elevated and embellished. The decoration of the walls is not yet complete. A sage-green dado, 6 ft. high, runs round the walls, and will be surmounted with further and more elaborate embellishments. Mr. Vialls, of London, has been the architect, and Mr. J. Gaisford, of Warminster, the contractor; Mr. John Ponton having been the sub-contractor for masonry, &c., and Mr. Grant for plastering and colouring. The carved work in wood and stone was done by Mr. Harry Hems. The beams of the roof were stained by Mr. Luke, and the seats by Mr. Edwards. Mr. R. R. White executed the gas-fitting. The church now contains about 750 sittings, of which 250, in the aisles, are set apart for children.

Edinburgh.—North Merchiston Established Church, an important addition to the ecclesiastical edifices of Edinburgh, has made rapid progress during the past six months. The building occupies a site on the Slateford-road, opposite the new Dalry Cemetery, and will accommodate 1,000 persons without galleries. It is in the Gothic style of the thirteenth century. The plan consists of a nave and side aisles, with a small transept for organ at the east end of the north aisle, adjoining which is the vestry. The principal entrance is at the other end under the tower, the base of which forms the porch, while to the west of this is placed a session-house, a hall for prayer-meetings, &c., and a beadle's house, so that the total length of the buildings fronting the Slateford-road is 197 ft. The width of the church inside is 62 ft. 6 in., and the height from the floor to the top of the ridge is 66 ft. The tower is nearly 30 ft. square, and rises to a height of 134 ft. 6 in. above the road. The richest part of the exterior is the east gable. This has massive buttresses at the angles, between which the whole space is occupied by three tall lancet windows, having clustered shafts between them and arcading on each side, while between the window-sills and the base course an arcade with clustered shafts extends across the gable. The architect of the building is Mr. John Honeyman, of Glasgow.

Letterston (Pembrokeshire).—This church was re-opened by the Archdeacon of St. David's, on the 30th ult., after considerable alterations and improvements. It was badly rebuilt some thirty years back, and nothing could be colder,—more comfortless,—than the interior prior to the execution of the recent works. The roofs have been boarded and otherwise improved, and encaustic tiles substituted for the damp stone flagging. New open pitch-pine seats have been provided in the nave, and stalls in the chancel, with reading-desks, communion-table, and altar-railing. A commodious vestry has been added, one of Porritt's warm-air apparatuses supplied, and new chancel-arch, windows, and doorways throughout are substituted. More, however, requires still to be done when funds permit. The work has been carried out by local tradesmen, from the plans and under the superintendence of Mr. E. H. Lingen-Barker, architect.

DISSENTING CHURCH-BUILDING NEWS.

Lossiemouth.—The new United Presbyterian Church, at Lossiemouth, N.B., which stands facing the sea on the higher side of the square of Branderburgh, has been opened for worship. The building is in the Gothic style, and is entirely of freestone. The principal architectural feature of the building is the front gable, surmounted by the belfry, rising to a height of about 80 ft. Each of the front angles of the building is supported by a double buttress, and on each side of the large doorway there is also a buttress, all of them surmounted by carved finials. Above the doorway there is a large window, something after the style of the Alpha window of the Elgin Cathedral. The platform at the further end of the church is ascended by a staircase on either side, enclosed by iron railings. The front of the platform is of Gothic panelling, stained and varnished, like the front of the gallery, all round. Below, and immediately in front of the platform, is a commodious choir seat, only slightly raised from the area of the church. The gallery extends all along the sides and the gable of the church in front of the platform, and is supported by iron pillars. To the rear of the church are the vestry, and a large meeting-hall. The cost of the building has been 2,020*l.* The architects are Messrs. Matthews & Mackenzies, Elgin. The contractors were:—Mason, Mr. Alexander, Buckie; carpenter, Mr. Kenneth M'Kenzie, Lossiemouth; slater, Mr. Findlay, Elgin; plumber, Mr. Gordon, Elgin; plasterer, Messrs. Brown & Munro, Elgin; painter and glazier, Mr. Ellis, Grantown; ironwork, Messrs. Seller & Co., Elgin; while Mr. James Smart was inspector of works.

Miscellanea.

Too-attractive Shop Windows. — The recent decision of the Court of Queen's Bench in the case of Manchester shopkeepers exposes an injustice which we do not think will be silently submitted to by a class which is able to make its voice heard, and which possesses not a little influence. The dealers in question were each mulcted in a fine of forty shillings, which was a trifle; but the sting of the sentence lies in the order of the judge, who bound them under a penalty of 500*l.* not to repeat the offence. In other words, he constrained them from carrying on legitimate trading in a way which has always been looked upon as being sanctioned by law. But such appears not to be the case. The local authorities, which happen to be the Manchester Corporation, by virtue of some antiquated regulations, thought fit to prosecute the dealers for seeking to arrest the attention of their customers by exhibiting in their windows attractive photographs, &c. There appears to have been nothing morally wrong in the display, the only offence being, according to the existing law, the assembling of large crowds. It is thought that these crowds might have been dispersed by proper police supervision; but instead of using the powers thus possessed, the authorities prosecuted, and successfully prosecuted, the offenders for causing an obstruction. We have no hesitation in saying that, if the law which sanctions such persecution is statute law, the sooner it is abolished or amended, the better for the community.—*Iron.*

Explosion of a Street Lamp.—At Stratford-on-Avon, on the 2nd inst., an alarming explosion of gas took place in Warwick-road, resulting in the complete destruction of the large public lamp which stood in the open space near the Red Horse bowling-green. A slight escape of gas was suspected, the lights of the lamp not being so full as usual, and in order the better to discover its whereabouts, one of the corporation gasmen was sent to make an examination of the lamp soon after the extra pressure was put on at the works. The man obtained a ladder, and opening the globe of the lamp examined the burners. The escape was considered only trifling, and thinking it was in the vicinity of the burners, new ones having lately been put in, the gasman applied a light underneath. Immediately afterwards there was a terrific explosion, the lamp being shattered, and the whole fell with a tremendous crash to the ground. The masonry was upheaved, and the paving stones around torn up and displaced. The standard was hollow, and it is supposed that a slight leakage in the supply-pipe had filled the interior of it with a mixture of gas and atmospheric air, producing the explosion when a light was applied.

Appointment.—At a meeting of the Leeds Town Council, held last week, it was decided to instruct Mr. W. Hoffman Wood, building and quantity surveyor, of Leeds, to take off the quantities for all new buildings erected by the Corporation of Leeds.

Railway History.—The Exeter newspapers for the 13th inst. contain the following obituary announcement:—December 11, at Mount Vernon, Magdalen-road, Exeter, Elizabeth Gray, aged 66 years, eldest daughter of the late Thomas Gray, the author and projector of the railway system.

Bodmin Asylum, Cornwall. — The important additions to Bodmin Asylum, which are about to be undertaken, will supply additional accommodation for 170 pauper patients. The main building will be two stories in height, and will exceed 250 ft. in length. It will contain large day-rooms and dormitories, with a proper proportion of single rooms, approached from the corridors, which will be the entire length of the building and 10 ft. in width. At one end of the structure will be an epileptic ward, shut off from the rest of the establishment, and constructed on the most approved modern principles. Attendants' rooms will be in close proximity. In central positions there will be spurs thrown out for bath and dressing rooms, lavatories, and closets. All the drains will be extra-mural and ventilated. Detached for the most part from the main building,—but connected with it and the last erected asylum block by corridors,—will be a hall to dine about 240 patients, with kitchens and offices in the rear. In front of this detached building will be the apartments of the assistant medical officers. The building will be erected and faced with an excellent freestone, quarried on the asylum grounds, and now being raised by the patients. The plans, which have been approved by the Commissioners in Lunacy and the Home Secretary, have been prepared by Mr. Norman and Messrs. Hine & Odgers, the joint architects (Plymouth) whose designs for the Carew-buildings (for private patients) were accepted in competition about eighteen years ago, and whose professional services have since been retained by the visiting justices. The new buildings will be publicly tendered for early in the coming year.

House and Police Telegraphs. — We understand a complete system of telegraphs has been introduced in the metropolis, between the nearest police or other stations and mansions, banks, public offices, and places of business of all kinds where valuables or valuable securities are kept. By this system when a house is shut up for the night, and in communication with the nearest police or other station, no one can enter the premises without giving instant notice of the same at the station. The name and number of the street being shown as distinctly to the man on duty at the station, as if he were standing before the house itself, and if necessary the exact room or part of the building wherein the attempted burglary is being made can also be indicated. The marvellous assistance which this system affords cannot fail to be recognised in the proper quarter, and we should say it only requires to be known in order to be taken up by all business men and gentlemen having valuable property at their houses, which offer inducements to the burglar and robber. This safeguard is the invention of Messrs. Francis & Co., the well-known telegraph engineers, of Hatton-garden.

Death of Sir Antonio Brady.—We regret to see the announcement of the death of Sir Antonio Brady, whose career of usefulness in the service of the public was of two kinds,—official and general; but his labours have assumed a greater prominence since he ceased to serve the State in an official capacity. He assisted in preserving a considerable portion of Victoria Park from the inroads of bricks and mortar; and he subsequently threw all his energy into the movement for preserving Epping Forest to the use of the public. He was announced to read a paper on Wednesday, at the Brighton Health Congress, on the prevention of smoke in fireplaces.

Borough Engineer, Newcastle.—At the last meeting of the Town Council the business was the election of a Borough Engineer and Town Surveyor, the following being a list of the selected candidates and the amount of salary asked for by each:—Garrett J. Barry, Liverpool, in private practice, 800*l.*; Ernest Benedict, resident engineer, London and South-Western Railway, 900*l.*; J. Bartwright, Borough Engineer of Bury, 700*l.*; R. Davidson, Sheffield, Borough Surveyor and Engineer of Sheffield, 1,000*l.*; James Hart, St. Helen's, Borough Engineer and Surveyor of St. Helen's, 750*l.*; Albert Latham, Margate, Borough Engineer and Surveyor of Margate, 900*l.*; W. George Laws, Newcastle, in private practice, 600*l.* Ultimately Mr. Laws was elected.

Value of Land in the City.—No 50, Eastcheap, containing 1,685 superficial feet, was let by auction by Messrs. Philip Tuckett & Co., of 10A, Old Broad-street, on Wednesday last, on a building-lease for eighty years, at a ground-rent of 1,200*l.* per annum.

Prize-gainers, Royal Academy.—The principal prize-winners were Mr. Samuel Melton Fisher, Gold Medals and Travelling Studentship (200*l.*), for historical painting; Mr. Bryan Hook, Turner Gold Medal and Scholarship (50*l.*), for landscape; Mr. Oscar Alexander Junck, Gold Medal and Travelling Studentship (200*l.*), for composition in sculpture; Mr. James Howard Ince, Gold Medal and Travelling Studentship (200*l.*), for a design in architecture; Miss Margaret Hickson, the Creswick Prize (30*l.*), for landscape; Mr. Henry Marriott Paget, prize (40*l.*), for a design for the decoration of a portion of a public building; Mr. Maurice W. Griffenhagen, first Armitage Prize (30*l.*); Mr. T. C. Sirrell Benham, first prize (50*l.*), for a set of six drawings of a figure from the life; and the following silver medallists, who stood first in various competitions:—Mr. Horace B. Fisher (two medals), Mr. John Ernest Breun (two medals), Mr. Bernard Evans Ward, Miss Theodora Joan Noyes (medal and prize), Miss Susan Ruth Canton, Mr. David John Wade (medal and first prize), and Mr. W. B. Bassett-Smith.

The Society of Engineers.—The twenty-seventh annual general meeting of the members of the Society of Engineers was held on Monday evening last, the 12th inst., in the Society's Hall, Victoria-street, Westminster. The chair was occupied by Mr. Jabez Church, vice-president. The following gentlemen were balloted for and duly elected as council and officers for the ensuing year, viz.:—As president, Mr. Jabez Church; as vice-presidents, Mr. F. E. Duckham, Mr. Arthur Rigg, and Mr. W. Schönheyder; as ordinary members of council, Mr. R. Berridge, Mr. S. Cutler, Mr. C. Gandon, Mr. C. J. Light, Mr. Perry F. Nursey, Mr. Heber Duckham, Mr. A. F. Phillips, and Mr. Arthur T. Walmisley, the three last-named gentlemen being new members of the council; as honorary secretary and treasurer, Mr. Alfred Williams; and, as auditor, Mr. W. H. Bennett.

Ashburnham House.—The following memorial, signed by Sir Henry Cole, Mr. William Morris, Mr. H. S. Milman (director of the Society of Antiquaries), Mr. J. L. Pearson, R.A. (architect at Westminster Abbey), Mr. F. C. Penrose, and others, was presented to the Governors of Westminster School by the Dean of Westminster: "On behalf of a meeting of gentlemen interested in the preservation of Ashburnham House and of the ancient remains on its site, and earnestly desirous that no encroachment should be made on the ground closely adjacent to the Abbey Church of Westminster, we venture to request that the Governing Body of Westminster School will not come to any decision adverse to the proposal about to be made by the Dean and Chapter, until they have received and heard a deputation from such meeting on the subject."

Ventilation.—Since the last meeting of the United Grand Lodge, important improvements have been made in the ventilation of the Temple, the Board-room, the De Grey, the Zetland, and the whole of the rooms in which the various lodges are held. The ventilation improvement works have been carried out by the Sanitary Engineering and Ventilation Company, of Victoria-street, Westminster, who have applied their "Imperial" ventilating-tubes and "Imperial" exhaust ventilators, under the direction of Bro. John Gibson, F.R.I.B.A. We are told that it has given general satisfaction.

Cost of Wood Paving in Chelsea.—At the last meeting of the Chelsea Vestry, the Surveyor presented a report showing that the total cost of the Fulham-road wood paving from Thistle-grove to Stamford-bridge, was as follows:—Total amount expended for labour, plant, materials, new gullies, and sundry works, 5,691*l.* 12*s.* 11*d.*; area of work executed, 10,573 yards superficial; the actual *net cost* of the wood pavement (after deducting the new gullies, and the value of the old materials carted away) amounts to 9*s.* 5*d.* per yard superficial.

Selenitic Cement. — The *Boston* (Mass.) *Journal* of November 23rd states that the American company for carrying out General Scott's well-known patent has received a gold medal at the Fourteenth Triennial Exhibition of the Massachusetts Charitable Mechanic Association at Boston.

Bagshot Church Competition. — H.R.H. the Duke of Connaught has been pleased to accept the design submitted by Messrs. Bromilow & Cheers, of Liverpool, for his church to be erected in Bagshot Park.

The Royal Academy.—At a general assembly held on the 8th inst., Mr. Peter Graham, Associate, was elected a full Academician. At the close of the President's address to the students on the 10th inst., elsewhere noticed, the students adjourned to the Antique School, and there presented the Keeper with a testimonial, in the shape of three silver salvers, and an address, which ran as follows:—"To F. R. Pickersgill, Esq., R.A., Keeper of the Royal Academy of Arts.—Sir, We, the past and present students of the Royal Academy of Arts, desire most respectfully to offer this testimonial to you, as a mark of our full appreciation of your valuable teaching, and the unvarying kindness that you have always shown to us as students of the school during the time you have so worthily held the office of Keeper. We sincerely trust that you may long remain among us, and we rest assured that both we and those that follow will alike reap the benefits of your valuable counsel and advice for many years to come."

A Norwegian Peasant, rejoicing in the sonorous name of Ola Samsonsön Midnäs, has, it is said, invented a new system of propelling vessels which dispenses with manual labour, sails, or steam power. The inventor has constructed almost without assistance a small vessel, which, according to a recently published account, was at Bergen. The general principle of the system is said to be the utilisation of the column of water which the weight of the vessel forces through an opening made to receive it, but the details have, it is stated, been kept a secret by the inventor.

Testing Traps.—We have received from Mr. Emptage a reply to Mr. Davies, but do not think it necessary to print it. We must also decline to print five other letters on the same subject; the affair has degenerated into a squabble.

TENDERS

For the erection of proposed new school at Binstead-road, Buckland, Portsmouth, for the Portsmouth School Board. Mr. A. H. Bone, architect. Quantities supplied by Mr. H. P. Foster:—

G. Longley, Worth, Sussex	£9,979	0	0

The late G. E. Street, R.A.

ALL our readers will have heard, and all will have heard with great regret, of the sudden and unexpected death of Mr. Street, at the comparatively early age of fifty-seven, and just when he seemed to be at the zenith of his professional success, and was looking forward soon to witness the completion of the greatest work of his life, and the most important English building since the Houses of Parliament. Unexpected his death may be called; for though he had been very ill a short time previously, and the necessity for complete rest and relief from responsibility for a considerable time had become quite obvious as a condition of his recovery, we had had the assurance since then of his friends' belief in his having rallied from his previous attack, and in the prospect of his complete recovery with time, rest, and the change of climate which he had decided on. But this was not to be.

He had experienced a stroke of paralysis on November the 19th, which had given the first warning that his powers had been overtaxed. This was succeeded on Thursday, the 15th of this month, by a more serious recurrence of the same calamity, from the effects of which he did not recover, and which terminated in his decease at his house in Cavendish-place, on the night of Sunday last. His plans had been laid for leaving England for Egypt, in search of rest and recruited health, on the Friday before the day which proved to be his last.

Mr. Street was born at Woodford, in Essex, June 20th, 1824, the third son of his parents, Thomas and Mary Anne Street. In March, 1841, he commenced his professional studies as articled pupil to Mr. Owen B. Carter, architect, of Winchester. In April, 1844, he entered the celebrated studio of Gothic architecture, as it might well be called, in Spring-gardens, and soon drew the attention of Scott as an assistant of unusual ability and promise, and was selected to give special assistance to his principal in the preparation of some of his most important designs. Sir G. Scott gave special testimony in regard to the high value he then set on Mr. Street's assistance, on the occasion of the presentation of the Institute Gold Medal to the latter a few years ago. In 1848 he left Spring-gardens to enter practice on his own account at Wantage. On his appointment as architect to the Oxford Diocesan Commissioners in 1858, he removed his residence to Oxford, and in the same year was married to Mariquita, the daughter of Mr. Robert Procter, of Geys House, near Maidenhead. In 1856 he removed to London, settling, in the first instance, at 33, Montague-place; and in 1863 removed to 5, Russell-square, where he practised till 1870, thus occupying for a considerable time a neighbourhood which has been a favourite one with architects and other artists. Thence he removed to the house which he inhabited till his death, at 14, Cavendish-place. In 1876, having lost his first wife some time previously, he married again, his second wife being Jessie Mary Anne, daughter of Mr. William Holland, whom he had the great and trying misfortune to lose two months after their marriage, and, if we remember rightly, while they were still on their wedding tour,—a calamity which, it may be feared, laid the first foundation of the ultimate breaking up of his formerly robust health and strength. Some other dates in his professional career may also be noted here. It was in 1868 that he received the appointment of architect to the Law Courts, after the great professional competition which excited so much attention at the time, both within and without the ranks of the specially architectural world. Two years previously, in 1866, he had been elected an Associate of the Royal Academy, and in 1871 was elected to its full privileges as R.A. On the death of Mr. E. M. Barry, now nearly two years ago, he succeeded that gentleman as Treasurer of the Academy and as its Professor of Architecture, although he was only once or twice spoken of in our columns as "Professor" Street, this being his own desire, as expressed in a letter to us, on the ground that he did not wish the title to stick to him. He had filled the post of Vice-President at the Institute of Architects, at the meetings of which, however, he for a long period did not take any prominent place, partly, it may be presumed, from his constant professional employment and consequent want of time, and partly, we believe we shall not be incorrect in saying, from the fact that he did not find the architectural tone and tendencies of that body altogether what he was in sympathy with. On the institution there of the new arrangements for regulating the succession to the Presidential chair, he, in fact, withdrew from the Council and from his technical right to the succession, thinking, as we also did, that the policy thus instituted was a mistake. The feeling, however, of a considerable number of members was that the architect who had confessedly attained the most eminent position in the profession should be solicited to preside over the leading professional body. After a rather strenuous skirmish between his supporters and those of the new code, which will be fresh in the memory of all concerned, and which in some of its features we think was to be deplored, he was elected by a majority, and read his opening address as President at the first meeting of the present session, which was listened to with much sympathy by one of the most crowded professional audiences ever assembled in the rooms of the Institute. Without, as we have implied, entirely sympathising with all that was done and said on the occasion of what may be called the Battle of the Chair, we were of opinion that his election was the right step to take in the main, that it was due to the remarkable position he had achieved, and that it was calculated to infuse new life into the proceedings of the Institute and give a fresh impetus to it; and many even of those who took the opposite side at the moment will feel that his death at this juncture is a heavy loss to the Institute of Architects.

The place which Mr. Street filled in connexion with the modern Gothic revival was one which was only second to that of Sir G. G. Scott. His earliest works were in Cornwall, at Biscovey and other places in the county, and Hadley Church, Essex, may also be mentioned, which was built in 1844. Buildings by him are now to be found, it may be said, all over England, as well as in Scotland and Ireland, and in many parts of the Continent. Churches from his design are in existence in Constantinople, Rome, Genoa, Lausanne, Vevay, and Mürren. One of his churches in Rome was for the American congregation there, for with Americans his reputation stood very high indeed, and another church from his designs for the American colony in Paris (no insignificant one), is just now being commenced. We append at the close of this article a list of his principal works in various localities. We may add here the following list of works by him of which illustrations will be found in various volumes of this journal:—

Memorial Church at Constantinople, second premiated design, vol. xv., pp. 162, 183.
Cathedral at Lille, second premiated design, vol. xvi., p. 81.
Church, Parsonage-house, and Schools (All Saints'), Boyne-hill, Berks, vol. xviii., p. 769.
Church of St. James-the-Less, Westminster: exterior vol. xix., p. 411; interior, vol. xx., p. 187.
Monument to Major Hodson, Lichfield Cathedral, vol. xx., p. 45.
Law Courts, competition design, vol. xxv., pp. 113, 645.
Law Courts, plan of Court Floor, as determined for execution, vol. xxviii., p. 666.
Church, St. Peter's, Bournemouth, vol. xxviii., p. 1,027.
Law Courts, Strand front, vol. xxix., p. 947.
Reredos, Carlisle Cathedral, vol. xxxii., p. 1,011.
Church, Episcopal American, Rome, vol. xxxiv., p. 1,096.
New nave, Bristol Cathedral, vol. xxxvi., p. 14.
Bench-ends, Dunster Church, vol. xxxvi., p. 726.
Reredos, York Minster, vol. xxxviii., p. 357.

One of the first buildings by Mr. Street which was much talked of and contributed to bring his name as an architect into general repute was the church of St. James the Less, a comparatively small work, which evinced the results of much study of detail, and perhaps attracted attention the more on account of its exhibiting hints taken from the study of Italian brick architecture into which Mr. Street had gone largely some little time before, when on the tour of which the publication of his work on "Brick and Marble Architecture in Italy" was one of the results. There were not wanting, indeed, those who objected to the infusion into English church architecture of features borrowed from or suggested by Italian Gothic, certainly a more mixed and less complete style, as Mr. Street himself observed in his book, than that of Gothic north of the Alps. Mr. Street, however, held

always in theory, and carried out in practice, the idea that all forms of Gothic architecture were worth study, and contributed valuable suggestions to the architect, and it was about this time, and probably in reference to some of these criticisms that he addressed to the conductor of this journal a letter (dated January 1st, 1858), the following extract from which may be of interest as furnishing his own expression of his views on this subject:—

"No one who has examined the brickwork of Germany and Italy, would doubt that the latter is in all respects the best, whilst it is at least equally Gothic in its character. To me it appears that an architect ought to be allowed to see this without being charged with being desirous to impert Italian architecture into England. We do not trouble ourselves as to the origin of anything that is really good and artistic. If it come from Venice, well; if from Lincoln, so much the better; but, at all events, and above all things, it is essential that we should trouble ourselves to be artists and not mere antiquaries. The hold which Gothic art is rapidly obtaining in this country is the result of the resolute endeavour which has been made to effect this. The new museum at Oxford is not so free from Italian influence as Mr. Parker may desire, but all of us must admit that it is singularly attractive nevertheless; and unquestionably Mr. Scott would be throwing away his best chance of securing for himself a name in the future history of art, if he allowed himself to be debarred from following in the same direction.

I believe that we, who assert that there are lessons to be learnt in Italy and all parts of France, are not one whit less really devoted to our national style than is a gentleman who would limit our foreign studies to a portion only, and that far from the best portion, of the latter country.—George Edmund Street."

It may be observed, however, that the rather marked tendency towards the employment of forms suggested by Italian Gothic, which was exhibited in the building in question, and which was a not unnatural result of his having given special study to that form of architecture shortly before, did not continue to characterise his work to any very great extent, and he soon returned to his natural predilection for the taste and genius of Northern Gothic.

The Gothic style which Mr. Street developed in his buildings was, however, unquestionably largely influenced by a preference for French rather than for English models. The solidity of character, and the sparing use of ornament, which belongs to early French Gothic, had a peculiar charm for him; and his tendency to rely upon solidity and mass in his architecture, and simplicity of detail, seems to have increased as his work went on. He appears to have more and more acted upon the theory that reticence in the employment of ornament, even if carried to the extent of producing a somewhat stern expression, was an infinitely preferable extreme to that of over-decoration. In his lectures on architecture, delivered at the Royal Academy, he decidedly and emphatically urged this view of architectural design, insisting that the very first quality required to produce good architecture was the expression of solidity and endurance in a building, and that only when that was fully considered and attained was it time to enter upon the question of ornament. All his buildings, from a very early period of his practice, exemplify this theory of the conditions of good architectural design. In all of them there is to be remarked the entire absence of anything like flimsiness or flagree, the obvious desire to produce, above all things, solid, substantial, and dignified building. With this quality in his work we are in entire sympathy. His best churches stand as monuments of solid architectural work, in which many of the finest qualities of Mediæval architecture are reproduced with a success which no other modern architect has equalled. They are more notable in this respect than even the modern Gothic of Scott, because they are less actually imitative, and present examples of reproduction of the true spirit of ancient Gothic, rather of its mere outward forms; so that in comparing them with many examples of ancient English Gothic, we might even say, in a sense, that they are essentially more Gothic than Gothic architecture itself always was. Considering how much ornament has been crowded into many modern buildings, in London more particularly, regardless of the conditions and effects of London atmosphere, the Law Courts themselves stand as a remarkable example of reticence in this respect. There can hardly be said to be any ornament that is architecturally superfluous in them; some parts of the building, indeed, rather err in the contrary direction, for which it is possible that Government ideas as to economy are, to some extent, responsible. But, on the other hand, he attached the greatest importance to one source of architectural effect,—that produced by mouldings; the source of effect, which a recent theoretical writer on architecture has generalised under the title, "the modelling of surfaces." Referring to this in his lectures, he stated, very truly, that there was hardly any more decisive distinction between good and bad architecture than that furnished by the style and character of the mouldings. Illustrating the importance of this in his own practice, we are told, on good authority, that in the case of the Law Courts alone he designed with his own hand about 3,000 different profiles of mouldings. Indeed, the personal supervision extended to the details of that immense building, was, we believe, far greater than was generally supposed, or even thought possible by the public or by his professional compeers.

The greatest architectural successes of Mr. Street, however, were in our judgment exemplified in his treatment of ordinary-sized churches rather than of the largest buildings. He had a peculiar power in rendering comparatively small churches dignified and impressive, more particularly in their interior effect. Notable instances of this are to be found in his St. Margaret's Church, at Liverpool, and in All Saints, Clifton. The former gives the impression externally of a small and unpretending church; it has no tower, only a *flèche*, which adds to this unpretending expression; but the appearance of space and dignity in the interior is surprising. All Saints, Clifton, which is really a large church, has the defect externally of hardly looking as large as it is; a defect which would perhaps be less felt if the tower and spire were completed, which are still wanting. But the interior is very fine and spacious in effect. This church was an early example of an experiment, which has occasionally been tried since, of making the main body of the church in one span, and reducing the aisles to a mere passage, securing the effect of the arcade while keeping all the congregation within it, so that no pier anywhere interposes between them and the clergy. The result was not practically as successful as it might have been, as the space between the piers and the outer wall is somewhat too cramped to allow of commodious passage, and the external treatment of the roofing of the aisle, in a series of rather low heavy gablets abutting against the main wall above the piers, is not very picturesque, though the internal effect, as a piece of effect, is remarkably good. With all drawbacks, however, it was a bold and, in its intention, a thoroughly practical idea, and one which it is to be regretted has not been more worked out as a means of rendering the Mediæval form of church more practically adapted to congregational worship.

In the treatment of revived Mediæval architecture, Mr. Street had the good fortune to enjoy one opportunity such as rarely indeed falls to the lot of a modern architect. This was the actual completion of an unfinished Mediæval cathedral, that of Bristol. We call it an unusual piece of good fortune, not only in view of the exceptional interest in such a piece of work, and the repute necessarily attaching to its successful achievement, but because in carrying out such a commission all the critical questions which may be raised as to the suitability of the revival of Gothic as a modern style may be entirely thrown on one side. The commission is to complete in its own style a building which has never been finished, and the architect can indulge fully his sentiment in favour of Gothic architecture without the slightest misgiving on the part of any one as to whether the indulgence is made at the expense of architectural logic and fitness. In carrying out the nave of Bristol Cathedral, Mr. Street obtained a real triumph in the mastery of the power of reproducing Mediæval architecture. Sir G. Scott observed, on the occasion we have before referred to (the presentation of the Gold Medal to Mr. Street), that at an early period of Mr. Street's career his acquaintance with Gothic architectural detail was so complete, that he himself had on one occasion mistaken for original Mediæval work details which had been carried out under Mr. Street's direction some time before. Such a power of assimilation found at least a perfectly legitimate opportunity in the completion of Bristol Cathedral, and except in the fresh appearance of the stone, it would really be difficult to trace any discrepancy of style or manner between the old and the new portion. We regard this as perhaps the most thoroughly successful thing which Mr. Street has accomplished.

This is hardly the time to express any definite opinion about the largest of his works,—the Law Courts,—especially as it is not yet finished, and has not had time to pass the practical test arising from continued use and occupation. Readers of the *Builder* are, however, aware that we never did regard the design, when first published, as fulfilling what might be expected from so important an architectural opportunity, though we fully recognise the fine and powerful character of a great deal of the detail. We must leave the building, however, to the verdict of Time. One thing we may say here,—that those who were present when the architect did the honours of the building to the members of the Architectural Conference, and who may have regarded Mr. Street as an architect aiming at the picturesque of architecture rather than at considerations of plan and arrangement, must have been surprised to hear, in his address on the occasion, so much evidence of the consideration which had been given to the arrangement of the internal planning and the separation and communication of the various departments as required, and the general practical and common-sense tone of the whole address; and if the building should not be successful in regard to its internal convenience, about which we have no sufficient data for a conclusion as yet, it will at any rate not have failed from any intended indifference to practical considerations on the part of its architect. The plan carried out is not the plan we were forced to take exception to when reviewing the design.

The literary portions of Mr. Street's contributions to architectural study is mainly represented by his book on "Brick and Marble Architecture in Italy," published in 1855, and "Some Account of Gothic architecture in Spain," published in 1865. The first-named book dealt with a subject which was then much less familiar to English Architects than it is now, and had a considerable influence in developing architectural taste in that direction in England, possibly a little too much so: but the book is exceedingly well done and the illustrations admirably selected and executed. The work on Spanish architecture which is much larger and more elaborate, has not attracted so much general attention as the interest of the subject and the amount of information and the number of beautiful illustrations it contains might well have acquired for it. In his preface Mr. Street said, "I feel that I have undertaken almost more than an artist like myself, always at work, has any right to suppose he can properly accomplish in the little spare time he can command. Nevertheless, I have always felt that part of the duty which every artist owes to his mother art is to study her developments wherever they may be seen, and whenever he can find the opportunity. Moreover, I believe that in this age it is only by the largest kind of study and range of observation that any artist can hope to perfect himself in so complex and difficult an art as architecture, and that it is only by studying the development of Gothic architecture in all countries that we can form a true and fair estimate of the marvellous force of the artistic impulse which wrought such wonders all over Europe in the twelfth, thirteenth, fourteenth, and fifteenth centuries." It certainly was a most spirited undertaking for so hard-working a professional man to form the design of thus illustrating what is almost an unstudied field of Gothic architecture, as a holiday task in the intervals of business; but this is not the only example that those who do most and work hardest are always those who can manage to do a little more, and certainly the book shows no signs of any undue haste, and is a most important and valuable contribution to architectural literature. Mr. Street's Royal Academy lectures, which were all printed in full in our columns, were among the best professional lectures that have been delivered at the Academy, and showed, as we observed at the time, a catholicity of tone which might not have been expected from his known strong predilections in favour of one school of architecture.

Mr. Street was probably one of the most indefatigable workers ever known in the architectural profession. It is asserted by those who knew him that there was hardly an ancient building of note or importance in Europe which he had not measured and sketched, in whole or in part. He was a splendid draughtsman, and his works were generally illustrated at the Royal Academy by perspective drawings made with his own hand, in the free style of drawing with the pen for which he was noted. We do not mention this as if it were a very peculiar

merit for an architect to illustrate his works with his own drawings,—on the contrary, we hold that there is far more of deputy draughtsmanship than there ought to be in such cases; but it is an exceptional merit, as the present general practice goes. On the occasions when Mr. Street took part in debates on architectural subjects at the Institute of Architects, his remarks were always noticeable for their plain, straightforward, and common-sense tone; he said what he had to say briefly and to the point, without any superfluous words.

From a correspondent who worked a good deal with Mr. Street, we receive some interesting particulars as to his manner of conducting his work. He had generally in his office two or three able draughtsmen (some of whom have since become distinguished architects on their own account), trained under his own eye, and accustomed to carry out what was conveyed in his own carefully-considered but rather roughly-executed pencil work. He drew and figured a plan, a section, principal elevations, with one bay of each expressed distinctly, and with some details sketched to a larger scale as guides to "inking in," and these were completed by his leading draughtsmen, or, in the simpler parts, by the juniors, under their care. He gave details also sketched to a scale of 1 in. or so to the foot with the contract drawings, but in carrying these out full size, he almost invariably altered them in some respects from the form in which they were drawn out in pencil by his draughtsmen, as he said sometimes, "not that *your* work is necessarily bad, but that it must be *mine*." A builder, restoring a church, waited for some full-sized details of mouldings, which were worked out quickly for him in the office, and brought up for Mr. Street's inspection, when, as the contractor said, "he changed them all in shape, drawing all *in* that Mr. —— had drawn *out*, and all *out* that he had drawn *in*." His rapidity was astonishing, and his command of hand for large curves for metalwork and the like, equally so; as, however quickly done, they could generally be followed with the pen implicitly. A clergyman whose church he was restoring having written for details that did not arrive, called at Cavendish-place, and came down from Mr. Street's room in an hour or so with a large roll of papers under his arm, and a triumphant smile, saying, "I have got them all!" When preparing for his usual autumnal run abroad, the quantity of work he put out of hand to be dealt with during his absence was amazing, and at all times his work might be called *ceaseless*, save when sleeping; for even when entertaining friends he went in the evening into his studio, having the doors open from the drawing-room, telling his guests, "You know where to find me." His management of mouldings was supremely good, and probably none, ancient or modern, can exceed those to be found in his carefully-studied church work. He varied his pier-cap mouldings, for instance, in most of his larger churches, drawing them within the same dimension lines on one sheet, and preserving the same character through all, so that it is only on examination in the executed work that you find how beautifully varied they are. His experience and natural shrewdness made him a valuable adviser on points of professional practice, and he had a humour, often very caustic, which one could not help sympathising with. Being asked one day by a brother architect what he advised in a case where a client (on the strength of the Westminster Palace decision against Mr. E. M. Barry) peremptorily claimed possession, as of right, of the drawings for a public building raised at his cost, he replied, "that depends on what sort of a man your client is, and whether you have any expectation of further commissions from him."

As to construction, he was more accustomed to trust to massiveness than to science for security. In restoration, no man could be more conscientious; never disturbing what could be well retained, never altering what had to be taken down and rebuilt, or departing from the spirit of his original where the work was necessarily new, and *specifying* old stone-work not to have the lichens disturbed.

Besides his appointment as architect to the diocese of Oxford (which was bestowed on him through the influence of Bishop Wilberforce, with whom he maintained a warm friendship, which was only closed by the death of the Bishop), Mr. Street also subsequently filled the same post in the dioceses of York, Ripon, and Winchester. He was a Fellow of the Society of Antiquaries, and a member of the Imperial and Royal Academy of Arts at Vienna, and a Knight of the Legion of Honour.

Mr. Street's funeral was to have taken place on this Friday, the 23rd inst., at Holmbury, near Dorking, where he had built for himself the beginnings of an unfinished country house, and where he had built also a church at his own expense. Everything had been arranged, we understand, under the direction of his executor, Mr. Wells, the well-known Royal Academician, but the Dean of Westminster has since sanctioned the interment of his remains in Westminster Abbey, and the funeral will take place on Thursday next, the 29th inst.

In thus briefly reviewing his life and work, we feel that this is not the time to enter into any consideration how far Mr. Street's views and practice as to the all-sufficiency of a revival of Mediæval architecture were or were not in accordance with the genuine requirements of modern architecture. That we have our own views on that subject, and that they are not entirely in accordance with his, our readers will will have no difficulty in understanding. But Mr. Street started in his professional life under the auspices of an enthusiasm for revived Gothic, and it is from that standpoint, and in reference to his own ideal, that his work must, in one sense at least, be judged. His merit, and his claim to the position that he earned, is that he spared no pains in perfecting his own ideal of architecture, and that whatever he did, he did with all his might.*

The following is a list of some of Mr. Street's works:—

Churches.

Kingstone, Dorset.
St. Mary, Holmbury.
Boyne-hill Church and Almshouses.
St. John the Divine, Kensington.
St. James the Less, Garden-street.
St. Mary Magdalene, Paddington.
St. Saviour's, Eastbourne.
St. John's, Torquay.
Long Ditton Church.
American Church in Rome.
English Church in Rome (now building).
English Churches in Genoa, Constantinople, Lausanne, Mürren, Vevay.
All Saints', Clifton.
Toddington.
Garrison Chapel, Portsmouth.
Pylingdales.
New Pitsligo.
St. Margaret's, Liverpool.
Tinsley.
Muirhead.
St. Mary, Southampton.
Speenhamland.
Church for Americans Paris, now just being begun.
Helperthorpe, Kirby, Grindalythe, Thixendale, Fimber, and many others, for Sir Tatton Sykes.
Buterofct, Ellon, Llandulas, Swinton, Eltham, Milarow, &c.
St. Philip and St. James, Oxford.
Summertown, Oxford.

The most noteworthy Ecclesiastical Buildings.

Bristol Cathedral, nave and western towers.
Dublin, Christ Church Cathedral and Synod House.

Some Restorations.

Bere Regis, Thornhill, Melksham.
York Minster, south transept.
Works in Carlisle Cathedral and Fratry.
St. Peter's, Bournemouth.
Works at Salisbury Cathedral.
High Wycombe Church.
St. Peter's Mancroft, Norwich.
Hythe Church, South Hayling, Kettering, Tettenhall, Henbury, Luton.
Jesus College, Oxford.
St. Luke's, Lower Norwood.
Wheatley, Welchpool, Guildfield, East Harptrees.
Wellington Barracks Chapel.
Kirby Underdale, Kirby Wiske, Kirkby Overblow, Sledmere, Charleywood.
St. George's, Bloomsbury.
Farlington, Tamworth, Thirsk, Barnsley, Bignor, Hagley, Hadley, Claybrooke, Colmere, Clun, Great Dufficld, Kildare Cathedral, Monmouth, Oswestry.
St. Martin's, Leicester; St. Margaret's, Leicester.
Yatton, Dunster, Thurgoland, Backwell, Weatherthorpe, Speen, Monkland, Gresford, Aston Abbott's.
St. Michael's, Penkivel, &c.

Buildings other than Churches.

Theological College, Cuddesdon; St. Margaret's Convent, East Grinstead.
Vicarages:—Kingstone, Dorset; East Heslerton; Chapel Allerton; Melksham, &c.
Rectories:—Wigan, &c.
Duncombe House and Chapel.
Haddo House.
Grwych Castle, private chapel.
Luton Hoo, private chapel.
Longmead, Bishopstoke.
House in Cadogan-square.
Holmdale (near Dorking).
School buildings at Uppingham, Marlborough, and Bloxham.
Master's house at Winchester.
Schools at Wigan, Eaton Town, and Wantage.
Home at Wantage.
Dundee House of Mercy.
Parsonage, Erle Stoke.
Many other schools, houses, and vicarages.
Royal Courts of Justice.

* A portrait of the subject of our memoir will be found in vol. xxvii. (1869) of the *Builder*, p. 706.

THE LATE MR. DECIMUS BURTON.

WE regret to record the death of an old and eminent member of the architectural profession, Mr. Decimus Burton, F.R.S., F.S.A., which took place on the 14th instant, at his residence, No. 1, Gloucester Houses, at the mature age of eighty-one.

Mr. Burton, although he had been practically for fifteen years past a retired member of the profession, and owing to his advanced age, had of late years been little seen amongst his professional brethren, was well known to many, and was, by all who had the advantage and pleasure of meeting or associating with him, respected as a straightforward and high-principled professional man, and in society as a cultivated gentleman.

Born in the year 1800, he received a good practical education in the office of his father, Mr. James Burton, who was well known sixty years ago as one of the most active and enterprising of London builders, and afterwards as the founder of the town of St. Leonards-on-Sea. Mr. D. Barton completed his professional education in the office of Mr. George Maddox.

Mr. Burton received, when quite a young man, important commissions, and found himself, before he had completed his twenty-fourth year, in the full tide of professional work. He was scarcely twenty-three when he was commissioned by Mr. Horner to build the Colosseum in the Regent's Park, a building which, although as a panorama and a place of entertainment a failure, was regarded as involving the architectural feat of throwing an unsupported dome, a few feet larger than that of St. Paul's over the whole building,—a success. It has since been pulled down, and its place, which knows it no more, has been made the basis of a more profitable investment in the shape of the terrace of private residences forming Cambridge-gate.

Mr. Burton was in the year 1825 commissioned by the Government to carry out the Hyde Park improvements, which comprised the laying out of the roads, and the design and erection of the façade and triumphal arch at Hyde Park-corner.

The arch was intended to form the principal entrance to Buckingham Palace; but the alterations subsequently effected in the approaches have left the arch in what appears to be a comparatively unmeaning, although a still effective, position.

It is the frequent fate of architects to undergo many and sore disappointments in the alteration or incomplete fulfilment, and sometimes the mutilation, of their cherished designs. One of the hardest trials Mr. Decimus Burton had to bear was the disfigurement of his arch by the imposition of a colossal equestrian statue of the Duke of Wellington, and that too, placed, contrary to all classical precedent, across, instead of parallel with, the roadway spanned by the arch.

In vain did Mr. Burton protest against the disfigurement of his beautiful edifice, urging upon the authorities that the arch, if it was to be treated as a pedestal, was not properly proportioned to the statue, or, having regard to the character of the latter, in harmony with it; that the group originally designed for the surmount was a *quadriga*, the car, with its four horses, forming a pyramidal group proportioned to the whole structure. In vain did Viscount Canning write in his official capacity from the Office of Woods and Forests to the then Duke of Rutland, the chairman of the committee of subscribers to the Wellington Memorial, on the 15th of May, 1846,—"It is my duty to state to your Grace that the remonstrances which reach her Majesty's Government against the proposed appropriation of the arch are so many and so strong; the representations of its architect, Mr. Burton, in the same sense, are so earnest; and the opinion of every other eminent architect, artist, or competent authority who has been consulted on the subject is so decided, that her Majesty's Government feel called upon, not only to make a final effort to induce the subscribers to reconsider the subject of placing the statue on the site at present proposed, but to do all that lies in their power to facilitate a change in the design." And he proceeded to propose that the statue should be erected upon a suitable pedestal of its own elsewhere (other sites being suggested), Parliament defraying any increased cost of the change. All was to no purpose; the arch had, so to speak, been engaged to the statue seven years before by Lord Melbourne, the Minister of the day, and the alliance was ratified by his successor: subscribers had sub-

scribed their money, and the statue had been bought on the faith of its being engaged to Mr. Burton's unhappy arch, and the customs of a strictly constitutional country did not permit of the engagement being repudiated. The opinion as to the unfortunate effect of the result, in the minds of those who had any sense of the architectural and artistic fitness of things, is well indicated in an anecdote which, if not true, is at least *ben trovato*, of a French general officer, who, after contemplating the arch and statue for some time, was overheard to say to himself, "Nous sommes vengés!" It may be added that any idea of removing the statue from its unsuitable position would have been rendered impossible during the life-time of the Duke of Wellington by his own strong opposition to any such proposal. The duke's sense of artistic propriety was not strong, and his feeling probably was that where the nation had decreed to place a statue in honour of him, there it ought to remain. Of Mr. Burton's own strong feeling in the matter, he gave a remarkable practical proof in the fact that for many years afterwards, if we are rightly informed, he made provision for the payment to the nation, out of his personal estate, of 2,000*l.*, if they would accede to the removal of the statue from its unsuitable position; but seeing little prospect of his hope being fulfilled during the present century, he before his death withdrew the legacy, cherishing, however, to his dying day the hope that the nation, when it should return to, or develop, its artistic senses, would remove the Wellington statue elsewhere, planting it on a fitting pedestal of its own, and carry out the *quadriga* and bas-reliefs to complete the work according to his original design. We know not whether it is of any use still to express the hope that this may be done eventually, in justice to a man who held a distinguished place among English architects in his own day, and in the furtherance of architectural art and the removal of an absurdity which is still the subject of constant satire. Much cannot, however, be hoped in a country in which it has just been considered suitable to adorn the site of the Egyptian "needle" with a couple of modern sphinxes placed, contrary to all architectural precedent and meaning, with their noses to the central object and their posteriors displayed to the spectators approaching in either direction along the only route of approach.

Greek architecture was in Mr. Burton's time the order (or the "Orders") of the day, and formed his model mainly, though the Constitution Hill arch is, of course, a Roman type of erection. He did not, however, in his buildings for practical purposes, affect massive temple-like structures with heavy porticos and light-obscuring columns, but gave to his works graceful and refined elevations, and provided ample openings for light and air; and though such provision be nothing more than the common-sense of architecture, he must be given the credit of having attended to this at a period when many architects ignored it; and we consider that the criticisms which have been elsewhere made as to the want of practical character in his domestic buildings, are, considering all the circumstances and the taste of the time in which he worked, unjust and uncalled for.

Mr. Burton's public works would probably have been far more numerous and important had he not been early tempted by the offer of Mr. John Ward, of Tunbridge Wells, from whom he accepted a special retainer to lay out for him the Calverley Park Estate. This engagement occupied most of his time for some years; and this break, coupled perhaps with his disinclination to work much for the representatives of a public which had already suffered one of his best architectural works to be marred, tended to divert him into the quieter field of house-building for noblemen and gentlemen, in which he much distinguished himself. The mansions, villas, and cottages designed by him were numerous, and were characterised by good internal arrangement combined with external simplicity and purity of style.

Mr. Burton had for several years before his death retired from the active pursuit of his profession, and in 1869 finally relinquished it. He was much attached to St. Leonards-on-Sea, where he had a pleasant bachelor's cottage. Latterly he had been in failing health for some months, but it was not until some seven weeks before his death that his friends had special cause for anxiety. His physical powers then gradually failed, and he breathed his last on the 14th of December, without pain or suffering; a quiet decease which seemed in happy accordance with a life during which he had been known as amiable, considerate, and gentle to all.

Mr. Burton made, when travelling was not so common as it is now, a lengthened tour in Italy and Greece, visiting and carefully studying the ancient buildings and remains in those classic regions; and at a later date he made a visit to Canada and the United States. He was a Fellow of the Royal Society and of other learned bodies, and was one of the earliest Fellows of the Royal Institute of British Architects, of which also he had been a vice-president.

The death of Mr. Burton occurring almost simultaneously with that of Mr. Street brings into significant contrast the characteristics of two successive epochs of modern English architecture, and the extraordinary rapidity with which the pendulum of architectural taste in this country has swung from one extreme to another. Mr. Burton's long life has only just terminated, and yet the method of architecture which he practised during a long professional career is already like a vanished dream. Of the men who are most prominently and strenuously engaged in architectural practice at this moment, there are probably few who would not be disposed to regard Mr. Burton's architecture as hardly worth recollecting; Mr. Street himself would probably have scouted all reference to it, as exemplifying the work of a period of architectural imbecility. There is no pretence for saying that Mr. Burton, as a leading representative of his period, evinced anything like that extraordinary enthusiasm, force of character, and power in dealing with architecture from his own point of view, which have made Mr. Street's career such a remarkable one. But if we consider how highly in his own day he was esteemed, and how completely right his view of architectural art was considered to be by a large following of clients, many of them men of high education and culture, it certainly may be said that his career suggests matter for serious reflection, on the part of those who, with perhaps more enthusiasm and genius, are now nevertheless carrying out other revivals of past styles of architecture, with, in many cases, much less consideration for the really practical objects of architecture than he evinced. Are they sure that in the lapse of another generation of men their own favourite revived phase of architecture may not appear as *passé* to their successors as Burton's architecture now appears to some of them?

Dropping this consideration as one not unworthy of being followed out to practical ends, we conclude by appending a list of Mr. Decimus Burton's principal executed works:—

1822-24. Cheshunt, residence, additions, &c.—Mr. Joseph S. Jessopp.
1822 23. Brighton, villa.—Mr. H. Fauntleroy.
1823 26. Holyrood, mansion, &c.—Mr. John Ward.
1825 55. Tunbridge Wells, Calverley improvements.—Mr. John Ward.
1822-24. Regent's Park, Grove House and offices.—Mr. G. B. Greenhough.
1822-27. Regent's Park, the Colosseum.—Mr. Thos. Horner.
1822-25. Leatherhead, Elm Bank, additions.—Captain Stanley Clarke.
1822 48. Pall-mall East, house and warerooms.—Messrs. Hebbert & Co.
1823 25. Baston House, Kent, additions.—Mr. Samuel N. Ward.
1824-44. Molesey, Surrey, additions; Stokes Bay, Marine Villa.—Rt. Hon. J. W. Croker.
1826 27. Pall-mall East, houses and shops.—Sir H. F. Cooke.
1827. Mitchells, Tunbridge Wells, villa.—Mr. C. H. Okey, Mr. John Carruthers.
1826. Abersychan Iron Works, the designs.—The Company.
1827. Liverpool, mansion, the designs.—Mr. Joseph B. Yates.
1826-41. Zoological Society, London, buildings and gardens.—The Society.
1829-30 Tunbridge Wells, Great Culverden House.—Mr. J. Jeddere Fisher.
1829. Bath, Public Baths Improvement, report.—Corration.
1828-30. Tunbridge Wells, Calverley Park, villas, &c., d signs.—Messrs. Bramah.
1825 46. Hyde Park, general improvements; lodges at Cumberland, Grosvenor, Chesterfield, Hyde Park-corner (façade), and Prince of Wales Gates; archway on Constitution-hill; improvements and lodge in Birdcage Walk; guards' store and Westminster Mews; the railing and piers, Buckingham Palace.—H.M. Commissioners of Woods, Works, &c.
1828-31. Carlton House-terrace, mansion.—Lord de Clifford.
1828-32. Carlton House-terrace, mansion.—Lord Stuart de Rothesay.
1829. Beckenham, villa residence.—Mr. B. Oakley.
1827. Harrow, two houses.—General Macgregor.
1828-31. London, Royal Naval Club.—The Club.
1827 30. London, Athenæum Club House.—The Club.
1830-32. London, warehouse, &c.—Messrs. Gilpin & Co.
1832 33. Regent's Park, Holford House.—Mr. James Holford.
1831-33. London, Charing-cross Hospital.—The Governors.
1831 32. Sevenoaks, Rectory House.—Rev. Thomas Curteis.
1831-32. Pain's Hill, Surrey, additions, &c.—Mr. W. H. Cooper.
1830 34. Clifford's Inn, improvements.—The Society.
1830. Park Hatch, Surrey, conservatory, &c.—Mr. Joseph Goodman.
1831. Stock Grove, Beds, additions.—Col. Hanmer.
1833. Holland House, restorations.—Lord Holland.
1830. Pall Mall, alterations of residence.—Mr. John Kirkland.
1829 31. Mabledon, Kent.—Mr. John Deacon.
1831 32. Ramsgate, East Cliff House, additions, &c.—Sir Moses Montefiore.
1829-34 Southborough, Kent, church.—Mr. John Deacon.
1831 31. St. Martin's Place.—Royal Society of Literature.
1832-33.—Benthall Hill, Kent, house and offices.—Mr. Arthur Pott.
1833. Worth Park, Sussex, additions, &c.—Mr. Montefiore.
1837-48. Chatsworth, palm-house, home farm, &c.; Chiswick, lodges and gates; alterations, &c., at Grove House; Corney House, Sutton Court; Devonshire House, portico, hall, staircase.—Duke of Devonshire.
1831-3?. Penshurst, Kent, the Grove.—Mr. Allnutt.
1831 35. Bury Hill, Surrey, additions, &c.—Mr. Charles Barclay.
1832 30. Penbury, Kent, Spring Grove.—Mr. A. B. Reiver.
1837-31. Riverhead, Kent, church.—The Trustees.
1831 32. Whitehall Gardens, additions.—Mr. Cuthbert Ellison.
1832-37. Regent's Park, St. Dunstan's Villa.—Marquis of Hertford.
1831-34. Combe Wood, house and offices.—Mr. W. C. Hunt.
1835-38. Vere, Somersetshire, additions, &c.—Sir W. Medycott, bart.
1830 31. Regent's Park, St. John's Lodge, additions, &c.—Sir J. L. Goldsmid, bart.
1831-38. Broomhill, Kent, house and offices.—Mr. David Salomon.
1831-38. Burswood, house and offices.—Mr David Salomon.
1834-37. Oaklands, Sussex, house and offices.—Mr. Hercules Sharpe.
1838-40. Blackheath, Kent, house and offices.—Mr. James Traill.
1836-38. Blackhurst, Kent, house and offices.—Mr. Ford Wilson.
1845. Bellevue, Tunbridge Wells, house, &c.—Mr. Aretas Akers.
1838 44. The Hooke, Sussex, additions, &c.—Mr. R. W. Blencowe.
1858-60. Bineham, Sussex, mansion and offices.—Mr. John Blencowe.
1839 41. Woodhayes, Surrey, additions, &c.—Mr. Wm. Brown.
1847-48. Bury Hill, observatory.—Mr. A. K. Barclay.
1845-46. Harrow, boarding-house.—The Committee.
1855-56. Hyams, Surrey, additions and alterations.—Hon. Mr. Seymour Bathurst.
1855-58. Sennowe, Norfolk, additions and alterations.—Trustees under the Court of Chancery.
1841 45. Stapleton Palace, near Bristol, additions and alterations.—Ecclesiastical Commissioners of England.
1834-35. Glevering Hall, Suffolk, additions, &c.—Mr. A. Archdeckon.
1834-35. Derby House, near Liverpool, building estate,—Mr. R. A. Barton.
1835-40. Eastbourne, building estate, a villa.—Earl of Burlington.
1839-40. Belgrave-square, additions.—Earl of Burlington.
1835 37. Kennington, near Canterbury, additions to residence.—Dr. Carter.
1835-36. Holland's, near Tunbridge Wells, villa.—Rev. H. Cholmondeley.
1838-39. Harrow, Middlesex, residence.—Rev. J. W. Colenso.
1838 39. Club Chambers, Regent street.—The Association.
1837 39. Trinity Church, Eastbourne.—The Committee.
1834-35. Great Brick Hill, rectory house.—Rev. H. Poulis.
1838 40. Flimwell, Kent, church.—The Trustees.
1837-38 Putney Park, additions to mansion.—Mr. R. Hutton, M.P.
1839 50. Grimstone Park, Yorkshire, mansion and offices.—Lord Howden.
1839-40. Kelvinside, near Glasgow, building estate.—Mr. M. Montgomerie.
1835-36. Grosvenor-street, additions to residence.—Duchess of Roxburgh and Col. O'Reilly.
1839-40. Greenstead, Essex, parsonage.—Rev. P. W. Ray.
1830. Wolstone, Bucks, parsonage.—Rev. Dr. Butler.
1835-4?. Coghurst, Sussex, mansion and offices.—Mr. Musgrave Brisco.
1839-61. Stanwick Park, Yorkshire, additions, &c.; Syon, river terrace, ornamental dairy, &c.—Lord Prudhoe, afterwards Duke of Northumberland
1844. Stokes Bay, villa.—Lord Ashburton.
1843-50. Queenstown, Cove of Cork, improvements, seawall.—Viscount Middleton.
1840-59. Royal Botanic Gardens, Regent's Park.—The Society.
1835-43. Fleetwood, new town, church, hotel, lighthouse, &c.—Sir H. Fleetwood, bart.
1845-59. Bournemouth, new town.—Sir G. T. Gervis, bart., and Trustees.
1836-38. Goring, Sussex, parish church.—Mr. David Lyon.
1843. Folkestone, building estate.—Earl of Radnor.
1841-50. Union Club, London, additions, &c.—The Club.
1842-60. United Service Club, London, additions, &c.—The Club.
1842-52. Junior United Service Club, London, alterations.—The Club.
1853-58. Beswood, Berks, additions, alterations, &c.—Mr. J. Walter, M.P.
1834-49. Dublin, Phœnix Park Improvements.—Her Majesty's Commissioners of Woods, &c.
1844-66. Kew Royal Botanic Gardens' Improvements, Palm House, Winter Garden, &c.—Her Majesty's Commissioners of Woods and Works.
1840 49. Paris, Ambassador's House, improvements, &c.—Her Majesty's Commissioners of Works, &c.
1852-55. Belmore, Sussex, additions, &c.—Miss Dealtry.
1855-57. East Retford, Free Grammar Schools.—The Trustees.
1841-42. 18, Hyde Park Gardens, residence.—Mr. Drummond.

1841-43. Hayden Hill, Bushey, Herts.—Mr. T. G. Fournereau.
1845-46. Hill of Howth, building estate. — Earl of Howth.
1845-46. Harrow, head master's house.—The Governors.
1842-43. Hemingford, Huntingdonshire, house and offices. —Rev. J. Linton.
1849-53. Church, Launceston, restoration.—Church Building Society.
1845-47. Whipp's Cross, house and offices.—Mr. J. Masterman, jun.
1849-51. Bradford Peverell, Dorset, church.—Mr. H. N. Middleton.
1850-54. Bradford Peverell, house and offices.—Mr. H. N. Middleton
1853-54. Great Stanhope-street, additions, &c.—Mr. A. Mitchell.
1857-58. Finchampstead, Berks, house and offices.—Rev. T. Mozley.
1852-54. Oriental Club, London, additions, &c.—The Club.
1853-54. Calstock, Cornwall, Rectory House.—Rev. C. L. Pemberton.

ABOUT THEATRES AND CHURCHES.

THE terrible catastrophe at Vienna impels us once again to raise the voice of warning as to our own negligence,—we fear, increasing negligence,—in the provision of due exits from our public buildings. We did so, our readers may remember, on the occasion of the last general election; and very serious injuries were reported, within a few days after our warning, as occurring to well-known individuals, in consequence of the absence of proper arrangements for this purpose. We have now the accounts, daily increasing in the estimates which they give of the loss of life by this last fatal occurrence, of which it may certainly be said that if fire slew its units, panic slew its hundreds. The slaughter effected is as much as that of a great battle; and the proportion of deaths to wounds very far more than in any battle of modern times. But we cannot but remember that even this frightful slaughter is far less than that which took place in a church in South America. And while it is well that a thorough investigation should be made of the condition of our theatres, both as to construction and as to the readiness for use of all those appliances which a wise forethought has provided for service in case of fire, we must reiterate the advice to take some similar precautions in the case of our churches. Year after year they become more numerous, as well as more densely filled. Year after year are they more luxuriously warmed, more dazzlingly lighted, and, in but too many cases, so carefully guarded against draught that the wise architectural rules of the old Roman and Gothic builders are wholly disregarded, and ancient doors are even walled up without any substitute being provided. In new churches the same utter disregard of the first requisite of a public building, provision for the safety of its inmates, is to be found. We called attention, as yet without effect, to one example, that of a church built within the last few years in a country town with many elements of architectural excellence and beauty; served by devoted clergy, filled by numerous and munificent congregations, and yet in which the main exit at the north-west corner of the building is marked by the combination of almost every fault that can deform this part of a public edifice,—doors opening inwards, two doors opening into one vestibule, from which there is only one door of exit, and steps downwards, both into the vestibule and from the outer door of the church. In addition to this accident-trap there are only a north door of moderate size, and two or three very small doors used for the purposes of the clergy and attendants of the church. There can be no doubt that, in the event of a panic, from which no gas-lighted building is safe, the consequences here would be most disastrous; and yet benevolent and well-meaning people are content to go on raising funds for the adornment of the church, paying no heed to the loud warnings which are given to them, by such an occurrence as that at Vienna, of its utter unsafety. Is it necessary now to recall attention to the fact how apt a source of panic, and even of disaster, is a copious illumination by gas?

One of our correspondents discusses, in a thoughtful manner, the necessity for providing against panic, as well as against danger. The method which he suggests is to provide tiers of open galleries outside the main walls of the building, each gallery being of sufficient area to contain all the occupants of that stage of the theatre. Broad staircases, apparently intended to be external, would descend from these galleries into the street. The idea is not without merit. But the large addition that it would make to the non-paying area of the ground covered by the theatre would prove a very strong obstacle to the adoption of the plan.

But why are we so slow to follow in principle the wise, and we may almost say perfect, arrangements of those great builders from whom we have derived almost all that we know of architectural theory? In Rome, especially in the Imperial times, public amusement was one of the chief subjects of the study of the statesman. The call which he made on the architect to provide a stage and an auditorium for great exhibitions was responded to by the very genius of architecture herself. Let the student climb the deserted steps of the great amphitheatres at Capua, at Pozzuoli, at Pompeii, or on other Italian sites, and ask himself what arrangements can be more perfect. It is, no doubt, true that the requirements of the modern theatre are necessarily different from those of either the amphitheatres or the theatres of Imperial times. Of that class of building which suits the exigencies of modern opera or drama we have no classical example, and that for the good reason that the method of the performances is entirely different from that which prevailed on the Greek or the Roman stage. Palladio, indeed, built a theatre at Venice, and Serlio built one at Vicenza, according to the principles of Vitruvius; and towards the close of his life the former architect built the Teatro Olympico at Vicenza, which still exists, being at once the finest and the best of its race as a classical theatre in modern Europe. With these exceptions we cannot trace one existing theatre, or those which they represent, further back than the first quarter of the seventeenth century. The theatre of the Hôtel de Bourgoyne was famous in Paris about 1620, and was rebuilt, with tiers of boxes, in 1645. The theatre of the Palais Royal was built by Richelieu in 1639, and the horseshoe form was first given to the auditorium by Fontana, in 1675, in a theatre which he built in Rome.

The consideration which led modern architects to depart from the admirable simplicity and beauty of the amphitheatrical arrangement was, that in the modern drama, which is not intoned, but spoken, and in which prose is for the most part used instead of metrical verse, it is necessary to bring the furthest auditors within range of the audibility of the human voice, and even of the female voice. Again, with the disuse of the strongly-accentuated mask, and the other appliances by which the Greek drama was able to affect spectators at a considerable distance from the stage, it became necessary to bring the most distant spectators within such a distance of the actors as to allow the play of their features to be distinctly visible. In the common Punch's show of our streets we find a survival of the classic drama. It is evident that a human Punch, furnished with an appropriate mask, might perform his well-known pranks, aided by his instrumental squeak, on a stage in such a manner as to tell on an immense audience. On the other hand, and at the very opposite extremity of the scale, we can cite the Policinello Theatre at Naples, which we conceive to be probably the smallest public permanent theatre in Europe. Stalls, boxes, pit, are all of the most miniature description; and the largest possible audience is so small, that the performance is repeated twice in the day. But in this wonderful little cockleshell, the art of pantomime has reached its very acme. The pantomime of the principal performer, Policinello, or Punch, who wears a loose white linen blouse and trousers, and a mask over his forehead and the upper part of his face, is so magical as to affect the spectators to the highest degree, so that the little den, fetid as it becomes in the course of the performance, is,—or at least was in the Bourbon days,—a favourite resort of the royalty as well as the nobility of the Two Sicilies. The play of features on the exposed part of the face of the actor was such as it would be idle to attempt to describe. Here the connexion between a very small theatre and a perfect actor, of his class, was intimate and essential.

The limit of distance at which the practice of the theatrical architect has usually halted in Europe has been from 50 ft. to 70 ft. The theatre at Marseilles has a distance of 76 ft., and that of Versailles of 77 ft., from the curtain to the back of the boxes; but the noble theatre at Bordeaux has only 70 ft., which is also the distance in our own theatre of Drury Lane. This regards dramatic theatres. For lyric theatres the range is wider, reaching up to 100 ft. in the San Carlo Opera-house at Naples, and to 105 ft. in La Scala Theatre at Milan. Taking, then, this extreme range of, say, 66 ft. to 100 ft. for the two kinds of theatres, the arrangement of boxes tier above tier becomes a necessity,—the height being only limited by the angle at which the performers become so foreshortened as to be out of true vision.

Thus far the architecture of the modern theatre has been a natural growth; whether it provides three tiers of boxes, as at Versailles, or seven, as at La Scala. But here comes in a point which, so far as we are aware, has never yet been adequately grasped by any architect or architectural writer.

If we look at the sections of any modern theatre, the building divides itself into two main parts of almost equal dimensions, to which all the other arrangements are subsidiary. These are, of course, the stage and the auditorium. But if we look at the section of an amphitheatre we see three equally important parts,—of which the stage, indeed, is generally the smallest. But the provision for the exit and entrance of the people is as conspicuous as, and occupies as much if not more space than, the auditorium itself. Thus, in a building as vast as the Colosseum, the time of from 100 to 140 seconds was sufficient to empty it altogether, and as crush was impossible, panic was deprived of its terror.

Whether this wise and beneficient arrangement sprang directly from the brain of the great architects, or to some extent wrought itself out from the other conditions of the amphitheatre, it is unnecessary now to discuss. What is important is, first the fact, and secondly the truth, that the precaution has been absolutely neglected in the modern theatres. We do not say that care has not been given to entrances, staircases, corridors, or the like. But we say that that balanced compensation for thickening crowds which is present in all the amphitheatres of which we have any knowledge is wholly absent in the modern theatre.

The reader will see at once what we mean when he reflects that the amphitheatre presents the frustum of an inverted cone, enclosed in a tower. The modern theatre presents two concentric towers, — or rather one tower, with interior landings, divisions, and staircases. In the amphitheatre the largest number of persons that could be contained in equal vertical heights was that which sat on the topmost six or seven steps of the ring. For these an external corridor, separated by a wall thickening as it descended from the auditorium, gave ample space for circulation. Rapidly as the people could pour out from the numerous gangways between the *cunei*, there was in every instance room for them all in their own corridor. But in the corridor below, answering to the next eight or ten steps of the conch, there was not only the width of the top corridor, but the additional width of 10 ft. or 12 ft. due to the contraction of the cone. And thus, however fast the people poured from above, even had the flow been like that of water itself, there was no heading back, no stoppage. The only thing necessary to care for to prevent this was equally to increase the number of staircases from story to story. The corridors, which of course, became not widened so much as multiplied, as they descended, were each always ample to accommodate not only their own population, but that of all the superior zones.

Of this admirable self-compensation for thickening crowds there is not a vestige in the modern theatre. We do not, of course, pretend to say that in planning corridors and staircases the architect has taken no heed of the number of persons that they were to serve. But there is no evidence in any section of a great theatre with which we are acquainted, from La Scala to the New Opera-house at Paris, of the presence of the idea that it might be necessary to prevent the heading back of a madly precipitant crowd. On the contrary, the outer wall containing the corridor is as vertical as the inner wall. Serial escape is thus alone possible, unless the accommodation be immensely in excess on the top story, in which, it must be remembered, the position of the gallery in most theatres accumulates the class of people likely most madly to suffer from panic, and that in the most overpowering numbers. We cannot but conclude that modern theatre-builders, from Fontana downwards, have neglected one of the most subtle and important rules acted on by the Roman builders.

It may be said that to carry out the dictates of absolute prudence in this case would involve

the giving a conical or pyramidal form to the outside of the building. To the structural proportion of auditorium and exit it would no doubt give such a form. If you wish to produce the economy of room, which was given by the inverted cone in the tower, it can only be done by the use under modern arrangements of the upright cone without the tower. But there is no reason why the outer walls of the building should be conical, or, rather, stepped; although there is reason for the successive widening of the corridors. Rooms available for many purposes might be built over the receding galleries. If the great principle of absolute safety from crowding were once accepted, other details would fall into place.

We say nothing here of those great *salles des pas perdus*, and the like, which are daily assuming more importance in modern theatres, forming almost a third part of the structure. All with which we are now concerned is absolute safety of exit. We have seen how that was assured by the Roman builders. We have seen how it has been lost sight of, at all events as a self-regulating feature of the building, by their successors. And we commend the consideration of the subject to those whom it so closely concerns. In a building on one plane, all that is demanded for safety is an adequate supply of doors. In a building on many planes, the exigencies of each plane become the more serious, the more stories rise above it from the ground.

Nor is it less important to provide for the structural separation of auditorium and exit. This ought to be such that while free egress from the one to the other is practicable, there should be a substantial barrier against fire. This the use of sheet-iron doors renders easily practicable. In the amphitheatre this security was attained by the small size of the gangways, and the thickness of the wall which was required for the support of the stepped seats, increasing as that did in thickness with every row. No doors appear to have been fixed to these gangways. Nor were they requisite. Curtains were no doubt hung over the apertures into the corridor, which would answer the only end for which doors would be otherwise needed, the prevention of draught. And we have personally little doubt that the thick-padded curtain which usually falls over the ever-open wickets in the doors of the great Italian churches, is a survival of the kind of curtain thus used in the Roman theatres.

If we contrast this simple and effective separation of the auditorium and the exit galleries in the Roman theatres, with the flimsy backs that divide the boxes of our opera-houses and theatres from the corridors which give access to them, we cannot fail to be struck with the difference in the matter of safety, in the event of fire. Of all instances that occur to memory, that of La Scala, at Milan, is the most reprehensible in this respect. We cannot, indeed, speak positively as to the structure of the back of the boxes here, although long habit of attendance in our own box at the San Carlo Theatre, at Naples, induces us to think that no true structural division exists at Milan. But to the greater number of the boxes in La Scala a small *salon* or cabinet is attached, not immediately, but on the opposite side of the passage. Thus the outer case of the auditorium is not so much the horse-shoe form of the back of the boxes, as the rectangular form of the back of the *salons*; the corridor, or passage, forming a mere pathway between the two rooms. Thus, in case of any great fiery catastrophe, such as an explosion of gas, or a storm of flame such as enwrapped the Vienna Theatre, the corridor, or mode of escape, would be involved in the same destruction as the auditorium; and escape would be rendered impossible. We think that after this essential requisite for the safety of a theatre has thus plainly been pointed out, any architect who neglects to provide for it will undergo the gravest responsibility. But further than that, we think there should be legislative interference to prevent the construction or use of buildings intended for public occupation without due heed to the principle of safety.

Of course it would be competent to the architect who desired to prevent the widening or multiplication of corridors with each tier of descent to accomplish the same object by supplying each corridor with its own pair or two pairs of staircases, independent of those below. But in this case no access into these staircases should be allowed from any lower corridor. Each set of stairs should be rigidly restricted to the service of its own floor. In the amphitheatre the stairs are in proportion to the width or number of the parallel corridors. It might, perhaps, prove more accordant with the turret form of the auditorium to multiply external staircases, rather than to multiply concentric corridors, each furnished with its own means of ascent or descent. That is a matter of detail which will form a feature in any future designs, according to the genius of the architect. We refer to it as showing a mode in which the great aim of safety can be carried out, without attempting to put any limit on the freedom of design. What is essential, in our opinion absolutely essential, is this.

While entrance to a church, theatre, or other public building, may be conveniently allowed by the use of an appropriate number of small doors, each admitting only one or two persons at a time, it is essential to safety that exit should be afforded by an adequate number of large doors, opening outwards, and all of equal width with the aisles or corridors that lead to them. The stately western doors of some of the great cathedrals were not matter of pomp alone. In fact, the occasions on which they were so used must have been rare, as the clergy usually entered in procession from the chapter-house, or some room for assembly on the south of the church, through a south door west of the chancel. But not only were these large doors (never obstructed by those inner vestibule and baize-covered doors now required to guard our congregations from the west wind) noble architectural features of the building, but they possessed a special value in any case of emergency or alarm. By throwing wide open, as is generally done at the close of a solemn service on a *festa*, all the doors of a cathedral, exit is afforded for the worshippers in a very brief space of time. Nor shall we be entitled to be regarded as a people whose boasted regard for human life is strong enough to induce us to take a little trouble when danger is not visibly before us, if we do not take stringest measures to ensure such a visitation of all our great buildings, religious or secular, as shall ascertain which of them are, and which are not, duly provided with ample means of exit.

For buildings on one floor the rule is simple enough; and it is not one of the least valuable features in the modern movement for the restoring and building of churches that the clumsy expedient of the gallery is more and more disused. But when galleries are allowed in churches, and tiers of boxes and galleries in theatres, the inflexible rule that each plane occupied must have its own adequate and independent exit, with the flow of persons from which no flow from any other plane or story can mix or interfere, should be made imperative.

We need hardly add that the provision of an iron curtain, shutter, or pair of strong doors, to shut off the stage from the auditorium, should be imperative in every theatre. It may be said that this proved useless at Vienna. It would be more correct to say that this expedient, though provided, was not used there. Why not, we shall probably never know, but it is probable that all those whose duty it was to act lost their presence of mind at the critical moment. But this brings us to another point, without attention to which we have ample and reiterated proofs that the best provision for safety usually proves inoperative. Provisions for safety can rarely be made self-acting. At this moment we can only recall one, architecturally speaking, which is so, and that is the mode of exit from the amphitheatre which we have above described. The human element comes in, if it be but to turn a tap or to move a lever; and when suddenly called on to act, nine men out of ten, or more likely ninety-nine out of a hundred, lose their heads. If this hesitation be only for a few seconds, the mischief may be irremediable. It is of no use to lament; such is human nature, or rather, such has human nature become under the influence of civilisation. We do not fancy that the hardy warriors of Pepin or Charlemagne would have allowed themselves to be destroyed by the cause, whatever it was, that led to the destruction of the Ring Theatre.

Even in military sentinels we should place little reliance, unless they were men actually trained in the exigencies of war under the fire of the enemy. But there remains an expedient which we think might be adopted with admirable results. We are not aware whether it is at this moment in force in the Royal Navy. But in times when the Commodore of the Tagus or the Mediterranean Squadron hoisted his flag on a wooden three-decker it certainly was. At prescribed intervals,—that is to say, so many times in such a period of time,—but at utterly irregular and unexpected moments, it was the duty of the Captain of each of her Majesty's vessels to give a sudden alarm, to pipe his men to quarters, and to put his ship in such trim as would be required for instant combat; and a register was bound to be kept of the date of each use of this precaution, of the time occupied in getting all taut, and thus of the efficiency of the crew. Such a precaution would be as useful in case of alarm from fire as in that of sudden surprise by an armed enemy. In the case of a church or theatre the plan could be only partially carried out, as public opinion would resent its application during a service or a performance. But apart from this, if it were the duty of some official,—let us say an officer specially appointed by the Insurance Companies, under the sanction of a special short Act of Parliament,—to give the alarm of fire at some unexpected moment at every public building at least once in every year, and to note with what alacrity doors were opened, shutters closed, taps turned on, or any other well-designed safeguards called into instant and effective action, more would probably be done to preserve human life from the most terrible and sudden end than by any other method that we can imagine. Nor is it only to England that we address this counsel. We trust to hear it echoed from France, Germany, America. It is worth the careful attention of the civilised world, or at least of all those visitants of churches or of theatres who object to being burned alive.

PUBLIC SAFETY IN THEATRES.*

The burnings of theatres, whether in France or abroad, when frequently numerous victims perish, have always had the melancholy privilege of profoundly moving public opinion. The frequency of these terrible disasters appears to show, of itself, the insufficiency of the precautions taken to secure general safety. On the other hand, the inquiries undertaken on the occurrence of every disaster illustrate the necessity of increasing the proper means of preventing, or, at least, of diminishing, new dangers. It appears, moreover, from the figures of a curious statistical table, that the average life of a theatre before it is destroyed by fire does not exceed 43 years.

By fits and starts administrative commissions have been charged with the examination of various questions connected with the measures of security applicable to theatres; but until of late no complete study of the subject has been made.

Wishes have been expressed, some experiments made, but in the end no important modification has been effected in the old rules. In fact, the police supervision of theatres in Paris is to-day conducted in accordance with orders framed in 1828, slightly enlarged in 1864 and 1868, by supplementary regulations now recognised as being incomplete.

As to provincial theatres, they are generally still worse cared for. Not only do the regulations as regards precautions against fires leave much more to be desired than those of Paris, but the greater part of the rules which have been laid down are less frequently observed. In short, permanent supervision is far from being exercised with so much vigilance as in Parisian theatres.

Such was the situation when the news arrived of the catastrophe at Nice, the terrible consequences of which immediately revived the apprehensions of the public by exciting them to the highest pitch.

It is under the influence of this general feeling which was re-enforced by the recent disaster to the theatre at Montpellier that a new inquiry into the measure respecting the general security in the theatres of Paris, was ordered by M. Andrieux, then Préfet de Police, with a view of revising and completing previous regulations by putting them into harmony with the progress made in recent years.

The interesting studies of the commission named by M. Andrieux have served as the basis of the proposed new regulations with regard to the supervision of theatres, the moving circumstances of which are set forth with great precision in the report submitted by the Prefect of Police to the President of the Council, Minister of Public Instruction and Fine Arts.

In this report, which is remarkable for its

* Extracts translated from *Le Génie Civil*, November, 1881, which includes some diagrams.

precision and lucidity, the various questions relative to the security of the spectators and the persons employed in theatres are discussed *seriatim*, and are clearly summed up in a series of regulations to be observed by the proprietors or directors of theatres.

At the outset M. Andrieux is to be congratulated on his resolution to treat the question as a whole. It is impossible to effect any real improvement by any mere modification of the old regulations. On the other hand, it will not do to begin everything afresh. To attain the desired end it is essential that the new regulations should fulfil as nearly as possible the conditions required, and above all that these regulations should be capable of practical application. Now if the general spirit of the *ordonnance* of the 16th of May, 1881, correctly responds to the legitimate demands of the public, it is to be feared that the enforcement of its provisions does not produce all the good that might be expected from it.

Two principal observations appear to us to result from the attentive study of M. Andrieux's report: the first is that several clauses of the new law would only remedy imperfectly the dangers which they are intended to prevent; the second is that with regard to other clauses he has not taken sufficient account of the great difficulties which would result from their application. In concluding his report to the President of the Council, M. Andrieux shows, among other things, that the difficulties to which we here allude had not entirely escaped his observation. He justly foresees that the alterations and important works desired to be made to the various Parisian theatres will encounter considerable opposition. He trusts, however, to find the necessary support to overcome interested resistance in the force of public opinion. This support will not be wanting to M. Andrieux, nor to his successor, if, as we hope, the latter persists energetically in endeavouring to carry out the indispensable improvements long since called for in the public interest.

In the analysis of M. Andrieux's report, to which we are about to allude, we shall not make ourselves the advocate of the proprietors and directors of theatres. Our aim, on the contrary, is to assist as far as we can the municipal authorities by pointing out the new measures which are desirable, as well as by modifying or restricting, with a view to a practical solution of the question, such as appear to us as utopian or would interfere with the practical working of a theatre.

Having thus defined the scope of our inquiry, we now proceed to pass in review the different questions discussed in the report of the Prefect of the Seine, following the order adopted by M. Andrieux, and accompanying each of the principal points with comments which their examination has suggested to us.

The *ordonnance* of the 16th of May, 1881, has a threefold object:—

1. To guard as far as possible against danger from fire.

2. To secure in the case of fire prompt and sufficient assistance.

3. To render as rapid as possible the emptying of the theatre.

Under the first head come measures for the prevention of fire, the construction, and position; under the second head, regulations with regard to the fire brigade; and, under the third, those having for their object the improvement of the means of exit in order to facilitate the departure of the spectators and the persons engaged in theatres.

Construction.

The isolation of theatrical buildings is admitted in principle. The separation of the whole of the theatre from the neighbouring houses should be obtained by a passage-way around it of, at least, three mètres (10 ft.) in width. As this measure cannot be insisted on in the case of old theatres, it is proposed that an independent wall (*contre-mur*) of brick shall be added to existing buildings in order to protect the party-walls from danger from fire.

It is further proposed that the three great divisions of the theatre, auditorium, stage, and administrative buildings, shall be separated by thick walls. It is further proposed to prohibit in any portion of the auditorium any workshops or store-rooms, in order to keep away from that part of the building used by the public everything that might serve as fuel for fire.

Finally, the erection of firemen's balconies in the highest part of the stage is recommended to allow the firemen to obtain complete command over this part of the house, and to make their escape in the event of danger. All this is excellent, but with the exception of the independent wall and the firemen's balconies, it is at once seen that the above recommendations can only apply to theatres to be built in the future.

Wherever a theatre is placed between houses, and the case is unhappily very frequent in Paris, it is clear that we cannot obtain the passage around recommended, because this isolated maximum of three mètres (10 ft.) in width could only be obtained by encroaching on the space (always too scanty) for the work of the theatre, and still less could it be obtained at the expense of the adjoining houses except by their compulsory purchase.

There remains, then, only the independent brick wall, which would be sufficient to preserve the party-walls, but which would not hinder the fire from spreading by means of the roof. At the time of the fire in the great theatre at Rouen, the higher stories of all the neighbouring houses were destroyed by the fire, which was communicated by means of the roofs. This danger would be greatly diminished, as we believe, by requiring in certain cases the raising above the roof of the lateral party-walls in such a manner that they should exceed the height of the highest portions of the roof of the theatre.

In the majority of the Parisian theatres the premises belonging to the three departments into which the theatre is divided are intermixed, instead of being distributed in different separate buildings. The separation of the departments by thick walls cannot, therefore, now be effected without interfering with the whole of the building. For the same reason it will probably be very difficult to obtain the transfer of the store-rooms or workshops near the *salle* to another part of the theatre, where the other offices are already too cramped. As regards the firemen's balconies, these should be placed outside of the stage; on the inside the corridors and bridges for the scenery serve the same purpose. The access to these should be made more convenient.

With regard to existing theatres, it does not appear to us at all possible to lay down any general rules. The only means of effecting any serious tangible improvement of the actual state of things is that indicated in the report, viz., to form a commission, composed of competent men, who should be empowered to make a careful and special investigation on the spot of each theatre, and afterwards to require the rigorous execution of all works which shall be specified, and are recognised as being practicable, care being taken that they are completely carried out.

As regards regulations for the construction of new theatres, their scope should, we think, be much more extended than those which are indicated in the law of the 16th of May. We cannot enter here into details as to these technicalities, which would involve us in explanations too long for the pages of a review.

Reserving for future consideration these special measures, we shall limit ourselves for the present to the following points as being necessary, viz.:—

1. Isolation, as complete as possible, of the theatre from the neighbouring houses.

2. The exclusive employment of brick for the construction of all interior walls.

3. The exclusive employment of iron for the construction of the floors, roofs, and of the framework (*ossature*) of all decorative work.

The roof should be of metal, or of slates secured on to the rafters by copper hooks, or galvanised iron.

All the openings in the proscenium should be provided with doors of solid sheet-iron, in such a manner as to permit of the isolation from the fire of the adjoining premises.

Scenic machinery should be constructed entirely of iron.

Covering in plaster of all the interior surfaces of the roofs, as well as all the small parts where wood has been necessarily used.

The establishment of a fire brigade in the immediate neighbourhood of the stage, &c.

Iron Curtain.

According to the prescriptions of the 16th of May, "the opening between the stage and the auditorium shall be closed by an iron curtain, which, being suspended by combustible cords, shall fall automatically in case of fire, and shall have counterweights to regulate its descent." The curtain here referred to exists already in nearly all the theatres in Paris. It is composed of an iron frame, divided into triangles by iron laths, and filled in with a trellis of iron wire. The usefulness of an iron curtain so constructed has been much contested.

Many persons, ourselves amongst the number, think that it does not fulfil its object, inasmuch as it does not oppose any serious obstacle to the spread of fire from the stage to the auditorium. Not only, we believe, would the bearers and the uprights on which the scenery is fixed, easily tear in their fall so feeble a trellis; but supposing even its mesh resisted the shock of heavy *débris* falling from the flies, and rebounding on the stage, it is necessary to admit that the flames attracted towards the auditorium by the flue from the sun-burner in the centre of the house would readily pass through this curtain, and would then rapidly communicate the fire to that part of the theatre used by the public.

By continuing the requirement of this curtain with a large mesh, the condition of affairs is not improved. This appears to us the more to be regretted, that remarkable progress has been made in this respect in several theatres abroad, and that improvements are on the point of being adopted in several of the provincial theatres in France.

Amongst improved iron curtains we will instance at once that of the new theatre at Geneva, composed of three thicknesses of trellis-work, separated from one another.

The frame is made of two pieces of (half-round) iron, holding a metallic gauze, with a very small mesh. This gauze, which is similar to that of a miner's safety-lamp, absolutely stops the progress of flame. But its thinness renders it very liable to be broken: hence it is protected from blows on its two sides by a double trellis-work of stout iron wire, of $\frac{1}{10}$ in. in diameter, with a $\frac{3}{4}$-in. mesh, and strongly fastened to the back of the frame. Thus arranged, this triple trellis-work evidently possesses very great resistance, and it can be assumed that it would present an effective obstacle to the spread of fire.

This iron curtain, designed by M. Diosse, master carpenter, has been in use for the last two years at the theatre of Geneva. It is rolled upon two iron drums, and counterbalanced by weights. The ascent and descent are accomplished by means of a roller, checked by an automatic brake working outside the stage. The weight of this curtain is 2,500 kilogrammes (2½ tons), and the total cost was 320*l*.

The iron curtain of the Théâtre des Célestins, at Lyons, which has just been rebuilt, is constructed after the same principle, of a sheet of thin metallic gauze, protected by two strong trellises, with a large mesh. But here, for greater precaution, the frame of the curtain is made of stout sheet iron, 2 mètres wide, in such a way as to still more completely protect the stage boxes and other parts of the house nearest to the curtain.

On account of the limited dimensions of the stage, the weight of the curtain is only 1,800 kilogrammes (1¾ ton). The entire cost has been 7,000 francs (280*l*.).

Although these curtains offer a certain security against the spread of fire, we find that they have two serious defects, of which we now proceed to speak.

In the preceding remarks we assumed the fire to originate upon the stage. This is, indeed, the most frequent, and by far the most dangerous, instance. We would almost say the only dangerous instance, for there are very few cases of fires in theatres originating in the auditorium, where the fire would be tolerably easily subdued, the combustible materials there being comparatively small in quantity.

But it is not sufficient simply to prevent the flames from entering the auditorium; it is not less indispensable, in our opinion, to prevent the smoke from spreading there. Now, painted canvas and the framework of scenes, which are always found in considerable quantity on the stage, fall to pieces immediately on catching fire, produce an abundance of black smoke, which would be drawn into the auditorium by the flue over the central chandelier, would easily pass through the finest metallic curtain, and would at once stifle the spectators, who, from the blocking of the passages or other cause, would be prevented from rapidly escaping. Facts have proved that in numerous fires in theatres the victims had died from suffocation.

It is thus of equal importance to prevent the passage of smoke into the auditorium, and to do this there is but one way. A close curtain of

iron, covering completely the proscenium opening. This curtain would, besides, have another advantage, that of hiding from the public the progress of the fire. We must insist upon this latter point, to which we attach very great importance. That which is most to be dreaded during a fire in a theatre, should it break out during a performance, is the panic produced amongst the spectators by the sight of flames. It is this which causes the obstruction of exit passages, the frantic rushes, the heaping up of bodies, and eventually suffocation.

Every suitable means for diminishing panic, it seems to us, then, should be employed, and we think that a close iron curtain, concealing the flames and presenting, as well, a serious obstacle, would contribute much to reassure the public. This is why we strongly advocate the employment of a close curtain of sheet iron, which should, we consider, be required for every theatre.

This suggestion is not an innovation, and, in adopting it, the City of Paris would only be following afar Germany, America, and shortly the provinces of our country. There existed, in fact, for several years, a close curtain of corrugated iron, of large size, in the theatre of Dresden, and in a great number of theatres of second-rate towns in the United States. In France, several such curtains are now being made, intended for the theatres of Besançon, Lille, and Toulon.

These latter are fixed according to the system patented by MM. Grafton & Co., engineers. The curtain is formed of a series of sheets of iron, which are raised one over another during their ascent, hung with hinges similar to those used for shop-shutters. The curtain is moved by hydraulics by means of an accumulator and piston working an endless chain. Without entirely approving of certain details of this system, we nevertheless consider it as a notable improvement which is to be commended.

The incontestable advantages of a close iron curtain appear to us so important, that notwithstanding the rather high price of this kind of division, we have hesitated in recommending its employment to the municipality of Rouen for the Theatre of Arts, which is now being rebuilt.

It is worked by hydraulic machinery, working by means of two pistons set in motion by two taps placed outside the stage, and forcing the water into lateral tubes. A third tap placed below these serves to empty the pipes in the event of repairs by necessity.

This solid curtain, which is in one height, weighs 4,000 kilogrammes. It will be counterbalanced by weights for nine-tenths of its total weight, and the remainder will be raised by the pressure of two columns of water, one at each side, upon which the curtain, when raised, will be supported during the time of performance.

The entire cost of this curtain, including the pipes for the admission and emptying of the water, the pistons, the guides, and the counterbalance weights, as well as the suspension-ropes of thick steel, and all the necessary fittings, would be from 14,000 fr. to 15,000 fr. (560*l.* to 600*l.*). By causing this same curtain to be worked non-hydraulically, but by means of a windlass with a self-acting break, the expense would be reduced to 9,000 fr. (360*l.*).

Lighting.

As the report by M. Andrieux states, nearly all the disasters which are produced in theatres have been caused either by an accident happening to the gas-piping or lighting apparatus through their defective or incomplete fixing.

On the stage, and especially in the flies, the danger is constant on account of the accumulation of the most combustible materials, in the midst of which are distributed a large number of movable gas-jets necessary for the changeable lighting of scenery. Gas, then, is the formidable enemy against which we cannot take too many precautions. The question, also, of replacing gas-lighting by electricity was discussed as soon as the discovery of the application of motive power to the economic production of electricity was made. It appears, unfortunately, that gas could not be completely dispensed with in the lighting of theatres; many experiments have been made but without giving practical and conclusive results.

The most that can be hoped for at present is the introduction of a mixed system of lighting, electricity being used for large spaces and certain effects of the *mise-en-scène*, and gas for small spaces. It seems reasonable, then, that the Order of the 16th of May imposes conditions with regard to both the methods of lighting.

The first condition required concerning gas is that of having a separate meter for each of the three divisions of a theatre, so as to prevent the sudden extinction of lights in the whole of the building. To prevent complete darkness in the auditorium in case of the extinction of the chandelier, it is also prescribed that the manager shall keep oil-lamps in all parts of the auditorium accessible to the public; and during the whole time of the performance a sufficient number to permit the public to see their way out.

The principle of these precautions is certainly excellent, but it is necessary that they should be properly carried into effect. And would it not be possible to arrive at the same result in a manner more simple,—in determining, for example, the general distribution of the gas, in the following manner?

The first meter should serve for lighting of the scenery and the auditorium. The second meter would supply the wings of the stage and the administration-rooms. The third meter, lastly, would light the staircases, vestibules, passages, and back rooms of the auditorium, as well as a certain number of gas-jets distributed in the interior of the house, to the various boxes and corridors, which would allow persons to see their way, even after the extinction of the central chandelier, without the necessity of any oil-lamps. This would avoid the inconvenience of a supplementary system of lighting. It would be necessary in order to complete this arrangement that three meters should be placed in a position easily accessible, and also brought as near as possible to the public way. In case of an alarm on the stage the gas supplying the footlights could be cut off at the meter; then, if needed, the gas supplying the wings of the stage, leaving alight all the internal jets of the auditorium, and the lights of the corridors.

The report of M. Andrieux goes on to say,—"That it would appear equally useful to compel the managers of theatres to execute in iron all the large gas-pipes, in order to prevent the escapes so frequent in leaden ones."

We also are in favour of the use of iron pipes for the distribution of gas in theatres; yet opinion is much divided respecting the preference to be given to iron or lead pipes.

Escapes rarely take place in the length of pipes. It is at the joints they most commonly occur, and the number of joints is about the same in the two materials.

As a matter of fact, many of the theatres of Paris have their gas-pipes of lead, and the advantage of one system over the other does not appear very marked. Is there reason, in consequence, to compel the proprietors of theatres (for it is they whom this concerns, and not the managers) to immediately replace all their gas-pipes? This would occasion a heavy expense, while the result to be obtained is of small importance.

We think that it will be sufficient to render compulsory the use of iron gas-pipes in theatres to be erected, and to prescribe their use in executing necessary repairs and partial substitution of existing pipes. This should apply to the ground-lines, and all lights should be protected by wire-guard work. These guards are already in use in the greater part of the Paris theatres.

As an improvement used lately in the apparatus of scenic-lighting, we here describe an improved float invented by M. Diosse, the use of which should be general. The ordinary floats are merely enclosed in a single tube of sheet-iron, often overheated by a number of cylindrical gas-jets which it conceals. On several occasions, in the old theatre of Geneva and elsewhere, fire has been communicated to the threads of light cloths fluttering on these almost red-hot coverings. The new float by M. Diosse remedies this danger by means of a second covering separated from the first by a current of air, preventing the overheating of the outer surface.

For the footlights the Order of the 16th of May requires the use of jets reversed, with the view of absolutely protecting the dresses of the actors approaching the proscenium. The system of reversed jets has certain advantages, but it has many drawbacks, not the least of which is that it increases enormously the consumption of gas. Moreover, the construction is complicated, the regulation of the jets is very difficult, and the rapid replacement of broken glasses during the performance is difficult. These defects, which are very annoying in practice, have caused this system to be abandoned in many theatres where it had been introduced at great expense; at the present time it is only used at the New Opera.

It seems to us that without increasing the danger, the jets of reversed flame could be dispensed with, by fixing to the reflector of the footlights the double envelope fitted to the float by M. Diosse, and in making it obligatory for all theatres to be provided with an iron wire screen placed immediately in front of the footlights, which is only used in a few theatres. Thus modified, the ordinary footlights would offer, we believe, nearly all the same guarantees of safety with that of reversed lights without their inconveniences.

A defect easily remedied would be to render obligatory the employment of metal ropes for the suspension of the float, and other apparatus of movable lighting, and also to impose everywhere the use of regulators in order to prevent a sudden lengthening of the flames at the nibs, in case of sudden changes of pressure in pipes.

With regard to the installation of lighting by electricity, the regulations are confined to requiring the complete isolation of wire for the transmission of the currents, and preserving them from breakage by enclosing them in a strong and incombustible casing. It wisely adds that precautions shall be taken to prevent the fall of incandescent carbon.

On the occasion of the experiments in electric lighting made at Rouen, we were able personally to testify to the necessity for precautions in this regard, as well as to prevent sparks flying (*petittements d'étincelles*), on account of the impurity of the carbon pencils. During a performance, the commencement of a fire, occasioned by an electric lamp, broke out on the stage of the Théâtre Lafayette. Fortunately, the accident occurred during an entr'acte, the curtain being down, and the fire was rapidly extinguished unknown to the public.

The position of dynamo and other machines for generating electricity should be the object of conditions and special authorisations.

The diversity of systems of electric lighting, and the undecided nature of their working, compel us to confine ourselves, at least for the present, to these generalities.

L. Sauvageot, Government Architect.

DEATH OF THE PRESIDENT OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the meeting of the Institute held on Monday evening last (Professor T. Hayter Lewis, vice-president, in the chair), after the minutes of the previous meeting had been read and confirmed, it was announced that the secretaries had received a letter from the hon. secretaries of the Architectural Association, in which the writers said they had seen with very much regret the announcement of the death of the President of the Institute,—a regret which would be shared by all the members of the Association. The Institute, in common with the whole profession, had sustained a great loss by the death of one of its most distinguished members. The writers desired to be informed of the arrangements for the funeral, in order that the Association might be duly represented thereat.

The Chairman,—I need scarcely tell you, gentlemen, of the event which has just taken place. But before I allude to it more particularly I have another sad task to perform, namely, to allude to the deaths of two other of our most distinguished members,—Mr. Salvin and Mr. Decimus Burton. Mr. Salvin was well known some years ago as a very earnest worker in the profession, and, having made a study of old castles, his advice was sought and taken in the extensive restorations which have taken place of late years in the Tower of London. Mr. Decimus Burton had long ceased to practise, but his principal works were very well known, and included the Athenæum and United Service Clubhouses in Pall Mall, and the entrance to Hyde Park at Hyde Park Corner. In his time no architect was better known, and none was more respected. I have now to allude to the real business of the evening. The Council, of course, could not by any possibility postpone this meeting, the sad event of Mr. Street's death having happened at so recent a period, namely, at about half-past ten yesterday (Sunday)

night. I told you at our last meeting that I had had an interview with him; I likewise read a portion of a letter from his son, and I knew at that time that the feelings of his physicians were decidedly hopeful. All signs continued to be favourable, and last Friday he was to have left town for Egypt, where he hoped to have passed some short time in entire repose. It was a new country to him,—a country which he had always hoped to see, and had he had the opportunity, he would doubtless have made good use of both pen and pencil in recording his impressions of his sojourn there. Man proposes, but God disposes. On Thursday afternoon last, while he was sitting conversing with one of his old friends, a Royal Academician, he was struck down suddenly by a severe stroke of paralysis. The whole of his left side was paralysed, and he was rendered speechless. He remained conscious for a short time after the attack, but he soon became unconscious, and so remained up to the very last. He had, I need scarcely say, every possible advantage which the skill and science of his physician and the love of his family could bestow, and I believe he likewise had the most affectionate care of his domestics. He has been too much before the artistic world for me to need to give you much of his history, and you all knew him too well, and respected him too much, to render it necessary for me to say much in his eulogy. To many of us he was known as a friend, hearty and cheery, and of ready wit, giving and taking sallies and home-thrust in a most playful way. Above all, he was sincere. Fearless in asserting his own views, he no doubt sometimes came into collision with others, and perhaps sometimes appeared to bear rather harshly upon them. But you must forgive a man who speaks and does fearlessly what he thinks. From my personal knowledge of Mr. Street for years I am able to apply to him the words which Shakspeare makes *Polonius* say to *Laertes*, for he was indeed a friend to be grappled to one's soul with hooks of steel. To all of us he was known as a skilful artist and as a most powerful writer on our art. He was a fearless champion of the views which he considered right, regardless of what others thought; and whatever the results to himself might be, he had the courage of his opinions, and stuck to them through thick and thin under all circumstances, no matter what the loss of profit or office might be. Most people knew him best by his works, and in the conduct of those works he was known as a high-minded gentleman. He was a friend of all that is true and noble in art, and the friend of all about him, sparing no exertion of any kind to advance his art. Attending to his work in the most minute details, which he looked upon as important to the carrying out of a design, he was an absolute master of every detail in his buildings. To all those who knew him well and could see him at work he was a marvel of power and of action. Most of you, I dare say, know that in that great work of his, the New Law Courts, there are hardly two windows or doors all over the building which have the same mouldings, and yet, there is not a single moulding, whether in wood or stone, which was not drawn out by him with his own hand full-size. Others will speak more worthily than I; I dare say at greater length, and better, but no one can be more sensible than I of the loss of a dear friend, and no one can feel more keenly than I do that a great power in art was lost and passed away when George Edmund Street died. Gentlemen, it is hardly necessary for me to add that the Council have passed a resolution of condolence with the members of Mr. Street's family. That resolution, which I am sure will have your hearty concurrence, is to this effect:—"That the secretaries be requested forthwith to draw up and transmit to Mr. A. E. Street a letter in the name of the Council expressive of the sorrow of the members of the Institute, corporately and individually, at the sudden death of their President, and of condolence with the family in their bereavement."

Mr. Wyatt Papworth said that the letter should be sent in the name of the Institute, and not in that of the Council merely.

The Chairman said that was, of course, the intention.

The Right Hon. A. J. B. Beresford-Hope, M.P., said,—I quite agree with that very proper suggestion, and I rise to move that that resolution of the Council be adopted by this meeting. It is a painful duty for me to perform, but I find, on looking round the room, that I enjoy the melancholy pre-eminence of being the senior past-President here. In that character, then, I venture to come forward, in this moment of stunning grief, to make myself the mouthpiece of the Institute as the Institute, and not only of its governing body. In this dreadful year 1881 we seem to have been continually walking *in tenebris et umbra mortis*, and I thank God that there are only about ten days of this most terrible year to pass away. I cannot help reflecting that it is just six weeks ago to-night that I was standing up where I stand now and addressing him who then, as President, occupied the President's chair, apparently healthy and vigorous, and who had just before delivered a grand and massive address, well-conceived, logical, well-argued, powerful in tone, admirable in composition. We all were proud of him, and could any of us have thought then that in only six weeks we should have to meet as we are meeting to-night? Really, I feel that "we have come to bury Cæsar, not to praise him," but still, something must be said. You, sir, have embodied so well, so fully, and so clearly, the great and good points of his grand character that I feel that there is very little for me to add. His honesty; his boldness; the way he conquered people by the conviction that about him was no trickery, no diplomacy in the bad sense of the word; his fearlessness and earnestness in the advocacy of what was right and true and beautiful, whether in the moral or the material world, were all grand traits in his character. He has passed away young, but he has passed away in many senses full of honour,—passed away our President, and ten years a Royal Academician,—passed away just completing *the* monumental building of our own later generation,—the building which will be, we hope, for generations after generations (if, as we hope, the British Empire and British Monarchy will go down from age to age), unless some unexpected catastrophe occurs to it, the palace in which the administration of the justice of this great empire will be carried on. He has gone, following only at a distance of a few months his honourable rival Burges. Both of them Death's trophies in this year 1881! To pile up words would only be to weaken the feeling of sorrow that wells up in all our hearts. I move that the resolution read be made the resolution of the Institute, and would suggest that after that we dismiss all other business, and separate to meditate in sorrow upon him we have lost, whom we should take as a personal and artistic exemplar in our exertions.

Mr. Horace Jones.—After the excellent speeches we have heard, I think the fittest tribute we can pay this evening to the memory of our late leader and companion will be to cease our business for the night. I therefore move the adjournment of the business of this meeting.

The Chairman said he must first of all dispose of the motion made by Mr. Beresford-Hope, but which had not been seconded.

Mr. Charles Barry, in seconding Mr. Hope's motion, said,—I am sure it must be the anxious wish in the hearts of every one here to express the feelings which individually animate us with regard to our late President. Those feelings have been well expressed by you, sir, and they have been further well expressed by Mr. Beresford-Hope, but I cannot forget, and I shall feel privileged in remembering all my life, that during the time I had the honour to occupy that chair, Mr. Street was my loyal co-adjutor as Vice-President. Much superior to myself in mental vigour and in artistic power, he yet did not feel it to be inconsistent with the powers which he knew himself to possess to support me loyally during the three eventful years during which I occupied the chair. It is known, of course, that on certain points we have felt it our duty to take somewhat different views, but I can bear witness to the absolute sincerity and honesty of Mr. Street's character, inasmuch as though we were in the position of differing on certain points, we felt for each other, and I am sure he felt for me as I felt for him, both of us being assured that the only object either had in view was to benefit the profession to which we belonged, and to add to the stability and permanence of this Institute with which we were so fully identified. Outside these walls, and beyond that official difference of opinion, our friendship, which was the growth of many years, and which was cemented greatly by the three years of our working together here, never faltered for a moment. Cordial, kind, genial, personally friendly, Mr. Street always was to those who had the privilege of knowing him well, and I hardly know how to express the feelings which I experience now at the suddenness of the stroke which has deprived us of the assistance of our distinguished late President. I shall not add any further words, but I could not be here without testifying my deep sense of the great and exceeding loss which this Institute and the whole profession have suddenly and so unexpectedly sustained.

Mr. Ewan Christian.—I am sure we must all feel that a great light has been quenched, and that a prince and leader among us has fallen. The fewer words spoken on this occasion the better, and I therefore venture to second Mr. Horace Jones's motion that we do now adjourn.

Both motions were adopted, and it was announced, as the meeting closed, that Professor Hayter Lewis, as the senior Vice-President, and the two secretaries, had been appointed by the Council as a committee to take such immediate steps as they might deem necessary to do honour to the memory of the President, and to make known, as far as possible, the arrangements as to the funeral.

THE WESTMINSTER PLAY.

IN these days, when theatrical matters absorb so unusually large a share of public attention, it can be understood that the Westminster Play is not likely to have lost any of that interest which it has for so long excited in certain circles. The Westminster Play is thoroughly well understood as the classic play acted by the Westminster boys in accordance with a time-honoured custom observed for generations past in most schools throughout England, and which now seems definitely to have taken root on the other side of the Atlantic, where the oldest of the American universities, Harvard, mounted, not long since, the "Œdipus Tyrannus," with a luxury of costume which, if we are to believe the series of illustrations that appeared in an American magazine, approached as nearly as possible the Greek ideal. But dramatic power we can scarcely look for in the schoolroom, and the "Œdipus" even of Harvard, with all its care, we may be sure fell very far short of the play which, in a French translation, was put on the stage of the Théâtre Français not long since, and interpreted, as the play requires, with masterly skill by a well-known artistic company.

It is scarcely in a critical mood that one visits the old dormitory of Westminster School, which is annually fitted up for the play, and on the dusky walls of which are scored, scratched, and painted so many of the names of old Westminster boys, forming, it is true, not so architectural a wall decoration as the painted armorial bearings of past *alumni* which crowd the staircases and passages of the old dormitories of Padua and Bologna.

The play chosen this year by the Westminster boys was Terence's amusing comedy of the "Adelphi; or, the Brothers," an old favourite, "conveyed,"—to employ a word now in use to express a practice as well known in the days of Terence as in our own,—from the Greek of Menander. As may be imagined, the success of Thursday, the 15th inst.,—the first night of the series of three performances of the play,—was great, and it scarcely required the well-measured and traditional admonitions of the "god-keepers," with their long canes, to prompt the applause of the audience; the brilliancy and quickness required in the action of the play, could not, of course, be expected from scholars, even less experienced than what are so generally understood in this country as amateurs. The comedies of Terence are singularly modern in their spirit, as any translation will show. We hear, or rather have heard, a great deal of the need for the revival of our fine old plays, many of which are not improperly regarded by some as fine old bores, but the Greek wit and wisdom of Terence, Roman though he was, tells as well now as it did when, centuries gone by, it roused the mirth of audiences to whom the language of the poet was familiar, as still, for centuries to come, the well-weighed sentences will supply an ample fund of thought and worldly wisdom to the reader. If, as Mr. Russell Lowell told us the other day, quoting an American proverb,—taken over from our country,—there is a great deal of human nature in man, we are still the men whom Terence studied, for whom he wrote.

It would be perhaps asking too much from the Westminster boys to expect that, in addition to the representation of a classic play, they should give us between the acts classic music. The audience would be exacting indeed who required, to accompany the "Adelphi" of Terence,

the quick music of the Sarranian flutes, which, we are told, with freedom, Flaccus composed originally for the piece. Bizet's "Carmen" and Mr. Sullivan's ever-popular "Patience" formed, perhaps, a better substitute more in accordance with that good-humoured indulgence with which we now are expected to receive the "waits" between the acts. As a matter of what our French neighbours term *actualité*, the chief interest of the Westminster Play for most persons is centered in the epilogue, which, contrary to custom, was given on the first night.* Here enters the charm of novelty, for the epilogue deals in choice modern Latin, with a variety of contemporary topics. It can be easily understood that the epilogue this year did not neglect to touch in amusing terms on the Irish question, and loud was the laughter raised by a variety of the political "hits" made; but the heartiest and most prolonged applause of the whole evening was reserved to the *finale* of the epilogue, when a huge packing-case, duly labelled "*cum cura*," was hauled on to the stage amidst various timid suggestions made that the package might prove to be an infernal machine, but from which was eventually dragged a large model of Ashburnham House (restored). The well-composed and warm words which accompanied this discovery were interrupted during several minutes by the applause of the whole room, renewed when the determination was expressed to preserve as an honour and glory to the school this choice architectural relic, the threatened destruction of which has justly roused so much indignation in all quarters.

THE KING OF SPAIN'S COMMISSIONER ON ENGLISH ARTISANS' DWELLINGS.

Señor Mariano Belmas, the special envoy of the King of Spain, has now returned to Madrid to report to his Majesty the result of his inquiries relating to the artisans' dwellings of England. Señor Belmas is the editor of the *Revista d'Architectura* and secretary of the Central Society of Spanish Architects. Some months ago a congress of architects was held at Madrid under the auspices of this society, and the king presided in person at the sittings; taking not only an active interest in all the debates, but delivering the opening speech. This oration was more than a mere display of that eloquence and fluency of speech for which Don Alfonso is now renowned. The king, by insisting with much earnestness and at great length on the importance of providing suitable dwellings for the poorer sections of the community, initiated a movement which must bear beneficial results of a most practical description. It fortunately happened that Señor Belmas, who, as the secretary of the congress, was brought into frequent personal communication with the king, had not only studied this question, but made several experiments in the outskirts of Madrid.

Utilising the sand which abounds in the neighbourhood, Señor Belmas mixed it with cement and formed a sort of concrete with which to build the main portion of his walls, and thus reared a number of little houses which only cost 100*l.* each, and this included the cost of the land, estimated at 20*l.* for every house. These houses consist of two floors and four rooms, with ogival roofs, a form Señor Belmas found to be cheap, strong, a little more elegant, and affording great facilities for ventilation.

The discussion during the congress so interested the king, that he determined to send some competent person to England and to the United States to inquire what had been done in those countries to provide dwellings for the poor, and, in selecting this envoy, his choice fell not unnaturally on Señor Belmas. But as, considering the somewhat troubled condition of Spanish politics and finances, it would have been difficult to have obtained a Government grant for this purpose, the king resolved to defray the cost of this mission from his private purse. It was, therefore, as the personal envoy of Don Alfonso, and not as the emissary of the Spanish Government, that we had the honour of welcoming Señor Belmas on his arrival in London; and before his departure we were not a little curious to know what were his impressions. In the fulfilment of his mission, Señor Belmas conscientiously visited the estates of the Artisans' Dwellings Company, the Peabody Buildings, and many other model and recent creations; but, so far as the economy of building is concerned, he failed to discover anything important that could be imitated in Spain. Spanish customs are so radically different that it would be extremely difficult to create on a large scale special dwellings for the poor. In Spain the poor live with the rich and under the same roof. The first-floor or flat of a Spanish house will be rented to a wealthy, perhaps an aristocratic, family; the second-floor to a family well-to-do, but not so rich; the third-floor, divided into two separate apartments, would be occupied by lower middle-class tenants; while higher up, each room is let in separate tenements and occupied by workmen and their families. Of course, according to the general character of the house, the various tenants are more or less wealthy or high-class; but, however noble or however humble the dwellings, the diversity of position between the inhabitants is always in about the same proportion, and as we ascend the stairs so we, in equal ratio, descend the social scale. The Spanish people would not tolerate any system that parks off various classes into various districts, like different breeds of sheep, in separate pens. The mixing of different classes under one roof is an important factor in Spanish life, and in no country does the maxim, "Charity begins at home," apply more appropriately than in Spain. The wealthy occupants of the first floor have only to ascend the steps of their own house to find worthy objects of compassion in the attics. This, indeed, gives rise to considerable familiarity between rich and poor, and the ignorance and indifference too often shown in other countries as to the condition of the poor are less prevalent in Spain.

Under these circumstances, any system of dwellings which would compel poor people to live together would certainly occasion considerable opposition. They would naturally object to be severed from their wealthy neighbours, who so often prove themselves useful friends in the hour of need. These observations apply, at least, to large towns, but not to the neighbourhood of factories, mines, and other industrial districts, where of necessity colonies of work-people must be grouped together.

Of the model dwellings in London, Señor Belmas was specially impressed by the most recent Peabody buildings, where turrets disconnected from the main part of the dwelling contain the closets, &c. He also spoke very favourably of the Shaftesbury Park Estate, so far as the general scheme is concerned, but found the structure of the dwellings somewhat flimsy, while it seemed to him that the land of the Queen's Park Estate was very damp, and that some of the houses were being built on refuse. With these exceptions, the Spanish delegate had nothing but words of praise to utter relating to what he had seen, to the facilities afforded him, and the hearty reception he had received. The readiness with which all documents, reports, and balance-sheets relating to all enterprises having a public interest were communicated to him, afforded a favourable contrast to what would have been done in Spain. The printing by municipal or local authorities, and free circulation among the public, of reports relating to all administrative questions, the way in which criticism was accepted, and even courted, were striking and admirable features of English life.

But the one point, surpassing all others, that will constitute the principal feature of the advantages resulting from Señor Belmas's mission, is the impetus it will give to the introduction of sanitary reform in Spain. In this respect, an entirely new field of action has been opened out. Everything Señor Belmas saw was new to him. In Spain no effort whatsoever is made to prevent the admission of sewer gas into dwellings. Intercepters, methods of ventilating house-drains, the care with which closets are ventilated, and, if possible, placed without the walls of the dwellings, the mortality statistics which establish the necessity of taking these precautions, and the saving of human life resulting when they are efficiently carried out,—all this was new to the king's delegate. Fortunately, the novelty of the subject did not militate against its importance. Señor Belmas was fully aware of the gravity of this topic, and had already joined the Madrid Sanitary Society; but had had no opportunity of studying the practical details, the mechanical appliances, which in this country have attained a comparatively high degree of perfection. Nor was he aware of the rigour of our law with respect to disinfection, and the remedying of unwholesome dwellings. All these matters will now, however, be skilfully laid before the King of Spain, and action will doubtless soon be taken. The high death-rate in Spain, the dangers we run of contracting typhoid and other fevers when we visit that interesting country, give us a personal as well as a general interest in this prospect of sanitary reform; and we are glad to think that the king himself is likely to take the initiative in this movement.

NOTES FROM THE WEST.

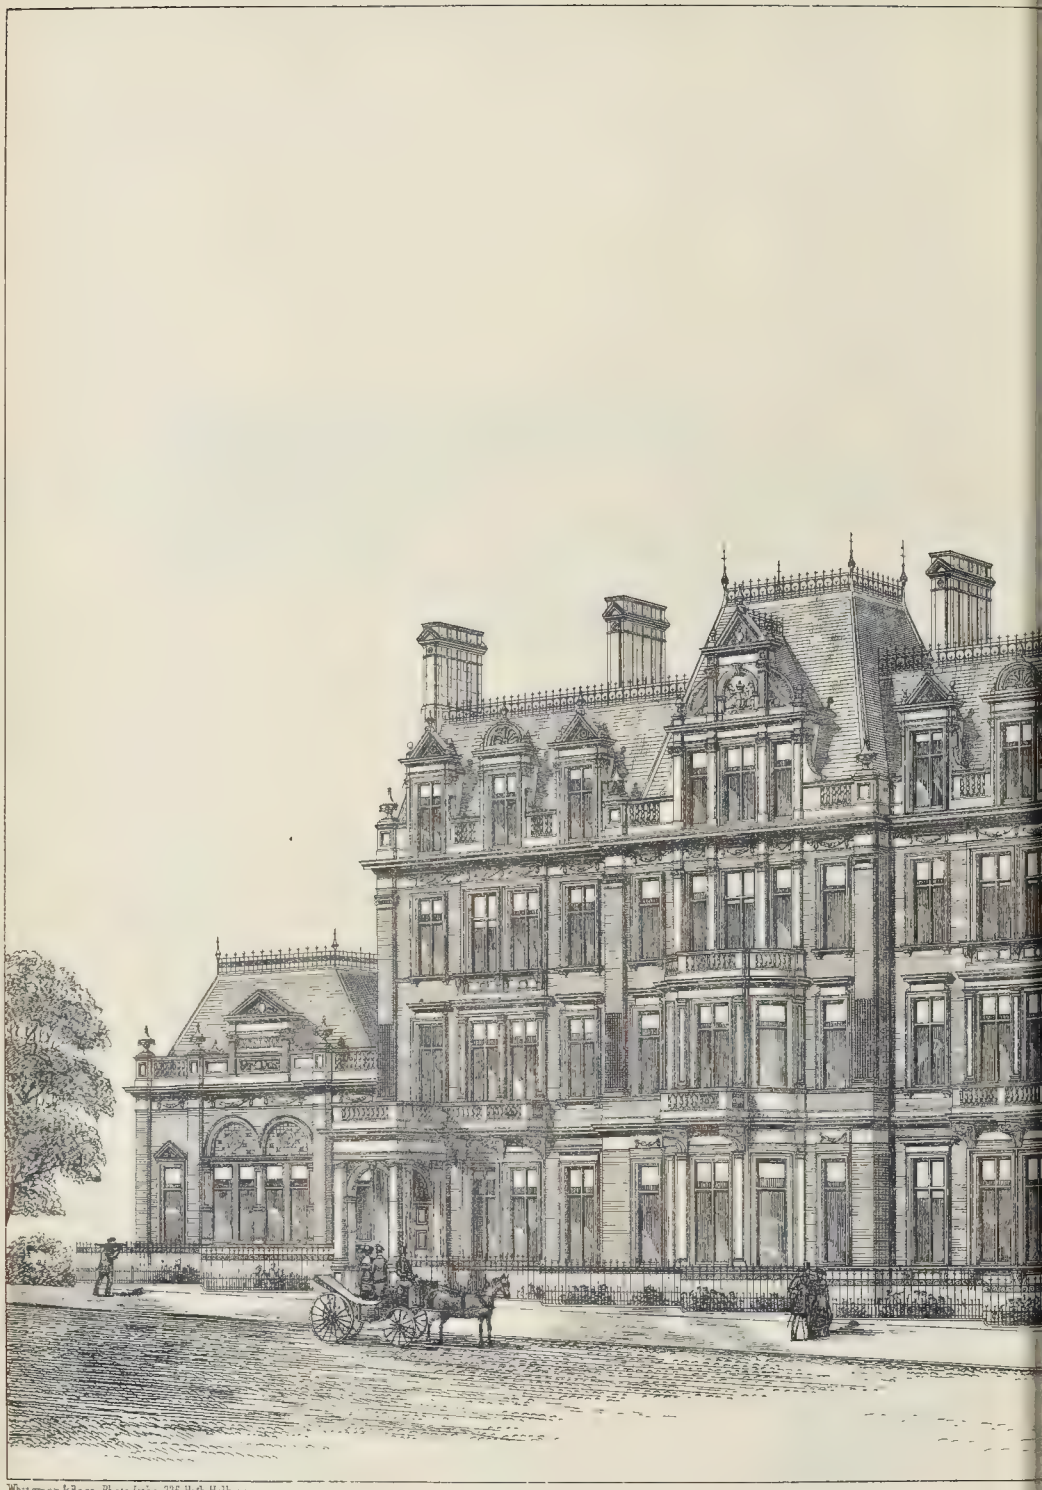
Steam having been used on one section of the Bristol tramway for a year, has been this month superseded by horse-power. A great many complaints were made by occupiers of property adjoining the route of the noise, smell, and inconveniences attending steam-working.

A company has just been formed in Bristol for supplying electric lighting and electricity as a motive-power on the Brush system, Lane-Fox incandescent lamps being used for domestic purposes.

Messrs. D. Glass & Co. have had extensive premises erected for them at the union of Clare and New Baldwin streets. The design is effective, and displays a series of carvings representing tobacco growing, importation, and manufacture. Mr. H. C. F. Hansom was architect, and Messrs. W. Cowlin & Son, the builders.

A peculiar dispute has arisen between Messrs. G. C. Ashmead & Co., one of the oldest firms of surveyors in Bristol, and the St. George's Local Board. St. George's, a district of about 30,000 inhabitants, just outside the Bristol boundary, a few years ago connected its drainage system to that of Bristol, and Stapleton, another large country parish adjoining, unable to satisfactorily dispose of its sewage, arranged to connect with St. George's. Messrs. Ashmead drew out the levels, which they calculated from a "bench mark," the elevation of which had been ascertained years ago, and fixed by the firm in Stapleton-road. On the work being gone on with, it was found that the sewers would not connect, the Stapleton end being lower than anticipated. Messrs. Ashmead could only account for the error in the calculations by assuming that an extensive subsidence had occurred in the district in which the "bench mark" was placed, but agreed to leave themselves in the hands of the St. George's Board, and were required by that body to pay 200*l.*, this being one-third of the expense attendant upon the mistake. Since then it has been clearly proved that the subsidence conjectured had taken place. It extended over a length of road of not less than 600 ft. or 700 ft., and the deepest sinking was as much as 2 ft. 3 in. Near the "bench mark" the subsidence amounted to 1 ft. 10 in. This being so, Messrs. Ashmead decline to pay such a sum as 200*l.*, but the Board argue that they had nothing to do with the "bench mark," and have resolved to enforce their claim.

A rather interesting discovery has been made at Gloucester Cathedral. A memorial brass being moved from the north-western transept, where it was trodden upon, to another part of the building, an excavation was made, and the workmen came upon a massive slab of freestone, 8 ft. long, 5 ft. wide, and 6 in. thick. It was found to be the memorial stone of one of the abbots, turned face downwards, it is thought, by the Puritans, before the present raised pavement was laid down. Examination of the stone leads to the belief that it is that to the memory of Abbot Thomas Horton, who governed the church twenty-six years, and resigned 1377. During his long term of office he provided the abbey with many vestments, and gold and silver vessels and candlesticks for the altar, and caused a great part of the presbytery, the St. Paul's aisle, and the guest-hall to be made.



Fires in Theatres.—The Glasgow Justices of the Peace have issued recommendations to theatrical managers to have separate exits for each class of audience; to inspect the whole theatre before the performances begin; to see that the appliances for extinguishing fire are in proper order; to cause the lights in the lobbies and stairs to be supplied from pipes different from those supplying light to the auditorium. The Lord Provost recently intimated to the Glasgow Town Council that the magistrates had visited all the theatres and made suggestions for the public safety. The lessee of the Glasgow Royalty Theatre has already introduced oil lamps into all the stairs and lobbies of his theatre.

NAMENTATION BY MICHELOZZO MICHELOZZI, 1391–1472.

Whiteman & Bass, *Photo-Litho* 236 High Holborn.

Wyman & Sons Printers G^t Queen S^t

PROPOSED GRAND HOTEL, ALDERSHOTT: *Ground Plan.*

NEW CHURCH, OAKLANDS, NEW ZEALAND.

THIS church will accommodate 500 adults, and is of brick, with stone dressings. The interior will be faced with red bricks, relieved by stone bands. The actual cost is not ascertained, but will be about 9,000*l*. A marble reredos will be added at a future date. The building is expected to be finished about July or August next year. Mr. H. Nathan Smith, of Manchester, is the architect.

COURT OF THE "PALAZZO VECCHIO," FLORENCE.

IN reviewing recently M. Yriarte's splendid book, "Florence," we gave several illustrations of the city. We add to these, in our present number, a view of the Court of the Old Palace. This shows it, not as it was designed by Arnolfo di Lapo, about the year 1298, but as it left the hands of Michelozzo-Michellozzi, about 1434. Other decorations, including some fine frescoes, were executed on the occasion of the marriage of Francis I. and Jane of Austria, 1565. The fountain by Verocchio is a work famous in the history of sculpture.

THE ALDERSHOTT GRAND HOTEL.

THIS building is about to be erected for the Aldershott Grand Hotel Company on a corner site close to the railway station and South Camp.

The building will contain, besides the accommodation shown on the ground-plan, in the basement,—spacious wine, beer, and coal cellars, and the heating apparatus; on the first floor, suites of rooms; and drawing-room over the principal entrance. The bedrooms will be sufficient for 100 visitors, exclusive of servants. The kitchen offices are one story high, with top lights.

The style is French Renaissance; the circular corner and tower are placed to break the acute angle.

The walls are faced with red bricks; all the architectural decorations being stone, except the large pilasters above the ground-floor, which are formed in the brickwork.

Messrs. Martin, Wells, & Co., of London and Aldershott, are the general contractors; and Mr. George Edwards is the architect.

COLOUR IN ARCHITECTURE.

THIS was the subject of an interesting lecture delivered on Monday evening last in the Theatre of the London Institution, Finsbury-circus, by Mr. George Aitchison, A.R.A., who said it was almost self-evident that the first worship of beneficence must have been the worship of the sun, the source of light and warmth, and, proximately, of vegetation; while night, with its cold and darkness, was the evil deity. Each thing that added pleasure or profit to existence was an *avater* of the Great Beneficent, while the storm, the tempest, and the water-spout, the beasts of prey, the deadly snakes, the venomous insects, and the poisonous plants, were incarnations of the Evil One. When the first shrine or temple to the sun-god was made, it seems likely that those colours that were most striking or most prized were lavished on the deity or the temple; and it was dependent on the mood of the worshipper or the priest whether the same colours were lavished on the temple of the Evil Deity, or withheld; whether he was to be propitiated by having the same attentions lavished upon him as upon his rival, or whether the temple was to strike the proper awe or horror on the suppliants. It is probable that from their beauty, their brilliance, or their rarity, certain colours got appropriated exclusively to religious use, and were afterwards relegated to or seized upon by the chiefs and their families,—the imperial yellow of China, or the purple of Rome, for example. Fortunately for us, there are the traces of colour amongst the ruins of Babylon and Nineveh, and we still have the colouring of some of the temples in Egypt; but it is almost useless to speak of colour unless it has been seen by one's own eyes, and in its proper situation. That which looks crude and harsh when brought close to the eye, in full light in a climate like our own, may have the greatest richness, splendour, and harmony in its original situation, with a mighty "contiguity of shade," and under a burning subtropical sun. The scheme of Egyptian colouring might be described as bands and patches of brilliant colouring on a white ground. Sir Frederick Leighton, who has seen the temples of Upper Egypt, describes their effect as fairy-like, not that of a rich sustained magnificence, but like that of a flight of lovely butterflies, and he dwells particularly on the method of lighting, the sun pouring in from high aisle windows, so that the whole nave is lighted up by reflected light. That the Greeks painted their temples and statues, or at least portions of them, we know; and by some, that painting has been described as crude, garish, and vulgar; but in the case of temples we have to consider this point: Was the colouring a fair specimen of Greek taste, or was it done solely to please and attract the herd of vulgar worshippers? Mr. Watts, R.A., was with Mr. Newton when he was carrying on the excavations at Halicarnassus. A large slab, now in the British Museum, which formed a part of the tomb of Mausolus, was turned over. On its face was a wide floral border, and the whole of the ornament was painted with vermilion and golden yellow, on a ground of greenish-tinted ultramarine, and under the blazing sun Mr. Watts declared that the effect was magnificent, and his were the only cultivated eyes that ever saw it. It was carefully covered up for Mr. Newton to see on his return some few hours afterwards, but on being uncovered the whole colouring had vanished. After describing some Oriental and Italian coloured exteriors, the lecturer proceeded to consider roughly the schemes of internal decoration, of which, exclusive of stained glass, it might be said that there were only three divisions,—Firstly, the fully-coloured, where white and the very pale tones were used as jewels on a generally rich half-tone. The second scheme was that in which a white or very light-coloured ground was wholly enriched with ornament. In the third scheme a white or very light ground was only partially enriched by spots, bands, or cartouches. The effects produced would greatly vary with the materials used: greater limpidness, depth, and richness would be attained when polished marbles, glazed tiles, and mosaic were used, than when a similar effect was sought by the use of fresco or distemper, or even by the use of oil-colour. The most perfect examples of full coloured decoration which the lecturer had seen was the interior of St. Mark's, Venice. Perhaps the next most splendid example was the Under Church at Assisi, painted in fresco; while the third was probably the Council Chamber of the Doge's Palace at Venice. The Church at Subiaco, and the Arena Chapel at Padua, were fine examples. The house of the Sheik-el-Islam at Cairo was a fine example, and doubtless, if Owen Jones's restorations of the Alhambra were correct, so was the Alhambra itself. Of the wholly decorated buildings on a white ground, the lecturer could not recollect a single good example, but of the partially decorated, the Church of St. Anastasia at Verona was cited as a very perfect example. Stained glass was of itself the most perfect vehicle for the highest form of colour. It might possibly be objected that that pre-eminence belonged to painting in oil, and it was difficult to conceive anything more gorgeous than some of the colour of the masterpieces of the world; but the stained-glass windows of the twelfth and thirteenth centuries were like a glory of every lovely tone and colour that exceed imagination, like the liquefaction of every conjunction of every lovely gem. Where there was stained glass in its fullest perfection no farther colour decoration was needed, though in certain rare instances it did not greatly interfere with highly coloured decoration, as was to be seen in some of the mosques at Cairo, and at the Sheik-el-Islam's house. Having referred to the plumage of birds, the lecturer expressed the hope that brilliant composers in colour might again spring up amongst our race. Colour, like music, would lend itself to any words, still, it was well to have it set "like perfect music unto noble words." From the peculiar position we were now in, mankind having but just completed an upward step in physical acquisitions, we had not yet re-learned to love the beauty of anything, so that all we could get was what some other people once thought or now think beautiful, instead of having what we love or think beautiful ourselves. In interior decoration the one great rule should be that when the eye is half closed there is but a delicate suffusion of the particular coloured tone we wish to predominate; and in any perfect system we want a small portion at least of pure white and of pure black, as a scale by which all other colours and tones may be measured; but that need not prevent us from making any deep recess or portion, that is so cut off as to make itself a separate object, a spot of brilliancy or coloured loveliness. As far as the external decoration of buildings is concerned, the lecturer was prepared to admit that greater dignity might be obtained by a light monochrome, than by any other means; and it was obvious that where great beauty of form and exquisiteness of line were required, colours were apt to draw off the attention from that which was too precious to be lost. Still, he would fain see our streets filled with houses of some more cheerful and beautiful material than dingy brick, with its patina of soot and dust. Coloured tiles and earthenware seemed to afford the means for this indulgence. For more costly buildings, polished granite, porphyry, serpentine, and bronze might be used with happy effect. All the marbles perished too rapidly in our damp atmosphere. In conclusion, the lecturer said he had longed to see the walls in our fine public buildings which were protected by porticoes adorned with splendid mosaics on a deep blue or a golden ground, as the case might be, on which some grand episode of our nations history might be portrayed by some of our great artists, and their interiors also enriched by gorgeous friezes and splendid panels.

AN IDLER AT BRIGHTON.

AFTER reading the interesting account given by you last week of the Domestic and Sanitary Exhibition in this "city by the sea," I thought I would take a stroll to the Pavilion and look at it. You once did me the honour of publishing a few notes of mine on the Paris Exhibition, and I thought, therefore, your first article having entered into the more scientific part of the question, you might find a small space for the few lighter and more frivolous observations of a mere looker-on.

Having seen many exhibitions, I was prepared to be disappointed, but was agreeably surprised. Small, compact, bright, and clear,—it is a most admirable *multum in parvo*,—enough to give people not deeply learned, or who have not studied these matters much, a desire to know more, yet enough also to give the really earnest people a feeling that they can, figuratively speaking, pat it on the head and say, "Well done." It is interesting as being the largest exhibition known in this town, nearly 300 firms being exhibitors, and it has been the means of bringing home in a pleasant and easy way to the minds of a large concourse of people the various later discoveries and improvements in science. We think, though, that as the basis gone on that it is to bring all this home to the minds of the people at large, and that as to the very poor a shilling represents a large amount, two days should have been set apart ere it closed, and the rate of admission reduced to threepence.

After a glance at the various stalls and the food products, art decorations, sanitary improvements, and machinery, I could not help thinking that a bright little exhibition of this kind, which whilst it instructs amuses, opened now and then in Bethnal-green, Shoreditch, and other outlying parts of our great city, with a merely nominal entrance-fee and some entirely free days, would do more to bring home to the people certain sanitary facts, and make them understand more clearly how much depends on themselves, than a hundred mere lectures from the tongue of a lecturer, charm he never so wisely.

There is no doubt that a certain additional Government force put on landlords and builders, to compel them to see the original architectural and sanitary condition of a house is as well organised as it can be, is wanting. But even that would be of no avail, merely spelling ruin to these two classes if the inhabitants themselves are as ignorant and as dirty as the "masses" in every country generally are. And a palace with every perfected and modern improvement would soon be but an Augean stable if the inhabitants themselves be "but as the beasts that perish." It is then by making them clearly understand how much comfort, combined with saving to their own pockets, can be brought about by adopting good arrangements and inventions that philanthropists and scientific men will be best able to put their sweeping reforms in motion.

The exhibition itself is so well arranged that no time is wasted. With a courage worthy of so good a cause, and disdaining the horrors of a fit of indigestion looming in the distance, I pass from stall to stall, tasting beef in varied forms

of condensation. Some is given me as soup, steaming hot; some I take in cold water. This latter is meant to try and beat all the beef "compressists" known, four pounds of meat being reduced to an extraordinary small space. Excellent as it is, a thing may be of the earth, too earthy, and of meat, too meaty, and all condensed food to my palate is so: therefore I rush on and quaff with gratitude a glass of sparkling Ferrozodone a friendly hand holds out. I refrain from accepting another invitation to taste some excellent, they say, Curaçoa, manufactured from something that is not the real thing, though it looks like it. On every side the energetic exhibitors offer products of all sorts,—butter, wheaten bread, sweets, lime juice, &c. I pass the oysters in their tanks with a friendly nod, and still, like the busy bee gathering honey all the day from every opening flower, accept cakes of terrebene soap, the use of which I am assured will make the washee handsome or beautiful, as the case may be, for ever. The air is redolent with the jets of perfume; books, cards, &c., are (as the divine Williams says greatness sometimes is) thrust upon one. After pausing to admire the splendid potatoes raised from the seed Mr. Sutton sells, and wishing poor Ireland had sown and reaped such fruit as this instead of rebellion, bloodshed, and famine, I pass rapidly to the decorative arts. Crockery and pottery from Staffordshire and Worcester can well bear their juxtaposition with some from Austria; all are beautiful. Painting on silk, satin, tapestry, wood-carving, modelling, amongst which a mask by a young Brightonian, Mr. W. H. Caddy, is noticeable; the Lincrusta-Walton wall decoration, which bears washing; Messrs. Mayall's electric-light photography in indelible carbon; and a hundred other things, are all interesting.

In the scientific department, from every kind of machinery meant to save time and labour; from wonderful cooking apparatus, smoke-consuming stoves; from the telegraphic signalling apparatus exhibited by the Brighton Railway Company; from electricity in domestic matters (one arrangement, notably, an ingenious street fire-alarm, by which, by pulling a bell, the locality of the fire is indicated to the central fire station); from the chronograph, the first of its kind, I believe, in England, that Mr. Douglas, of Stourbridge, exhibits, which not only registers minutes and seconds, but so small a space of time as the 300th part of a minute, down to a pen, which, if you only dip it into water, writes in ink, and which is supposed to last two years; all is instructive and interesting, and we can earnestly congratulate the promoters of the Congress on the well-deserved success of their well-organised scheme.

C.

ARCHITECTURAL ASSOCIATION.

At the ordinary meeting of this Association, on the 9th inst., Mr. Aston Webb, President, in the chair, twenty-six new members were nominated.*

Mr. Cole A. Adams then read his paper on "Barnacles," the substance of which we printed last week.

In the discussion which followed,

The President said that Mr. Cole Adams had favoured the Association with a very valuable and interesting paper. With regard to the memorial on competitions, the success of which was so largely owing to the labours of Mr. Adams, it was already having a great deal of good effect by the now very frequent, if not universal, adoption by competition committees of the suggestion for the appointment of a professional referee in each case. Mr. Adams had taken a wide view of the whole architectural world, and given his opinions on its present condition. One of the points upon which he had commented was the confusion of styles which now reigned, and which all must lament. It was to be hoped that out of the confusion would arise some new and satisfactory development. During the progress of any new movement which took place, the principles which underlay it were not usually known until afterwards, and the actors in such movements were not usually the men to formulate those principles. As an instance, Turner painted his pictures, but Mr. Ruskin followed out the principles on which they were unconsciously painted. In regard to architecture, Mr. Adams recommended the system of consulting specialists. They were to be, as he (the President) understood, in the profession, though not exactly of it. He hardly saw how that would work, because a man who devoted all his attention to one speciality,—drainage, for instance,—could hardly be a full architect. Then the system of employing specialists would, if he understood it aright, be very expensive to the client; for if different men were to be employed for every speciality, such as warming, drainage, and so on, the professional remuneration would amount probably to 10 or 12 per cent. upon the outlay instead of 5 per cent. In relation to the competition question, while it was very desirable to insist on the appointment of a professional referee to report upon the designs submitted, it would greatly add to the value of the concession if the referee were appointed at the very outset, so that he might draw up the conditions.

Mr. F. H. A. Hardcastle said that Mr. Adams's paper was exceedingly well conceived, and contained a great deal of excellent matter. With regard to perspective drawings in competitions, the evil referred to seemed to have over-reached itself. Perspective drawings had been so misused and abused for competition purposes that it was very common now in competition conditions to find them expressly excluded. Now he thought that their total exclusion was to be deprecated, for it was but reasonable to recognise the fact that other people besides the professional assessor,—those, for instance (or their representatives), who find the money for the buildings,—had an interest in seeing what the proposed buildings would be like. It was only from a perspective drawing that a non-professional person could judge of the appearance of a proposed building, and therefore, if the perspective view was fairly and honestly drawn, and was not a purely fictitious affair, it would form a very valuable and important part of a set of competition drawings. As to specialists, they were already employed in some directions. Sometimes when an architect had a large building to erect he had a somewhat hazy idea of how he was going to construct his ironwork, and he went to a specialist and said, "Here are my plans and drawings; look at them and tell me what girders should be put in, and what you will do them for, and I will include your price as a provisional sum in the contract." That was a perfectly straightforward method, and it had its advantages, and it did not take out of the architect's commission a fee for the work. If, however, the architect called upon a consulting engineer for advice as to what he was to do, he must either pay him out of his own pocket, or must contrive to include his fee in the charges for lithography of the specification, or something of that sort, which of course would not be a straightforward and satisfactory course to pursue. Mr. Adams's remarks upon sanitary science, although they followed the line of observations which had been frequently made before, it would be impossible too often to repeat or too strongly to insist upon. It was perfectly certain now that the profession must be alive to the fact that people who employ architects often know a great deal about science. Science during the last twenty years had become so generally a subject of study with every decently-educated person that if an architect did not know anything about sanitary science he would be likely to find his client greatly shocked at discovering that his (the client's) knowledge of the subject was greater than that of his skilled professional adviser. As to the unfortunate speculating builders who were responsible for so much bad work, and who were sometimes blamed for a great deal more than should be laid to their charge, he was very glad to hear Mr. Adams's allusion to the ground landlords, for undoubtedly one great reason why we had such miserably-constructed houses was the short-lease system. How on earth could it be expected that a man should incur the cost of erecting a house capable of lasting for two or three hundred years upon land leased to him for only eighty or ninety years? As long as the pernicious system of short leases continued, so long would the houses of the masses of the people continue to be run up in the flimsy and depressing style which was so much to be deplored.

Mr. Sydney Vacher, in proposing a vote of thanks to Mr. Adams for his paper, said that a great deal had been said about the necessity of resorting to specialists, but specialists not only existed, but were largely resorted to. A specialist for writing a specification, when the architect was busy, was the quantity surveyor. For heating, ventilation, fire-proof construction, &c., architects took the advice of firms who had made those subjects their special study and business, and who could not only give advice, but carry out the work, with, perhaps, a "fad" or two introduced by the architect, which might (or might not) be improvements. In his opinion, to resort to practical trade specialists was generally sufficient. As to perspectives in competitions, in one or two competitions recently given, the picture line had been given for the perspective, but in his opinion it would be preferable to give the line of sight.

Mr. Hampden W. Pratt, in seconding Mr. Vacher's proposition, said he thought the Association was very much indebted to Mr. Adams for his encouraging paper, the keynote of which seemed to be that if architects were to be worthy of the name they must be thoroughly in earnest in striving to do all their work well. With regard to sketches made during travel, he thought with Mr. Adams that they would be all the more valuable and useful if dotted with "barnacles" in the form of figured dimensions. Mr. Adams's observations about speculating builders were very suggestive, and seemed to show that the responsibility for the bad building of the houses of the people did not rest so much upon architects as Mr. Street implied. Touching the question of competitions, the preliminary sketch competition system seemed to have many "barnacles" attaching to it. If the double-competition system was going to be generally adopted, it was not desirable to make the competitors go over a great deal of the ground twice, and if it were to be insisted upon that a competitor must not, in the second competition, deviate in any perceptible degree from the design submitted by him in the preliminary competition, the system would work its own death. When there was a preliminary competition, very little work, compared with what would be necessary in the second competition, should be required.

Mr. Charles Smith, in supporting the motion, said there was a good deal of common-sense in the remark that clients nowadays appreciated science a great deal more than they did. There might be some architects who could with impunity neglect to give due attention to the sanitary details connected with building, because they might have a numerous *clientèle* who employed them for other matters, but no young architect would find that it would pay him to neglect sanitary science, and he was very pleased that Mr. Adams had so vigorously hammered in that truth. As to the employment of specialists, everybody knew that there was a great deal of specialism involved in the working out of any contract, especially for a large building, and it seemed to him that the tendency towards specialism in building must increase as time went on, and as the wants of the public became more complex. He had been very much amused with an article which appeared in the *Spectator* a few weeks ago, in which the writer suggested that the builder of a house should be made responsible for everything connected with it, he employing the architect among other specialists whose services would be required in its erection. He had heard that idea broached by men thoroughly interested in the progress of art, and he had even heard it suggested that in architecture one man should make the plan and the other should clothe it in an artistic garb in the form of architecture. It was, in fact, deducible from experience that many architects who were thoroughly wrapped up in art-matters were not sound in planning; while, on the other hand, there were many good schemers in planning who were nowhere in art matters. When a man combined the two faculties, skill in planning and excellence in design, the result, of course, would be more satisfactory than could be achieved by a division of the work between two persons.

The vote of thanks having been passed,

Mr. Adams, in replying on some points raised in the course of the discussion, said that his

* At the previous meeting sixty-two members were elected, viz., Messrs. M. Collins, C. S. Cornish, F. Ward, F. W. Lane, A. E. S. Whitelock, F. A. Dry, F. A. R. Willey, J. N. Hamilton, S. H. Davies, G. H. Oakley, L. Dawson, F. A. Huntley, F. Macey, J. E. Newbery, W. R. Lawrence, W. Duffett, C. Turner, R. Kershaw, A. O. Breeds, C. J. Clark, P. J. Byrne, F. E. Masey, J. J. Wood, F. J. Webb, C. S. Meadway, B. Potter, N. J. Stanger, G. G. Wallace, P. H. Watson, C. T. Moxon, E. J. Stow, E. P. Tucker, L. Lunn, J. Shepherdson, W. G. Roberts, G. E. Holman, C. R. H. Tyndall, G. P. K. Young, H. C. Chevalier, R. W. Paul, W. R. Crewe, A. G. Griffith, H. W. Webb, J. M. Hatfield, E. J. Thomson, E. H Dance, W. C. Rea, Y. E. Bigsby, F. D. Hoyland, P. Brown, C. J Knight, H. O. Jackson, P. L. Sweet, T. E. Pryce, H. C. Brookfield, J. M. Keith, W. H. Closson, A. Turner, J. I. Murray, J. C. Waghorn, W. E. Symington, and W. A. Aldertan.

views on the subject of the employment of specialists had been somewhat misunderstood. What he proposed would not materially add to the cost of building. He presumed that an architect having a large building to erect, and finding himself not sufficiently conversant with some particular subjects, would find it advantageous to consult some other gentleman who, while being an architect in general practice, was known to have given attention to some one particular branch of his profession. To take the subject of drainage, for instance. Within the last year Mr. E. C. Robins and Mr. Ernest Turner had read admirable papers on the subject of house sanitation, to which subject it was known they had given special attention. Suppose, on a matter connected with warming, ventilation, or drainage, an architect wanted information which it was no doubt in the power of one or the other of those gentlemen to give, why should he not consult them, paying them a fee of a guinea or two for their advice, just in the same way as medical and surgical practitioners consulted physicians and surgeons of larger experience than themselves? If such a course were to be generally pursued, it would prevent a great deal of the architect's own proper work drifting out of the profession into other hands. With regard to other subjects, such, for instance, as colour decoration, architects known to excel in that subject might be consulted in the same way, instead of going to Mr. So-and-so, the painter and decorator. Where more than mere advice on any particular part of the work was needed, some system of sharing the commission on the cost of the work could surely be arranged between the parties. When he spoke of specialists, he did not mean those specialists who were tradesmen, for of course they would recommend nothing but their own appliances, materials, and schemes. As to perspectives in competitions, there could, of course, be no objection to them if they were honestly made, as suggested by Mr. Vacher, from one point of sight. With regard to iron-girder work, it was a common thing for an architect to go to an engineer for advice, and he thought that the architect was wise in so doing, although the idea was entertained by some people that it was a dreadful thing that an architect should not be a thorough master of constructive iron-work. Surely, seeing that the subject was one which took almost a lifetime to thoroughly master, the architect, who had to give his mind to so many matters, might be excused if he called in competent professional advice rather than risk the safety of his building? As to Mr. Smith's observations about the powers required in planning and design, he thought it was the late Professor Cockerell who advised that, at any rate in every important building, two architects should be employed, one to make the plan, and the other to design the elevation. Unfortunately, many young architects were apt to think lightly of planning, but, rightly considered, the plan was the *alpha* and *omega* of all good art in building.

The meeting then terminated.

ENGINEERING WORKS PROJECTED AND IN PROGRESS.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

THE inaugural address was delivered by the president, Mr. A. T. Walmisley, on the 8th inst. First sketching the history and progress of the Society, the writer treated of the position and duties of the profession, passing thence to a notice of works now in progress. We print the latter half of the paper:—

It is now about fifty years since electricity may be said to have become just ripe for adaptation to practical purposes, and was much developed by the experiments of Faraday and Wheatstone. In 1838, the first telegraph line from Paddington to West Drayton on the Great Western Railway was set up, and so universal is its present application that even the interior of the great continent of Australia is now crossed by the electric telegraph. Among various applications of electricity to motive power may be mentioned the propulsion of trains by currents passing through the rails. The recent Paris Electrical Exhibition demonstrated the progress made in all branches of electricity, and particularly in its application to railway work. A curious experiment in engineering will be the execution of the proposed plan of Mr. Maxim, of New York, for the drainage by electricity of the basin around the city of Mexico, to do which a company has been formed, the funds raised, and the contracts signed. The plan in brief is to establish on the western slope of the mountains, where the fall is great and rapid, a number of water-wheels sufficient to develop some 20,000 horse-power, and make them drive dynamo-electric machines of high electro-motive power. The current from these machines is to be conducted about twenty miles to a set of electric motors placed on the margin of the lake, and driving pumps which will require about 7,000 horse-power to work them. The water has to be raised about 40 ft. to clear the ridge, but once raised it has an uninterrupted fall toward the Pacific of several thousand feet, so that the descending water is made to keep up the work. The whole apparatus constitutes what Mr. Maxim calls an "electric syphon." The plan will (says the New York *Iron Age*), it is believed, succeed, and thus relieve Mexico from the inundations that have damaged it so much for several centuries.

The Naval and Submarine Engineering Exhibition, to be held next April at the Agricultural Hall, is being well supported, and will doubtless be productive of much good. The exhibits will consist of machinery and mechanical contrivances employed in or connected with the construction and equipment of ships, docks, harbours, forts, and the like, and the value of the exhibition will be increased by lectures on naval architecture which will be given. In the designing, construction, equipment, and working of our fleets the foremost talent is engaged, and upon it the highest mechanical skill is employed, and the prizes to be offered will doubtless act as an incentive to many inventors to make known their ideas. The great progress made of late years in marine engineering is due to the continual competition between rival lines, thus necessitating economy of working by developing the largest amount of power out of the smallest quantity of fuel, so as to leave more room for cargo. Great Britain has now over half the sea-carrying trade of the world, and the great increase of length in modern vessels necessitates in many cases either the enlargement of old, or the construction of new, docks. This great enlargement of our dock accommodation is a feature of no small importance as regards the industrial progress of England,—at Leith, at Liverpool, at Folkestone, at Swansea, at Cardiff, at Milford, at Hull, and Penzance, in addition to other places on the coast. London herself has now special plans under consideration. The construction of the Victoria Docks provides an entrance lower down stream, where the navigation is less impeded. New docks are also in contemplation at Dagenham and Tilbury, with the object of avoiding the navigation of the somewhat circuitous reaches above Gravesend. The Act of Parliament for the Dagenham Dock was obtained last session, Messrs. Bell & Miller being the joint engineers, and Mr. James Abernethy, President Inst. C.E., the consulting engineer. The Tilbury Dock scheme is promoted by the East and West India Dock Company, and though not much more than one-third that of the docks at Dagenham in water area, it will, when carried out, possess the great advantage of a very large quay area and quay wall length. Plans have been deposited to accompany a Bill for next session, under the direction of Mr. Manning, the company's engineer, and Mr. Ahlfeldt, the manager of the Millwall Extension and East and West India Dock Company's railways. The site selected is at the natural entry of the Port of London, on the west side of Tilbury Station, opposite Gravesend, and the scheme is designed to meet and accommodate to the fullest extent the large steamships engaged in the East India, China, Colonial, and American trades, and will be capable of docking the biggest vessel afloat, except the Great Eastern. It will be essentially a railway dock, having lines running along the jetties connected with the Tilbury system, and laid with easy curves, and without turntables, so as to expedite the rapid handling of the immense railway traffic, which must necessarily pass over the Tilbury line into these docks. The junctions at Barking, Bromley, and Bow place the whole of the Tilbury Railway system in connexion with the great trunk lines of the kingdom, and the dock traffic will thus be enabled to pass by less conjested routes than those serving other dock undertakings. Ample shed roofing will be provided, a large quantity of grain and food stuffs having to be dealt with, which has now become such a prominent feature it the importations of this country, and the East and West India Dock Company will be enabled to maintain their supremacy in the chief port of the United Kingdom. It is proposed to construct two graving docks of about 900 ft. in length, with a sill 27 ft. below high-water mark, thus ensuring the reception at any time into dry dock of the largest American vessels. The *City of Rome* is 535 ft. long, 52 ft. beam, and 26 ft. draught, and is the largest vessel afloat, except the *Great Eastern*. The *Orient* is 470 ft. long, 46 ft. beam, and draws 26 ft. 6 in. when very heavily laden. The new deep-water docks at Tilbury will thus be seen to be capable of docking any vessel that can pass into New York, where the draught is limited to 26 ft. The new graving-docks will be capable of sub division by caissons sliding in grooves, so as to dock two or more vessels in separate compartments as may be required. The quay berthing accommodation will be over 15,000 ft. in length, with a uniform depth of 35 ft. of water throughout, and thus there will be no necessity to remove a vessel of the greatest capacity and draught for the completion of her loading, to the outer or tidal basin, the sixteen acres of which, with a depth of 41 ft. at high-water spring tides and 26 ft. at the lowest time of the tide, will be exclusively available for the direct entrance or departure, at any moment, of the largest class of ocean-going vessels now in existence or likely to be constructed, after the experience of the *Great Eastern*. The Port of London will thus cease entirely to be on the same footing as the other great commercial ports round the coast, the approaches to many of which are by tidal rivers, having shallow bars or with insufficient depth of water in their navigable channels at low tide, to admit of the reception and departure of vessels of the type enumerated, except at or about the time of high-water. Much has been done of late years in floating docks. Hydraulic docks, with floating pontoons exist at Bombay, Malta, and the Victoria Docks, London, and a new dock on Messrs. Clark & Standfield's system, is now being constructed at Barrow for the Furness Railway Company, which will be entirely a floating dock capable of accommodating vessels of nearly 3,200 tons displacement, not only raising them out of the water, but placing them, if desired, on fixed staging erected along the shore. One peculiarity in the construction is that the dock can be divided equally into two parts, each provided with its own engine, pumps, &c., so that each half can be used as a separate independent dock for smaller vessels, and can also be employed to raise the other half, so that every part of the dock is accessible for painting and cleaning.

Competition between railway companies is good, and preserves the public against limited accommodation, high rates, and imperfect service. Our leading companies have recently seen the advantage of separating the goods traffic lines from the passenger traffic line as much as possible. The widening of the London and North-Western Railway system at Liverpool is about to be followed at Birmingham, where it is proposed to throw the approach tunnel leading into New-street Station into open cutting, and to construct four lines of rails instead of two. The Great Northern Railway are about to widen their line between Hornsey and Potter's Bar, and similar widenings and extensions are going on in various parts of the country. Though all the main lines of the kingdom may be said to be constructed, a great deal remains to be done in the way of loop-lines and junctions, so as to effect a better connexion between our existing systems; for instance, to quote a case near home, all the goods traffic between the North-Western Railway and the South-Eastern Railway has, for want of direct railway communication, to be carted across London in wagons.

As regards metropolitan Parliamentary work there are more independent schemes proposed for next session than have been brought forward in any single session since the great railway years. There are 131 plans deposited for railways, twenty-seven plans for tramways, and eighty-three miscellaneous schemes, in addition to sixty-nine plans in connexion with Provisional Orders. The 14th of January will, however, test a great many, when, according to the Standing Orders, the usual five per cent. upon the amount of the estimate has to be deposited in the Court of Chancery. Among the schemes submitted are two Bills to improve the communication by railway to Waterloo Station. An Electric Railway is proposed to be made by a

new company leading from the north-west end of Northumberland Avenue, and running to within 9 yards of the arch of the loop-line of the South-Western Railway in Vine-street, York-road. Another scheme proposes to connect Waterloo Station with the City by a railway terminating near the Mansion House Station, on the west side of Queen-street, in Cannon-street. On the Surrey side, the connexion with the South-Western Railway is proposed to be formed by lines leading direct out of the station, and also by a curved loop-line entirely outside to enable trains to run through without entering either of Waterloo Stations. The London and South-Western Railway Company ought long ago to have run on to Charing-cross and Cannon-street rather than allow the South-Eastern Railway Company to have made this branch. A useful junction is made between the London, Chatham, and Dover Railway and the South-Eastern Railway on the north-east side of the latter line, enabling trains to run on from the north of London and Holloway to Woolwich, and a similar curve might easily be constructed on the south-west side, forming a junction between the South-Eastern and London, Chatham, and Dover Railway lines, which would enable the London, Chatham, and Dover Railway passengers to run on to Charing-cross. The plans connected with the proposed Metropolitan Outer Circle Railway as deposited, show various junctions by means of which it is contemplated to connect Ealing and other places in Middlesex, with Barking and other places in Essex, by a north-east route, running powers over the necessary existing lines being sought for. Another scheme, bearing the title of the Mid-Metropolitan Railway, proposes to form a railway to be worked on the pneumatic principle, commencing by a junction with the West London Junction Railway at Hammersmith, and running to near the Minories at Whitechapel; also another pneumatic line from the Exhibition-road to Park-lane, and another from Clarendon-place, Uxbridge-road, to Bridge-street, Westminster. Plans are also deposited for a railway in connexion with the Channel Tunnel, which is making fair progress. This Channel tunnel is not yet taken up by the Government officially, but the Board of Trade will, no doubt, watch the proceedings; for, as forming a link between the two realms, the proprietary rights of the constructors should be clearly limited. It is, however, only fair to the shareholder that the legal aspect of the question should be definitely settled, in order that their interest may not suffer with the realisation of the project.

Among various schemes suggested, a central station has been proposed for London; but I doubt very much if it would answer as such. The Post-office find that district offices can be better worked than one large central office; and if this is so in the case of letters, it certainly will be so in the case of people.

Railways have hitherto been the means of employing a larger number of civil engineers than any other branch of the profession. The population of our large towns and cities is increasing daily and a large field lies open in connexion with drainage and water supply. Where sufficient land can be obtained sewage irrigation is undoubtedly the very best way of dealing with it, but it needs to be managed in a proper manner, the object being utilisation and not mere convenient disposal. Where land cannot be obtained suitable, the aid of chemistry may be called in, but it is best to avoid chemical means as much as possible on account of the annual expenditure needed to maintain the works in good order. Pure air and unpolluted water are indispensable essentials to health and happiness: hence the importance of strict attention to sanitary matters cannot be over-estimated.

Time will not permit me to do more than allude to the proposed new Tay Bridge and the Forth Bridge. The Tay Bridge will be built about 60 ft. west of the old bridge and will be nearly two miles long. The spans will be 85 in number, and the level of the under members of the girders, 11 ft. lower than in the late Sir Thomas Bouch's work. The future Forth Bridge is to be a continuous girder bridge of varying depth. There are to be two spans of 1,700 ft. and two spans of 600 ft.; the depth of the proposed girder will be 330 ft. over the piers and 55 ft. in the centre. The bridge is designed to take a rolling load of 1,700 tons on each line as compared with 600 tons in Sir Thomas Bouch's design. Bouch's bridge was calculated to sustain 10 lb. per square foot wind pressure; in the new design no part of the bridge would be blown over or any member permanently injured with a wind pressure of 112 lb. We shall probably have an opportunity to allude to these structures further in our discussions during the session.

In conclusion, let me address to our new members a few words on the use of note-making for the preparation of a paper. The value of note-making can scarcely be exaggerated, but it is necessary to bestow great care upon each fact collected in its individuality of source and bearing, otherwise the caustic criticism of Dr. Johnson will be applicable that "they were neither meat, drink, nor good talk." Observe and record, but remember that to be useful an engineer's note-book must be clear, concise, and well-illustrated with sketches of details. A good index is also indispensable. Much as Molesworth's "Pocket-book of Engineering Formulæ" is used, it is very difficult to find what one wants from the Index. I, for one, attach great importance to note-making, and consider a note-book and pencil as essential to carry in the pocket as a 2-ft. rule. In writing a paper or a report upon any subject, it is impossible to do it justice without some precedent or allusion to similar cases, and this is furnished by the note-book. It has been well said that "great effects are produced, not by the effort of the moment, but by the preparation of past moments," and what I am now simply urging upon those members who have not already tried the experiment is preparation by the collection of material, which, judiciously made, is certain to prove useful in a professional career.

It is not easy to give a written description of any engineering work. One may readily write down thoughts as they occur, but the difficulty is to arrange them together for the illustration of a principle. I have known many men able to execute work efficiently who could describe their plan most intelligibly in ordinary conversation, and yet who would utterly fail in writing a paper or addressing a meeting. Notwithstanding this, I am of opinion that those who write as well as read upon any subject are those who acquire the most perfect knowledge of any art or science, and the very best way to find out our own deficiencies is to write about the subject. A paper to give rise to a good discussion must be no mere collection of separate disjointed thoughts, like the recipes in a cookery-book. It must be no perfunctory composition, but display consideration, thought, and be practically suggestive. It should not attempt to exhaust the subject of its title, but simply to introduce it, supplying, as it were, the right key-notes for discussion, and leaving the variations to be taken up by the meeting. Considering that we award no premiums, as in other societies, our list of papers is certainly a matter of congratulation:—

NORTHERN IRON TRADE IN 1881.

The facts are now obtainable from which there may be formed an idea of the value and the volume of the Northern iron trade during 1881. Not the least interesting of these facts are those that point to the value of the product,—to the prices that have been obtained for it is in a very great degree to this that the extent of production is due. In the crude iron trade of the Cleveland district, the official facts show that a declension in price continued throughout the first three-quarters of the year. The realised price for the first quarter was 2*l.* 0*s.* 2*d.* per ton, that for the second quarter 1*l.* 18*s.* 2*d.* per ton, that for the third quarter 1*l.* 16*s.* 9*d.*, and though that for the last quarter will not be declared for some time, it is probable that it will show an increase in the price on the whole. Generally speaking, the prices of iron of other kinds has varied in a somewhat similar way throughout the year, and this indicates, in great degree, the position that the trade, as a whole, has been in throughout the year. In the first seven or eight months the market was falling, and orders were in consequence kept back as long as possible, with a consequential decrease in the prices of iron, and an increase in the stocks in the hands of the makers. In the last quarter of the year, the attitude of the makers, and the reduction in the output of Cleveland iron, changed the position, and with the probability of a decrease in stocks that has been since demonstrated true, the market felt an impetus, and prices rose with rapidity to the point that the year commenced with. And in the last month, when the operation of the restriction of the output and the fuller demand were felt, stocks showed so marked a declension that the price again rose, and it is probable that at the close of the year it will be above that of the beginning.

Prominent in the features of the year has been the collapse of the demand for crude iron for the United States. Last year there was the pouring in from the North of England of large quantities to America; this year there has been little or none sent there direct from the Cleveland district. But in the meantime there has been a clearance of the stocks of imported iron that had accumulated at the ports of importation west of the Atlantic, and prices of Cleveland iron having risen there, it is probable that there will be a not inconsiderable export of crude iron thence in the course of a few months. There has, however, to the district been a counterbalance in another part of the American demand,—that for steel rails. The demand for steel for the United States in the shape of blooms and of rails has been so great that the local consumption of crude iron in the manufacture has been far above that of the quantity sent last year as pig-iron. Hence the demand from the United States has done much to steady the trade as a whole, and has given much of a demand that has kept up the output at the highest rate, and given a large increase over that of the past year. In 1880 there were produced over 2,500,000 tons of pig-iron of all kinds in the Cleveland district; in 1881 it is certain that the production will in the total be over 2,600,000 tons. But the increase is almost entirely in the production of iron for use in the steel manufacture,—iron, that is, mainly produced from ores imported from Spain, Carthagena, &c. The largeness of the production of this class of iron in the Cleveland and Durham district is one of the features of the age, as showing that in that great district, surrounded by its own ores, it has been needful to turn furnaces to the production of over 600,000 tons of iron from ores brought long distances. This, and that restriction of the production of pig-iron that has been so much condemned on economical grounds, but which seems to have been successful in its operation,—these have been the chief features that have marked the history of the Cleveland iron trade in its first producing branch.

In the manufactured iron trade the fluctuation in prices has been less, whilst the production has been very considerably enlarged. This branch of the trade has now fully overcome the effects of the decay in the iron rail manufacture. It has substituted for it the production of shipbuilding iron, and this to an extent that the total production of finished iron in the north of England is now nearly equal to what it was when the trade was at its briskest and had the rail-trade in addition to the branches that survive. It is to the growth of the demand for shipbuilding iron that the improvement is due, and the fact that briskness rules in the shipyards, and that freights are tolerably good, leads to the belief that the activity will continue for some time, and that the iron trade, as a whole, will feel the prolongation of the benefit that it has felt for the past year. That demand has enabled the plate-makers to maintain prices that are on the whole profitable, and has one by one brought nearly all the finishing ironworks of the north into operation after a continued period of dulness. The local demand for shipbuilding iron has, indeed, been one of the chief supports of the iron trade, for it is believed that the plate and angle mills in Durham and on its borders will have this year consumed the bulk of 800,000 tons of pig-iron; so that, except the shipments to other districts, they have been the largest users of the Cleveland pig-iron. The year, then, has seen the iron trade of the North placed on a firmer foundation; prices that, at the middle of the year, owing to the heavy stocks, were only occasionally remunerative, are now generally

profitable. The production, if not at its highest point, is very large, and the present demand is shown by declension in the stocks in the hands of the makers to be above it, so that the trade will enter the new year with brighter and brightening prospects, that must, as the facilities of production are increasingly used, be reflected on the prices, and, by the operation of the sliding scales, on the wages of the workmen; and by means of an increased circulation of money, must contribute to the general trade improvement.

THE AMSTERDAM ARCHITECTS.

THE Netherlands Society for the Promotion of Architectural Art, which has its head-quarters at Amsterdam, has invited an international competition for plans for a new architects' club-house. The conditions prescribe that ground-plans shall be in the proportion of 1 to 200; sections and views, 1 to 100; and external and internal details, 1 to 10. The prizes are the gold, silver, and bronze medals of the Society, together with premiums of 42*l.* 10s., 25*l.* 10s., and 8*l.* 10s. respectively. The jury is to consist of three foreign and four Dutch architects. The date for sending in the plans expires on May 1st, 1882. M. C. F. J. L. Rieber, the secretary, 2, Wyde Kapelsteeg, Amsterdam, will supply applicants with the programme of the competition.

PROPOSED REVISION OF METROPOLITAN BUILDINGS ACT.

SIR,—I am induced to trouble you with another letter, as a suggestion is made in your pages to alter the existing provision as to the capacity of buildings by enlarging the cubic area allowed by the present Act. I am inclined to question the wisdom of this suggestion, as the objection to the present limit could be better overcome without increasing the risk.

What I recommend is to legalise horizontal party structures of a specified construction, such as concrete and iron, the iron in all cases being either embedded wholly in the concrete or encased in terra-cotta or other fire-resisting material. Each floor or space so enclosed to be allowed to contain the present stipulated area, and all communications between such areas as staircases, lifts, &c., to be enclosed by cavity and continuous walls, with double iron doors to the apertures of communication, the whole of the construction being of fireproof material. This, I contend, would meet all the requirements, and, while allowing larger spaces under one roof without lateral divisions, which constitute the chief objection to the present law, would not extend the area exposed to danger from fire. The security from spread of fire in such construction was recently fully demonstrated in the case of the Haymarket Stores. I had a case in my own experience some time ago, in which the subdivision vertically by two party walls was very undesirable. I therefore formed the whole basement (being below the street-level) of vaults, with brick arches, enclosing the stone staircase to the ground-floor with brick walls, with double iron doors to the basement, thus reducing the area above, so as to require only one vertical party wall. This, after the building was erected, was objected to by the district surveyor as illegal; but the magistrate, being appealed to, decided in my favour, on the plea raised that vaults were excluded from the computation of area, and the matter was not carried further.

Here, again, another anomaly exists in the present Act, for flats or separate dwellings can be constructed as I suggest, only they must be separately approached by an open fireproof staircase from the street, and I fail to see any more security in such a separate outward approach than in a fireproof enclosed one such as I suggest. The revision of the Act as I suggest would, I contend, meet all objections without the risk of extending the ravages of fire, as would be the case were the present allowed area to be increased.

While writing, there is a point under the Metropolitan Management Act to which I should also like to call attention, viz., the control of the Metropolitan Board of Works over projections from the line of house-fronts in existing thoroughfares. This should be restricted within certain defined limits, say, within 10 ft. or 15 ft. of the footway; for it appears to me to be a great hardship and an unnecessary interference with the rights of owners to exercise any restriction beyond some such limit.

We will take a case where the houses were originally set back 50 ft. or so from the roadway, the gardens being formed in front of the houses. The thoroughfare having become urban, vegetation does not thrive, and the character of the houses has changed. The original leases expire, and it is necessary to rebuild the houses as the leases fall in. Is it just? It certainly is not consistent to say, "As you have once set up a frontage line, and cannot vary it, however the circumstances may differ, even if the adjoining owners raise no objection, you must perpetuate as an eyesore that which was originally intended for an ornament, as a garden." The width of new streets is prescribed, and if the old street is of the proper width fixed for a new street, 10 ft. more on either side, given to the public, is surely a sufficient concession, and would barely meet the justice of the case, in my opinion.

THOMAS HARRIS.

COMPETITIONS.

The Proposed Statuary for Blackfriars Bridge. At the meeting of the Court of Common Council on the 15th inst., the Bridge House Estates Committee presented a report on the reference of July 1st, 1880, instructing them to obtain, by public competition, designs, which shall be the absolute property of the Corporation, at an expense, by the way of premiums, of a sum not exceeding 1,000*l.*, it being desirable that Blackfriars Bridge be completed in accordance with the designs and provisions of the engineer, by the addition of appropriate groups of statuary to be placed upon the pedestals provided for that purpose at the extremities of the bridge. The committee having advertised, forty-nine designs were sent in, and referred to Sir Frederick Leighton (President of the Royal Academy), Mr. W. C. Marshall, R.A., Mr. G. F. Watts, R.A., and the City Architect, to make a selection therefrom, and they had laid laid before them a letter from Sir Frederick Leighton to Mr. Comptroller, which they submitted for the consideration of the Court.

The letter stated that the committee of award had inspected the models on two separate occasions, and had selected the six in which in varying degrees appropriateness and talent were best combined. But they were not prepared, in view of the great importance of the work, and the high gifts required for its adequate and satisfactory performance, and in view also of the calamitous results of failure, to recommend the execution on a large scale of any of the designs submitted to them, or the employment of the competing artists in the preparation of other designs with a view to their execution. But whilst they had with unfeigned regret arrived at this conclusion, they unanimously pressed on the Bridge House Committee the importance of not yielding to discouragement at the failure of a competition in which so much of the best ability of the country took no part, and of seeking now through some other channel to achieve, or at least to partially accomplish, the great object for the fulfilment of which the competition was instituted. The committee recommended that premiums of from 100*l.* to 250*l.* be given for the six best designs, the designs to become the property of the Corporation, and that it be referred back for the committee to consider the best means of carrying out the order of the Court relative to the placing of statuary on Blackfriars Bridge.

Mr. Bedford moved the adoption of the report, which was agreed to.

PATENT RECORD.*

APPLICATIONS FOR LETTERS PATENT.

5,276. J. Teer, Salford. Fire-grates. Dec. 2, 1881.

5,279. T. Ivory, Edinburgh. Gas-cooking stoves. Dec. 2, 1881.

5,294. E. Kaulbach, London. Smoke-consuming furnaces, &c. Dec. 3, 1881.

5,299. H. Green, Preston. Removing obstructions occasioned by frost, and preventing freezing in cisterns, &c. Dec. 3, 1881.

5,315. W. Clark, London. Fixing window glass. (Com. by T. Tanner, Otago, U. S. A.) Dec. 5, 1881.

5,319. S. Sturm, Cologne. Increasing the heating-power of stoves and fireplaces. Dec. 5, 1881.

5,324. W. Saunders, Stepney. Implement and receiver for cleansing floors, &c. Dec. 6, 1881.

5,351. T. Rowan, London. Warming and ventilating, &c. Dec. 7, 1881.

5,371. J. Bissett, Glasgow. Apparatus for heating currents of air. Dec. 8, 1881.

5,377. D. G. Cameron, Lambeth. Water-closets. Dec. 8, 1881.

* Compiled by Hart & Co., patent agents, 28, New Bridge-street, E.C.

NOTICES TO PROCEED

have been given by the following applicants, on the dates named.

Dec. 6, 1881.

4,731. J. H. Johnson, London. Compositions to render stone, wood, &c., impervious to air, water, &c. (Com. by G. O. Kramer & Co., Osnabrück, Prussia.) Oct. 28, 1881.

4,941. W. Cunningham, Dundee. Ventilating apparatus. Nov. 11, 1881.

Dec. 9, 1881.

3,416. J. C. Vanlohe, Providence, U.S.A. Sawing or cutting stone, &c. (Com. by P. Gay, Paris.) Aug. 6, 1881.

3,796. A. M. Clark, London. Lenses for use in pavement lights, &c. (Com. by P. Collamore, Boston, and N. Boyle, Springfield, U.S.A.) Aug. 31, 1881.

3,828. M. Merichenski, Poplar. Apparatus for raising and lowering gaseliers, &c. Sept. 2, 1881.

5,027. E. R. Hollands, Newington. Open stoves or firegrates, Nov. 16, 1881.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending December 10, 1881.*

1,812. A. E. Carey, Newhaven, and E. Latham, Birkenhead. Manufacture of concrete.

In order to mix the several materials of which concrete is composed thoroughly, they are placed in different hoppers which deliver the required quantities on to a mixing-pan. This pan is stationary, or capable of being rotated, and is fitted with movable or stationary mixing-arms. When the materials are thoroughly mixed in the pan they are delivered in a dry state to rotating-inclined cylinders, where they are damped with water, and again mixed, and from whence they are delivered ready for use. April 27, 1881. Price 8d.

1,900. T. Jackson, Edinburgh. Utilising waste heat of kitchen ranges, &c.

Shafts are made to enclose the water-pipes, cisterns, &c., the air in which is heated by the kitchen range, as all danger from frost is prevented. May 3, 1881. Price 9d.

1,903. M. Ingram, Manchester. Fireplaces for dwelling-houses.

The fireplace has bars in front, but a solid bottom. The products of combustion pass through an opening at the back of the fire downwards to the underside of the bottom. A door is provided to this space, in which is a grid, through which a small quantity of air can be admitted to consume the smoke. The gases then pass backwards again to a vertical flue leading to the chimney. Air chambers can be fitted at the sides of the grate for heating the air of the room. May 3, 1881. Price 6d.

1,927. H. Hill, Macclesfield. Manufacture of paving flags and tiles.

At the bottom of a mould, fragments of hard stone with their faces outwards are arranged, and a "grouting" of Portland cement is poured in. The backing may be composed of gravel and an inferior quality of cement. The flag is allowed to set, and then removed from the mould. May 4, 1881. Price 4d.

1,966. W. Jones, Manchester. Water-meters, &c.

A cylinder has two pistons connected by a rod. Between them is a lever, one end of which is moved by the pistons as they traverse to and fro in the cylinder, while the other end actuates a slide valve by which water is admitted to and withdrawn from the cylinder. The lever has a registering dial. (*Pro. Pro.*) May 5, 1881. Price 2d.

1,976. J. Carrick, Glasgow. Stoves and fireplaces.

Within a chamber of metal and glass is a basket containing the fire. The flue with a bell-mouthed opening is placed above the fire. The basket can be placed in any part of the chamber and the flue be made telescopic. May 6, 1881. Price 6d.

2,010. H. J. Haddan, Westminster. Warming apparatus.

An air supply-pipe passes from the hearth to the chimney, and is provided with a valve. The openings of the stove and of the chimney which communicate with the room may, therefore, be closed. (Com by A. H. Godefroy, Versailles.) May 9, 1881. Price 2d.

3,707. W. R. Lake, London. Water-closet apparatus.

The pan is made of glass, blown in a mould, and inclosed in a metal jacket. The outlet is shaped so as to form a trap, and at the end of the outlet is a flap-valve. A valve is also fitted to the commencement of the outlet, which is raised by hand. The water is admitted to the basin automatically by a float, which, when the water falls below a certain level, opens a valve and admits more. (Com. by the Hartford Sanitary Plumbing Company, Hartford, U.S.A.) August 25, 1881. Price 6d.

Scott Memorial Fund.—A meeting is to be held at the rooms of the Royal Institute of British Architects, No. 9, Conduit-street, on this Friday, December 30th, at two o'clock p.m., to consider the transfer of the balance of the Scott Memorial Fund as an endowment of art teaching at the Royal Architectural Museum.

* Want of space compels us to omit those published in previous week.

HALF-TIMBER HOUSES WITHIN THE METROPOLITAN DISTRICT.

Mr. J. C. Taylor, of Acton, was summoned by the Local Board in respect of a building which he had erected in the High-street in contravention of the by-law.

Mr. Palmer, who appeared for the Local Board, said the building was a staircase consisting chiefly of wood constructed outside a house. According to the by-law, the building should be constructed of brick, stone, or other hard incombustible material.

Mr. Kisch, for the defendant, said externally it was covered with tiles, lime and mortar being inside.

Mr. Palmer, in reply, said there would not have been any objection to the building had it been all tiles. The by-law required the building to be constructed of hard and incombustible materials.

Mr. Kisch pointed out that the same kind of building was erected on the Bedford Park Estate,—a wooden frame with tiles outside.

Mr. Paget thought it was not in compliance with the by-law. It was what was called a lath-and-plaster house, many hundreds of which existed all over the kingdom. Ultimately, Mr. Paget convicted the defendant, but allowed the summons to be adjourned for him to pull down the building.

LEAD POISONING.

Sir,—In so important a matter as lead poisoning, and which your valued paper has lately been noticing, it appears to me very desirable that any information on the matter derived from personal experience would not only be acceptable, but useful. The minds of many persons who possess a nervous temperament are unduly excited over this matter, which really need not excite alarm or anxiety, for it is well known that there was much truth in the crude saying of the ancients, "Nature abhors a vacuum," and "water must dissolve something," and the highly solvent power of water is universally admitted; yet it is equally well known it has in this matter a greater preference or affinity for some bodies than others. Thus water containing lime, magnesia, and earthy carbonates never can, or will, act on metallic bodies, and as the water we use for domestic purposes contains these, little fear need be entertained of any evil arising from its passing through leaden pipes in its transit. Take from the water these earthy salts and bodies, then the water immediately begins to act on the body (be it metal or otherwise) that it comes into contact with. A simple experiment will show the action of water on lead. Take a little solution of acetate lead,—known as Goulard's extract; if this is mixed with the purest of water (distilled water) a clear solution is obtained, showing its perfect solution. If the next in purity (rain-water) be used instead, turbidity is shown, proving a certain separation of the lead; but if ordinary water, as we obtain it from the water companies or from wells be used, then an opacity and milkiness are thrown out, showing perfect separation of the lead, simply arising from the fact that the water of the solution prefers, or has a greater affinity for, the earthy salts, and hence it parts with the lead not being able to hold it in solution. On this principle, then, there need be no fear of lead poisoning whilst we derive the water we use from the sources we do. But as in some parts of the country water is scarce, and the rain-water is caught and stored in leaden-lined tanks, then a certain acting on may be relied on, and the water contained is sure to indicate by the test of sulphurretted hydrogen lead in sufficient quantities to induce slow poisoning.

Sidney R. J. Smith, A.R.I.B.A.

CLERKS OF WORKS.

Sir,—Whether or not the suggestion of a "Clerk of Works" as to the desirability of forming an association such as he describes is ever likely to develop into a reality is a matter which at this early stage it would be premature to offer an opinion, but doubtless it will, as it deserves to do, engage the serious attention of the numerous body of men to whom it is especially addressed.

In nearly every sphere of professional and industrial occupations are to be found associations or clubs whose members at certain times and places meet together for some purpose or other of mutual interest; then surely there is nothing very extraordinary in the idea of an association of "Clerks of Works," who, it must be generally admitted, form an important factor in the building operations of the present day.

I, as one who feels proud to be classed among the number, although for various reasons cannot take any active part in the organisation, am quite prepared to enrol myself as a member when the proper time arrives, feeling certain it is a move in the right direction, and, if carefully worked out and soundly established, cannot fail to be the means of elevating and bringing into notice a class of men who at present, it is feared, are, like policemen, thought but little of until their services are needed.

Having said thus much I beg permission to offer a few remarks bearing upon the letter of an "Old Clerk of Works," wherein he calls upon architects to select their clerks of works from properly trained and qualified men. "Very good." But he would have better explained himself had he described the kind of training he meant. Perhaps it is only my ignorance, but I should have thought that architects are the best judges for themselves of the class of men who are most likely to best suit their purpose; and it is notorious that, as a rule, the men selected have been builders' foremen, having worked their way up to that position from journeymen, the instances being very rare indeed that they are drawn from the office,—for this reason, that such a one would have to submit to be led instead of being able to command.

It would be perfectly gratuitous to assert that clerks of works any more than other men are *perfect*, but it cannot be denied that there are, both in London and the provinces, many noble edifices which have been reared under the careful supervision of clerks of works whose names have been honourably mentioned in these columns, and who were thought by the architects who employed them not unworthy of their trust because they had not been trained as architects nor been born gentlemen.

In conclusion, I beg to suggest that all those clerks of works and builders' foremen who sympathise with this question shall send their names and addresses to you, sir,—stating their willingness to assist by a small subscription to meet the preliminary expenses; that these addresses shall be placed at the disposal of the originator; that he may communicate as he deem fit with the owners with a view to promote at first a private meeting for the purpose of organising a public meeting to be convened at the earliest opportunity after the necessary arrangements are made. With this end in view I place at his service my name and address.

Another Old Clerk of Works.

COURTESY TO CLERKS OF WORKS.

Sir,—Will you kindly allow an old subscriber and reader of the *Builder* for these last thirty years to have a little grumble?

I am an old clerk of works, and have had the honour of superintending the erection of many good works in this old England of ours, both for private individuals and her Majesty's War Department as well, and I have had some little experience with the Admiralty. I mention this to show I am somewhat competent to speak of the matter I wish to grumble about.

I mean as to the plan of advertising for clerks of works. In this matter I think a little needful reform is really necessary.

An advertisement appears in your journal asking for applications for an appointment, say, for a clerk of works to superintend the erection of a mansion; candidates are requested to state age, ability, experience, and to send references and copies of testimonials.

In all cases a number of men (many of whom are really up to their work), reply, and send all the necessary particulars. I am afraid to say how many apply. The usual result is they hear no more of their application. Surely, sir, common courtesy should induce the person who advertises to send a notice to the unsuccessful ones, or at least advertise in the same journal, as at first, saying the appointment was made.

I am induced to make this little growl, from the fact that I completed my last engagement in May of this year, and I have replied to some forty advertisements, and not in one instance have I been favoured with a reply,—this, too, in the face of the fact of my having sent an addressed envelope for a reply (yes or no). We clerks of works are a long-suffering race. It is all very well for architects to say they have no time. My experience of twenty-five years convinces me to the contrary; and the least a gentleman can do who asks a number of men to give their time to make an application for his work is to let them know when he has made his choice. A reform in this direction is much needed.

E. H. Cogswell.

Dangerous Chimney-stacks.—The daily papers have already described the terrible havoc caused by the blowing down, during the gale of Sunday morning last, of a great number of chimney-stacks belonging to houses in the neighbourhood of Pentonville and the New River Head. Heavy stacks of brickwork have fallen through the roofs of houses, and have been carried through two or three floors, destroying the furniture and injuring the inmates. At least one fatality is recorded, and there were many marvellous escapes. The public safety demands that the condition of the lofty chimney-stacks of many old houses should be carefully inspected by competent observers from time to time.

PROVIDENT INSTITUTION OF BUILDERS' FOREMEN AND CLERKS OF WORKS.

Sir,—Your correspondent of December 3rd (a "Clerk of Works"), is quite correct in supposing that there is a Clerks of Works and Builders' Foremen's Association; or, more properly speaking, a Provident Institution of Builders' Foremen and Clerks of Works, which has been established for the last forty years, not only for the advancement of its members, but to render assistance to the aged and afflicted members, widows, and orphans.

The society meet on the first and third Wednesdays in every month at 8.30 p.m. for the transaction of business and to admit members. The advantages of the institution are the mutual intercourse of the members, a valuable library of first-class works in connexion with the building trade, and occasional lectures to members and friends.

A copy of the rules and every information can be obtained on application by letter to the secretary, or by inquiry at the institution on any of their meeting nights, when the members will be pleased to see any person desirous of becoming a member.

It is open to clerks, or any foreman in the building trade who has held the position for over two years, and has not less than twelve men under him, and who can give satisfactory proofs of his ability and respectability.

J. W. H. Bedford,
Corresponding Secretary.

9, *Conduit-street*.

ANTHRACITE.

Sir,—I have no interest in any colliery, stove, or process of combustion, and therefore claim to be held as impartial a witness as your correspondents, Messrs. Smith & Stevens. I have been familiar for many years with Carmarthenshire and Pembrokeshire, where, as they observe, anthracite coals are burnt (although the rich Cannel coal is occasionally burnt in the drawing-room), and as a professional man, who has probably superintended the expenditure of more money in those counties than any other person now alive, I think I may be pardoned for expressing an opinion on the subject of their letter in the *Builder* of December 17th.

That opinion is, that it is extremely undesirable that anything should be said or printed tending to invalidate the force of your warning as to the danger attendant on the unwary consumption of a class of coal that is excellent in all other respects. As to that danger, I hold that there can be no more doubt than as to the similar risk attendant on the use, in France and Italy, of fine wood charcoal, the fatal effects of which, in a close apartment, are but too well known. It may, perhaps, be the case that with a brisk fire and carefully-regulated stove and flues the greater part of the carbonic acid gas formed in burning anthracite can be carried off; but it is extremely difficult to prove that this is, at any time, the case. The specific gravity of carbonic acid gas is rather more than half as much again as that of air, being from 1·51 to 1·52, if air is 1·0. As invisible, tasteless, and devoid of scent, unless when it contains some mixture of sulphur, its presence in an apartment is hard to detect, while only a violent draught can sweep such a heavy body up the chimney, as it naturally sinks to the floor. Now the great value of anthracite as fuel is the slow, steady combustion by which it maintains a constant heat; so that in theory, as well as in practice, the escape of gas into the room is for the most part steady, and in considerable quantity.

You will, perhaps, permit me to give my own first personal experience of the consumption of anthracite in a dwelling-house. I had occasion, many years ago, to visit Pembroke Dockyard professionally. I had been married little more than a year, and my wife accompanied me. It was before the South Wales Railway had made much progress, and we stopped for a night at Carmarthen. We had a sitting-room in the hotel, opening into a bedroom, and when my wife retired to undress, she left me by a very bright anthracite fire, of which the warmth was very agreeable. Becoming alarmed at my not following her for a long time, she returned to the sitting-room, and found me in a heavy sleep on the sofa. She had much difficulty in arousing me, opening the window, and providing a supply of fresh air. There is but little doubt, I think, that if I had been left undisturbed that sleep would have been my last. I apprehend that any one accustomed to the coal would have been aware of the danger of falling asleep by the side of an anthracite fire.

The fact is that all the safety signals of nature, of which pain is the principal, have in them something disagreeable. Such is the case with the acute pain experienced on any injury to the skin, occasioned from without. Such is the case with the noise of wheels, which we are now so careful to minimise, at the cost, more or less, of public safety. Such is the case with the warning which smoke gives of the presence of fire. And if we contrive, as we readily can do, to dispense with smoke, it becomes necessary to take such precautions in so doing as may prevent the additional danger to life resulting from the suppression of the danger signal. To urge, in opposition to this wise rule, the fallacy that "carbonic acid cannot be produced from anthracite coal without sufficient draught to carry it off," is to incur a responsibility which might very probably be attended by very unpleasant results.

C. E.

The Mortgage Company of England, Limited.—Our advertisement columns give the particulars of this undertaking. The list of directors,—Viscount Sherbrooke being chairman,—shows, beyond cavil, that it will be conducted honourably. It seems to us to have a good career before it.

WORKS IN INDIA.

SIR,—I trust you will give me space to say a few words in justice to myself, as Major Mant's principal assistant during the last seven years, with reference to your report of Mr. Spiers's communication at the meeting of the Royal Institute of British Architects on the 5th inst.

Mr. Spiers says that Major Mant trained Indian talent and employed native draughtsmen to work out his designs, especially ornamental detail.

As a fact, Major Mant did train two men, natives of the carpenter caste, who were excellent draughtsmen, and capable of doing original work; these men, who were brothers, were employed by him up to the middle of 1875, the time I joined him in Calcutta (not 1876, as stated by Mr. Spiers).

I, indeed, took their place in his office, as one of them fell ill, and returned with his brother to Bombay, where he died soon afterwards.

I managed Major Mant's office from 1875 to the time of his death. I had the assistance of the surviving brother on the Baroda and Kolhapur palaces, after we returned to Bombay in 1878, but, other than this, I had no assistance for original work from any native draughtsman.

I may also mention that the Baroda Library and Hospital were designed in 1880, not in 1876, as stated in the report.

I have been instructed by the Kolhapur and Baroda States to complete the working drawings for these palaces.

JOHN FOTHERINGHAM.

VARIORUM.

WE mentioned recently the importance to owners of house property and others of clauses contained in the "Conveyancing and Law of Property Act, 1881." A "Synopsis of this Act, with Index and Forms," by Mr. J. W. Dawson, Solicitor, has now been published by Fry & Son.—Of the pile of Almanacks, Diaries, Christmas Numbers, Shilling Annuals, and such like, now before us, what are we to say? All are good and useful to a certain class. The "City Diary, 1882" (Collingridge), "Blackwood's Shilling Scribbling Diary," "The Railway Diary and Officials' Directory" (McCorquodale), and others, tell their own tale, and will be selected according to circumstances. The latter includes a list of the directors and officers of the independent lines of railway in the United Kingdom; the weekly traffic returns for 1881, with blank columns for 1882; and an abstract of four half-years' accounts of some of the principal companies.—Waterlow & Layton's "Surveyors', Architects', and Auctioneers' Diary and Almanac" cannot be too highly praised. The best version, which is, of course, a little dearer than some other diaries, gives a whole page for each day, is strongly bound, and contains a very large amount of information for the professions to which it is addressed. We can praise it honestly.—The Art-Union of London issues, as usual, its unique little Almanac, which is obtainable by all subscribers.—The Gog and Magog of all books of this kind, however, are the "British Almanac and Companion" and "Whitaker's Almanac," the latter again increased in size and value. If asked "which shall we take?" our clear, distinct, and well-thought-out answer is, "both." The British Almanac contains, as usual, a summary of the architectural progress of the year. —"The Steadfast Aim" is the title of the extra Part of the *Quiver* for Christmas, 1881, and an excellent part it is, full of very good illustrations.—Under the title of "Gas and Electricity as Heating Agents," the important lecture delivered at Glasgow, by Dr. C. W. Siemens, is published by E. Stanford. There's matter in't. —"The Gentleman's Annual. Christmas, 1881" (Chatto & Windus), consists of two stories only, both by ladies apparently, and both above the average.—"Mdlle. Angèle," by Alice Corkran, and "A Double Bond." We have read Miss Corkran's with particular pleasure. It is a story of Normandy life, fresh and natural.—Messrs. Bentley & Son follow suit in the game of 6d. editions of popular works, and the card they play is "The Ingoldsby Legends,"—giving the illustrations by Cruikshank, Leech, and Tenniel.—The New York *Sanitary Engineer* for December 1st contains a valuable article, by Professor Henry Morton, on "Electric Lighting: its Fire Risks and their Remedies." So considerable, it is said, has been the success of this periodical that it is to be hereafter published every week.

Christmas Cards.

Messrs. Eyre & Spottiswoode, of Great New-street, Her Majesty's printers, have sent us a large assortment of Christmas and New Year's cards. Some, of course, are less good than others, but the variety and the grace of many of them are remarkable. Mr. E. Maurice, Mr. Harry Arnold, and Miss Steel are their special artists. Such of our readers as want cards of this sort cannot do better than ask at their stationers' for Eyre & Spottiswoode's.

Miscellanea.

The Edison Electric Light.—A paper was read on Wednesday evening before the Society of Arts, by Mr. W. H. Preece, F.R.S., upon Electric Lighting at the Paris Electrical Exhibition. The lecturer traced the progress of the application of electricity to purposes of illumination from the early machines made by Professor Elias, of Haarlem, in 1842, and by Signor Pacinotti in 1861. The arc-lamps, which were described in detail, and the Lampe Soleil, which held an intermediate position between the arc and incandescent lights, had done good service. The rising favourite, however, was the incandescent light pure and simple. The chief lesson of the Paris Exhibition was that the arc-light was suited only for external illumination, while the incandescent lamps were eminently adapted for internal and for domestic illumination. Referring to devices for measuring the quantity of electricity consumed, he showed Mr. Edison's apparatus, an iron box like a small gas-meter. Inside is a glass cell containing two copper-plates which have been immersed in a solution of sulphate of copper. A definite proportion of the current passing through a house passes also through this cell, depositing itself upon one plate, and the weight of copper so deposited measures the current used. Many unkind things had been said, observed the lecturer, about Mr. Edison and his promises, and perhaps no one had been severer in this respect than himself. It was therefore some gratification for him to be able to announce his belief that Mr. Edison had at last solved the problem that he had set himself to solve. Mr. Johnson (Mr. Edison's representative in this country) explained that Mr. Edison contemplated the manufacture of electricity on a large scale for distribution over a wide area. It could be used without any skilled supervision, and could be applied to any purpose for which power was required, such as working sewing-machines, &c. The cost of the lamps was so slight that his company intended to supply them without any charge beyond that made for the electric current. Sir F. J. Bramwell, in bringing the discussion to a close, said he believed that we were near a practical possibility of applying electricity to the illumination of ordinary households.

Gas in Theatres.—The Lord Chamberlain has sent a circular to all the theatres in London, in which he says:—"The theatre at Vienna, which has now been destroyed, appears to have been fairly well arranged and supplied with many modern appliances for safety, but the explosion of gas on the stage extinguished the lights in the auditory. The consequent darkness added to the panic and confusion which ensued, and doubtless prevented the audience from availing themselves of the means of escape provided for them. The Lord Chamberlain has already called the attention of the managers to the extreme importance of an entirely distinct and separate system of lighting for the stage and auditory. At the annual inspection of the theatres in September last this was specially inquired into, when it appeared that, almost without exception, the houses were supplied with gas from two or more mains, and that a distinct service to the front and stage could be arranged without material difficulty or expense. The Lord Chamberlain is fully prepared to acknowledge the readiness of the managers to carry out any reasonable requirements for the safety and convenience of the public, and he feels convinced that they will agree with him that the experience of these recent calamities makes it imperative that the arrangements above alluded to should be carried out in all theatres with as little delay as possible. The Lord Chamberlain must, therefore, call on them to do so, and requests the manager of the —— Theatre, in acknowledging the receipt of this circular, at his earliest convenience, to state what steps he may propose to take in the matter."

Another Vienna Theatre on Fire.—Vienna has had another fright on Monday. In the southern suburb of Mätzleindorf a private theatre, with only wooden stairs, caught fire, and the stupidity of the officials was within an ace of causing another terrible loss of life.

The Contractor for Truro Cathedral is Mr. Shillitoe, late of the firm of Shillitoe & Morgan, of Doncaster. Mr. Shillitoe commenced active operations on Monday, December 19. The footings are in, and the crypt is well forward.

The Builders' Accident Insurance (Limited).—The Employers' Liability Act has now been in operation some months, and several important cases have been tried in the various courts throughout the country as to the responsibility and liability of employers of labour in case of accidents to their *employés*. Several companies take the risk by insuring employers against it. There is one company,—the Builders' Accident Insurance, Limited,—which differs from the others by being restricted to the building trades and those trades which are allied with it, such as timber merchants, slate merchants, and the many other trades more or less in connexion with building. Another feature in this company is that, as it is established and conducted by members of the trade, for mutual benefit, the profits, after paying losses and expenses, will be divided amongst the policyholders.

Electric Light for Lambeth.—A correspondent writes:—"The Lighting Committee of the Lambeth Vestry have decided to make a preliminary trial of the electric light from Westminster Bridge, along Westminster Bridge-road, Kennington-road, Kennington Park-road, to Kennington-gate, where the Brixton and Clapham roads meet, and have invited tenders accordingly. Since Mr. W. T. Wiseman's motion in the Lambeth Vestry on this subject, Camberwell and other vestries are taking the question up with great spirit. In lead of the proverbial parochial apathy reigning supreme, it is now a race among the parishes as to which shall have the electric light first. Perhaps Mr. Wiseman's startling statement as to a saving of 10,600*l.* a year on the tower system of lighting may have had something to do with the energy now displayed.

Reopening of the Royal Polytechnic Institution.—We observe that this favourite place of entertainment and instruction will be open for the delectation of the public during the forthcoming Christmas holiday. Its closing in September last called forth general expressions of regret. That there is a decided demand for such an institution appears to be the opinion of several ladies and gentlemen of high social position who have the welfare of the masses at heart. The Marchioness of Lothian, Earl Brownlow, and Mr. Samuel Morley, are amongst those who are named as having expressed a desire to contribute largely of their wealth to the re-establishment of the institution. We are informed that the transfer now halts simply for the want of some six or seven thousand pounds.

Banbridge Union.—The Guardians of this Union have had for some time under consideration a report, together with plans and specifications, by Messrs. Munday & Lidstone, of Westminster, for the entire reconstruction of the drainage arrangements at the Banbridge Workhouse. The proposal involved the substitution of the earth-closet or pail system in place of the existing cesspools, and an entirely new set of drains for slop-water. The construction of the new drains is to be postponed until the spring, but it is the intention of the Guardians to abolish the cesspools and construct new closets on the pail system at once.

Royal Italian Opera, Covent Garden.—In view of the strong feeling being at present manifested on all sides relative to the danger of theatres consequent upon the recent catastrophe at Vienna, Mr. Herbert F. Gye has thought that it may be of some service to persons interested in the matter, as well as to the public at large, to know the arrangements at this important theatre, and has, therefore, had a description of them printed. The means adopted (we are not speaking of structural arrangements) appear to be ample, and the circulation of the notice will serve to give confidence to the public.

Subterranean Telegraph Cables in Germany.—The network of underground cables in Germany, which was commenced in 1876, was completed this year. The total cost has been thirty million marks (1,500,000*l.*), and 221 towns, including the principal industrial and military centres of the Empire, are connected by the new system. The entire length of the cables is 5,463 kilomètres (about 3,400 miles), and of the wires 37,372 kilomètres (about 23,000 miles. Seventy river cables have been laid. The entire weight of the cables is stated to be 12,829,408 kilogrammes, or over 12,000 tons.

The New Leadenhall Market was opened by the Lord Mayor on the 15th inst. We shall have more to say about it in a future number. Messrs. Francis & Co., of Gray's Inn-road, are fitting up the whole of the shops in the market with their revolving shutters.

Obituary.—On Sunday, the 18th inst., at Alfred Lodge, East-hill, Wandsworth, died Mr. Alfred James Hiscocks, F.R.I.B.A., in the 76th year of his age. For thirty-seven years he had been District Surveyor of Wandsworth and Tooting. Death has been fearfully busy amongst members of the profession during the last few days.

TENDERS

For portion of work in completion, Granville Lodge, Redbill. Mr. Banister Fletcher, architect:—

King & Sons	£1,690 0 0
H. Burman	1,291 0 0
T. Heath	1,268 0 0
W. & H. Castle	1,209 0 0

For a house at Putney, for Mr. Peter Yapp. Mr. F. W. Hamilton, architect. Quantities by Mr. C. W. Brooks:—

Adamson & Sons	£1,678 0 0
Craske	1,618 0 0
Avias & Co.	1,553 0 0
Pain	1,533 0 0
Aries (accepted)	1,507 0 0

For a villa residence, Melville-road, Falmouth, for Mr. William Hamilton. Mr. F. W. Hamilton, architect:—

A. E. Skinner (accepted)	£945 0 0

For rebuilding two houses in North-street, for Mr. Romain. Mr. C. A. Legg, architect:—

A. S. Judd (accepted).

For temporary chancel, sacristy, side-chapel, gallery, and laying on gas in Catholic Church, Portemouth. Mr. J. S. Hansom, architect:—

Patman & Fotheringham (accepted)	£839 0 0

For additions and alterations to 1, Castelnau Villas, Barnes, for Mr. G. W. Jones. Mr. Frederick Rogers, architect:—

Potterton	£885 0 0
M'Manus	762 0 0
Gibbs & Flew	720 0 0
Jordan	689 0 0
Batstone	680 0 0
Woolf (accepted)	666 0 0

For the erection of the eastern portion of Raikes Memorial Church, Gloucester, including the tower up to the ringing-stage. Mr. Capel N. Tripp, architect. Quantities by Mr. Henry Garrington:—

Henry Lovatt, Wolverhampton	£3,459 0 0
Wall & Hook, Brimscombe	3,285 0 0
William Cullis, Hereford	3,150 0 0
D. C. Jones & Co., Gloucester	2,980 0 0
James Clutterbuck, Gloucester	2,900 0 0
Edward Godwin, Gloucester	2,811 0 0
White & Co., Evesham	2,800 0 0
Alfred King, Gloucester (accepted)	2,744 0 0

For rebuilding No. 46, Warner-street. Mr. Wm. Paice, architect:—

Aylett (accepted).

For certain works at Bedford and Norfolk Lodges. Mr. Wm. Paice, architect:—

W. Downs (accepted).

For the erection of boys' school, Hatfield road, St. Albans. Messrs. J. & S. Flint Clarkson, architects. Quantities prepared by Messrs. Hodgson & Mundy:—

Miskin, St. Albans	£2,264 0 0
Iveson,* Northampton	2,160 0 0

* Revised and accepted at £2,210.

For the erection of a house for the manager at the Market Harborough Gas Works. Mr. John Runson, engineer, and Mr. S. J. Newman, joint architects. Quantities prepared by Messrs. R. L. Curtis & Sons:—

Iveson, Northampton	£526 0 0
Barlow, Market Harborough	494 9 0

For memorial to the late Mr. William Smalley, for the Incorporated Society of Licensed Victuallers. Mr. H. J. Newton, architect:—

Cusworth & Sons	£117 0 0
Farmer & Brindley	98 0 0
Waite	72 0 0
Sansom (accepted)	65 0 0

For house at Kent Hatch, Westerham, exclusive of foundations. Mr. M. Ed. Macartney, architect. Quantities by Messrs. Evans & Deacon:—

Durtnell, Brasted	£5,275 0 0
Punnett & Sons, Tonbridge	5,145 6 1
Maides & Harper, Croydon	4,995 0 0
A. M. Deacon & Co., Norwood	4,698 0 0
Bromwich, Foster, & Co., Rugby	4,666 0 0

For alterations and additions to the North Surrey District schools, Anerley. Mr. A. G. Hennell, architect:—

Burman	£4,497 [illegible] [illegible]
Mowlem & Co.	4,474 0 0
Amer	4,250 0 0
Turtle & Appleton	4,175 0 0
Crossley	4,000 0 0
Kirk & Randall	3,884 0 0
Macey	3,880 0 0
Masters	3,775 0 0
Careless	3,729 0 0
Candler	3,720 0 0
Bowyer	3,672 0 0
Hart (accepted)	3,556 0 0

For the construction of roads and sewers, &c., Bower Building Estate, Bedford. Mr. D. W. Aston, surveyor:—

Taylor & Co., Pimlico	£2 995 0 0
W. Harris, Camberwell	2,792 0 0
J. Pizzey, Hornsey	2,431 3 3
H. Morris & T. Peckham, Islington	2,299 0 0
W. Norris, Lambeth	2,242 0 0
Bottoms Bros, Lavender-hill	2,061 0 0
Wilson & Stoddard, Leyton	1,875 0 0
J. Wood & Son, Leicester (accepted)	1,643 0 0

For two houses, Mann-street, Hastings, for Dr. Allen. Mr. W. H. Murray, architect:—

Stubberfield	£748 0 0
A. Vidler	697 0 0
A. H. White	650 0 0
Peter Phillips	624 0 0

Additions to the South London Brewery.—In reference to the list of tenders for these works, published by us last week, we are requested to state that Messrs. Adamson & Sons' tender was accepted because it was really the lowest, deducting the sum allowed by them for the gravel and sand to be excavated.

TO CORRESPONDENTS.

Thanks to many unknown friends for good wishes received. The unexpected pressure on our pages forces us to omit reference to a pile of communications.—T S (next week).—W. B. B. (next week).—S. All statements of facts, lists of tenders, &c must be accompanied by the name and address of the sender, not necessarily for publication.

We are compelled to decline pointing out books and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under ..... 4s. 6d.
Each additional line (about ten words) ..... 0s. 6d.
Terms for series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under ..... 2s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

REPLIES TO ADVERTISEMENTS,
Addressed Box —, Office of "The Builder,"
Cannot be forwarded, but must in all cases be called for, and the Office Receipt produced.

THE CHARGE FOR A BOX IS AS UNDER:—
For "Situations Wanted" Advertisements ..... 3d. per Week.
For all other Advertisements ..... 6d. per Week

PREPAYMENT IS ABSOLUTELY NECESSARY.

*** Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, King-street, Covent-garden, W.C. to

DOUGLAS FOURDRINIER, Publisher,
Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied *direct* from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum, *prepaid*. Remittances payable to DOUGLAS FOURDRINIER, Publisher, 46, Catherine-street, W.C.

Best Bath Stone.
WESTWOOD GROUND,
Box Ground, Combe Down,
Corsham Down,
And Farleigh Down.
RANDELL, SAUNDERS, & CO., Limited,
Corsham, Wilts. [ADVT.

Box Ground Stone
Is the best for use in all exposed positions, being a well-known and tried weather stone.
50,000 feet cube in stock.
PICTOR & SONS,
Box, Wilts. [ADVT.

Doulting Freestone and Ham Hill Stone of best quality, in blocks, or prepared ready for fixing. An inspection of the Doulting Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK, Norton-sub-Hamdon, Ilminster, Somerset.—Agent, Mr. E. WILLIAMS, 73, Charlotte-street, Portland-place, W. [ADVT.

Doulting Stone and Ham Hill Stone, of best quality. Prices and Estimates, including delivery to any Station, on application to STAPLE & HANN, Quarrymen, Stoke-sub-Hamdon, Ilminster. Agent, Mr. E. CRICKMAY, Langbourn-chambers, 17, Fenchurch-street, E.C. [ADVT.

Asphalte.
Seyssel, Patent Metallic Lava, and White Asphaltes.
M. STODART & CO.
Office:
No. 90, Cannon-street, E.C. [ADVT.

Asphalte.—The Seyssel and Metallic Lava Asphalte Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms, granaries, tun-rooms, and terraces. [ADVT.

Immense quantities of

Barry's Lectures on Architecture.

MR. ALFRED BARRY has edited the republication of the late Professor E. M. Barry's lectures on architecture,* delivered from time to time to the students of the Royal Academy. The lectures are prefaced by a short memoir of the author's professional career, by the Editor, of which we need only say here that it includes the history of the rather curious and much-debated matter of the Law Courts Competition, more fully to be read in our own pages, by the way, than elsewhere, for those who are interested in looking up the subject again. We do not think it, at the present juncture, advisable or suitable to enter afresh into any critical remarks in reference to what was obviously in some way or other a mismanaged affair, in regard to which Barry had much right to consider himself ill-used. The memoranda in regard to his subsequent treatment, *consule* Ayrton, serve to remind one very disagreeably of the great injustice and discourtesy with which Government officials in England do not scruple to treat eminent members of the architectural profession, of which there are unfortunately not a few other instances on record, though none so flagrant as this. It is to be hoped things may be somewhat better now, but at that time it appeared that an eminent architect, long in Government employment, and son of the still more eminent architect of the greatest of our Government buildings, was regarded as a person who had no rights whatever, and whose letters and representations in regard to the injustice with which he was treated did not even call for the courtesy of a reply. There can be only one judgment, in fact, in regard to the relations between the Commissioner of Works' Department and Edward Barry, viz., that the Government officials did not even behave like gentlemen, let alone all consideration of their notions upon architecture and architects.

We pass from the memoir, however, to the lectures themselves, which form a bulky volume of over 400 pages. The editor has exercised a discretion in regard to the arrangement of the lectures, which are not printed in the order of the dates of their delivery, but are arranged in reference to their subjects; being classified under two main groups, a first series embodying the discussion of "general principles," and a second "historical" series, the latter being arranged so that the styles are treated of in the historical order in which they arose. Notes are added giving the actual dates of the lectures: thus we find appended to an early chapter of the volume on "Architecture Governed by Technical Principles," a note to the effect that this was the last lecture delivered by the author. Our first impression was rather against this transposition; but, on consideration, we are disposed to think that the book is made to appear a more complete and readable treatise in this manner, when regarded as a whole.

These lectures, as here published, differ very much in two points from the last volume of reprints of Academy professional lectures which we had before us, those of the late Sir G. G. Scott. The latter were profusely illustrated (not, as we pointed out in reviewing them, without some curious slips in regard to accuracy). The present volume, as a book dealing with architecture, is certainly deficient in illustrations, and all those which are given are reprints of cuts previously published in other works. There may have been circumstances connected with the bringing out of the book which rendered this unavoidable; but the value of the book to those who are not already well acquainted with the phases of architecture of which it treats is certainly much lessened thereby. On the other hand, while Scott's lectures dealt chiefly with the concrete facts of architecture, Barry's in many parts cover a wider range, and are largely taken up with the consideration of architecture as affected by social conditions of life, &c., and some of these questions are treated in a broad and philosophic spirit which is not very often to be found in architectural works.

Lights are thrown on a good many points in relation to the causes of failure of modern architecture, in a plain and common-sense spirit, in the first lecture on "The Variety of Interest in Architecture." That people in general should be made to feel that there is this variety of interest is, according to Professor Barry, one of the most essential conditions of architectural improvement. It is not easy to believe, he suggests, that the great public monuments of antiquity were constructed on the disheartening principle which governs public works now, where the question is not, How shall we get a worthy building? but, How little can it be made to cost? "We cannot fancy the architects of Westminster Abbey compelled to cheapen their design by reducing their mouldings, omitting the diapers and carvings, or leaving out the groined roofs, in order to save expense." Thinking of it in this way, it seems sometimes perfectly extraordinary that our press and Parliament should hold so mean a tone about art, and should be so utterly unconscious of its meanness. "Great nations," says Barry, "sometimes do little things, and their very greatness makes them impervious to criticism. It has been said that no one but a banker could walk down Lombard-street in a bad hat; and in a similar way it is, perhaps, only rich communities that can afford to show with impunity a public indifference to art." This may be only too true, perhaps; but there are other rich communities which do not show the same indifference. That this inertia in regard to art and architecture on the part of the public, and of their official representatives, is one of the very heaviest drags on artistic progress which exist among us, there can be no doubt whatever.

This sentence is one example of Professor Barry's tendency to look at reasons and motives, and not only at facts connected with his subject. He touches well, in the same lecture, on the revival movements of modern times, in a tolerant though not admiring spirit, as perhaps being only examples of carrying too far, for a time, the degree of study and of interest in the architecture of the past, which, when reduced to its right place, may in due time be a powerful factor in the formation of the architecture of the future. He was not blind to the fact that the Mediæval revival was from the outset "much mixed up with questions of religion and ritual"; a fact to which many modern Mediævalists are astonishingly blind.

We cannot, of course, go with the author when, in his second lecture, he by implication apologises for the recently-proposed iron balcony to London Bridge, on the ground that it was only a legitimate way of further utilising an existing structure in the best practical manner known in our own day. The project would have ruined the grand architectural expression of Rennie's bridge, and it is questionable whether it would have practically answered the proposed end. Nor can we concur in the apology which he makes in Lecture III. in regard to machine-made ornament, "that it must be clear to us all that the world will never give up a system, which by cheapening production serves the wants of the many, even at some cost to the artistic cravings of the few." This is an argument which is true enough as to machine-made pins and needles, or any other articles of purely utilitarian object. But cheapening ornament by machinery does *not* "serve the wants of the many," for it only gives the many that which is worthless, and which they had better be taught not to want. Ornament made by machinery can never really be worth much,—can never give the pleasure and interest which arise from design into each part of which the hand and feeling of the designer has gone.

The lecture on "Architecture as an Art of Utility" contains much which students would do well to read, mark, learn, and inwardly digest; among others, in regard to the seeking after intentional irregularity. "Young architects are apt sometimes to act as if it were a triumph of their art to throw down at random parts of a structure and accept the result. Irregularity is supposed of necessity to give picturesqueness, and the external quaintness of

* Lectures on Architecture, delivered at the Royal Academy. By the late Edward M. Barry, R.A. Edited, with Introductory Memoir, by Alfred Barry, D.D. With Portrait and Illustrations. London: John Murray. 1881.

a house is more studied than either the purse or the comfort of its inmates. This, I need hardly say, is a complete inversion of the principle that our art is based upon utility. . . . . Excepting in large structures, I should advise the student to be on his guard against needless irregularities of plan. In an artistic sense he has usually no greatness of dimensions or breadth of effect to throw away, and from the utilitarian point of view irregularity means too often expense and want of comfort, from an excessive surface of internal wall and of complication of roof." The fifth lecture, "Architecture Governed by Technical Principles," while there is nothing in it to which we should take exception, might have been more practically valuable if it had been more detailed and less general in its treatment of the subject.

We fear the same must be said of the chapter on "Architectural Proportion and Ornament," at least of the part of it dealing with "proportion," a matter which is said to be of great importance, but in regard to which we certainly can gather little idea from the lecture as to whether Professor Barry entertained any definite opinions on it. The first question in regard to "proportion" is to decide what we really are to mean when we talk of it; whether we are to mean a rule of relative sizes decided by mathematical or arithmetical laws; whether we are to mean the adoption of arbitrary rules, such as those embodied in Vitruvius, as recognised authorities merely on account of their acceptance by many generations of men; or whether our idea of proportion is merely to be derived from the judgment of the eye in each case. The first question is the most important, because on its acceptance or rejection so much depends in our method of looking at and judging architectural works. We do not derive from the author any certain judgment for or against this theory of mathematical proportion in architecture, or any statement of the arguments by which it may be supported or opposed; we have a general statement that the author is not disposed to accept the *dicta* laid down by some writers (as, for instance, that the best Gothic architects based their buildings on the equilateral triangle), but he gives an example of the fact that some conventional rules have produced good results: "A satisfactory proportion of a room may, for example, be obtained by first deciding the width, then drawing a line from one of the corners, so as to form an isosceles triangle, and making the length of the room equal to this line, being the hypothenuse of such triangle." What this means it is impossible to say. An isosceles triangle is simply a triangle of which two sides are equal; the relation of these two to the third side, and of the two equal angles to the third angle, may be anything we like, so that the definition is obviously incomplete somewhere. In regard to the question between the mere general satisfaction of the eye, which an unlearned spectator may be conscious of, and the satisfaction of the architectural critic who perceives that all the parts and mouldings follow out correctly a proportion which his eye has been accustomed to, and which he has been educated to consider as correct, a distinction is drawn which seems to us rather too decided. The instructed architect, we are told, "knows what should be the relative size of every detail,—what ratio the base should bear to the shaft, the shaft to the capital, and so forth. Any departure from recognised rules is to him a solecism and an offence, it is like a false quantity to a scholar, a *lapsus linguæ* to an educated man. The ordinary and not specially instructed observer sees none of these things. It is nothing to him whether a Grecian Doric column be used with a base, or a Corinthian column without one. The relative proportions of mouldings to each other have no significance for him, nor does he appreciate the differences of style which strike at once the more educated critic." Of course not. But how far are the perceptions of the more educated critic due to habit and acquired knowledge of the rules of a particular style, how far to a sense of innate and essential qualities of proportion? Because that is a very important question indeed. An architect who has been trained in a study of Classic models knows in what proportion (approximately, at least) various parts ought to be, and when he sees them differently proportioned he is struck with an impression of awkwardness in the architecture and want of knowledge in the designer; but we can hardly affirm positively that if he had been habituated to these proportions in the original style they would not have appeared satisfactory to him. Habit is an immense factor in architectural taste, far more so than is generally recognised. Then, appended to this, is the question whether it is an object of architecture to reproduce past styles correctly or not. If it is, of course this question of the correct proportion of the parts becomes of great importance. If it be not, the matter is altered entirely. The author, building on the fact that everybody has an opinion that an object is well proportioned or not, and that average cultivated judgment on the subject is not generally wrong, concludes that there must certainly be a science of proportion; but apparently also concludes (though he does not say so in so many words) that we cannot say what it is. That, however, is equivalent to saying that there is nothing that can be called science in the matter; it is a question of natural perception or "eye," heightened by culture. Nor can we say that the subject of ornament is treated in a way to clear it up very much to the student mind. It is certainly rather a contradiction in terms to be told in the same paragraph that a builder may erect a house which is practically satisfactory but displays no art, and that "the latter is shown in the application of ornament," and then in the next sentence, "not by the mere addition of carving, colour, or whatever may be thought to be ornament, but by giving dignity and beauty to the forms of construction," which is the exact opposite of "the application of ornament." A large proportion of the remarks on ornament enforce, in a suitable manner, views which have now been generally adopted by most people who are competent to form an opinion on the subject. We must question, however, the idea that we owe to the Greek love of sculpture the existence of the pediment as a prominent feature in architecture as a means of displaying sculpture. This would have been quite contrary to Greek architectural logic in general, besides which, we know that the pediment (which grew naturally out of the necessity for closing up the end of a roof) is found in the rock-cut architecture of Asia Minor, in places where no sculpture whatever is attempted.

In the lecture on "The Position of Modern Architects in respect of Architectural Restoration," the common-sense of the matter, as far as it can be urged on the side of restoration, is very well put. "Our churches," says the author, "are not mere tombs of the dead, but places of worship for the living. . . . . If the church of the district be so arranged that reverence in the service be impossible; if the pomps and vanities of earthly grandeur make themselves felt in it; if there be signs of neglect and deadness, all the more conspicuous from the contrast outside its doors, are we seriously to be told that we must not alter all this? And why? Because the gallery which darkens and divides bears the names of some old churchwardens; because the damp and ague-giving pavement exhibits some half-legible inscription; because the great Squire's pew, which symbolises selfishness, and shuts out the poor, has perchance some pleasant mouldings, some cornices of Georgian date, or, better still, some reminiscences of Queen Anne." This is just the common-sense of the matter, and it is satisfactory to find it so plainly and clearly put. "If," as he says elsewhere in the same lecture, "there be anything in architecture that is worthy the attention of earnest men, it cannot be that we are to look only to the past."

The lectures which form the historical portion of the book commence with one on "Early Military Architecture," which, as a phase of architectural work in which a great deal of really picturesque effect was evolved from the provision for the sternest and most exacting practical requirements, is not unsuitably placed at the head of the sketch of Mediæval architecture. The author confesses to having been much indebted in this lecture to Viollet-le-Duc, who had made the subject quite his own. We are then taken through the history of domestic architecture in the twelfth, thirteenth, fourteenth, and fifteenth centuries, and into the various periods of the Renaissance. Nothing new is professed or attempted, but there are some new lights thrown on the meaning and significance of some of the changes in architectural style which are worth attention. A remark is made, we observe, as to the vague and incorrect manner in which the expression "Palladian architecture" is frequently applied to Italian architecture:—"When men say they like or dislike Palladian architecture, they do not generally mean to refer to the architectural forms which Palladio himself actually used, but rather to Italian architecture generally, which has come to be described by a term only applicable in reality to one phase of its development." Much of what is called otherwise "Italian architecture" is, no doubt, entirely free from the peculiar faults of Palladianism (which latter is not without its peculiar excellencies also). The editor does not seem to be aware that since these lectures were delivered the history of the connexion of Bramante with St. Peter's has had much new light thrown on it, and it is a pity that he republishes the plan of the church ascribed elewhere to Bramante, and which, if it was Bramante's at all, must have been only a subsidiary sketch for an idea of the church quite different from and quite inferior to the original idea of the Greek cross of which Bramante was certainly the author. Otherwise the review of the history of the Renaissance, except that it requires, like other parts of the book, more illustration, is a very well-connected and suggestive one, which we cordially recommend to the perusal of our readers. We may conclude by quoting the final paragraph, which closes the volume, and suggests matter for thought:—

"A calm review of the history of the Renaissance, and of the circumstances which led to it, leads us to the conclusion that the movement is not yet over. The Classical tastes, which gave to it the first impulse, still exist among us and are likely to continue. An architecture which can give us solidity and magnificence; which can adapt itself to purposes of utility, and assimilate progressive scientific construction; which unites elegance of proportion with refinement of detail, and which welcomes the best efforts of the painter and sculptor in a loving combination of art, cannot be easily banished from the modern practice of the civilised world." Its spirit, at all events, is not likely entirely to die, in whatever different and even eventually improved forms it may hereafter exhibit itself.

THE LATIN PLAYS: ILLUSTRATIVE OF EDIFICES, AND OF EDIFICATION.

No word is more frequent in the mouths of the playwrights than "construction,"—well-constructed dramas, badly-constructed, loosely-constructed, defectively-constructed,—in fact, to listen to them, construction sometimes seems the main difficulty of the craft. Wit, repartee, incident, character, sentiment, humour,—these are the flesh and blood; but construction seems to deal with the skeleton, which is the support and foundation of all.

So far, dramatic construction agrees with architectural, for it would seem that the best materials may collapse if badly put together; but, in truth, the terms do not bear parallel interpretation in the two arts. The dramatist's notion of construction is the distribution of the subject which he has in his mind into successive scenes which shall gather force and effect from order of succession, and contrast without being confused, provide opportunities for introducing the richest variety of dramatic material, and avoiding tardiness on the one hand, and precipitate revelation on the other, keep interest and enjoyment ever advancing up to the very last scene of all.

So that what a dramatist means by construction answers more precisely to what an architect has in his mind when he is contriving a plan, or more generally, to take a simple example, in combining the various elements that complete accommodation in an ordinary house. Both artists have a main purpose that governs throughout. The dramatist has, or ought to have, a primary theme, a specially characteristic collision of interests or feelings, of which the speciality is put into lively evidence by the varieties of humanity selected to be brought into apposition with it, or opposition. It is, in fact, when the author fails to bring out a decisively marked and interesting characteristic by shifting about from one theme to another, so that no one is predominant, or when he does not seem to know how to work out the proper resources of the theme that he has undertaken to develope, that as an architect looks on he is reminded of apartments disproportioned to each other, passages that lead to nothing or trespass on space ill-spared by rooms, and all appropriate juxtapositions and communications neglected, and even some omitted entirely.

If ever an architect has such sins on his conscience,—that "guilty creature sitting at a play" can never be more conscience-stricken than when he recognises a very compendious re-

flection of his errors in the "Adelphi" of Terence, agreeably represented otherwise as it may be before Mr. Cockerell's scene in the old dormitory of Westminster.

The fault lies with the ancient Roman, not with our young moderns; if, indeed, it is not rather to be carried back to the Greek, from whom Terence borrowed most of his play, if he did not translate his original frankly and freely. The Roman dramatist made no scruple of such borrowings; there was the less reason in one respect that he should, as the author of the Greek original had been dead and gone some century before, and there was no possible question of unexpired copyright. The only point of honour which the prologues admit obligation to, is not to re-adapt a Greek comedy that some contemporary Roman compatriot had already laid hands on. Even so ancient was that "courtesy of the trade,"—known to the present generation as dignified respect for the first appropriation of an English author's work,—that has just expired among American publishers.

The extraordinary flatness with which these Roman plays conclude is noteworthy. If there is one principle most honoured by the modern dramatic constructors, it is that all main interests that have been roused in the course of the action shall contribute more or less to excitement and subsidence at the conclusion. This lameness at the last is observable in Plautus as much as in Terence. Only in one of the twenty plays of Plautus is there anything approaching to a comprehensive interplay of dialogue in a last scene; the exception is the "Asinaria." Otherwise we might have charged the defect upon the Athenian Diphilus, from whom Terence took the "Adelphi,"—Diphilus, who, if an epigram can be trusted, was apt to err by frigidity. Thus it runs, preserved to us by Athenæus:—

> "Gnathæna! wine I never drank
> So cool as yours; once more refill it."
> "My Diphilus! yourself you thank;
> 'Tis with your comedies we chill it."

To return to the "Adelphi"; the construction is, of necessity, unsatisfactory from a flaw in the original scheme. Two brothers are brought up,—one by his father, another by his uncle,—upon contrasted systems of extreme severity and extreme indulgence. Both turn out equally dissipated, and the play ends with the severe father reconciling himself to allowing his pupil even greater licence of irregularity than his brother had always taken advantage of unchecked. The laugh is turned against the disciplinarian when it proves that his own pupil was the misdemeanant in riotous conduct of which the brother, with no character for steadiness to lose, had kindly borne the blame; and against the easy-going uncle when his good nature is imposed upon, and he is forced to carry out his principles by manumitting slaves right and left, and to take a wife at a moment's notice of whom he knows nothing. Elegance of language and versification nevertheless retain the interest of the audience for an action in which there is so little to excite sympathy in any but the abettors of lax morals in the young, and so little to stimulate laughter except for those who side with a triumph over the weakness or corruption of the elderly. Such was the judgment of Julius Cæsar, most distinguished of all the long line of theatrical critics, who admitted, in six excellent *vers de société*, the charm of the style of Terence, and so far gave him the credit of being half what Menander was, but complained of short allowance of the *vis comica* that was so unfailing a distinction of the Greek.

His nephew, Augustus Cæsar, seems to have been of the same mind, for his predilection was decided for the old-fashioned plays of Plautus,—so Suetonius tells us, and this goes far to explain the querulous expostulations of Horace, who, in his long epistle to Augustus, makes a hard fight to assert the superiority of the new school of poetry, and to persuade the emperor out of his better senses, that the old poets had nothing more to recommend them than the fact that they were old, a merit which, give it time, contemporary poetry would enjoy no less.

As regards the particular issue between Terence and Plautus,—Plautus with whose volumes Erasmus said he would be content to go on, give him but the New Testament as well,—let us appeal unto Augustus Cæsar, and cite the elder poet to speak for himself, and to speak a speech which always commends itself to ourselves, redolent as it is of bricks and mortar. It is the better, if not spoilt in the translation, for being read with the thought how it must have been enjoyed by the friend of Colet and Sir Thomas More, the author of that repertory of wit and wisdom, "The Encomium of Folly,"—"Encomium Moriæ."

But a word first as to comparative moralities. Plautus, who drew from the same Greek fountain-head the New Comedy of Philemon, Diphilus, Menander, and the rest, is quite as ready as Terence to adopt and adapt a plot of which the chief interest turns on the success of the young in cheating and debauchery, and can always find opportunities for exuberant wit, and for as much true humour as is consistent with restriction to certain well-established types of character. We are the more taken by surprise when, in the single instance of the "Captivi," in both prologue and epilogue, he makes a merit,—exceptionally among comedians he declares it,—of having presented a play which is free from any immoral stain either in language, characters, or incidents,—one by attending which those who are already good may become still better. And yet one word more for Plautus. He has given a representation of maidenly modesty that would be beautiful in the fiction of any time, and could scarcely be expected on the comic stage of the ancients. The daughter of a worthless old sycophant is required by him to help a plot by personating for a time, without further consequences, a woman of loose life and conversation. She protests to the utmost of her power, but in vain, and the picture is touching of how she preserves what dignity she may in the dialogue in which she is required to bear a part, by ingenious ambiguities of language that go some way to preserve her sensibility from admissions that her soul rebels against. But now turn we to the promised speech.

In the second scene of the first act of that most amusing play, the "Mostellaria,"—the "Haunted House," we may translate it,—*Philolaches* soliloquises, though with a not unusual occasional reference to the audience:—

> "I've long and often thought and argued deep,
> And in my heart (if I have any heart)
> Have long debated and revolved, What's man,
> Just born, to be compared to? and have now
> Found out his likeness. Man is a new house,—
> I'll tell you how; and though you think it not,
> I will convince you what I say is true.
> When you have heard, you'll think and say as I do.
> Lend me your ears and you shall hear my arguments,
> For I'd have all as knowing as myself.—
> As soon as e'er an edifice is plann'd,
> But it up in taste, and polish'd to exactness,
> The architect's commended; and his house
> By all approved; each takes it for a model
> And spares no pains, no cost to have one like it.
> But when a tenant comes, unthrifty, mean,
> Neglectful, with a lazy family,
> The fault is straight upon the building laid,—
> Good in itself, but kept in bad repair.
> Then, as it often happens, comes a storm,
> Demolishes the tiling, spoils the gutters,
> And the too careless owner takes no heed
> The damage to repair. A shower succeeds,
> Washes the walls, the roof admits the water,
> The weather rots the builder's edifice,
> The house grows worse by use; and in all this
> The architect is not at all to blame—
> A great part of mankind affect delay;
> And if it cost them money to repair it,
> Delay it still till every wall fall in,
> And the whole's then anew from the foundation.
> Thus much for buildings. Now, how men are like them.
> First, then. All parents are their children's architects;
> They first lay the foundations and then raise
> The superstructure of their education.
> They carefully add firmness; that they may
> Become good men and be an ornament,
> As well as use and safeguard to their country.
> And to such end they spare nor cost nor pains;
> Expense on this account they count for nothing;
> Refine their manners, teach them letters, laws,
> And by their cost and care endeavour still
> That other men should wish their children like them.
> Then to the army. There their fathers place them
> Under protection of some great relation;
> And so they pass out of the builder's hands
> Ere they have served a year. You then may see
> A sample how the building may turn out,
> For I myself, as long as I was under
> The builder's hands, was sober all the time,
> And honest. But as soon as e'er I follow'd
> My own inventions, I at once undid
> All that my architect had done before.
> Then enter'd Idleness, and was the storm
> Brought on my hail and rain; quite overthrew
> My modesty and each restraint of virtue,
> And utterly untiled me. Heedless I
> Again to cover in my edifice;
> Love like a torrent rush'd into my heart,
> O'erflow'd my breast, and soak'd quite through my soul;
> And now my fortune, credit, and fair fame,
> My virtue and my honour all have left me:
> By negligence, I'm grown still worse and worse;
> These rafters are so ruinous, so foul,
> With rotting moisture, that, by Pollux' temple
> I see no means remain to patch it up.
> The whole must fall, and its foundations fail
> Without a hand to help me."

Surely, now, the poet deserves that we should by anticipation respond to his appeal as the curtain fell,—or rather rose,—for such was the Roman way:—

> "The play is finish'd; give us your applause."

THE LATE MR. ANTHONY SALVIN, ARCHITECT.

THE late Anthony Salvin was the son of General Anthony Salvin, of Sunderland Bridge, in the county of Durham, and the representative of that branch of the ancient family of the Salvins of Croxdale. He was born, October 17th, 1799, was educated at the Durham School, and passed many of his early days with his uncle, the Rev. Wm. Nesfield, at Brancepeth Rectory. The restoration of Brancepeth Castle was then going on, and the youth, much interested in the operations, it may be, acquired the taste for architecture which determined his choice of the profession he followed during the remainder of his long and active life. He came to reside in London about 1820, and with his future brother-in-law, William Nesfield, the painter, mixed in the society of the art-world of that time, Turner, Prout, and others, and was for a short time in the office of Nash when the elder Pugin was in the office. He was elected into the Society of Antiquaries in 1824, and lived to be the oldest member. Salvin began practice at an early age, as in 1828 he built Mamhead, near Exeter, for Sir Robert Newman, at a cost of about 20,000*l*., and in the same year Morby Hall for Mr. Henry Preston, at a cost of 40,000*l*., while in 1829 he had the gratification of being called in by Mr. Russell to restore the Great Hall at Brancepeth Castle, the building which inspired his career.

Then followed in quick succession such works as Methley Hall, in 1830, for the Earl of Mexborough; Parham, for the Hon. Robert Curzon; and many others of equal importance. Mr. Salvin was consulted for many years on all matters relating to Government castles, and his skill and knowledge of Mediæval fortresses were generally admitted. His careful study of the remains of English and Welsh castles, in all their details, is shown by his sketches, which are admirable for their artistic merit and archæological knowledge. Amongst the most successful of his works may be named Peckforton Castle, which was built from the foundation for Lord Tollemache. He also restored the Beauchamp Tower, and Traitors' Gate, at the Tower of London. The manner in which Caernarvon Castle has been kept from ruin may be credited to Salvin's influence in high quarters, and his enthusiasm for our ancient work.

At Windsor Castle he considered himself somewhat controlled in the restoration of the Curfew Tower; but in all things he earnestly endeavoured to be conservative. Alnwick Castle was restored by Salvin for Algernon, Duke of Northumberland, between the years 1852 and 1861. This was his great work, and the outlay was large. The decoration of the interior was controlled by the Duke, who insisted on its being carried out in the Italian Cinque-cento style, and for this purpose Cardinal Antonelli, at the Duke's behest, persuaded Commendatore Canina to come from Rome with a number of Italian artists and carvers; but the whole of the internal work was under Salvin's direction.

Keele Hall, in Staffordshire, near Newcastle-under-Lyme, built for Mr. Ralph Sneyd, between 1855 and 1862, is spoken of as one of the best planned houses in England, from its clever adaptation to the ground. The court-yard is on a low level, and a flight of steps, similar to the ancient arrangement of Parham Court, approaches the great hall on the first floor, on which the principal apartments are arranged, the basement being occupied by servants' offices. The whole shows attention to old work. Amongst his later works, Thoresby Hall, in Notts, commenced in 1864, for Earl Manvers, and finished 1875, is conspicuous; and the restoration of Dunster Castle, for Mr. G. T. Luttrell; Petworth House, for Lord Leconfield; Longford Castle, for Lord Radnor; Encombe Hall, for Lord Eldon; and Birdsall House, for Lord Middleton, are all works of importance. Salvin may be said to have died in harness, at the age of eighty-two years.

As late as last year he was building a house in Chesterfield-gardens for Lord Leconfield, when the growing infirmity of age compelled him to relinquish the task. But his work did not end here, for within the last few months, and greatly at his own expense, he interested himself in the restoration and enlargement of the church in the village of Fernhurst, Sussex, near which he lived during the last seventeen years of his life. His anxiety at the last was that the bells which he had bestowed should be hung in the new

tower and tone his departure. He died on the 17th of December, 1881.

Salvin was a true gentleman that the profession may be proud of, a man of business, and courteous, as all who knew him, employers and employed, will acknowledge. W. E. N.

A list of his works, as far as can be ascertained, is appended,—

Before 1826:— House in Durham.—Dr. Cook. Brancepeth Castle.—Mr. Matthew Russell. Church of Northallerton.
1827. Norwich Cathedral, west front. Harlaxton Manor (or Hall).—Mr. Gregory.
1828. Mamhead.—Sir Robert Newman, bart.
1828-33. Moreby Hall.—Mr. Henry Preston.
1828-33. Somerhill.—Mr. James Alexander.
1829. Brancepeth Castle, Durham, alterations in hall, &c.—Mr. W. Russell.
1830-36. Methley Hall.—Earl of Mexborough.
1831-32. Sunderland Chapel.—Lord Crewe's Trustees.
1831-33. Barley Rectory.—Rev. W. Turner.
1832-46. Farham.—Hon. R. Curzon.
1830-32. Ulverstone new church.—H. M. Commissioners.
1833. Stoke Green House.—Lieut.-Col. Rolfe.
1835-39. Burwarton House, Ludlow. — Hon. G. F. Hamilton.
1835. Grosvenor House alterations. —Marquis of Westminster.
1835-46. South Shields, new church.—Dean and Chapter of Durham.
1838. Keswick, new church.—Mr. J. Marshall.
1836. Cowsley Hall.—Mr. G. Lloyd.
1837. Seaton Carew Parsonage.—Rev. A. Guiness.
1833-35. Durham University.—The Warden and Trustees.
1834. Sheldon new church.—A Committee.
1835. North Runcton.—Mr. Daniel Gurney.
1836. Chalfont House.—Mr. John Herbert.
1836-41. Danesfield. Mr. C. Scott Murray.
1836. Woodlands.—Mr. W. Ley.
1837-43. Scotney Castle.—Mr. E. Hussey.
1838. Shutterskelf.—Viscount Falkland.
1838-40. Rufford Abbey.—Earl of Scarborough.
1839-48. Greystoke Castle.—Mr. H. Howard.
1838-40. Burtonfield, York. - Mr. C. Darley.
1837-45. Heath Hall, Wakefield.—Mr. T. G. Smith.
1839. Moor Park (work in terraces). — Marquis of Westminster.
1839-41. Sand Hutton, near York. -Mr. J. Walker.
1840-41. Durham University.—Warden and Fellows.
1840-45. Worden Hall, near Chorley. — Mr. J. N. Harington.
1840-41. Spittlegate, Grantham, new church.—A Committee.
1841. Kilndown, Goudhurst, new church.—A Committee.
1841. Ley Fields.—Earl of Scarborough.
1841. Willow House.—Earl of Scarborough.
1841. Esholt Hall, new chapel.—Mr. W. R. Stansfield.
1841-42. Sherborne House.—Lord Sherborne.
1841. Grantham, new savings bank.—Trustees.
1841-42. Denton, new rectory.—Rev. G. Potchett.
1842-43. Trinity College, Cambridge, Master's lodge.—The Master and Fellows.
1842-43. Flixton, Suffolk, Priest's house.—Sir R. Shafto Adair, bart.
1843. Ayott St. Peter's Rectory-house.—Rev. E. Prodgers.
1843-45. Arley Chapel.—Mr. R. E. Warburton.
1843-44. Hemel Hempstead Church, restoration.—Churchwardens.
1843. St. Paneras, Christ Church.—Rev. W. Dodsworth.
1844. Cambridge, Church of Holy Sepulchre, restorations.—A Committee.
1844-47. South Otterington Church, rebuilding.—Mr. W. Rutson.
1844-47. Durham Cathedral, rescating choir.—Dean and Chapter.
1844-46. Kelham Hall.—Mr. J. Manners Sutton.
1844-45. Newark Castle, repairs. — Commissioners of H.M. Woods.
1845. Carisbrook Castle, repairs.—Commissioners of H.M. Woods.
1845. Newark, new baths.—A Committee.
1845-48. Castle Rising Church, Norfolk, restoration.—Hon. Col. Howard.
1845-46. Lynn, new church.—A Committee.
1845-46. High Cross, new church, new parsonage.—Lady Louisa Giles Fuller.
1845. Tabley House.—Lord de Tabley.
1844-48. Blickedown House, Haslemere.—Captain Henry.
1844-50. Flixton Hall, Suffolk.—Sir R. Adair.
1846-51. Hafod, North Wales.—Mr. Henry Hoghton.
1846-48. Haworth Castle.—Earl of Carlisle.
1846-48. Pennoyre House.—Lieut. Col. Lloyd Vaughan Watkins.
1846-50. Peckforton Castle, Cheshire.—Mr. John Tollemache.
1846-48. Oxon Heath.—Sir W. Geary, bart.
1845-50. Tatterdale Hall.—Mr. W. Marshall, M.P.
1847. Runcorn, new church.—A Committee.
1847-48. Carnarvon Castle, restoration.—Commissioners of H.M. Woods.
1848. Torquay, new church.—A Committee.
1848. Wern Eynon, additions.—Mr. J. H. Vivian.
1848. South Park.—Viscount Hardinge.
1848. Stapeley House, near Nantwich.—Rev. James Folliott.
1848. Hatfield Hall, Durham University.—The Warden.
1857. Wells Cathedral Choir.—Dean and Chapter.
1849. Greystoke Church, chancel rebuilt.—Mr. Henry Howard.
1849. Shepherd's Bush, St. Stephen's new church.—Bishop of London.
1851. Shepherd's Bush, St. Stephen's parsonage-house. Bishop of London.
1849. Langley Hall, alterations.—Admiral Sir W. Proctor.
1849-51. Rockingham Castle.—Hon. R. Watson.
1849. Finchley Rectory.—Rev. T. R. White.
1849. Lanercost Priory, restoration.—Commissioners of Woods.
1849-51. Freethorpe Church, Norfolk.—Mr. H. Vade Walpole.
Goring, new farmhouse.—Mr. David Lyon.
1850-53. North Wootton Church.—Hon. Mrs. Greville Howard.
1850. Derwent Sole House.—Mr. Henry Marshall.
1851. Lanercost, parsonage-house.—Earl of Carlisle.
1851. Norwich Bank.—Messrs. Gurneys.
1851. Juniper Hill.—Mr. Cuthbert Ellison.
1851. Rothbury Church, Northumberland, restoration.—Rev. Vernon Harcourt.
1851. Sailsbury Schools.
1851. Betshanger Church.—Sir Walter James, bart.
1854. Betshanger Lodge.—Sir Walter James, bart.
1852. Stoke Holy Cross, Norfolk, mansion.—Mr. Henry Birkbeck.
1860. Stoke Holy Cross, Norfolk, farmhouse.—Mr. Henry Birkbeck.
1852. Bangor Castle.—Mr. R. E. Ward.
1852. Highgate National Schools.—A Committee.
1852-55. Balliol College, Oxford.—The Master and Fellows.
1852. Wilderness Park.—Marquis of Camden.
1852-53. Trinity Hall, Cambridge.—The Master and Fellows.
1853. Little Stanmore, new rectory.—Rev. B. Tuson.
1852. Highgate House.—Mr. Harry Chester.
1852-61. Alnwick Castle and estate improvements.—Duke Algernon of Northumberland.
1851-52. Sudbury Hall, Uttoxeter.—Lord Vernon.
1853-57. Torquay, new church, Upton.—A Committee.
1853. Lower Rover Church.—A Committee.
1853. Rose Castle, Carlisle, restoration.—Bishop of Carlisle.
1853. Hugh Legh, new schools.—Mr. George Cornwall Legh.
1853. Aldridge Church.—A Committee.
1853. Worden Hall, New Lodge.—Mrs. Harington.
1853-55. Caius College, Cambridge.—Master and Fellows.
1853. Tatterdale, new church.—Mr. W. Marshall.
1853. Arley Hall.—Mr. R. E. Warburton.
1853. Warboys, new schools.—Rev. W. Finch.
1854. Warboys, rectory.—Rev. W. Finch.
1853. Lympsfield schools, Surrey.—Mr. Wm. Leveson Gower.
1853. Wilby Church, Northamptonshire, restoration of chancel.—Rev. R. Stockdale.
Tower of London.
1853. Beauchamp Tower, restoration.—Commissioners of H.M. Woods.
1857. Salt Tower, restoration.—Commissioners of H.M. Works.
1861-62. White Tower, armoury, council chamber.—War Office.
1864-66. White St. Thomas Tower.—Commissioners of H.M. Works.
1867-68. Warders' new quarters.—Commissioners of H.M. Works.
1867-89. New Jewel Room, Wakefield, St. Thomas Towers. Commissioners of H.M. Works.
1854. North Runcton, additions.—Mr. Daniel Gurney.
1854. Yarmouth Bank.—Messrs. Gurney.
1854. Newfoundland, new church st.—Mr. Thos. Newman Hunt.
1854. Over Tabley, new church.—A Committee.
1854. Queenstown, new club house.—J. H. Smith Barry.
1854. Trinity Hall Lodge, Cambridge. — Mr. T. C. Geldart.
1854. Weaverham Church, Cheshire, restoration.—A Committee.
1855. Scothy New Church, Cumberland.—Mr. G. Head Head.
1855-63. Keele Hall, Staffordshire.—Mr. Ralph Sneyd.
1855. Headley New Church, Surrey.—Hon. Mrs. Greville Howard.
1855. Lindisfarne Abbey, restoration. Commissioners H.M. Woods.
1856. Hartford, Huntingdon, new house.—Mr. W. H. Desborough.
1856. Abbotts Ripton, Huntingdon. — Rev. P. P. Rooper.
1856. Rock Church, Northumberland, restoration.—Rev. N. W. Bosanquet.
1856. Buckworth Rectory.—Rev. J. D. Shafto.
1856. Upper Tooting, new church.—A Committee.
1856-58. Marbury Hall, Cheshire.—Mr. J. H. Smith Barry.
1856-57. Carlisle County Hotel.—Mr. Geo. Head Head.
1857. Trinity College, Cambridge, alterations.—The Master and Fellows.
1857. Shouldham Thorpe Church, Norfolk, additions and restoration.—Sir. Thomas Hare, bart.
1857. Great Badworth Church, alterations.—A Committee.
1857. Diddington Hall, Huntingdon.—Mr. Geo. Thornhill.
1857. Dutton Chapel. Lord de Tabley and Mr. J. H. Smith Barry.
1857. West Cowes Castle, Isle of Wight. — Commandant Royal Yacht Squadron.
1857. Silkstone Church, Yorkshire, restoration.—Mrs. Clarke.
1857. Vine Cottage, Cambridge.—Professor Selwyn.
1858. Church Fenton, restoration of church.—A Committee.
1858. Sherburn Church, Yorkshire, restoration.—A Committee.
1858. St. Mary's-the-Great, Cambridge, chancel.—Trinity College.
1858. Durham Library, restoration, &c.—Dean and Chapter.
1859. Congham Hall, Norfolk.—Mr. R. W. Elmes.
1859. Somerford Hall.—Sir C. Shakerley.
1859. Farham Church, Cumberland.—A Committee.
1860. Torquay, St. Mark's new church.—A Committee.
1860. Torquay, St. Matthias's new church.—A Committee.
1860. Mears Ashby Hall, Northamptonshire.—Captain Stockdale.
1860-62. Horsley House.—Mr. J. R. Hildyard.
1860-68. Trinity College, Cambridge; the Master's Court; the Master's Second Court. — Rev. W. Whewell, D.D.
1861-62. Aberford Church, Yorkshire, restoration, &c.—A Committee.
1862. Tupton House, alterations.—Lord Churston.
Churston Schools.—Lord Churston.
1861-62. Windsor Castle, embankment wall and 100 steps; new guard-room; Bell and Garter Towers, restoration; Henry VII.'s Library, restoration; Waterloo Gallery, restoration; Norman Tower, restoration; grand staircase.—Commissioners of H.M. Works.
1862. Windsor Castle, Oratry Tower, restoration.—Dean and Chapter of Windsor.
1862. Bolton-le-Gale Church, restoration.—A Committee.
1862. Whitehall, Cumberland.—Mr. Geo. Moore.
1862-66. Muncaster Castle Cumberland.—The late Lord Muncaster.
1863. Flixton Church, restoration.—Sir R. S. Adair, bart.
1863-66. Warwick Castle.—Earl of Warwick.
1863. Whickham Church, Durham.—A Committee.
1863-64. Tynemouth, new churches, viz.:—North Shields; Whitley; Percy Main.—Duke of Northumberland.
1864. Cambridge Free Grammar School. — Caius College.
1864. Crossrig Hall.—Colonel Rigg.
1864-65. Cambridge, new museums.—The Senate of the University.
1866. Cambridge Anatomical and Chemical Schools.—The Senate of the University.
1864-75. Thoresby Hall and stables.—Earl Manvers.
1864-73. Brancepeth Castle.—Viscount Boyne, the late.
1866-69. Capesthorn Hall, part by Mr. A. S., jun.—Mr. A. H. Davenport and Mr. W. H. Bromley Davenport.
1866. Lazonby, new church.—Mrs. Maclean.
1866. Nateby Scures Church, restoration.—Colonel Carleton.
1866. Stanwick Parsonage. — Dowager Duchess of Northumberland.
1867. Stanwick Church.—Dowager Duchess of Northumberland.
1866. Parkhurst, new house.—Mr. Cotsford Burdon.
1867. Windsor Great Park, the Royal Chapel.—Commissioners of H.M. Woods.
1867-68. Fawsley Hall.—Sir Rainald Knightley.
1867. Hampton Court Palace, rescating Royal Chapel. —Commissioners of H.M. Works.
1868. Worth Maltravers Church, restoration.—Earl of Eldon.
1868. Simonbrom Church, restoration.—Colonel Chateris.
1869. Northumberland House, new ball-room.—Duke of Northumberland.
1869. Albury House, Surrey.—Duke of Northumberland.
1868. Windsor, new stables.—Dean and Chapter of Windsor.
1869. Hutton Hall.—Sir H. Vane.
1869-70. Worth Church, Sussex, restoration.—A Committee.
1869-72. Dunster Castle.—Mr. G. F. Luttrell.
Paddockhurst.—Mr. Geo. Smith.
1870. Virginia Water, royal fishing cottage.—Commissioners of H.M. Woods.
1870-72. Petworth.—Lord Leconfield.
1870-75. Longford Castle, in progress Christmas, 1875.—Earl of Radnor.
1871. Flixton Parsonage. Sir Shafto Adair, bart.
1871-74. Encombe Hall, Dorsetshire.—Earl of Edon.
1871-72. Cumberland Lodge, Windsor.—Commissioners of H.M. Woods.
1872. Melbury House.—Lord Ilchester.
1872-74. Rogate Lodge.—Mr. Hugh Wyndham.
1872-74. Muncaster Castle; Church; Parsonage.—Lord Muncaster.
1872-75. Bridsall House, Yorkshire.—Lord Middleton.
1873-75. Osborne House.—Mr. C. S. Roundell.
Burwarton Church.—Viscount Boyne.
1875. Thoresby, new church.—Earl Manvers.
1876. Sedgefield Church.—A Committee.
1875-78. Greystoke Castle.—Mr. Henry Howard.
1876-77. Burwarton Hall.—Viscount Boyne.
1877. Cumberland Lodge, Windsor Great Park.—Commissioners of H.M. Woods.
1878. Royal Lodge, Windsor.
1878. Longford Castle.—Earl of Radnor.
1878-79. No. 9, Chesterfield-gardens, Mayfair, new mansion. —Lord Leconfield.

BERLIN AND PARIS.

The building activity which at present seems so universal in the great cities of the world,—in New York, where "flats" are being erected with a rapidity that anywhere else than across the Atlantic would be extraordinary; in Vienna, as has been noticed in these pages; in England, as our readers know well; in Paris, as recent accounts amply show,—is no less remarkable in Berlin. In the German capital new buildings are rising, and new means of communication are being laid out, chiefly, it appears, at the West End, a feature to be remarked in most capitals, arising probably from the fact that it is the south-westerly winds that prevail in the year, thus leaving the atmosphere of the west end clear. In Berlin this rule holds good: squares, public gardens, and public promenades, planted, of course, with the favourite linden and chesnut trees, and amply supplied with granite seats, are being laid out. The Bourse is being enlarged, and a new bridge is to cross the Spree, obliging the opening of a new street and the widening of several others in the neighbourhood. It is, however, as previously remarked, at the West End, in the fashionable neighbourhood, that building is most active. It was here that was recently opened by the Crown Prince the Industrial Museum,* a magnificent quadrangular three-storied edifice, which cost over three millions of marks, the work of the architects Gropius and Schmieden, a museum containing a mass of artistic treasures, among them Dr. Schliemann's Trojan antiquities, and a choice selection from the Prince of Wales's Indian collection. In addition to the museum, now completed, is being built a new theatre, to be as im-

* It will be remembered that the Crown Princess did not neglect on this occasion to refer in a few feeling words to the work of her father, Prince Albert, in the direction of technical education.

portant as any of the existing Berlin theatres, the Wilhelm Theater, the Friedrich Wilhelm, or the Victoria. The name of the new house has not been determined on, decision hovering between the Augusta or the West-end Theater. We may rest assured that the sad series of accidents which have lately been so terribly frequent in the theatres of the great capitals, will cause all due consideration to be given to the point of the safety of the public, and the recent and most terrible of all these, in the twin German capital of Vienna, will lead to still further precautions being taken in this direction. Such events seem to come cruelly to force lagging improvements, — improvements which, at the same time, can avail but little where panic is found to paralyse those very persons behind the scenes who, at such moments, should have about them their utmost presence of mind; it is alone by rehearsal of the part to be played by each in case of fire that its real presence can be combated. Firemen are never flustered; in the recent Cheapside fire we saw how fire-drill rendered a number of young warehousemen excellent aids to the fire-brigade. In this matter of fire-drill at the theatre, our own experience can fully confirm the statement of a writer to one of our daily papers, who mentions the successful action at the Munich Court Theatre (on the occasion of a fire there some time since) of the iron curtain,—dropped every night after the performance, and thus kept in perfect working order,—and the shower-bath taps behind the scenes. Here, as in every other point of its model management, which should be studied by all theatrical managers, the Munich Court Theatre showed that its *personnel* was admirably drilled.

In Paris, the building activity to which reference has so often been made continues apparently unabated. Here again, as in London and Berlin, it is at the west or fashionable end that the masons are busiest. The district between the Trocadéro and the Champs Élysées,—already so crowded with rich American and English residents,—is rapidly filling with huge five-storied stone mansions, in the construction of which enter none of those restricting considerations of short leases such as hamper so seriously the builder in England. In the Rue Pierre Charron (the former Rue de Morny) where the building activity is especially remarkable, there are several houses being erected worthy of notice as differing from the familiar Parisian type. One of these, at the end towards the Trocadéro, is, we learn, being built by the Comtesse de Gueridas, and is intended to serve as a museum of Roman and Egyptian antiquities, which, when completed, will be presented by the owner to the City of Paris, a princely gift; near this house the "Nationale" Insurance Company is erecting a group of magnificent dwelling-houses, five stories high, and which have now reached the third floor. The Paris Insurance Companies have been lately largely adorning the capital with the edifices they have been erecting each block, — they are to be found scattered over the fashionable quarter, in the Boulevard Haussmann, the Champs Élysées, and elsewhere,—bearing on a highly decorated marble tablet the name of the company by which the house has been erected. It can be understood that in this investment of their capital,—the returns from which in Paris are ample,—the companies insure the solidity of the work. It would be desirable, were our leasehold laws differently conceived, to see this plan more largely adopted on this side of the Channel. At no great distance from the "Nationale" Insurance Company's block, in the Rue Pierre Charron, is being erected a comparative novelty in Parisian street architecture, not too largely broken by eccentricity; a wealthy manufacturer of electric apparatus is building a two-storied house, the façade to be adorned with coloured faïence, and two large medallions, one to receive a clock, the other a barometer. It is to be a novelty in the direction of polychromatic architecture.

Before we leave the Trocadéro, let us not forget to mention,—as bearing on a subject recently alluded to in these columns, the artistic value of collections of casts,—the opening of a portion of the Cast Museum at the Trocadéro. At the time of the death of the late Viollet-le-Duc, reference was made in these pages to the scheme the eminent architect had drawn up of forming a Museum of Casts, to show the development of French sculpture as applied to architecture. The Commission of Historic Monuments took up this excellent idea, and since 1879 the special sub-commission,—which included among its members such well-known names as M. Proust, the present Minister of Fine Arts, M. du Sommerard, and Viollet-le-Duc fils,—has met almost every week; the result of this energetic action is the museum now opened at the Trocadéro Palace, one wing of which has been set aside for the purpose. Seven divisions have been made for each century since the twelfth, and a workshop and warehouse supplied in the cellars. No fewer than 300 specimens have been already gathered, some of considerable size, over 30 ft. long. At present only two rooms, those devoted to the twelfth and thirteenth centuries, have been opened, but these, as may be imagined, supply an ample fund of most interesting inquiry. The memory of the ex-minister, M. Ferry, and his Under-Secretary for the Fine Arts, deserves to be cherished for this fresh addition to the artistic treasures of the capital and its numerous educational establishments. Above the door of the new museum, it may be mentioned, has been placed the following label,—"Commission des Monuments Historiques. Musée de Sculpture comparée." It is in museums of this kind that the artist obtains that historical knowledge of his profession that leads him to further inquiry, and that love of the great works of the past that must leave an enduring impression on the works of the present and the future.

We have not yet done with Paris, where the progress of the new Hôtel des Postes is deserving of mention. The works, which, when some months ago we saw them, were still below ground, have now, with the rapidity for which building in Paris is famous, reached the first story, and some idea of the general appearance of the building can be formed. The new Post-office will be a large quadrilateral. There are to be three stories above the ground-floor, which latter is to be devoted entirely to the service of the public, and the yard to the mail-carts. On the first floor the letters are to be sorted; on the second, delivered to the carts. It is on this floor that the officials are to be lodged. On the third floor are the books and documents, and the store-rooms. Below ground will be situated the stables, the stamping-rooms, and the pneumatic apparatus. A double balance lift is to place all the floors in communication. A gallery, some 60 yards long, on the ground-floor, will contain, ranged on each side, in addition to the telegraph bureau, all the various other departments for the public convenience,—offices for registered letters, sale of stamps, &c., and an information bureau. The new Post-office, it may be remarked, when completed, will serve alone for the Paris correspondence, the country and foreign service will then be transferred to the residence of the Minister of Posts and Telegraphs. The new Post-office has already knocked a considerable amount of daylight into the gloomy and once fashionable quarter in which it is situated, and the value of land has, as may be imagined, risen to astounding prices, even for Paris.

As a last note from Paris, it may be mentioned that the neighbouring Bank of France is about to be enlarged on the western side, and the Rue Radziwill, a street which, though within but a few yards of the Palais Royal and the "Strangers' Quarter," we feel sure many an old visitor to Paris scarcely knows, will be built over. Eminently signs of the times these, the enlargement of the Bank and the Post-office.

As for the announcement of another Industrial Exhibition to be held in Paris next year, the professional world must wait till some further details are made known than those which have so far appeared.

Though there are those who have been recently telling us that they have a right from personal experience to state that the seasons have changed, winter still brings with it the need for fires; the heating of our houses, bringing in its train the necessity for the consideration of the appalling quantity of smoke produced, may fairly be said to be the burning question of the day. We hear of it in every quarter, discussed as it has never before been discussed; we have been for generations satisfied in England with our open grates and well-filled coal-scuttles, for we have long since ceased habitually to burn wood as our neighbours the French continue to do. There, as indeed with us, among middle-aged persons, the importance attached to the fire and its management is a marked feature of winter life. Every one must have met among his acquaintances some member whose pleasure it is, tongs in hand, to make up the fire, with infinite care piling up little piece of coal after little piece till the edifice is complete. In France, among the relics of the old society, there remain, just the same, those who regard themselves as the sole possessors of the secrets of fire-building, and fortunate is the outsider who may happen to meet any one kind enough to explain to him the art and mystery. He learns, in the first place, perhaps after breakfast on some wintry morning, that a servant is, and ever will be, incapable of making a fire, and then, tongs in hand,—*badine*, as the long flexible instrument is called,—the informant begins to build up the fire over the log or *buche*, each piece of wood touching its neighbour with due spaces for draught, the whole crowned with a mass of charcoal embers from the grate beneath. This, the morning fire, one is told, is made of hornbeam, oak, or apple wood, which, compact in fibre, generously distributes its heat and leaves a glow of embers. The after-dinner fire is very different it is to be made up exclusively of beech wood,—the champagne of combustibles,—helping the digestions of the diners by its brilliant, cheery aspect, spurting out from time to time in sparkling flashes on the group gathered round the fire. We can imagine our wood-burning forefathers enjoying something of this luxury of fire-building, the joy of the old, the consolation of the solitary. Prosaic, smoky coal has even seen wound round it some romance with its fire-pictures, and the slumbering embers, the cleanly cannel in our coal-consuming country being the champagne of the English hearth; but the days of coal now seem numbered, and gas is ruling triumphant, as in the distance looms the production of heat by dynamic energy.

THE EXCAVATIONS AT OLYMPIA.

AT a recent meeting of the Society of Architects of Berlin, Professor F. Adler delivered an address on the results of the excavations at Olympia. The diggings were commenced on the 4th of October, 1875, and, after six laborious seasons, were brought to a conclusion on the 20th of March of the present year. The entire expense of the series was defrayed by the German Government and the German Emperor; and in return Germany was permitted to appropriate any duplicates of objects found in the course of the excavations.

Professor Adler, who shared with Professor E. Curtius the honour of chief place in conducting the work, pointed out that these excavations were only intended to resume the task which the French had commenced in the year 1829, but which, notwithstanding that numerous important finds of ancient remains were made, they never carried beyond the preliminary stage.

The centre of Olympia, Professor Adler said, was undoubtedly the altar of Zeus. This, however, had manifestly been at a later time removed from its first and original position on the Kronos Hill to a spot that had been identified by the objects found on it, in the valley of the river Alpheios. Not far from the centre stood the altar of Hera, and a little further still the heroes' place of Pelops. This was enclosed with walls and planted with sacred trees. At a little distance further stood the shrine of Demeter, the mother of the gods. The four spots here mentioned formed, as could be shown from history, the starting-points around which gathered in the course of time a number of structures, large and small, devoted to a great variety of purposes. First we have the extensive Temple of Hera, which was in the Doric style; a little further, the hypæthral Temple of Zeus; and then, on the southern declivity of the Kronos Hill, an entire row of twelve treasure-houses close together. At a later date there was added the Prytaneion, with the sacred altar of Hestia, a building intended for the authorities at the contests and for the reception of the victors. Next we find extensive galleries or stands covered in, which were intended to afford a shady spot for the spectators of the festival processions; further, the Bouleuterion, probably used by the managers of the contests and of the sacred enclosure generally. Then there was a peculiarly-formed group of structures with two long and extensive side buildings and a square building in the centre, containing the altar of Zeus Horkios, where the competitors in the athletic struggles used to take the oath to observe the rules of the contest. The laying-out of the grounds on which the Olympic games were held proved to be exceedingly simple. The chief

spots were the Stadion and the Hippodrome; the latter had been for the most part effaced by the inundations of the Alpheios, so that it could only be very imperfectly identified. The remains had been found of the Gymnasion and Palaistra, and other buildings where the young athletes went through their courses of preliminary training and practice. One place, which in later centuries had been turned into a Christian church, appears to have been the actual *atelier* of Phidias, in which that sculptor prepared his celebrated chryselephantine statue of Zeus. Several buildings that were evidently of the Roman period had been only touched, and not completely laid open. The entire grouping of the numerous buildings which had been laid bare at Olympia shows that the ancient Greeks understood well how to turn the peculiarities of the site to the best advantage, both for the purposes of religion and of the festive games.

The task the expedition for excavations had before it was not only to clear up our notions respecting the size, plan, and general aspect of the chief centre of Greek festivals, but also to seek for any plastic remains that might still be discoverable on the site. Of bronze objects, such as were common in the earlier periods of Hellenic art, the excavators were unable to find a large number. It is probable that most of the bronze remains of value that were still in existence in the sixth century, A.D., were carried off by the invaders who plundered Olympia at that time, and perhaps repeatedly smelted and employed for other purposes. One of the most important objects found is the portrait-bust of a Greek who is unknown, but who was three times a victor at Olympia. This is a work of the first order. No less valuable are several heads of Zeus, and a variety of other objects, including several large archaic bronze reliefs, metallic vessels, weapons, and weights, as well as many well-preserved fragments of statues, such as arms, hands, and feet.

The number of marble groups and statues found is 130. In the number there are thirty figures with heads. Of the twelve metopes of the Temple of Zeus, with the twelve labours of Hercules, all except one have been found in a more or less complete state of preservation, so that a general reconstruction of the series will be feasible. Among the statues, as the world has already learned, the great acquisitions are the Nikè of Paionios and the Hermes of Praxiteles. The latter is, beyond question, the gem of the whole series of the plastic works discovered. It is, indeed, an object of priceless value. By its help it is possible for us for the first time to form an adequate judgment of a Greek original by an acknowledged master of the first rank in marble statuary.

Another most important class of discoveries is the inscriptions. These are numerous, and extend from the earliest times to the fourth century of the Christian era. There is a wide field for study in these literary remains. The same may be said of the numerous coins and smaller bronze articles which have been obtained.

As regards the architectural remains, it was of great interest to find, if possible, any examples or types of any classes of structures that might have hitherto been unknown, while, on the other hand, in the case of known styles the remains could not fail to be of value for the comparison they would enable us to make with existing or known structures. Among the former class of hitherto unknown edifices may be mentioned the Palaistra, the Prytaneion, the Bouleuterion, and the treasure-houses. These really fill up a large gap in our knowledge of Greek life and architecture. The comparison of the remains found at Olympia with the Greek edifices hitherto known is a task on which scholars and architects are still engaged, and on which they will probably yet have to spend much time before the results of their labours can be known, and before it will be possible to reconstruct on paper or in model the different separate buildings. It is a gratifying fact that the number of architectural remains found at Olympia is very extensive. Their preservation is due to the circumstance that when the barbarians from the North invaded Greece, and swept over the Peloponnesus, the latest Greek inhabitants of Olympia built strong walls round their district, and were compelled for this purpose to pull down and employ many of the old monuments and buildings.

During the concluding series of the German excavations, great attention was paid to that often obscure and neglected portion of architecture,—the question of the underground work and foundations. This portion of the work was entrusted to Herr Gräber, and he had succeeded in identifying, within a comparatively small area, no fewer than 120 distinct sets of drains or pipes, intended some of them for carrying off sewage, others for bringing water to the different edifices. Herr Gräber found the pipes to be of various materials and dimensions. The levelling, on investigation, showed that both in the sewage drains and in the pipes for water supply the natural fall of the ground had been taken advantage of throughout, and that reservoirs at an elevation had been employed.

Another class of objects abundantly found consisted of roofing-tiles. These had been systematically sorted and arranged, and the result showed beyond dispute that the well-known and greatly-admired marble roof of the Greeks had been preceded by a long period of development, when ceramic tiles only were in use, before the perfection that was still acknowledged had been attained. The oldest roof among the Olympian edifices was probably that of the Temple of Hera, and this exhibited the well-known style of "monks and nuns" common in Mediæval times.

One of the most important discoveries was that of the Treasury of Gela, which had only been found in the latest stage of the excavations. This had in front a colonnade, while it had two gables or pediments at the sides, thus presenting three aspects. The architecture at the summit of this stone building consisted of pieces of terra cotta, of bright colour, and fastened by nails. Herren Dörpfeld and Borrmann, two of the German officials employed at Olympia, on their journey home visited Sicily, and found that terra-cotta materials had been similarly employed in the Greek settlements there, at Selinus, Gela, Akræ, and other places. It appears, therefore, now certain that this style of building was pretty general among the Greeks about the fifth or sixth century B.C. The different kinds of terra-cotta exhibit the most varied and interesting transformations. Thus the waterspout may be followed through various developments, from a simple plain pipe to the richly-ornamented lion's mask.

Herr Dörpfeld had further the merit of having thoroughly examined in its technical aspects the much-neglected question of the Greek measures. This he had done by investigating the grounds and buildings at Olympia. After repeated and most careful measurements, Herr Dörpfeld had succeeded in demonstrating from the Temple of Zeus that the normal Olympian foot was 0·3204 mètre in length. The Stadion was known to be 600 Olympian feet long, and he had tested and proved the correctness of his measurement on the Olympian course itself. It is true that there was an earlier measurement of the foot prevalent about the time of the tyrant Pheidon, and by measurements on the Temple of Hera this foot was shown to be equal to 0·297 mètre. The later edifices erected at Olympia were based on the Roman foot, which was only 0·296 mètre in length. It is somewhat surprising that of the best known and commonest measurement among the ancient Greeks, namely, the Attic foot, there was no trace at Olympia. This is probably due to political jealousies, as there is at Olympia not a single trace of the Attic style of architecture. The Athenians, we know, were not popular with the Greeks of the Peloponnesus. The Doric, Ionic, and Corinthian styles, on the other hand, are all represented in the most varied combinations.

Finally, it is to be noted that at Olympia has been found the oldest specimen of the vaulted style of architecture of ascertained date. This is at the so-called secret entrance to the Stadion, which was used by the competitors and judges at the athletic games and contests. The passage is 100 Olympian feet in length, and each vault is constructed of fourteen wedge-shaped stones connected by bronze fastenings. There is also a second very interesting, but later, vaulted structure. This is the so-called Exedra of Herodes Atticus, the Sophist, and dates from the second century A.D. This latter work is specially deserving of attention, both on account of its peculiar construction and because it has traditionally exercised an influence on later works of the kind down to the period when the High Renaissance was flourishing at its prime.

Balmoral.—Mr. A. Anderson, architect, has been appointed Inspector of Buildings for the Queen at Balmoral Castle, in place of Mr. J. Beaton, retired.

THE CITY OF CHESTER.

Amongst British cities, Chester stands alone. Alike in its history and its architecture, in its commerce, in its walls and walks, in the public spirit of its citizens, the quaint old city presents a contrast to many much larger. It is changing, however, in this railway age, and round that antique inner circle of walls there is growing up a newer Chester that is commercial in its character, and that is contributed to by the position of the old town as a railway centre and by the visitors it attracts. Far away from the haunts of our early commerce, Chester has its history lost in remote ages, and whether its origin was with the great-grandson of Noah, whether with the early Britons or Roman colonists, certain it is that in the days of the Cæsars, forum and temple arose on its site as one of the legions there settled, and the tokens of the presence of the conquerors are many eighteen centuries after their days. And of these centuries Chester may say that "Saxon, and Norman, and Dane" it was; and that after the Conquest it, down to the days of the first Edward, was the scene of Welsh incursions and English revenge; and that in more modern times it has been the theatre of war, and from its walls monarchs have watched the fate of armies on whom their crowns depended. But from the time of the Civil War, Chester has kept on the even tenour of its way, and the growth of newer ports nearer the sea has lessened its trading importance. But since the era of railways the old city has received a strong impulse, and there has been very great development in recent years. That development may be best seen by a glance at some of the facts that tell its state in the past and in the present. About two score years ago, then, Chester had its nine churches, and half a dozen chapels; its infirmary was well off for funds; it had other charitable and philanthropic institutions. Its industries included lead, chemicals, and shipbuilding. Railways had not entered it, but its canal furnished cheap conveyance to Liverpool. Its population was some 21,300, and was slowly increasing. A dozen coaches passed through the town daily, and there were several "regular traders" by water; but trade languished for want of facilities, and Liverpool was beginning to tap the trade of the old town. Since then, Birkenhead has also arisen, and many of the old industries have passed away, and now there is little that is distinctive about the trade of the town. It has still its lead-works, and other of its manufactures, but the trade of its port has gone beyond recall. The city has gained, however, that which arises from its position, and from its being the centre of eight branches of railways at least, and in the trade that has grown thereout there has been more than a counter-balance, as the fact that its present population is 40,342 fully testifies. And there has been, as we have hinted, a corporate progress of the town that is fully entitled to notice, if brief.

Enter the city by that great general station (or even by that later and vast if less used structure that the Cheshire lines have had erected for them), and some idea of its importance is at once evident. Into that older station six lines converge; its roofs are said to cover over 123,000 square feet, its great platform is 1,000 ft. long, and it is computed that 3,000,000 passengers pass through it yearly. Near to it is the first and the largest of the series of stately hotels that Chester has,—one erected at a cost of 20,000*l*. The erection of that station may be said to have diverted in considerable degree the traffic of Chester, and to have made needful new bridges and buildings that have been supplied. Indeed, the extent of the renovations, restorals, and rebuildings in Chester may be said to have changed the town in the past four or five decades. Its ancient cathedral has been restored, additions have been made to old churches, and new ones have been built. Its post-office was enlarged a score of years ago; its old infirmary has had a new wing; the English Presbyterians have erected a new and stately church; the Wesleyans have been obliged so to alter and modernise that old chapels have been re-erected or altered, whilst to many, schools have been added. Barracks have been built for the militia, a drill-hall for the volunteers; whilst savings-bank, music-halls, banks, convents, have all contributed to the change that has been wrought in the appearance of the city in the decades we have named. Not the least of the changes is that of the town-hall which attests the public spirit of the citizens of Chester, and

lifts its central tower high above the noble halls and stately and ornate rooms. Nor is that great gift of the Marquis of Westminster, the Grosvenor Park, of twenty acres, with its trophies and statues, to be omitted as showing what has been added to the corporate provision by princely munificence for the recreation of the people of Chester.

A walk round those famous walls that for two miles enclose the earlier city, and that bring up to memory the builders of the distant ages: from them are seen the old town, with its newer additions, a mingled mass of towers, spires, and ancient dwellings alternating with those of more modern date. A glance at its curious "rows," where the first floor becomes the pavement, and there is a general sense on the part of the passer of doubt whether he is on the roof or in the cellar,—these curious old arcades are part of the picture of Chester that cannot be omitted. One of the writers too little read just now,—Albert Smith,—has described this curious feature of this old world city in one of his works in words that do not need to be now reproduced. But some of the quaintest of the old houses that are intersected by these rows have of late shown signs of decrepitude, and it is many years since that most famous one,—Providence House,—had to be rebuilt, though so well is the old mingled with the new that it needs the inscription, "Reconstructed 1862," on one of the beams to remind the passer of the change. These old gable-fronted houses are full of memories, and that known as Bishop Lloyd's House, with its square of carved Scriptural scenes, may be said to be one of the curiosities of Chester. And it is worthy of note that though the lapse of time and the work of decay's fingers renders repairs and reconstruction at times inevitable, it is generally done with some appreciation of the beauties of the old place and some attempts to revive its methods. Needless to say much more of the "rare old city." Of the glories of its "Roodee" we need not treat. Its citizens are public-spirited, as schools of design, infirmaries, and councils show; the efforts of the latter have made the death-rate a moderate one; and around the old and venerable town there are the signs of an extension that is not dependent upon any one industry, but is the result of the appreciation of the position and the attractions of the town. And it needs but a continuance of that public spirit, a provision for fuller wants of visitors and residents, to cause the rare old city to still more bask in the prosperity of the present whilst remembering that of the past with respect.

SALE OF A BUILDING ESTATE AT CHINGFORD.

MESSRS. FOX & BOUSFIELD lately submitted for sale at the Auction Mart, Tokenhouse-yard, a freehold estate, of 78 acres in extent, situated in Chingford. The property was described as being on the verge of Epping Forest, and about one mile from the Chingford Station on the Great Eastern railway. It was stated that there was an old-fashioned and commodious family residence on the estate, standing on an elevation immediately opposite the ruins of the old parish church, and commanding a fine view over picturesque scenery; and also four cottages. The entire property was said to be let on lease for a term of seven years from September, 1878, at a rental of 300*l.* a year, one of the conditions of the lease being that any portion of the land required for building was to be given up on six months' notice. The first offer made was 9,000*l.*, and the property was ultimately sold for 12,000*l.*, with the view of being laid out and resold for building upon.

Tramway Statistics.—A return has been published recently relating to street and road tramways down to June 30th this year, which shows the remarkable growth of tramways in public favour since 1876, when they were first generally introduced into this country. The capital authorised to be raised by shares in 1876 was 3,141,000*l.*; it is now 7,602,509*l.*, and of this amount 5,096,030*l.* have been paid up, and this, added to the sum raised by loans and debentures, makes the total amount expended 6,939,838*l.* There are 488 miles open for public traffic. The stock of the companies comprises 15,220 horses, 40 locomotive engines, and 2,045 cars. There have been 205,623,510 passengers carried down to June 30th this year; the gross receipts were 1,576,301*l.*; and the net receipts, after paying working expenses, 336,405*l.*

PROGRESS IN PRESTON.

AMONGST the Lancashire towns, whose material advancement within the last few years is indicated by the public buildings which have been erected and are in progress, Preston claims notice, more especially so at the present moment when preparations, architectural and otherwise, are already being made for the exceptionally historic festival, held every twenty years, which is intended to be celebrated in 1882.

In anticipation of the coming celebration several undertakings of a constructive character are now being carried out. The Corn Exchange, which was erected in 1824, and which, with the several spacious rooms in connexion with it, has for many years past been utilised for public meetings and entertainments, is at present entirely in course of reconstruction, and being converted into a large public hall. The external walls only remain, the building internally being completely transformed and greatly increased in height, whilst westward it is being considerably extended by the erection of an entirely new block, containing a range of several apartments in connexion with the general public purposes to which it is in future to be applied. The building, when completed, will be 230 ft. in length by 95 ft. in width, covering a ground area of nearly 22,000 superficial feet. The principal entrance to the interior of the building will be on the east side, leading into a circular vestibule 17 ft. in diameter. Through the vestibule a spacious entrance-hall, 34 ft. by 28 ft., is reached, having on each side several retiring-rooms and lavatories. From this entrance-hall the large hall on the ground-floor is approached. It is 147 ft. in length by 63 ft. in width, having a promenade on the north and south sides 16 ft. in width each, which can be either added to or partitioned off the main body of the hall at any time, by means of revolving shutters. The full width of the hall and promenades will thus be 95 ft. When used for meetings, concerts, or other similar purposes, it is estimated to seat an audience of 1,500 persons, for whom seven exits will be provided. At the west end of the hall there will be an orchestra, 44 ft. in width by 36 ft. in depth, designed with special regard to orchestral performances, and having accommodation for 300 performers. At the rear of the orchestra there will be a spacious organ-chamber, for which a powerful organ is now being erected by Mr. Wilkinson, of Kendal, at a cost of 3,000*l.* The instrument is the gift of a Preston merchant. The front of the organ-chamber will be an important feature in the work, having ornamental pilasters, with elaborate capitals and spandrels, with enriched plasterwork, modelled from special designs of the architect. In the new portion of the building, at the west end behind the orchestra, there will be ladies' and gentlemen's retiring and waiting rooms on the ground and first floors, with kitchens, heating apparatus, and storage rooms in the basement. The entrance for the band and principals, on musical occasions, will be from the waiting-rooms on the ground-floor, whilst the entrance for the chorus will be on each side of the organ-chamber, from the waiting-room on the first floor. Above the promenades galleries will be carried along the north and south sides, and also at the east end opposite the orchestra, the last-named gallery being circular on plan. Behind this gallery there will be a balcony or promenade, 8 ft. in width. The galleries and balcony are estimated to hold an audience of 1,500 persons, and will have four separate entrances and exits. The fronts to the galleries will have a handsome brass railing, with wrought-iron scroll-work between iron columns 14 ft. apart, with ornamental enriched capitals which spring from circular arches. Above these runs an enriched plaster frieze and cornice, surmounted by a cove to the underside of the ceiling, the latter being perforated by a series of circular lights. The hall will be heated by hot water, and lighted by three sun-burners in the ceiling, each having a large extracting-shaft for carrying off the vitiated air. The first floor over the principal entrance at the east end contains a spacious assembly-room, 102 ft. in length, and 45 ft. in width. The architect is Mr. Sykes (of the firm of Messrs. Garlick, Park, & Sykes), of Preston, and the contractor Mr. R. Saul, also of Preston. The estimated cost of the building, exclusive of the organ and fittings, is 10,000*l.*

The Free Library, Museum, and Art Gallery new buildings, to be erected at a cost of 60,000*l.*, part of the fund bequeathed to the trustees for that purpose by the late Mr. Edmund Harris, a well-known townsman, are about to be proceeded with, and it is confidently expected that the Prince of Wales will lay the foundation-stone of the building during the guild week next year. Active preparations are now being made for commencing the undertaking. The corporation have agreed to provide a site for the building, at an estimated cost of 30,000*l.*, and an Act of Parliament having been obtained for the purpose, the site will shortly be cleared. The structure will occupy a ground area of about 26,000 superficial feet, and will have four distinct frontages, being completely isolated from the neighbouring buildings. The principal frontage,—130 ft. in length,—will be on the east side of the Market Place, being the west front, and forming a fit architectural companion to the north elevation of the late Sir Gilbert Scott's noble Gothic production, the Town Hall, completed and opened a few years ago. There will likewise be a frontage on the east side, of similar length, facing Lancaster-road, a fine thoroughfare of upwards of 50 ft. in width, which has been opened out within the last few years. The north and south frontages will each be 160 ft. in length, facing two proposed new streets, of 50 ft. in width, which are about to be constructed by the corporation, under a comprehensive street improvement undertaking, intended to be carried out in connexion with the erection of the Free Library buildings. The designs for the buildings have not yet been prepared, and we are therefore not in a position to state what style of architecture will be adopted, but in anticipation of the foundation-stone being laid in September next, by the Prince of Wales, as above stated, we understand that the plans will very shortly be in the hands of the Harris trustees, at whose expense the building is to be erected. It is said that there is a strong probability of the designs being entrusted to Mr. James Hibbert, a local architect, who has taken a deep interest in the undertaking, and who has already erected many of the public buildings in the town. This probability receives force from an article on the subject which recently appeared in the leading columns of the *Preston Guardian*, and from which we make the following extract:—

"We are getting an admirable new Mayor, but we are also parting with a not less able and worthy retiring Mayor. In Alderman Hibbert we have a member of the Council who brings to all he has to do untiring zeal, inflexible straightforwardness, and the highest intelligence. The office of Mayor has lost nothing of its honourable tradition while in his keeping. He has served the Corporation well in every department of its business, but his exertions in connexion with the Free Library deserve especial commendation. His 'Notes on Free Public Libraries and Museums,' privately circulated in pamphlet form, have been sought after by many promoters of such institutions, and are proof of his great industry and ability. In order to procure the materials, and to make himself fully familiar with all the systems of working public libraries, he visited most, if not all, the principal libraries in the kingdom; and we believe he has mastered the conditions requisite for the planning and structural form of a perfect building for library and museum purposes more thoroughly than any other man within reach. During his year of office he has seized every opportunity to further the interests of the Preston Free Public Library. We trust that his restoration to health, and freedom from the cares of office, will permit him to devote himself in the succeeding years to the superintendence of the erection of a building which shall be at once a stately and splendid memorial of the Harris family, and one so skilfully adapted for its intended uses that the utmost degree of benefit from the liberality of Mr. Harris may be reaped by many future generations of citizens of the ancient borough of Preston."

The structure will include lending and reference libraries, a reading and news-room, together with a museum and art galleries. It is intended that when the building is completed and opened, the cost of its care and maintenance shall be defrayed by the corporation.

On a site on the north side of Fishergate (the principal thoroughfare in the town), covering an area of 32,000 superficial feet, which has been acquired at a cost of a little more than 5,000*l.*, a very extensive block of buildings has for some time past been in course of erection, which are intended for the constabulary and all other business purposes belonging to the county, Preston being the centre where all executive business connected with the Palatinate is transacted. The buildings, which have a frontage to Fishergate, nearly opposite the railway-station, of 160 ft. in length, with a return frontage on the east side, in Pitt-street, of 200 ft., are 54 ft. in height, and contain three floors, besides the basement. They are faced with red brick and Minera stone, from the Welsh quarries near Wrexham. The principal elevation is that in Fishergate. The several floors contain ranges of three-light mullion windows, and the frontage

is surmounted by nine ornamental gables, enriched by a free introduction of sculpture which includes the arms of the county palatine on shields, the "red rose of Lancashire," and the Prince of Wales's feathers. There are three projecting entrances, massive cantilevers supporting elaborately-carved canopies. The Pitt-street frontage is, in its main features, uniform with the Fishergate elevation, with an entrance, principally for the magistrates, at the north end. The eastern portion of the buildings contains the offices belonging to the clerk of the peace's department, the treasurer, and the auditor, together with a spacious apartment for the meetings of the magistrates of the county, another large apartment for the storage of the county records, the magisirates' dining-room, and other apartments; whilst the western portion of the block is set apart for the business connected with the county constabulary. This last-named part of the buildings is already completed and occupied, and the other portion is expected to be finished about June next, the interior works being now in progress. Within the building there is an open area from the basement to the top, faced with white enamelled bricks. The basement contains kitchens, stores, and several apartments for the sergeants and other members of the constabulary force. On the ground-floor a corridor, 6 ft. in width, and extending the entire depth of the building, from the Fishergate frontage, gives access to the various offices. The floor of the corridor is laid with polished concrete marble, manufactured in Germany, and the walls are faced with a dado in white and grey enamelled tiles. The offices of the clerk of the peace, the deputy clerk of the peace, and the several clerks' offices, are on this floor, as also the record-room, the magistrates' dining-room, and stationery-room. A spacious stone staircase, approached from the Pitt-street entrance, leads to the court-room on the first-floor, in which the annual meeting and other meetings of the magistrates of the county will be held. The size of this room is 63 ft. by 45 ft., and its height from the floor to the apex of an ornamental lantern-light 45 ft. The lantern-light is glazed with embossed coloured glass. Its dimensions are 44 ft. by 16 ft. The offices of the county auditor, the treasurer, the bridgemaster, and those of their subordinates, are also on this floor, along which there are corridors, uniform with those on the ground-floor, and similarly paved with polished concrete. An octagonal staircase, in Hopton Wood stone, from the Derbyshire quarries, having Dalbeattie polished granite columns at the foot, leads to the several offices in the upper parts of the building. The second floor contains what are designated spare rooms. All the record-rooms, which will contain documents of great value, are fireproof. Mr. Littler, of Manchester, is the architect, and Mr. John Walmsley, of Preston, the contractor. Mr. W. Fox is clerk of the works. The sculpture work is by Mr. Miles, who executed similar work at the Town Hall. The estimated cost of the entire building is 50,000*l.*

The new station, the joint property of the London and North-Western and Lancashire and Yorkshire Railway Companies, which is said to be the longest roadside station in England, although recently opened for traffic, is still incomplete, and at present is being further extended in width in a westerly direction. Some conception of the enormous dimensions of this station may be formed when it is stated that its entire length, from the approach in Fishergate, to the southern extremity of the platforms, is 1,800 ft., or one-third of a mile. The two central or island platforms, as they are called, are themselves 1,360 ft. long, or upwards of a quarter of a mile in length each, and 50 ft. in width. Between these two platforms there are three blocks of buildings 40 ft. in width, and carried to a length of upwards of 600 ft. The north block contains four spacious waiting-rooms, 40 ft. by 30 ft. each, and unusually lofty, together with the station-master's office. The central block contains the first and second class refreshment-rooms, 100 ft. in length; and also the grand dining-saloon, 70 ft. long, and capable of seating 300 persons. The express trains between London and Edinburgh and Glasgow, stop twenty minutes at Preston for dinner. Both the refreshment-rooms and dining-saloon are luxuriously fitted and furnished, and the floors are laid with ornamental encaustic tiles. The south block contains another general waiting-room, of the same dimensions as those already named; together with what are designated re-booking offices, or auxiliary booking-offices, in addition to the principal booking-offices at the entrance to the station. Also telegraph-offices, transfer, parcel, and other spacious offices which are occupied by Messrs. W. S. Smith & Sons. In addition to these, there are also the buildings, with booking-offices, waiting-rooms, and platforms on the east side of the station, which are specially set apart for the traffic of the Lancashire and Yorkshire Company. The station, when completed on the west side, will be about 400 ft. in width. There are at present twelve lines of rails, and the station is covered in to the entire length of the platforms with a light iron girder-roof in three bays. A short distance to the south of the station, on a high level, very considerably above the railway, the company are erecting a large hotel, an illustration of which has already appeared in the *Builder*. The building, which is in red brick, is almost externally completed, with the exception of a prominent tower, now in progress. The site of the hotel is on the summit of a beautifully laid out park, which slopes down to the margin of the river Ribble, and from which there is a commanding and extensive view of the valley beneath, and of the surrounding country for many miles in the distance. On the east side is the lofty eminence called Hoghton Tower, which has an interesting place in history as having been visited by James I.; the Rivington Hills; and other places inland, extending to the borders of Yorkshire; whilst on the west side the winding course of the Ribble is discernible down to its mouth, between Lytham and Southport. The hotel is intended to be approached from the railway platforms by an ornamental bridge thrown over the line leading to garden grounds, which are about to be formed on land between the railway and the hotel, at present covered by warehouses and sheds.

The West Lancashire Railway, a new line between Preston and Southport, is at present in course of construction. A section of the line, about eight miles in extent, from Southport to Hesketh Bank, in the direction of Preston, has already been completed and opened, and the works on the remaining portion to the Preston terminus have for some time past been in progress. The heaviest portion of the work is that part of the line which is carried over the valley of the Ribble by an embankment, and thence across the Ribble itself by an iron girder bridge of five spans, and in continuation to the intended station at Preston, on a stone viaduct of twelve arches. The bridge is 320 ft. in length, the central span being 64 ft., and the other spans about 51 ft. each. The girders will rest on stone piers, for the construction of which coffer-dams have been made, but the contractors have met with considerable difficulties in consequence of the coffer-dams having been swept away on three occasions by storms and floods. Owing to a project on the part of the Ribble Navigation Company for lowering the bed of the river, the contractors have been compelled to excavate from shore to shore, to a depth of 10 ft. down to the solid rock, and this has increased their difficulties. One of the piers is already in position, and coffer-dams for the others are being constructed. Several of the arches of the viaduct on the Preston side of the river are already completed, and it is expected that the line will be finished and ready for opening during next summer. The engineers of the line are Messrs. Brunlees & Fox, and Messrs. Braddock & Matthews, of Southport, are the contractors.

Several buildings of a public character have been erected in the town within the last few years, notably in Fishergate, where the street architecture of that locality has undergone great improvements. Amongst other structures may be enumerated the Lancaster Banking Company's premises, the Preston Banking Company's buildings, the new Post Office, the Preston Gas Company's Offices, a fine Gothic structure, both externally and internally; the Reform Club, the Conservative Club, and the refacing of the theatre. The Manchester and County Banking Company are also about to erect new bank premises in Church-street, opposite the Town-hall.

It may be added that the town is rapidly expanding in several directions, more especially northwards and north-westward, on the banks of the Ribble, where building is actively going forward. The population of the town, which in 1871 was 84,000, has within the last decade increased to 94,000.

IMPORTANT DOCK IMPROVEMENTS AT LIVERPOOL.

For some time past the shifting course of the sand deposits in the bed of the river opposite the docks at the south end of Liverpool has materially interfered with the shipping in that locality, the south docks having, during the last few years, been comparatively deserted, to the great loss of the inhabitants of Toxteth Park, and the district immediately around, in which they are situated. This has led to the Dock Board resolving upon carrying out improvements of an important character in several of these docks. At the meeting of the Board last week, Mr. Lyster, the dock engineer, presented a report on the subject, in which he stated that the question of deep sills for facilitating the working of the dock system was of such vital importance to the trade of the port that he had lately thought it well to give consideration to the possibility of providing an extra depth over the sills leading from the river into the Herculaneum half-tide dock, as well as a corresponding extra depth, not only in that dock itself, but also throughout the new system now in course of construction at the north end of the estate. He suggested the desirability of lowering the Herculaneum sills and dock to the levels of 10 ft. and 13 ft. respectively below the old dock sill datum, and, in addition, he suggested that he should be authorised to construct the sills of the main passages of the new docks, as well as the body of the docks themselves, to the level of 10 ft. and 12 ft. respectively. These suggestions met with the warm approval and sanction of the Board, Mr. Harrison, in moving their adoption, observing that this deepening of the sills and docks would enable vessels with large cargoes to enter the docks, and it would be a great advantage to the south end of the port. He observed that ultimately it would no doubt be connected with the Brunswick Dock, but whether that had to be deepened would be for the Board to say a few years hence. It was, however, he remarked, impossible to overestimate the advantages that would arise to the south-end trade. Mr. Brocklebank, one of the oldest and largest shipowners in the port, and who was for several years chairman of the Dock Board, said it was one of the greatest improvements that had been proposed for a great length of time. The advance of shipping was so rapid that it was scarcely possible to look ahead sufficiently far in order to accommodate every description of vessel. The estimated cost of the works thus sanctioned is 16,000*l.*

THE CASTLES OF SKENFRITH AND WHITE CASTLE, OTHERWISE LLANTILIO.

SKENFRITH CASTLE.

Among the numerous strong places in Monmouthshire, which, from their character and position, seem to have been thrown up during the occupation of that border territory by the Mercians and the English during the eighth and following centuries, Skenfrith holds a conspicuous place. Its fortune, moreover, was to be adopted, like Caerleon and Grosmount, by the Norman invaders, who placed a keep upon its ancient mound, and girdled its elevated platform with walls and towers of considerable strength, so that it became of even greater importance in the twelfth and thirteenth than in the preceding centuries. It stands in the deep valley, and upon the bank of the Munnow, five miles below the castle of Grosmount, and six above that of Monmouth on the same river, besides which it forms the south-eastern point of the celebrated Monmouthshire trilateral, Grosmount and Whitecastle being the two others, so celebrated in Border warfare, and especially in the contest between Henry III. and the Mareschals, earls of Pembroke. Churchyard writes of them as,—

> "Three castles fayre, are in a goodly ground,
> Grosmont is one, on hill it builded was;
> Skenfrith the next, in valley it is found,
> The scyle about for pleasure there doth pepe.
> Whit Castle is the third, of worthie fame,
> The country round doth bear Whit-Castle's name;
> A statelie seate, a lofty princely place,
> Whose beauty gives the simple scyle some grace."

Unlike the elevated and rock-founded castles of Chepstow and Ludlow, the strength of Skenfrith was in the low and marshy character of its position. The Munnow flows within a few feet of its walls, and overflowed into its ample ditches, and a few yards below the castle is the bridge mentioned by Leland. Skenfrith marks the uniting point of

several valleys, and even now, with the advantage of modern roads, is by no means easy of approach. Probably, in some measure on this account, it has suffered but little from additions or alterations, and as little from violence. Time, the greatest but least violent of revolutionists, has been the principal agent in the changes that have taken place, and the great obstacle to the study of the castle by the antiquary is the rich and redundant mantle of friendly ivy by which it is draped.

Skenfrith belongs to that family of castles of which Coningsborough and Launceston are the English types, and of which Brunlais, and, in some degree, Tretower, are local examples. Its keep is a cylindrical tower, with a widening or battering base, to which the elder antiquaries gave the name of a Juliet. This stands within an inclosure formed of curtains and bastion towers, in this instance forming a trapezium in plan, of which the northern and southern sides are 74 yards and 71 yards, and the eastern and western 31 yards and 59 yards. The diameters of the area, measured across the keep, are,—northern and southern, 48 yards, and eastern and western, 57 yards.

The keep stands unconnected with the curtains, and nearly on the central line of the area, about ten yards from its eastern end. It crowns a low mound, about 6 ft. high, and 50 ft. broad at the top, evidently artificial. If the mound ever had a proper moat, it has been long filled up. The tower is about 40 ft. high, and may have been 5 ft. or 6 ft. more. It is a cylinder of 36 ft. in diameter, with walls 7 ft. thick. 10 ft. above the ground is a bold half-round string or cordon, below which the wall batters, and at the base is 10 ft. thick, augmenting its diameter there to about 42 ft. The present entrance is to the west, by a doorway of 5 ft. 6 in. opening, having an interior door opening inwards, and probably having had an exterior door also, but the doorway is now a mere breach in the wall, with but a fragment of the rebate of its inner door. The masonry, and the absence of bar-holes, show this doorway not to be original. Probably it was opened in the Decorated period, when passive strength was less an object, and a first-floor entrance was found to be inconvenient. Such later openings are common in keeps with closed basements. There is one at Pembroke.

The basement chamber is circular, 22 ft. 4 in. diameter, and its floor is at the ground level. In it are two loops, with flat tops, in recesses splayed to an opening of 3 ft., of which the cills are 3 ft. from the ground. The wall is quite plain, and there is no trace of a well. This chamber was 11 ft. high; no doubt, a store-room, and must have been entered from the chamber above by a ladder.

The first floor, of the same diameter, was 14 ft. high. This was the principal chamber. The floor was of planks resting upon four large beams laid across, the outer beams receiving the ends of some shorter timbers laid at right angles to them. The doorway points about west, and is partly over that of the basement. It was 5 ft. broad, and its passage-vault was round-headed, but the ashlar dressings are gone. There is no trace of a portcullis. In the substance of the wall is a square hole, probably once containing an oaken tie, such as was used at Brunlais and at Rochester. This doorway was evidently the original and only entrance to the keep. To the right of the entrance a second door opened into a mural stair, a fragment of the cylindrical shell of which remains. This led to the second floor and battlements. For its support the external wall is thickened by a half-round buttress, solid below, and ascending to the summit. The door and the staircase are utterly ruined. In this floor are two window openings in flat-sided recesses, apparently round-headed. The windows, probably large loops, are broken away, and the ashlar face of the recesses is gone, but the relieving arch in the wall is flat pointed. Near the north recess is a corbel of Decorated aspect, 6 ft. from the floor.

The second story, entered by the winding mural stair, is much obscured by ivy. Its floor was of stout plank, resting upon a large single cross-beam, of which one support, a broad plain corbel, remains; the planks fitted into a rude groove or chase, not a set-off, in the wall, which is, therefore, not diminished in thickness. The curve of this story is a little impaired by a projection connected with the stair; and there is a sort of recess, which may have been the kitchen fireplace, the cooking being usually, in these towers, carried on in an upper floor, as at Castell Coch and Morlais. There were three windows in this floor, but of them little is to be seen, nor of what may remain of the ivy-covered battlements. The main floor was plastered, though thinly. It is evident that the floors were always of timber. The main strength of a tower of this character was passive, the loops and windows counting for nothing in the defence, but no doubt the battlements had a rampart walk, and the roof, therefore, was either flat, or if conical, sprang, as at Coucy, Coningsburgh, Pembroke, and Marten's Tower at Chepstow, from an inner wall. Nothing can be more senseless than, as some modern architects have done, to cover these towers with a conical roof springing from the outer wall, which thus could not be defended in the only way possible with such structures, from above.

The curtain wall of the single ward within which this Juliet keep is placed is 8 ft. thick, and from 30 ft. to 40 ft. high, the contained area being at a level 6 ft. to 10 ft. above that outside, and no doubt raised artificially. The four angle towers were cylindrical, 11 ft. internal diameter, and with walls 8 ft. thick. They have no internal projection, but the angle at each is crossed by a gorge wall, 7 ft. long. Both towers and curtain have an exterior base about 12 ft. high, battering below to a thickness of 10 ft., but without a cordon. Each tower is entered from the gorge by a door of 3 ft. opening, and its basement is elevated about 4 ft. or 5 ft. above the inner court. Each has three loops in recesses 4 ft. 5 in. deep, and 5 ft. 8 in. broad. There are no staircases, though there seem to have been two upper stories, the highest rising above the curtain. The floors were of timber. The arches vary; some are round-headed, others lancet, others drop-pointed. The loops are square-headed. The south-west tower has been taken down, and the present entrance to the place is through the gap.

In the south front, 60 ft. from the west end, is a half-round buttress tower, with no internal projection. The breaches in its interior and exterior faces show it to be solid. Opposite to this tower, in the north wall of the court, is a doorway of about 6 ft. opening, the pointed arch of which is seen just at the level of the court. As the sill of this doorway must be at about the level of the Munnow, it was probably connected with a short canal for the admission of a boat, like what is seen at Tonbridge and Leeds Castles, and at Caerphilly. In this same wall, but close to the north-east tower, is a small flat-sided recess, either a door or a window, and 6 ft. above the court level. If a door, it must have been for the lifting of stores from a boat upon the mill-leat which flows below it.

There is no trace of a regular gatehouse to this court, but a part of the centre of the west wall has been rebuilt with carelessness, and probably represents the entrance. This entrance was likely to have been by a mere doorway in the curtain without a regular gatehouse, like the lesser gateway at White Castle. From this point a slightly-elevated causeway, crossing the court, leads direct to the central tower.

The walls are tolerably perfect, but the battlements have been removed, and the upper stages of the towers are in ruin. It is remarkable that the mural towers are without staircases, and there are no visible mural chambers or garderobes, or, with one doubtful exception, fireplaces, in the castle. The material is the old red sandstone of the district, as was the ashlar. The workmanship is ordinary but pretty good rubble, and the mortar coarsely mixed and freely used. The mill leat, and the Munnow immediately beyond it, form the defences on the north front. Along the other three fronts was a broad and deep ditch fed from the river, and now filled up. As the ground with the walls is 6 ft. to 10 ft. higher than that immediately outside, they are to that extent revetments. It is pretty clear from the appearance that the original fortress was a raised platform, in its centre a mound, and around it a wet ditch, the whole, no doubt, strongly palisaded.

There is nothing of a Norman character in either the plan or details of the structure. The singular form of the area may be but an accommodation in right lines to an irregular earthwork. Had it been Roman, the platform would scarcely have been raised. The keep tower is clearly Early English of the time of King John, or early in that of Henry III. The surrounding walls and towers are of the same date.

The history of Skenfrith is obscure, but it is evident that it was built simply to contain a small garrison, and not at all as a private residence. The area contains no trace of hall, chapel, or kitchen. No lines of foundation are visible, and whatever lodgings were erected were probably of timber, with roofs resting against the wall.

Skenfrith is said, at the entrance of the Normans into the district, to have been held by Bach, a son of Cadivor ap Gwaethvoed, which Gwaethvoed is the reputed ancestor of several families in Monmouthshire and East Glamorgan, and who, or his father, was likely enough to have obtained possession of it during the victorious campaign of Caradoc-ap-Griffith in 1065. The pipe-roll of the first year of John shows the castles of Skenfrith, Llanteilo or White Castle, Kinton, and Ledbury, to have belonged to the king; and in 1205 (5 John) he granted Skenfrith, Llanteilo, and Grosmount to Wm. de Brecs, to hold them as they had been held by Hubert de Burgh, and Geoffrey, Earl of Essex, was allowed 20 marks which he had paid to De Burgh for fortifying them. This probably was the date of the present masonry. John de Monmouth, a powerful local baron, had some claim upon these castles, which was admitted by the king; but nevertheless, in 1219, De Burgh was ordered to have seizin of the three castles forfeited by the defection of William de Brecs. William's heir was Reginald de Brecs, who was in ill-health; he demurred to the decision of the king's court. In 1220 they were held by De Burgh. In 1223 the king had occasion to send a messenger to Skenfrith, and in 1224 the Sheriff of Hereford was directed to send thither to De Burgh 2,000 quarrels (heads of cross-bow bolts), and all through the troubled reign of Henry III. these castles continued to be of great military importance. At the settlement of Wales by his son they probably were allowed to fall to ruin. With most of the surrounding property Skenfrith finally fell to the Duchy of Lancaster. As early as the time of James I. it was presented by the local jury as "ruinous and decayed, time out of the memory of man."

The parish church, containing some fragments of early English or early Decorated date, stands a few yards west of the castle. It contains an altar tomb, bearing the effigies in a sort of trick of John Morgan, who died 2nd September, 1557, and Ann, his wife, who died 4th January, 1564. On the side of the tomb are figures in relief. The armorial bearings are,—quarterly, 1 and 4, Barry of 9, on six escutcheons, 3, 2, 1, as many lioncels rampant, 2 and 3, three towers, in the nombril point a roundel. Evidently these are the arms of Cecil, and point to the connexion claimed by that family with Wales. Another shield bears on a chevron three sprigs, between three spear-heads; crest, an arm embowed grasping a ————. John Morgan is said to have been of Wayne, in this parish.

WHITE CASTLE.

White Castle, called also from the parish in which it stands, Llanteilo Cresseny, and in the records "Album Castrum," stands upon very high ground about five miles east of Abergavenny, and commands an extensive and completely panoramic view over a country eminently characteristic of the old red sandstone. Within the wide circumference are mountains and hills green to their summits, deep valleys, oaks and elms of great size and in great profusion, and pastures of unusual richness. It is not to be marvelled at that the Welsh, having lost so glorious a possession, should strive to recover it, or that the English and the Normans, having won, should spare no labour or expense in the construction of strong places to enable them to retain it.

Unlike Grosmount, Skenfrith, Goodrich, and Chepstow, and the other castles upon the Munnow and the Wye, and the seaboard of the Channel, White Castle is far removed from any watercourse or defensible river, and is only to be reached by a long and steep ascent. It is five miles and a half from Skenfrith, and five from Grosmount, Grosmount and Skenfrith being four miles and a half apart, and forms the western and most exposed point of the celebrated trilateral. Its decay is due rather to time than to violence, for its walls and towers are all standing, and what is wanting are those parts which would naturally give way to rain and frost, or from time to time be removed for the rebuilding of houses and cottages in the neighbourhood.

White Castle is also as peculiar in its arrangements as in its position. It has no keep, and so far it resembles the Edwardian castle; but, unlike those structures,—of which Caerphilly in South, and Beaumaris in North Wales, are

typical examples,—its main defences are confined to a single line, covered, however, at the principal entrance by a walled earthwork or barbican, and at the lesser entrance by a second and rather smaller earthwork, without, or with but little, masonry. Its ditches also are on a formidable scale, both for depth, breadth, and extent, and altogether, both in position and details, it is not inferior in strength to any castle in the March, and is besides in the first-class as regards capacity.

It is composed of a central ward, in general figure hexagonal, but oblong and somewhat pear-shaped, its internal diameter, north and south, being 50 yards, and its greatest cross diameter, east and west, 37 yards. The northern end measures, also internally, 15 yards, the southern 18 yards. The sides next to the north end are, in length, 27 yards, those next the south end 23 yards and 26 yards. The wall is 10 ft. thick at the base, and slopes externally to 7 ft. at a height of 15 ft. In height it is about 30 ft. to the rampart walk or allure. The towers at the two southern angles are 18 ft. internal diameter, with walls 7 ft. thick. The two middle towers are 12 ft., the other two at the northern angles form the great gatehouse, and are 13 ft. They are about 45 ft. high. The four southern towers have a basement floor a little below the court-level, with one loop; a first floor with three loops, and a second floor, whence was a way to the ramparts of the curtain. There seems, also, to have been an upper or third story. The floors were all of timber, and there are no staircases or mural chambers. The gorge valley of the two southern towers are broken away, that of the western partially so; that of the eastern is perfect, and contains the entrance-doorway of 3 ft. opening. The gatehouse towers are also entered at the gorge from the court, but the gorge-wall is thicker, and contains a series of mural staircases ascending to the summit. These are not "turnpike," and are not continuous, but begin anew at each floor. The gateway, concealed, save from the front, by the unusually bold projection of the flanking towers, has a passage 10 ft. wide and 8 ft. deep. The barrel-vault remains, but the ashlar of the internal gate is gone, and its former existence is only shown by a barhole. Of the outer gateway two barholes remain, and a fragment of the portcullis groove, which is 4 in. square, and placed outside the gate, so that the grate was wholly visible even when raised, unless, indeed, concealed by a timber brattice. It was worked from a machicolation between the towers, now gone. The flanking towers are without loops, that to the left on entering is approached from the vault by a narrow doorway. If there was a drawbridge attached to this gate, its heel must have rested upon a large stone about 10 ft. in advance and 6 ft. below the level of the portal. The ditch at this point is nearly 100 ft. broad, and 30 ft. to 40 ft. deep. It is evident that there were no bridge piers of masonry in the ditch, so that the roadway probably rested on trestles.

The opposite and lesser gateway is in the south wall, close to its west end, and flanked, therefore on one side by the south-western tower. It seems to have been a mere opening in the curtain, about 10 ft. broad. It is now a mere breach, but the bar-holes remain. There is no sign of a portcullis. The approach to this gate came up along the edge of the ditch, between it and the wall, from the east, and was commanded by two loops in the curtain and by the south-eastern tower.

The area of the court is quite clear of buildings, but a few heaps of rubbish show that it contained barrack buildings of timber, with stone basements, placed against the walls, which have been plastered. There is no trace of hall, chapel, kitchen, well, or permanent lodgings, and no ornament of any kind; no moulding, no mural chambers or garderobes, no staircase save in the great gatehouse, and only two small fireplaces, in the first and second floors of the north-eastern gate tower. The towers are not only bold and lofty, and about 60 ft. high, but the outer half of these bases is carried many feet down the slope of the ditch giving them great breadth of base, and a very substantial and massive character.

The great barbican is a very remarkable work, not unlike a similar defence at Castle Rising, which there, however, is confined to an earth-work, whereas here the defences are both in earthwork and masonry. The work is irregular in its shape, concave where it rests upon the counterscarp of the main ditch,—on its other faces convex. In depth, or from north to south, it measures about 56 yards; in breadth, 74 yards. It is defended by a ditch of moderate dimensions, which communicates with the main ditch at each end, but is scarce a quarter of its depth. The curtain wall is very irregular in outline, the west side being made up of about four straight pans of masonry, meeting at various angles. The front is a long straight wall, and the east side, also straight, meets it at a right angle. The curtain of this outwork is about 5 ft. thick, and from 15 ft. to 18 ft. high. Upon it are four mural towers; three, drum-shaped, are 10 ft. in internal diameter, with entrances at the ground-floor from the court. In height they rise a story above the curtain. They are looped to the field, have timber floors, and their staircases seem to have been of timber. One tower is angular, and has evidently been the kitchen, part of the oven and the outline of the large fireplace being still visible.

The outer gatehouse is placed at the south-eastern corner of the barbican, terminating its wall and resting upon the counterscarp of the main ditch. It is of rude construction, composed of two solid masses or cheeks of wall, 46 ft. long and 9 ft. thick, rounded at the outer end. Most of the northern wall is gone, and with it the roof or vault of the entrance-passage, and the details of the gateway. This sort of entrance between the high and long walls is found at Coningsborough and Berkhampstead. The other or inner end of the barbican-wall, at the south-west corner, ends abruptly, and probably descended a little way down the counterscarp of the main ditch, so as to prevent an entrance. In the wall is a recess 6 ft. 4 in. broad and 3 ft. deep, which may have been a public garderobe, similar to that in the wall of the middle ward of Corfe Castle.

The lesser barbican covers the south entrance, the way to which does not, however, appear to have lain across it. It is of earth only,—that is, has no walls, but is of great strength; in shape, and indeed in function, it is a lunette. Its diameter, in the direction from the gate outwards, is 20 yards, and its breadth 100 yards. It rests upon the counterscarp of the main ditch, here about 20 yards broad. It has, also, on its front and sides, a ditch of its own about 20 yards broad, and communicating with the main ditch. In parts this work seems to have been revetted. It was connected with the main work or body of the castle by a narrow bridge, which sprang from its eastern angle, and of which traces remain. There does not appear to have been any outer gatehouse at this end; probably the approach was by a boat across the ditch, or by a plank bridge upon trestles.

Besides the above described works there is another and much larger, though less strong, earthwork, which covers the whole east face of the castle, as well as the flanks of its barbicans. It is about 30 yards broad, and outside the main ditch, on which it rests, and upon the ditches of the barbicans. It had also, towards the field, a ditch of its own, now converted into a hollow road. The approach to either gate of the castle, from the east, lay across this outwork, which was probably stoutly palisaded, and intended to give a moderately-safe refuge to the peasantry and their cattle, during invasions from the Welsh.

It is evident from the general design, position, and capacity of this castle, that it was not intended, like Caerphilly, for the accommodation of a great military baron, nor like Morlais or Castell Coch for a mere military port. Its central part is nothing but a fortified area, like Framlingham, where, however, there seems to have been, as at St. Briavel's, a keep. Here certainly there was none. It is and always was a mere shell, composed of a strong and lofty curtain, mural towers, and a gatehouse. There do not appear to have been any of the usual buildings contained within a large castle. The accommodation within the walls seems to have consisted in timber sheds, resting on stone foundations, and built against the walls. In this way a very large number of soldiers might have been accommodated.

Moreover, the capacity for lodging a large body of troops was not confined to the inner ward. The outworks are also spacious and strong, and could contain a small army, or the *élite*, or perhaps the cavalry, of a large one, besides affording accommodation for a considerable herd and flock of cattle and sheep. Such a place would be secure against any ordinary inroad of the Welsh, and supported, as it would be, by the equally strong, though less capacious, castles of Grosmount and Skenfrith, not to mention Chepstow and Caerleon, which were not always in friendly hands, not only would the entrance of a Welsh army into Gwent be difficult, but its retreat, once within the line, would be almost impossible.

As to the age of White Castle, it is difficult to speak positively. The earthworks are not at all of an English, still less of a Welsh, character. Nor, as a general rule, did the Normans ever throw up earthworks on so immense a scale. The masonry is probably of the age of John, or, perhaps, even of that of Henry III., contemporary with Skenfrith, or perhaps a trifle later, and the earthworks may be of the same date. They are certainly designed to suit a castle in masonry, not the mere palisaded residence of a Mercian Thane. They do not at all resemble the earthworks connected with Offa's Dyke, or those known to be the work of Æthelflæda or Edward. On the whole, it seems more probable that, looking to the extreme importance of the position, the early Norman invaders exceeded the usual character of their earthworks, and designed and executed those which are still seen.

The name White Castle,—in Welsh, "Castell Gwyn,"—is said to be derived from Gwyn ap Gwaethvoed, a brother of the reputed founder of Skenfrith, and one of the Welsh lords of this district. If so he must have held it during the troubles preceding and subsequent to the death of Harold, but any works that he may have found or thrown up were probably effaced by those of the present castle. The castle was held, with those of Grosmont and Skenfrith, sometimes by the De Breose family, sometimes by the Crown, and finally by the Dukes of Lancaster. No doubt it shared in the general neglect of the Border castles; that is, of such as were not the seat of any baronial family. In the time of James I. it was a ruin, and had been so beyond the memory of man.

G. T. C.

ROYAL BERKSHIRE HOSPITAL.

The extensions of the Royal Berkshire Hospital having in past years been confined chiefly to the wards, a deficiency in accommodation for nurses and servants became manifest, and the governors in the early part of the present year determined upon the erection of a laundry, servants' wing, new chapel, operating-rooms, &c., and by adding a story to the present nurses' home and outpatients' hall, providing additional accommodation for the nurses, and a museum, library, and students' rooms, for the medical staff.

Our illustrations show the nurses' home and servants' wing, which form a detached building on the east side of the hospital property, and these with the laundry (of which we give an interior view) are connected by a colonnade with the main building.

The new chapel (the interior of which we will illustrate on another occasion) is placed in the centre of the main hospital block, and by covered approaches access is obtained from all parts of the building.

The laundry is being fitted with machinery supplied by Messrs. Thomas & Taylor, of Stockport, worked by steam-power.

The interior of the chapel, museum, library, and students' rooms, will be handsomely fitted in walnut and pitch-pine French-polished, and in all the buildings sanitary and other appliances of approved kind are being introduced.

The work connected with the laundry, servants' wing, nurses' home, colonnade, library, and museum, is being executed by Messrs. Parnell & Sons, of Rugby; that of the chapel and operating-theatre by Mr. A. Sheppard, of Reading; the finishing of the library and museum by Mr. A. Kimberley, of Banbury; the engineer's work by Messrs. Thomas & Taylor, of Stockport; and the whole is being executed from the designs and under the supervision of Messrs. Morris & Stallwood, architects, of Reading, at a total cost of about 15,000*l*.

Architect and Builder.—In Station-road, Snodland, a new church, to be called the New Jerusalem Church, is to be built from plans prepared by Mr. H. Bridge, builder, of Maidstone, who is also the contractor for building the church. The style is Gothic, shape cruciform, with a tower. The church is to be of Kentish rag, with Bath stone dressings.

CLOISTERS OF THE ROYAL CONVENT OF THE HUELGAS, NEAR BURGOS, SPAIN.

SPAIN is the land of cloisters, both in respect of number and beauty. We have illustrated some of them before now. Foremost amongst them are those of the Convent of the Queen Santa Maria of the Huelgas, near Burgos, of which we are able to present a view. We should scarcely go so far as Mr. Fergusson, who says, in his "History":—"It is unrivalled for beauty both of detail and design, and is perhaps unsurpassed by anything of its age and style in any part of Europe"; but we can admire it greatly for all that.

DESIGN FOR A COTTAGE HOSPITAL.

THIS drawing illustrates a design for a cottage hospital proposed to be built in a small town. The object in view has been to obtain a cheerful homely effect, entirely removed from anything suggestive of a public official building dedicated to the sick.

The whole of the accommodation is arranged on one floor. On the left-hand side of the building there is a large operating-room, a dispensary, with separate entrance for out-patients, and two wards for males, together with lavatories, water-closets, and a bath-room. On the right-hand side of the building is placed the kitchen, scullery, and other offices, and two wards for females, with bath-rooms, lavatories, &c., planned the same as those in the male wing. In all, twelve beds are provided.

In the main or centre portion of the building is placed a medical officers' room, a committee-room, a matron's sitting-room and bedroom, the attendants' bed-rooms, and a convalescents' room, which opens out into a covered verandah. The mortuary is away from the building.

The author of this design is Mr. George E. Carroll, of King-street, Liverpool.

THE FUTURE CATHEDRAL OF LIVERPOOL.

SIR,—Approval having been expressed by a correspondent of the *Builder* ("Evacuates") of Canon Venables's suggestion in the *Nineteenth Century* to adopt Wren's unexecuted design for St. Paul's for the Liverpool Cathedral, I cannot, feeling the interest in the subject of a Liverpool man, resist the desire to state some grave objections to that idea which have occurred to me since it was broached.

The unexecuted design of Wren is, it is true, in some respects, superior to the executed one. It shows a compact and simple composition externally; and internally, though not fully adapted to the Protestant service, exhibits a concentration and uniform spaciousness approximating to the ideal of a Protestant church. But with all due deference to Sir Christopher Wren, I venture to assert that its chief characteristic, the four concave façades, is a mistake, and one which he himself would acknowledge were he to live again in the light that has since his days been shed on the sources of sublimity and grandeur. The form he chose for the body of the building is a very suitable one for the abacus of the Corinthian capital, with which it is identical in horizontal section, but it is very unsuitable for the main body of a great edifice, more especially a cathedral, the grave destination of which imperatively demands straight lines and right angles, as most expressive of stability and strength; and without which, a building, though it may please by its elegance and grace, can have but little of that majesty and grandeur of character which should be aimed at in an edifice reared to the honour of God, as well as to contain a certain number of his worshippers.

He was probably influenced in favour of the curved plan by that of St. Peter's at Rome, of which it seems to be the converse, and which represents a cluster of semicircular apses; forms which render that great building less great than a rectilinear Greek cross plan, with its re-entering angles, would have done. But whether led to them by St. Peter's Church or not, the weak though graceful concave façades of the design in question, had it been executed, would have rendered the realised structure a far less imposing pile than the executed cathedral, and excluded that combination of grandeur and grace which should distinguish a great church, the lofty elevations of which should sympathise with the sublimest material works of God.

As to the *style* of the cathedral, I cannot but prefer Canon Venables's suggestion, Classic, to that of your correspondent, "Evacuates," Byzantine. I have not seen Canon Venables's article, except through extracts, but presume that he means by Classic the columnar Græco-Roman style, of which the Byzantine and Gothic were the eldest daughters, and the beautiful varieties of the Saracenic in Spain, Egypt, Syria, Persia, and Hindostan, the grand-daughters, and which is susceptible of equal refinement with the Byzantine, and equal sculptural and pictorial glory with any style. He cannot, I think, be far wrong in suggesting for the future cathedral the style of the purest days of Christianity, probably long before the time of Constantine the Great,—the style of the early Christian basilicas and churches in Rome, when their arrangements were purely Protestant; and of the first Christian temples of Antioch, Alexandria, Jerusalem, and Constantinople, and which is certainly nearest to the style of Herod's Temple and contemporary synagogues, wherein the Divine founder of Christianity frequently taught; which it is more than probable partook largely of Roman character.

The Classic style is unquestionably the prevailing style in Liverpool.

I cordially agree with Canon Venables that in the Liverpool Cathedral there should be no playing at long choirs, banishing the altar far away from the sight and hearing of the people; and also in what he quotes from Mr. Beresford Hope, "that it should realise the spirit of the age, the wants of the special town, and the requirements of our National Church, and be the true *Ecclesia*, or House of Assembly of Christians of the city and diocese"; conditions which may be fulfilled consistently with,—nay, involve,—the highest architectural beauty and grandeur.

SAMUEL HUGGINS.

SUBSIDENCE OF LAND AT DENMARK HILL, CAMBERWELL.

A GRADUAL subsidence of land has taken place on the Champion Park side of Denmark-hill Station. Some eight or ten years back (says the *South London Press*) the embankment contiguous to Champion Park presented a uniform slope, and attracted the attention of the passengers from the care and cultivation which had been bestowed upon the land. From time to time, however, and almost imperceptibly, slight subsidences occurred, and temporary remedies were introduced for the purpose of preventing more serious encroachments. These appear to have been ineffectual; for within the last month or so a very perceptible alteration has taken place in the appearance of the embankment. The clay beneath has slipped away and the consequence has been that ruts and fissures mark the surface which it formerly supported.

At the meeting of the Camberwell Vestry on the 7th inst., the General Purposes Committee reported that they had taken into consideration a report from the surveyor as to the subsidence of the footpath in Champion Park, and that he had been in communication with Mr. Banister, the company's engineer, on the subject. It was thereupon agreed that the Vestry Clerk should be directed to serve notice on the company, informing them that the subsidence of the footpath and the road required immediate attention, and that they should direct their engineer to take immediate measures to secure the public safety. Consequent on this resolution, active steps have been taken to prevent a further subsidence. Workmen have been engaged in removing the clay, and putting in chalk in its place. By this means a firmer support will be obtained, and the ground, it is anticipated, will be more effectually drained. At the De Crespigny-terrace end, where the results of the subsidence are less perceptible, the wall is being protected by large bolsters of wood.

At the meeting of the Vestry on the 21st inst., the General Purposes Committee reported that the surveyor had directed the attention of the committee to the fact of a further subsidence that had taken place on the public pathway in Champion Park, next to the railings of the London, Brighton, and South Coast Railway, adjacent to Denmark-hill Station, which required immediate attention, and recommended that the Vestry Clerk be authorised to take such proceedings, by mandamus or otherwise, as he might be advised, to compel the company to adopt effective measures to make the path and road safe and secure for the protection of the inhabitants and the public. The recommendation was adopted.

PROGRESS OF THE INSTITUTION OF CIVIL ENGINEERS.

AT the annual general meeting held on the 20th inst. the report read showed that during the past year there had been an increase of fifty-two members, 119 associate members, and forty-nine students, with a decrease of sixteen associates, while the honorary members remained the same. There were on the books on the 30th of November last, eighteen honorary members, 1,261 members, 1,406 associate members, 552 associates, and 662 students; together, 3,899. At the same date in 1860, the number of members of all classes was exactly 1,000. The student class had only been created fourteen years. In the interval, 1,462 candidates had been admitted, of whom 400 had since been elected into the Corporation, and 400 had ceased to belong to the Institution and in most instances to the profession. The deceases had been at the rate of nearly 19 per 1,000, and had included several very old members, notably Mr. James Ashwell, the survivor of the five founders of the Institution.

The income last year was 12,398*l.* 11s. 5d., besides which the receipts had included 3,076*l.* 14s. on account of admission fees and life compositions (which were rigidly treated as capital, and were not used for defraying ordinary expenses), and 431*l.* 5s. 6d. from dividends on trust funds. The general expenditure had amounted to 12,092*l.* 7s. 11d., including 6,523*l.* 17s. 8d. for four volumes of Minutes of Proceedings and for the subject-matter index. A sum of 3,000*l.* had been invested, and 390*l.* 0s. 1d. had been expended for premiums and prizes under trust. The cash balance in hand was 771*l.* 12s. 1d., being 424*l.* 2s. 11d. above what it was at the same period in 1880. The income had been nearly 4 per cent., and the total receipts 6 per cent., in excess of the previous year.

The nominal or par value of the investments held under trust was 14,612*l.* 13s. 10d., and of those belonging absolutely to the Corporation 36,838*l.* 11s. 8d., the dividends on the latter having contributed 1,433*l.* 17s. 6d. to the income. It was stated that on the 30th of November, 1867, the Institution investments (irrespective of trust moneys) were of the nominal value of 17,133*l.* 1s. 3d.; that in the next two years 18,120*l.* 2s. 4d. had been paid for rebuilding and furnishing the enlarged premises, without the necessity for calling upon individual members for special subscriptions; and that the present capital had been the growth of little more than twelve years.

SANITARY PROGRESS AT HENLEY-ON-THAMES.

THREE years ago the inhabitants of this picturesque riverside town were roused out of their usually quiet state by a resolution passed by the Local Board of Health in favour of constructing waterworks to give the town a supply of pure water. This meant an expenditure of 10,000*l.*, and was considered a needless and extravagant waste of public money by many of the principal owners and ratepayers, and an agitation was begun which resulted in many of the members of the Board who had advocated waterworks being turned off the Board, and others opposed to it taking their place. The present supply is drawn from wells, the drainage being into cesspools, in many instances so near the wells as to make it at least possible for the water to be contaminated. After the failure of the authorities to carry out their scheme, a company was formed, and a scheme prepared by Mr. Jabez Church, C.E., of Westminster. The shares were well taken up, and contracts entered into for carrying out the works, Messrs. Docwra & Sons being entrusted with the construction of the reservoir; Mr. Charles Clements, of Henley, with the buildings at the pumping-station; and Messrs. Young & Co., of Pimlico, with the engineering work, including the laying of mains. The water will be softened and filtered by Atkins's process, carried out by the Water Reform Company, Fleet-street. The works are nearing completion, and it is hoped that water may be supplied in about two months.

It has lately been thought necessary that the surveyor and sanitary inspector should devote the whole of his time to carrying out the duties of the offices, and, with a view to this desirable purpose, Mr. H. Malcomson (late surveyor of Lichfield), has been appointed.

The Local Board has lately undertaken to do all the scavenging and cleansing of cesspools in the district, thus hoping to avoid carrying out a system of drainage. A memorial, however, having been sent to the Local Government Board, complaining of the want of such a system, Capt. Hildyard, one of the inspectors, came down to hold an inquiry, and to inspect the town. At a meeting of the Local Board last week, a copy of his report was read, in which he strongly condemned the present arrangement of draining into cesspools, and he also stated that it would be impossible to allow the slop water from the lower part of the town to continue flowing into the Thames.

The Local Government Board has given the authorities six months to prepare a scheme, and it is hoped that there will be no attempt to shirk this important matter, but that efforts will be made to render the drainage of this much-frequented summer resort of visitors perfect, and it will doubtless add to its popularity as a residential place.

CRYSTAL PALACE SCHOOL OF ENGINEERING.

The certificates gained by the students of the Crystal Palace School of Practical Engineering were distributed in the lecture-room at the palace on the 17th inst., by Sir John Coode, of the Council of the Institution of Civil Engineers. Prior to the distribution, Mr. F. K. J. Shenton, superintendent of the Crystal Palace School of Art, Science, and Literature, read the report of the examiners,—Mr. F. Wentworth-Shields, M.I.C.E, and Mr. Joseph Fogerty, M.I.C.E.,—both of whom congratulated Mr. J. W. Wilson, the vice-principal; Mr. J. W. Wilson, jun., and their assistants, on the excellent work done in the school.

Sir John Coode, in the course of his address, observed that anything more satisfactory than the report of the examiners could not be conceived. Forty years ago, when he himself was preparing for the noble profession to which so many of them aspired, there was not a single institution in the country which could for a moment claim to take rank with their school. The want being greatly felt, a college for educating civil engineers was formed at Putney, but it unfortunately had only a very short existence. He mentioned this in order to impress on them as strongly as he could the advantages which they enjoyed. He had been particularly struck with the very happy combination of technical instruction with practical training which this school offered to the young man who desired to join the profession of the civil engineer, or, indeed, of the mechanical engineer.

Major Flood Page, manager of the Crystal Palace, moved a vote of thanks to the examiners, and expressed the gratitude of his directors to the distinguished members of the engineering profession who had been ever ready since the school was formed to render their services as examiners, and to tell them candidly what they thought of the institution. The vote was passed with acclamation.

Mr. J. W. Wilson, jun., afterwards stated that nearly two-thirds of the students who had left the school were in good positions.

IMPROVEMENT OF GRATES.

In a lecture on the Economy of Fuel for domestic purposes, delivered at South Kensington in connexion with the Smoke Prevention Exhibition, Mr. Thos. Fletcher, F.C.S., said:—

It is well known that all metals are good conductors and bad radiators of heat. Any metal in contact with burning fuel lowers the temperature by conducting the heat away, and our first care must be as far as possible to encase our fires with a non-conductor, such as fire-clay. If economy of fuel is any consideration, no metal must come into contact with it unless absolutely necessary. It is or was the fashion to put iron backs, sides, grates, and bars to open fires, the result being dirt, smoke, cinders, and great waste of fuel. Thousands of people who have these extravagant grates, knowing they are extravagant, go on from year to year because they object to the cost and mess of replacing them in houses which may be left at any time, the certain outlay being greater than the probable economy. I will try to explain to you how you can, with very little trouble or expense, convert these extravagant grates into the most modern and approved forms. The result will be, if my own experience is any guide, a saving of at least one-third the fuel, and more than half the dirt and trouble. There is only one fairly good non-conductor of heat known at present which can be applied to grates,—that is, ordinary fire-clay. If we use this to line a grate, the result is, if not fitted and then burnt in a kiln, it simply cracks away and falls to powder when the fire is lighted, and here is the point to which I wish to call your special attention. If you take ordinary builder's fire-clay, and mix it, not with water, but with a solution of silicate of soda, you can build, shape, or patch your fire-linings to any extent, without risk of breakage or falling to pieces. If you get cracks you can repair them perfectly with the same material, and you can also repair broken or damaged fire-clay linings already in use, provided the surfaces you wish to join or build to are clean and damp, to ensure perfect adhesion. You will of course understand that loose fire-bricks or balls are an unnecessary nuisance, as you can reduce or alter your fire-grates neatly and well by this material, using, if necessary, lumps of broken brick to fill up any large spaces, and plastering over these, making a neat finish of the whole. Silicate of soda, or soluble glass, is not exactly what soap is made from, but it is used to an enormous extent for the adulteration of soap, and can be obtained easily at a very small cost. We pay for it at the soap-works at about 1s. 3d. per gallon. One most important point is, that the iron bars under the fire shall not only be closed by building up underneath the fire-grate with bricks, but the mixture I refer to must be laid on the upper side of these bars until it is about ½ in. to 1 in. thick, so as totally to prevent contact of the metal with the burning fuel. The front bars of the fire must be left alone; it is not possible to interfere with these without spoiling the appearance of the fire. When we get a solid fire-clay bottom, back, and sides to a fire, we get a much higher temperature, because the heat is not conducted away by the metal; we get no cinders, and our fire, burning, as it does, principally on the surface, is both brighter, hotter, and much more free from smoke. It will be found, also, that the fuel consumption is very much reduced, and the fire burns much longer without attention."

THE REMOVAL OF MATERIALS FROM BUILDINGS ON WHICH MONEY HAS BEEN LENT.

Sir,—From my experience last week it would appear that thieves need no longer fear the police or run the risk of a prison. I have a man in charge of some unfinished cottages at Edmonton which had been abandoned by the builders, and on which property I have lent money. I have an equitable mortgage and deposit of the building agreement, in which latter it is covenanted that no materials shall be removed without my written consent. The man in charge wired me the other day that a number of roughs had arrived, and were loading a van with materials from the buildings, purporting to be acting under a bill of sale.* I replied that he was to lock up any person stealing the materials, and detain the goods; but the police refused to take the charge or in any way to interfere, and so the materials disappeared and some portion of my security vanished under the eyes of the police.

What an opportunity for the thieves of London to get up bills of sale and plunder in broad daylight every carcass in the suburbs, under the eye, if not under the protection, of the police! In like manner a builder, to whom I had also advanced money, failed to complete his work at Wandsworth, and I had unfortunately to enter into possession, three months ago, under my powers contained in the building agreement. In November I entered into a contract with another builder to finish the property for me for a certain sum of money, and while he and his men were at work, a few days ago, there came upon the scene about a dozen roughs and a policeman, and forthwith a quantity of materials were forcibly taken away. It transpired that a mason who, four months ago, was employed by the original builder, sold, or pretended to sell, the materials taken away to a neighbouring publican, and, after flourishing a receipt, I was left minus the materials, the police looking on and refusing in any way to interfere.

The contractor who is responsible to me for the goods applied to Mr. Partridge on Saturday, but that gentleman simply called it a dispute of title, and referred the contractor to a superior court.

I wonder if the mason had sold Mr. Partridge's sideboard to a publican, and the roughs had dealt with it as they did with my materials, whether he would have considered it a dispute of title or sent the parties to prison?

The fact of refusing to interfere under a criminal charge in such cases opens the door to a flood of crime. The whole scum of London may now proceed to sell materials which do not belong to them, carry off the spoil, and dispose of it without fear or hindrance.

I do not complain of any man urging a claim or disputing my claim; but, with all respect to the learned magistrate and the police, I consider it a crime for a band of men to enter (trespass upon) my premises, and forcibly remove materials without my knowledge and consent, and dispose of the same before establishing a claim to them. It is no question of title, for that can and ought to be settled without a removal of goods. It is a question of crime or no crime, and if I am correct in calling it crime, then it is for the police and the magistrate to deal with it; if no crime, then it is a millennium for some of the denizens of Seven Dials.

W. G.

* A search has been made for the registration, but without result.

WANT OF A RAILWAY, EAST DULWICH.

At a public meeting held recently in East Dulwich, a resolution to the effect that a new railway was required giving additional accommodation for that district, was proposed and warmly supported by several speakers; amongst others by Mr. Mercer, who said that ten years ago there was little to be seen but green fields, and other indications of rural life. Since that time something like 4,800 houses had been built, but he was sorry to say that 40 per cent. of them were unoccupied at the present time, and it was simply because people were not afforded means of getting to and from the City quickly. Another speaker (Mr. J. Ball) said that within the last two days he had counted the number of empty houses in the three main thoroughfares of the district, viz., Lordship-lane, Crystal Palace-road, and Barry-road. In Lordship-lane, from Goose-green to Barry-road, he found 159 houses or shops occupied, 72 unoccupied, and 19 in process of building. In Barry-road, 107 were occupied, 44 unoccupied, and 12 were unfinished. In Crystal Palace-road, 215 of the houses were occupied, 105 unoccupied, and 9 were in an unfinished condition. The number of unoccupied houses amounted to about 30 per cent. of the whole. The resolution was unanimously adopted, as was also another resolution appointing a committee to wait upon the representatives of the two railway companies in reference to the construction of the proposed new line.

CURIOUS EFFECT OF A STORM.

A curious effect of the last equinoctial gales is reported from Griesheim, in Germany. A chimney had just been finished at the Chemical Works at that place when the storm came on. The total height of the chimney was 40 mètres. The upper 32 mètres above the socle were divided into four parts, which were respectively two bricks and a half, two, one and a half, and one brick in thickness, the mortar being of ordinary lime and sand. The violent wind which came on immediately after the bricklayers had finished had the effect of bending the chimney fully a yard out of the vertical line. But it did more than this, it twisted the upper portion of the chimney perceptibly round its axis out of its original position. The deviation from the vertical line begins a little above the socle, and then increases in a slight curve up to the top, which, as above stated, is fully a yard out of the perpendicular or axial line. The materials used were of very excellent quality, nor was there anything in the method of construction to account for the strange effect visible after the storm. It is clear that the mortar was not dry, and was, therefore, incapable of resisting the effect of the unusual violence of the wind.

FUNERAL OF MR. G. E. STREET, R.A.

On Thursday last, the 29th, the remains of the late George Edmund Street, R.A., P.R.I.B.A., F.S.A., &c., were interred with all due solemnity in the nave of Westminster Abbey. The procession started from the residence of the deceased, 14, Cavendish-place, Cavendish-square, about two o'clock, in the order hereunder mentioned:—

The funeral car carrying the body.

Seven mourning coaches, containing the members of the deceased's family, including Mr. Arthur Edmund Street, M.A., A.R.I.B.A, son; a brother and sister of the deceased; Mr. Wells, R.A., and a number of other private friends; besides several representatives of Mr. Street's office staff, including Messrs. Tanner, Gandy, and Holland.

Four mourning coaches, containing the President and Council of the Royal Academy, viz.:—Sir Frederick Leighton, P.R.A.; and Messrs. Alma Tadema, H. H. Armstead, Vicat Cole, J. E. Hodgson, F. R. Pickersgill (Keeper), and other members and officers of the Academy, including Mr. Fred. A. Eaton, Secretary.

Nine mourning coaches, containing the Past Presidents, Past Vice-Presidents, the Vice-Presidents, Members of Council and other officers, Honorary Associates, and other members of the Royal Institute of British Architects, viz.,—First coach, Professor Donaldson, P.P.; Mr. Charles Barry, P.P.; and Mr. George Godwin, P.V.P. Second coach: Mr. Horace Jones (the City Architect), V.P.; Mr. Ewan Christian, V.P.; Mr. F. C. Penrose, M.A., P.V.P.; and Mr. David Mocatta, P.V.P. The third, fourth, and fifth coaches contained the Members of Council, in the following order,—Mr. A. W. Blomfield, M.A.; Mr. James Brooks; Mr. David Brandon, F.S.A.; Mr. Arthur Cates; Mr. Joseph Clarke, F.S.A.; Mr. John Gibson; Mr. Henry Currey; Mr. Octavius Hansard; Mr. J. T. Knowles; Mr. Alfred Waterhouse, A.R.A.; Mr. E. G. Paley; and Mr. Thomas Worthington. In the sixth coach were Mr. J. Macvicar Anderson, honorary secretary; Mr. William H. White, secretary; Col. Sir Andrew Clarke, R.E., C.B., K.C.M.G. (representing the Royal Engineers); and the Right Hon. W. H. Smith, M.P. (Hon. Associate). In the seventh coach were Sir Philip Cunliffe Owen, C.B.; Mr. P. C. Hardwick, F.S.A.; M. le Professeur Émil Trélat, of La Société des Ingénieurs Civils, Paris (Hon. and Corr. Member); and Mr. James Abernethy, Past President of the Institution of Civil Engineers (Hon. Associate). The eighth coach contained Mr. G. J. Symons, F.R.S., President of the Meteorological Society; Mr. C. L. Eastlake (Keeper of the National Gallery); Mr. Joseph Goddard, President of the Leicestershire Society of Architects; and Mr. John P. Seddon (representing the Royal Architectural Museum). The occupants of the ninth coach were Mr. T. M. Rickman, F.S.A. (Auditor); Mr. J. Tillman, President of the Northern Architectural Association; and Mr. J. Wreghitt Connon (representing the Leeds Architectural Society.)

One mourning coach, containing representatives of the Council of the Society of Antiquaries.

One mourning-coach, containing the following representatives of the Architectural Association, viz., Mr. Aston Webb, President; Messrs. Frederick E. Eales and W. H. Atkin Berry, honorary secretaries; and Mr. J. Douglass Mathews, treasurer.

The carriage of H.R.H. the Prince of Wales, and several private carriages, brought up the rear of the procession, which took the following route:—Regent-street, Waterloo-place, Pall Mall, Cockspur-street, Whitehall, Parliament-street, Broad Sanctuary, and Dean's Yard, to the west cloisters gate, arriving at 2·50, whence the procession entered the Abbey, preceded by the choristers and clergy of the Abbey. The latter included the Very Rev. the Dean (Dr. Bradley); Canons Farrar, Duckworth, Barry, and Rowsell; and Minor-Canons Troutbeck, Price, and Cneadle.

The pall-bearers were:—The Right Hon. A. J. B. Beresford-Hope, M.P., Past-President of the Royal Institute of British Architects (representing also the Royal Architectural Museum); Sir Frederick Leighton, P.R.A.; the Right Hon. G. J. Shaw-Lefevre, M.P., First Commissioner of Works; Mr. W. H. Gladstone, M.P. (representing his father, the Prime Minister); Mr. E. Freshfield (representing the Society of Antiquaries); Professor T. Hayter Lewis, F.S.A., Senior Vice-President of the Institute; the Right Rev. the Bishop of Winchester; and the Hon. Mr. Justice Kay (representing the Lord Chancellor).

The mourners entered the Abbey in the order in which they proceeded from Cavendish-square, followed by representatives of the general body of the Royal Academicians, Associate-Academicians, and officers of the Academy; of the general body of the Fellows, Associates, and Honorary Associates of the Royal Institute of British Architects; of the general body of the Fellows of the Society of Antiquaries; and of the general body of the members of the Architectural Association. Also represented at the funeral were clerks of works, builders, and carvers who had worked under Mr. Street, including Mr. W. T. Creed (clerk of works), Mr. Wallis (clerk of works at the Royal Courts of Justice), and Mr. H. G. Margetson (carver at the Courts of Justice).

The service was full choral. The grave is in the nave, just by the pulpit, and close to the graves of Sir Charles Barry and Sir Gilbert Scott.

Besides the gentlemen whom we have already named as attending the funeral, we noticed Messrs. J. C. Horsley, R.A.; J. E. Millais, R.A.; W. Calder Marshall, R.A.; W. Q. Orchardson, R.A.; W. W. Ouless, R.A.; J. R. Herbert, R.A.; P. H. Calderon, R.A.; H. S. Marks, R.A.; T. O. Barlow, R.A.; Alfred Waterhouse, A.R.A.; E. Long, A.R.A., J. E. Boehm, A.R.A.; Marcus Stone, A.R.A.; J. McWhirter, A.R.A.; G. Aitchison, A.R.A.; R. Phené Spiers, Master of the Architectural School at the Royal Academy; Hugh Stannus; Professor Kerr; Professor T. Roger Smith; Messrs. E. Woodthorpe; W. White, F.S.A.; Bowes A. Paice; James Fergusson, F.R.S.; George Vulliamy; John Hebb; E. R. Robson, F.S.A.; E. C. Robins, F.S.A.; T. W. Cutler; E. I'Anson; F. H. A. Hardcastle; Hampden W. Pratt; H. Jarvis, jun.; Cole A. Adams; H. Lovegrove; Thomas Hawksley, M. Inst. C.E.; R. W. Edis, F.S.A.; C. F. Hayward, F.S.A.; Mr. R. L. Cox; and Sir Henry Cole, C.B. We were also informed that the following gentlemen were among many old assistants and pupils of Mr. Street who came from near and far to the funeral, viz., Mr. G. D. Oliver (Carlisle), Mr. H. G. W. Drinkwater (Oxford), Mr. W. Wood Bethell, Mr. James Bell, Mr. T. E. Collcutt, and Mr. Sidney Vacher.

No doubt many names are omitted in the foregoing account, which is, however, as perfect as it could be made in the two or three hours which intervened between the conclusion of the funeral ceremony and the time of our going to press.

The funeral arrangements were in the hands of Messrs. Holland & Son, of Mount-street, Grosvenor-square.

The Government has confided the completion of the Courts of Justice to the two gentlemen who have been Mr. Street's chief assistants in the work. This took place some little time before his death, but it was thought the mention of it might have affected him, and we, therefore, avoided doing so.——In our notice last week we mentioned as Mr. Street's executor a brother Royal Academician. This is not correct; Mr. Arthur Edmund Street is left sole executor of his father's will.

THE "ELECTRIC" PAINT REMOVER.

WE have had an opportunity of seeing some experiments with the new patent "Electric" Paint Remover lately introduced into the market by the patentees and manufacturers, Messrs. Rendle Bros., of Westminster-chambers, who, already well known (in conjunction with their father, the late Mr. W. Edgcumbe Rendle) for their admirable method of glazing roofs without putty, are likely to become as well known for the valuable material which is named at the head of this article. Before describing it and its method of application, we should perhaps note that the material is chemical, and not electrical, in its action, the title "Electric" being adopted by the patentees as expressive of the rapidity of action which is one of its chief characteristics. Although the results obtained by its use are not obtained with the rapidity of lightning, the celerity with which the "Paint Remover" does the work it professes to do, and does it effectually, is very striking. As to the composition of the material, its principal ingredient, we understand, is chemically pure soda, with other ingredients, all of which are stated to be non-injurious to the wood or other material from which the paint is to be removed. One ingredient common to most paint-removers, viz., lime, is totally absent. The material, which is in the form of a white creamy paste of equal consistency, is sold in tins, and it has the recommendation of being very cheap. It is easily applied, possesses no offensive smell, contains no grit, and is not injurious (as we are informed) to the hands of the workmen using it, nor does it injure the material operated upon. It is equally efficacious for the removal of old paint, varnish, tar, rust (where not eaten into the metal), grease, japan, &c., from wood, stone, iron, marble, &c. Another application of it is for the rapid removal of wall-papers, a pint of the "Remover" being mixed with a pailful of water, and the mixture laid on the paper to be removed with a plastering brush. By the time the workman has made the circuit of a small room in this way, he will be able to quickly wash off the paper, beginning, of course, where he commenced with his brush. To remove paint, japan, &c., a thick coating of the "Remover" is spread with a palette-knife or trowel on the surface to be operated upon, and allowed to remain for about half an hour. The *rationale* of its action is that the strong alkali of the compound, acting upon the oil contained in the paint, induces saponification, rapidly forming a kind of soapy paste in which the ingredients of the paint are taken up, and when this process is completed (a matter which is easily ascertained by the removal, with a knife or other tool, of a portion of the layer of "Remover," or by its change in colour, as it loses its whiteness in proportion as it absorbs the pigments in the paint), the work operated upon can be held under a water tap, or subjected to the action of a jet of water, or washed with a flannel and water. The newer the paint, and the fewer the coats of it which have to be removed, the quicker, of course, is the action of the "Remover," one application of which will be found to be sufficient for all ordinary work. Among the specimens which we saw operated upon were pieces of painted wood and parts of japanned gas-meter-cases, and each experiment was perfectly successful, fully bearing out the claims made on behalf of the "Paint Remover."

We have stated that the material will clean stonework. This it will do, whether the stonework be covered with paint or discoloured by soot or grease. Talking of grease, we call to mind a notable instance of the defacement of a building by that kind of "matter in the wrong place," viz., the Portland stone surbase on the exterior of the Metropolitan Meat Market at Smithfield. This is disfigured by being overlaid with a veritable "dado" of grease made quite black by dirt. The cause of this eyesore is that the butchers and market-porters, in the intervals of carcass-carrying, loll, pipe in mouth, and, of course, with their greasy "overalls" on, against Mr. Horace Jones's architecture. The Corporation of London will, we think, do well to allow Messrs. Rendle to try their new material on this greasy dado, which, however much it may tend to preserve the stone, is a great disfigurement to the building.

Messrs. Rendle prepare a special solution of their material, prepared expressly for cleansing very delicate carved work, and for use in the cleaning and restoration of textile fabrics.

We have said enough to show the remarkable properties of this material, which we have no doubt has a good future before it.

PROPOSED NEW WORKHOUSE FOR ST. PANCRAS.

THE Guardians of the above parish, after nominating the following architects, — viz., Messrs. Aldwinckle, Young & Hall, Hoole, Bridgman, Saville & Son, Isaacs & Florence, Verity, Norman Shaw, Seddon, Quilter, Giles & Gough, Wadron, and Gundry,—have selected the first five on the list to send in competitive plans for the new workhouse, which, it is estimated, will cost from 150,000*l.* to 200,000*l.* 300*l.* are to be equally divided between the four unsuccessful candidates; the successful one will be paid the ordinary commission on the outlay. Upon counting the votes, it was found that Messrs. Saville & Son, of 1, Argyle-square, and Messrs. Isaacs & Florence were seven each; this being so, a second voting took place, and the result was:—Saville & Son, 13; and Isaacs & Florence, 4.

THE PUBLIC SAFETY IN THEATRES.

At the meeting of the Metropolitan Board of Works on the 23rd inst., the Building Act Committee recommended that the Superintending Architect be authorised to have a translation made of the Berlin and Hamburg Theatre Regulations, and that he be instructed to obtain, if possible, a copy of the new regulations issued by the municipal authorities of Vienna, and have a translation thereof made, and that the translations be printed and circulated amongst the members of the Board. The recommendation was agreed to. The committee also reported that after the inquiry relative to the inspection of the Royal Comedy Theatre, Panton-street, and the Avenue Theatre, Northumberland-avenue, they regretted that the examination of the latter theatre had not been more carefully made, and under more favourable circumstances. A discussion of a personal character followed, in which the interference of the District Surveyor by a letter addressed to the Superintending Architect was condemned on one side and defended on the other. The report of the committee was adopted.

We have received a number of letters on the subject of these two theatres, and of the differences which have grown up between the District Surveyor and the Superintending Architect of the Board in connexion with them; but they deal so freely with persons that we have avoided discussing them. If the public safety, however, be at stake, it must of course be done.

At a meeting of the dramatic critics of the principal London newspapers, the following resolutions were passed: — 1. That the condition of many of the London theatres, both in regard to the stage and the auditory, in case of fire and panic, is extremely unsatisfactory and unsafe. 2. That the time has come for amending the laws that apply to theatres and places of amusement generally in the United Kingdom; and that it is highly necessary to appoint a Government official, to be held publicly responsible for the safety of theatres and places of amusement, and to be assisted by qualified inspectors. 3. That, pending the introduction of new legislative measures, and for the immediate protection of the public, the control, as regards danger from fire, of all theatres and places of amusement should be placed under the direction of the official chief of the Metropolitan Fire Brigade and his subordinates. 4. That the Lord Chamberlain be invited to assist, as far as lies in his power, in the prevention of danger from fire, or alarm of fire, in theatres.

Mr. C. J. Phipps, F.S.A., has, at the request of Mr. Michael Gunn, made an examination of the Gaiety Theatre, Dublin, with especial regard to facilities for safe egress in case of panic. He finds that the supplies of gas to the corridors and staircases are quite distinct and taken from an entirely different main from that supplying the stage. Each division of the audience has its own entrance and way out, and the various attendants and officials are charged with the duty of opening all doors, &c., under their control directly the exit of the audience is impending. All internal doors and barriers open outwards, and external doors are locked back while the audience is in the theatre. There are high-pressure mains on the stage, in front and in the flies, with a fireman of the Brigade always in attendance while the audience is in the theatre. On the most crowded nights the audience is out of the theatre in four minutes, so that, Mr. Phipps says, "the danger is not from fire, but from a mad stampede." Ay; but how to prevent danger from *this* cause?

The Safety of Churches.—Very little time has been needed to produce cases in confirmation of the truth of the observations we made last week touching the necessity for attention to the modes of exit provided in churches as well as in theatres. On Christmas-day at Warsaw, in the Church of the Holy Cross, a false alarm of fire was given by some evil-disposed person. A general panic ensued, the worshippers making a mad rush to the doors. Some thirty or forty persons were crushed or trampled to death, and about sixty others were more or less injured. Again, on Boxing-day the floor of the Methodist chapel at Camborne, near Plymouth, laden with goods for a bazaar, gave way and produced a frightful panic and serious injuries to many persons.

PATENT RECORD.*

APPLICATIONS FOR LETTERS PATENT.

5,379. J. C. Baker, Liverpool. Ventilating buildings, &c. Dec. 9, 1881.

5,381. D. Gill, Weston-super-Mare. Water-closet apparatus, &c. Dec. 9, 1881.

5,391. W. R. Lake, London. Cesspools. (Com. by L. Mouras, Vesoul, France.) Dec. 9, 1881.

5,397. W. Whitwell, Stockton-on-Tees. Apparatus for heating air, &c. Dec. 9, 1881.

5,419. G. H. Chubb, London, and H. W. Chubb, Chislehurst. Locks. Dec. 10, 1881.

5,424. E. A. Rippingille, Aston-juxta-Birmingham. Gas stove. Dec. 12, 1881.

5,439. W. E. Burder, Loughborough. Boilers for hot-water apparatus. Dec. 13, 1881.

5,466. W. Bash, J. Bash, and N. S. Dansa, Manchester. Locks and latches. Dec. 14, 1881.

NOTICES TO PROCEED

have been given by the following applicants, on the dates named.

Dec. 13, 1881.

3,451. E. Lee, Torquay, and A. C. Moore, Deptford. Regulating the supply of water to water-closets, &c. Aug. 9, 1881.

3,535. J. C. Johnson, Gravesend. Manufacture of Portland and other cements. Aug. 15, 1881.

3,862. J. Dunnachie, Glenboig. Regenerative kilns for burning fire-bricks, &c. Sept. 6, 1881.

4,927. E. de Pass, London. Manufacturing artificial stone. (Com. by R. H. Stone, Brighton, Victoria.) Nov. 10, 1881.

Dec. 16, 1881.

3,507. E. G. Brewer, London. Plastering. (Com. by D. W. Stockstill, T. J. McGeary, and E. W. Anderson, Washington, U.S.A.) Aug. 2, 1881.

3,512. T. Redmayne, Sheffield. Stoves and fireplaces. Aug. 12, 1881.

3,523. W. Brierley, Halifax. Venetian blinds. (Com. by F. Rüler, Teplitz, Austria.) Aug. 13, 1881.

4,678. S. Leoni, London. Apparatus for heating, cooking, &c., by gas. Oct. 26, 1881.

ABRIDGMENTS OF SPECIFICATIONS

Published during the Week ending December 17, 1881.

1,981. G. Giles, Birmingham. Cornice-poles.

A tubular pole is open-jointed on the underside, and has within it another pole on which is a right and left handed screw. On the inner pole are the rings for the curtains, each of which has a tooth working in the screw. On the end of the pole is a toothed roller end, which is actuated by a cord, and makes the pole revolve, taking backwards and forwards the curtain rings. May 7, 1881. Price 4d.

1,983. C. J. Pollard, Burnley. Stoves and fire-ranges.

A chamber, in the sides of which are air-passages, is placed in the centre of the stove or range, and fitted with a damper to regulate the supply of air admitted to the fire. (*Pro. Pro.*) May 7, 1881. Price 2d.

2,000. E. Edwards, London. Wrought-iron window-frames.

The frames and cross-pieces of the windows are made of iron of hollow square cross-section and a bed of non-conducting material is arranged between the parts to prevent cold air entering the room. (Com. by C. A. Schütz, Stralsund.) May 9, 1881. Price 6d.

2,021. E. V. Harris, Winchester. Sliding window-sashes.

The sash-tiles are divided, and to the side portions that slide in the grooves of the window-frames the sash is pivoted, so that it may be swung over for cleaning, &c. (*Pro. Pro.*) May 9, 1881. Price 2d.

2,037. H. J. Haddan, Westminster. Apparatus for drying, roasting, &c.

The oven and flues are formed of brickwork. A screw-conveyor and its casing, which are of metal, are placed over the oven. The fireplace is at the side of the oven, all round which the flues extend. (Com. by E. H. Potter, New York, U.S.A. (*Pro. Pro.*) May 10, 1881. Price 2d.

2,040. P. Jensen, London. Artificial stones or compositions.

Pulverised asbestor is mixed with a silicious solution of 25° to 50° Baumé, metallic oxides, and chalk, plaster of Paris, lime or clay. In the thicker states this forms an artificial stone, and in the thinner states a paint or cement (Com. by E. J. Erichsen, Copenhagen.) 10th May, 1881. Price 4d.

2,044. W. Clapham, Leeds. Fire-grates.

The bottom gratings of these grates have a rising and lowering motion by a rack and pinion, by which motion the size of the fire is increased or reduced. (*Pro. Pro.*) 10th May, 1881. Price 2d.

2,059. A. Guattari, London. Machinery for producing designs upon marble.

The surfaces of the moulds are roughened or covered with fine pyramidal teeth. The moulds are lifted by tappets on a rotary shaft, and allowed to fall upon the block to be carved. Emery powder falls upon the back of the mould, and water being distributed through a rose carries the emery between the roughened surfaces of the mould and the block. (*Pro. Pro.*) 11th May, 1881. Price 2d.

2,060. A. M. Clark, London. Window-cleaning chair.

This chair has a platform, folding guards, supports, steps &c., which can be arranged in either an open or folded condition. It is secured in position by a flat bar adjustably held in position by angle rods that project from each end of the bar up through slots in either side of the platform, where they are held by plates with bevel-edged perforations engaging teeth in the rods. Screws are used to clamp the bar. (Com. by Mrs. A. Dormitzer, New York, U.S.A.). May 11, 1881. Price 6d.

2,087. G. Osborne, Brighton. High-pressure regulating taps or valves.

This is an improvement on Patent 2,994 of 1875, in placing the additional valve near the stem of the ordinary valve on the upper side of the passage of the tap, instead of on the under side, so that it is easier to get at the stem or spindle when required. May 13, 1881. Price 6d.

2,100. A. A. Bedford, Clapham. Locks or fastenings.

The novelty here is that the handle must be pressed inwards before it can be turned, and when it is released a sprig forces the handle out again, so that the door cannot be opened by mistake. (*Pro. Pro.*) May 13, 1881. Price 2d.

2,105. F. C. Jeune, London. Manufacture of ornamental embossed fabrics for covering walls, &c.

Indiarubber is thoroughly cleansed and reduced to dough by a spirit solvent. This dough is mixed with an equal quantity of finely-ground cork, and spread on a cotton fabric. After being dried it is rolled and faced. The embossing is then performed by flat pressure, under a block having the desired pattern, and afterwards the fabric is coloured and varnished. May 13, 1881. Price 2d.

* Compiled by Hart & Co., patent agents, 28, New Bridge-street, E.C.

RESOURCES OF IRELAND.

At the Statistical Society, on the 20th inst., Dr. Balfour in the chair, a paper was read on "The Industrial Resources of Ireland," by Mr. G. Phillips Bevan, D.L., showing that the industrial position of Ireland has been strangely neglected, the attention of statesmen and others having been entirely engrossed with the political side of the question. Great ignorance, moreover, prevails as to what the industrial resources of the country really are. It is very clear that, with a few exceptions, the industries have been declining, as has also the industrial section of the population. There is no industrial point on which there is more misapprehension than about the coal and iron deposits of Ireland, which it is the fashion to ignore, though most unfoundedly. The coal deposits of the Leinster field are estimated to possess 102,580,000 available tons; those of the Munster field, 20 millions; of the Connaught field, 10 millions; of the Ulster field, 18,000,000; total, 182,280,000; and yet, with all these known valuable beds, the collieries of Ireland are in a languishing condition, the annual outputs never exceeding 140,000 tons, and seldom reaching that. While in 1876 the Leinster field alone produced 170,000 tons, the total yield of all Ireland in 1880 was only 133,719. No wonder, then, that the number of collieries is on the decline, as also of coal miners. It is the more unaccountable, as the coals are of excellent quality, both bituminous and anthracite, and the annual consumption of coal in Ireland is now nearly three million tons. Two centuries ago, Ireland possessed a flourishing iron trade, charcoal-smelted; and it has since been proved by competent authorities that the best iron can be made in Ireland as cheaply as in England; and although English and American competition would keep Irish iron out of the markets of the world, there is no reason why a large home demand should not be supplied at home. Cement works have been started in County Fermanagh by Mr. Bloomfield, of Castle Coldwell, and have proved a great boon to the neighbouring country. The Irish building stones, which are of unequalled beauty and goodness, have been greatly overlooked. Probably no country in the world produces finer marble, and yet Bath freestone has actually been imported at vast expense rather than use the stones at hand. The suggestions proposed are,—that an exhaustive examination should be made of every corner of Ireland by a Royal Commission, so as to obtain authoritative information of what the country is capable, and to ascertain why it is, for instance, that collieries are worked to such poor purpose; why an iron trade cannot be started; why woollens should not again be a national industry; why the fisheries should not be made more economically useful, &c. Premiums or bounties

should be offered, as was done with great success on the starting of the linen trade, and is being done in the fisheries, for the development of any new industry, and particularly for the applications of new materials. The lack of communication is a great drawback to Irish prosperity. Cheap light railways should be laid down between the west and north-west coasts and the interior, so that the wilds of Donegal, Mayo, Galway, Clare, and Kerry may be opened up and connected with markets. The rates of existing railway systems should be reduced, and by means such as these, present industries would be created, giving occupation to great numbers of starving people, while industrial energy would follow permanently in their track.

THE DURABILITY OF CALCAREOUS STONE.

SIR,—Referring to Mr. H. Travis's letter of the 3rd inst., and his remarks on the perishable nature of the calcareous stones used in our public buildings, and Mr. Codner's "Notes on our Cathedrals," p. 738, I shall be glad to make a few observations on the durability of calcareous stones, if you will kindly allow me, in your valuable paper. Having had thirty-five years' experience as a stone-carver in most parts of England, Ireland, and France, and for nearly two years taken casts from the old work for the Mediæval Court at the Crystal Palace, I have had rather a large field of observation with regard to the durability of the stones used in our Mediæval architecture.

When engaged on the carving at the west front restoration of Wells Cathedral, I pointed out to my late partner, C. J. Herley, the fact that I had noticed at Beverley Minster, York, Lincoln, Peterborough, Salisbury, &c., but here to a more marked extent, that the faces of the towers looking east and north were in a much higher state of preservation than those looking west and south; in fact, here,—Wells,—at the north-east angle of the north tower, the figure-ornament and mason's work are as sharp as when first cut, though they have been here about 700 years; the clawtool marks are quite plain. The stone is a fine limestone, an oolite, impregnated with a metallic oxide from Doulting, near Shepton Mallet, while that of York, Beverley, and Lincoln is a magnesian limestone from Bramham Moor, Tadcaster. The Percy shrine, Beverley Minster, one of the finest monuments of the Decorated period in England, is in Tadcaster stone, and is as sharp as when first done, though erected in the reign of Edward I. The same observation may be made with regard to our Portland stone buildings of London, Dublin, &c. Notice St. Paul's Cathedral on the north side,—Grinling Gibbons's carved panels are as good as ever; the same at Somerset House, the "Strand" north front,—those keystone heads, "the river gods of England," by Bacon, are as sharp as ever, only black, while the river front looking south is more decayed.

All this proves that it is not the cold frost or smoke that decays the stone, but the wet, as our south-west winds, giving us the benefit of the gulf-stream, are always more charged with moisture; and that if these calcareous stones can be kept dry, they will stand for an indefinite period. The question is, how to keep the water from percolating the stone? When erecting some monuments in the Dublin Cemetery, I noticed the clean whiteness of the Portland stones there; some that had been fixed for years surpassing anything I had noticed before, even in that mountainous cemetery of Père la Chaise of smokeless Paris. An unpractised eye might have thought they had been painted, but to paint stone is to spoil it. No, there were the little shells and flints, showing the proper granular surface of the stone. I found it was the practice of the cemetery masons there always to oil their Portland stones with boiled linseed oil; it must be done when the stone is quite dry. A warm summer's day is the best time, and only one coat, as a second would stand on the surface and turn dark; the result is, that the surface bleaches out almost as white as statuary, and the oil that is absorbed by the stone keeps the wet from percolating, and so preserves the stone. No doubt, a good deal of the soot that sticks to the surface is caused by the suction or capillary attraction of the stone; this has been stopped by the oil, is loose, and is washed away by the rain, and the stone kept clean. I have no doubt, if all the Portland and Bath stone buildings of London were treated in this manner, they would stand longer and keep cleaner; and if all the black bronze statues were gilded like King William at Hull, or Prince Albert in Hyde Park, London, they would have a more cheerful appearance than they now have.

C. ABBEY.

EMBLEMS OF THE TRINITY.

SIR,—I have read with great interest Mr. Dobson's recent lecture on "Symbolism," which is given in the *Builder* for December 10th. It may be of interest to your readers to know that there are still existing in England some representations of the "Trinity" which have escaped destruction. I have lately seen the following:—

1. On the slab of an altar-tomb, on the north side of the chancel of the parish church of Cookham, on the Thames, is a small "brass," about 6 in. in diameter, on which is engraved a representation of the Holy Trinity, in precisely the same manner as in the Yorkshire glass. This brass, it appears, was covered over by the base of a small pillar, supporting a "late" canopy, and, being thus hidden, it escaped being torn up, as so many other brasses were, in the troublous times of the sixteenth century.

2. There is a very perfect and well-carved representation of the Trinity in a niche in the west gable of the nave of the church of Creech St. Michael, in Somersetshire, a short distance from Taunton. The carved group appears to be about 3 ft. in height; its great distance from the ground, and the difficulty of getting a ladder to reach it, are, without any doubt, the causes of its preservation to our time.

3. A very curious group of the Trinity still remains *in sitû* in its niche, at the south-west angle of the tower of the church at Comb Martin, in North Devon (near Ilfracombe). This carving is placed at a great height from the ground, and is in an exceedingly difficult position to get at, either from below or from the top of the tower: to this cause (as in the case of Creech St. Michael also) we owe its safety. In these three groups the Eternal Father is represented as "The Ancient of Days" robed in a cope and crowned as a king, holding His Divine Son crucified; the arms of the Father being extended so as to support the cross, whilst the "Paraclete Dove," the Holy Spirit, hovers over the head of the Son, just where the "morse" of the cope is usually seen; the heads of the Three Persons are surrounded by "nimbi," that of the Son being a cruciform one. The Eternal Father in each case is seated on a throne. It was in the fourth century that artists began to represent the mystery of the Trinity as a group of three persons. These Divine Persons are sometimes represented as supporting a triangle. From the twelfth century upwards we see representations of the Trinity, such as those which I have just described. In many monuments of the thirteenth and fourteenth centuries we see symbols of the Trinity, such as three equal circles interlaced, three triangles entwined, and many other ingenious devices of a like nature. I have seen a very beautiful "Trinity" emblem of this kind engraved on a hewn stone, lying covered by brambles, near an early oratory (now in ruins), at Cahir, county Tipperary, Ireland; it is dated from about A.D. 1200. In the fifteenth and sixteenth centuries we often find figures of the Trinity represented as "triune" ones, that is, three human figures having their three visages united as one. This type has often been condemned and reproved by the Councils of the Church, and they have gradually disappeared from use. In the three examples of this subject which I have cited the Son is crowned with thorns, as in the illustration to Mr. Dobson's lecture. So great a similarity of design shows that there must have been a certain "canon" or rule of representation of sacred subjects prevailing amongst all Christian artists from a very early period, of which "canon" we get glimpses in such literary remains as the "Album of Villars de Honicourt," and in the still earlier pages of Theophilus, the "Monk of Mount Athos." The same rule or "canon of art" is followed out up to this day by the painter "deacons" of the Greek church.

MICHAËL J. E. BUCKLEY.

SIR,—It was with very great interest I read Mr. Dobson's paper on "Symbolism," also Mr. Heme's note on the "Emblem of the Trinity at Black Abbey, Kilkenny," and beg to remind him there is one similar to the one he mentions at Muchelney Abbey, Somerset (see the *Builder*, vol. xxxvii., p. 1078). This interesting relic was dug up during the excavations that have been made there, and was, when last I saw it, in the parish church which adjoins the site of the abbey. Unfortunately, the head of the Eternal Father is missing, but both hands remain, and are placed one on each side of the Son, who stands in front of the Father. The Son in this case is represented as a boy without the cross, and the dove is held in his hands in front of the body.

This valuable relic was found in a small chapel on the north side of the abbey church, near a tomb of one of the abbots. On the top of this tomb is the effigy of an abbot in full vestments, his feet resting on a lion. This figure is, strange to say, also headless.

The tomb being fourteenth-century work, and the emblem and tomb being of the same description of stone (not native), in all probability they are of the same date.

The figures are coloured gold, vermilion, and blue.

T. SHELMERDINE.

DEVELOPING SOUTHAMPTON.

SIR,—I have read the able letter of Mr. James Lemon in your publication of the 17th inst., offering some further information on this subject, and, observing a little incorrectness in the same, permit me, as engineer and surveyor to the Corporation, to add a few remarks in correction thereof.

The Corporation have not extended their paving operations with blue bricks directly in lieu of Caithness stone or any other description of paving, or on account of the former being laid at half the cost of the latter, as stated. The question of blue brick *v.* Caithness stone paving has not, to my knowledge, arisen in this borough, there being no difference of opinion as regards the superiority of Caithness stone. The blue brick paving has simply been laid to supply a great public and long-required improvement over the rough gravel foot-walks, principally in the suburban streets, where, as is the case in a great many other towns, it proves a most excellent, durable, and cheap paving. As regards appearance, I think the fact that the Corporation have received thirty memorials from the ratepayers during the last twelve months in favour of an extension of this class of paving proves that there is nothing objectionable under this head. Caithness stone is laid in the main thoroughfare.

Concerning the new roads which have been made up in the district of Portswood not being considered street improvements, they are not referred to as such in your article of the 3rd; but, under the well-known clause, section 150, of the Public Health Act, they can be classified as street improvements.

W. B. G. BENNETT, Assoc. M.I.C.E.,
Borough Surveyor.

ARCHITECTS' CERTIFICATES.

IN THE COURT OF APPEAL.—GOODMAN *v.* LAYBORN.

ON December 12, this appeal came on for hearing from the judgment of Mr. Justice Lindley and Mr. Justice Grove, who directed that a certain document was a certificate of an architect, and therefore that the amount stated therein was due to the builder for extras, though no written orders had been given to him for them. The document in question was endorsed "Estimate of extras and deductions," &c., and it contained a number of items and prices, being respectively extras and deductions, and the sum of 125*l.* came out as due to the plaintiff. At the foot the architect had written opposite this sum, "Balance due as in conditions, 125*l.*," and lower down had signed it "W. G. Osborne, architect, Ramsgate." Mr. Woolf appeared for the defendant, the building owner, the appellant; Mr. E. S. Roscoe for the plaintiff, the builder, the respondent. The Court held that, looking to all the circumstances of the case, and to the form of the document itself, this was not a certificate. If it had been, it would have done away with the want of written orders for extras, but as they could not hold it to be a certificate within the meaning of the contract, the absence of written orders was fatal to the validity of the plaintiff's claim. [When will architects and builders learn that the terms of contracts are meant to be observed, and are not mere surplusage?]

BITTESWELL CHURCH, LEICESTERSHIRE.

The restoration and additions to Bitteswell Church were commenced early in last autumn; the old church having been found to be in a bad state of repair, and the chancel condemned as being unsafe.

The church was repaired and "beautified," as the parish record hath it, in the early part of the present century, at which time the present Perpendicular windows were inserted, and the oak pews put up, which latter, though displaying to our eyes poor work, still are very fair, considering the period they were designed in. The outside of the church and the fine substantial tower have also been coated with a brown cement, to which time has now given a not unpleasing colour. The stonework alone appears on the spire of the tower, which is very graceful, and is much admired.

A still later addition was made to the church of a north transept, the arch of which it has been deemed necessary to secure in the present alterations.

The work now in progress comprise a north aisle the whole length of the nave, the modern transept being incorporated into it; it is divided from the nave by an arcade of four Transitional (Decorated to Perpendicular) arches on octagonal-shaped pillars.

At the east end of this aisle is introduced a vestry large enough to hold the organ, which will face the chancel.

The double arches between the tower and nave of the church have been re-opened, and the modern gallery removed; these arches are very curious; the tower, being for some 30 ft. up of Norman work, was originally attached to an older church, which was removed at a later period and the present church built, the west wall of which was built against the east wall of the tower, pierced with a high Perpendicular arch, which stands out in front of the fine semi-circular arch in the tower wall behind; the effect is peculiar and interesting.

The whole floor of the nave is being lowered to the old level, and the chancel floor will be raised by several steps to a higher level towards the altar.

The old chancel has been taken down, and a new one, in Late Decorated style, built on the old lines.

The south porch,—a modern erection in cement,—has been removed, and a new porch, Decorated in style, put in its place.

A new oak altar and reredos are being made. The latter will be in three compartments, filled in with mahogany panels, upon which are painted Scriptural subjects, after the manner of the Early Italian masters, which has been kindly executed and presented to the church by Mr. Andrew Donaldson, a resident in Bitteswell, which reflects great credit upon his artistic powers. The centre panel represents the Holy Child in the manger, between the Virgin Mother and St. Joseph, boy angels float about singing the "Gloria in Excelsis," whilst others kneel adoring.

The two side panels are filled in with angels adoring and playing on various musical instruments.

The woodwork of the reredos is in oak, and designed in the Perpendicular style.

The works are being carried out by Messrs. Law & King, from the designs and under the superintendence of Mr. Walter F. Lyon, R.I.B.A., of Lincoln's Inn-fields, London.

INDIAN ARCHITECTURE.

Sir,—After the warm eulogy by Sir R. Temple at the Institute, on the 5th inst., of Indian architecture, the following notes on some of the buildings referred to may be acceptable. They are mainly within the red sandstone fort of Akbar at Agra, and form an architectural group of unsurpassed beauty and interest. No creed possesses a temple of worship expressing a purer spirit of devotion than the Taj, or Moti Musjid, "the Pearl of Mosques," with its gleaming white domes crowned with gold, its silent marble aisles, its basement, arches, spandrels, and friezes of pure white marble, inlaid with exquisite designs in coloured stones. The sarcophagi of Shah Jehan and his wife Noor Jehan, are inlaid with agate, carnelian, bloodstone, and lapis lazuli, and there are numerous inlaid Arabic inscriptions in black marble. Surrounding these is a glorious marble screen of perforated tracery panels, each 6 ft. high and 3 ft. wide, with the frames inlaid with precious stones brought from all parts of India, from Persia, Arabia, and Ceylon.

With all this, the effect is one of such perfect purity that the opening lines of Wordsworth's sonnet have been applied to this building,—

"Quiet as a nun, breathless with adoration,"

And certainly human love never raised a more beautiful memorial of its joy and sorrow than "the dream in marble" on the banks of the Jumna.

The mausoleum of Prince Elmah-Doulah, and other buildings, have external arches filled in with delicate geometrical tracery, and dados panels, and friezes of coloured ornament, inlaid in white marble. The pointed arch is universal, and is generally four-centred.

The Diwan-i-Am, or public audience-hall, is 200 ft. long by 75 ft. wide, and has forty pillars supporting the roof.

Beyond the gardens is the Diwan-i-Khass, or private hall of audience, an exquisite chamber of white marble, with pillars of wonderful beauty. The white marble is everywhere relieved with graceful floral designs in precious stones, inlaid with marvellous art.

The Summan Boorj, a delightful little marble summer-house, overlooks and commands a splendid view of the River Jumna, on which boats of grotesque shape, laden with corn, float lazily down. It is as beautifully ornamented as the other buildings. To this charming little retreat the ladies of the harem had access. On plan it is an octagonal room, surrounded by an arcade, and it is surmounted by a cupola with a gilded dome. Geometrical designs, in coloured marbles, adorn every part. Here the Emperor played on the marble chequered floor with his women the game of "pachesse," and snatches of Persian song were heard from an adjacent tower. Not far distant is the harem bath-room. It is a large dimly-lighted chamber, covered with paintings and mirrors, in which many a lovely form has doubtless been reflected. The water entered in cascades over rows of lamps.

The Khass Mehal, or private drawing-room, also overlooks the river, and has windows of marble trellis, panels of marble or alabaster so thin as to be semi-transparent. Next are the private apartments of Shah Jehan, of plain red sandstone, in which he died in virtual captivity to his son.

The Palace of Jehanger stands beside that of his son, and, though in ruins, is distinctly of Hindoo character. Wooden buildings, with beams, lintels, and immense brackets, are slavishly copied in stone.

The Mosque (142 × 56) is a broad pavilion of several aisles, separated by rows of columns and arches. The perfection of its proportions, and the marvellous combination of simplicity and grace strike every beholder. Nothing calls for admiration but pure architectural design, whereas in the Taj one might be overcome by the vast wealth of gems and marbles, and the great evidence of human labour.

The late Mr. Bayard Taylor says,—"To my eye it is absolutely perfect. While its architecture is the purest Saracenic, which some suppose cannot exist without ornament, it has the severe simplicity of Doric art. It has, in fact, nothing that can be properly called ornament. It is a sanctuary, so pure and stainless, recalling so exalted a spirit of worship, that I felt humbled as a Christian to think that our noble religion has never inspired its architects to surpass this Temple to God and Mahommed.

These monuments, with their Mosaic ornaments, have recently been restored by the Government of the North-Western Provinces of India as far as possible to their original integrity, and at a cost of some thousands of pounds. This is a graceful and generous act, the effect of which will not be thrown away upon the people. It may be added that beautiful gardens, with majestic trees and shady walks, set off these monuments to the best advantage.

These few notes show that Sir Richard Temple was fairly justified in the praise he bestowed on Indian architecture, but that "the Great Mogul was perhaps the greatest architectural genius who ever lived, not excepting the ancient Greeks," may be questioned, inasmuch as the buildings of Agra are not absolutely unique and original. What architectural work is? Perhaps there will be a more general admission of the statement that "in respect of taste, imagination, and everything that related to beauty and sublimity, and to æsthetic culture," the natives of India far surpassed us. H. T.

TEMPLE BAR.

Sir,—In reference to the re-erection of Temple Bar, as alluded to in the address of the President of the Royal Institute of British Architects, I observed that he did not name any very appropriate site to replace it. I have looked forward with hope that some of your able contributors might rescue it from annihilation, and, seeing no such movement, I have therefore taken this opportunity of suggesting that it would be a very good position if rebuilt at Storey's-gate, St. James's Park, in place of the present mean iron gate at the end of Great George-street. If the City authorities would part with the old stones it would be a noble and a useful retirement from its former busy and admired position, now, however, outgrown its original purpose. It would be sufficiently large and appropriate for the park entrance, as would the statues on either side.

The supporters of the royal shield of arms should be reinstated as formerly over the foot entrances, and the arms over the centre arch, with a trophy of banners, &c., not forgetting to show, by a tablet or in some other way, to posterity its original name and situation, where now stands the useful and handsome memorial to its respectful memory. W. H.

THE LATHING STAFF.

Sir,—At page 248 of the third edition of Moxon's "Mechanick Exercises" (1703) mention is made of a plasterer's tool called a "lathing-staff." It is figured as resembling somewhat an old-fashioned boar-spear, having a broad lance-shaped head, a short shaft with a hook at the end, and a short cross-arm through the shaft a little below the head. Moxon described it as "a *lathing-staff of iron*, in the form of a cross, to stay the cross laths while they are nailed to the long laths, and also to clinch the nails."

I am very desirous of learning whether a tool answering this description is at present in use by plasterers, and whether it still goes by the same name. If it is not now in use, whether such a tool is known to have been formerly so; and also what equivalent tool is now used.

Alex. Beazeley, M. Inst. C.E.

LIGHTING BUILDINGS.

Sir,—Having to fit an electric lighting apparatus in a building for the purpose of illuminating a screen, I am at a loss to know where to place the light so as to secure the greatest amount of illumination on the screen. The building is 80 ft. by 40 ft. The light must be placed on a gas-pipe which runs along the middle of the building from end to end, and is 30 ft. from the ground. The screen is on the wall directly under the gas-pipe, the middle of it being 23 ft. below the gas-pipe. Can any of your readers tell me how far to place the light from the wall? If some one would give a rule for finding the distance it would oblige Electricity.

LIBEL ON A DISTRICT SURVEYOR.

KNIGHTLEY *v.* LETT.

It was stated that the plaintiff in this case (Queen's Bench) was district surveyor at Hammersmith, and the defendant, who was a retired solicitor, owned some property in Hammersmith. The defendant wrote to the Board of Works complaining that the plaintiff left his business in Hammersmith to be managed by another person, whilst he himself carried on business elsewhere, and that he had attempted to extort money when it was wanted to call him as a witness. The plaintiff claimed damages for these statements as libellous, and at the trial before Mr. Justice Mathew, the jury found for the plaintiff, damages, 150*l*.

Mr. Murphy, Q.C., for the defendant, now moved for a rule to show cause why there should not be a new trial. He submitted to the Court that the learned Judge had not properly directed the jury upon the question of privileged communication, and also as to some other matters, that the verdict was against the weight of the evidence, and that the damages were excessive.

Rule granted.

VARIORUM.

"Modern Alphabets," designed by Martin Gerlach (Fischer, St. Bride-street), are overflowery. Nevertheless, they are very well done, and may be found useful by writers, bookbinders, and others.——"Simple Hydraulic Formulæ," by T. W. Stone (Spon), has for its main object the purpose of enabling miners and others engaged in sluicing operations, or in the use of water for other purposes, to check the quantity supplied to them. It does, however, more than this. It has many diagrams.——"The Wild Garden," by W. Robinson, F.L.S., illustrated by Alfred Parsons (the *Garden* office), is a charming little book, and ought to produce good results. Its object is to make our groves and gardens beautiful by the naturalisation of hardy exotic plants, and has suggestions for the regeneration of the bare borders of the London parks. Mr. Robinson has a genius of his own.——Diaries come before us from all sides. Those of Messrs. T. J. Smith, Son, & Co., are varied and well esteemed. They have large Scribbling Diaries and Small Scribbling Diaries, Diaries in limp covers and Diaries in tight; in fact, all may suit themselves if they will take the trouble to read the published list.——Messrs. Hudson & Kearns's Diaries we praised last year, and they have been improved. Their distinctive feature is their comprehensiveness, each volume forming in itself a complete set of books indexed and paged throughout. Nos. 12 and 13 are specially arranged for the use of architects and surveyors, but are most useful for all pro-

fessional or business purposes. They contain not only a diary which is virtually a day-book or journal, but a cash-book, ledger, or note-book, rent and insurance register, and the paper and binding are of unusual excellence. No. 11 is specially adapted to the requirements of those in the building trades, and contains a series of tables of a practical character, including the calculation of wages, the checking of estimates, &c. In all, the index is a valuable feature. — "The Garden Oracle and Floricultural Year-Book for 1882," edited by Mr. Shirley Hibberd, is the twenty-fourth annual issue, and contains a treatise on the cultivation of the rose; a synopsis of the roses of fifty years, comprising descriptions and characters of 1,500 varieties; selections of the best roses now in cultivation for exhibition and garden decoration; a new selection of potatoes for all purposes and all soils; notes on new inventions, implements, &c.; and many matters of interest to gardeners, amateurs, botanists, and lovers of the country.

CHURCH-BUILDING NEWS.

Darlington.—The usual Christmas decorations at St. Cuthbert's Church are this year supplemented by a piece of decorative work of a permanent character, the ancient panelling at the back of the chancel-stalls, which was destroyed in 1748, having, through the liberality of the Duke of Cleveland, lay rector of the church, been restored from the drawings of Mr. J. P. Pritchett. As every particle of the old panelling was destroyed, the restoration has been imitated from that now existing in the chancel of Staindrop Church, where the stalls, and especially the ends, are so exactly like those at St. Cuthbert's that they must have been executed from the same drawings, if not by the same hands. This is the more interesting as at that time one of the Neville family, who owned Raby and Staindrop, was Bishop of Durham, and changed the constitution of Darlington Church from a vicarage to a deanery. The work has been executed by Mr. Osborne, contractor, of Darlington, out of old English oak which, after being in the roof of Middleham Church for 300 years, was taken down and replaced lately by a modern roof of foreign oak, during a "restoration" of the church.

Halesowen.—It is proposed to restore the church here as a memorial to the late Archdeacon Hone, at a cost of about 2,000*l*. Mr. John Oldrid Scott is preparing the plans.

Miscellanea.

A Corporation in a Dilemma.—The Corporation of Newbury are in a dilemma as regards their gas undertaking. The new gasworks are now in use, but after spending the whole of the capital borrowed (25,000*l*.), and charging the gas consumers 5*s*. 6*d*. per 1,000, the undertaking is practically insolvent. At the Council meeting on the 20th inst., the chairman of the committee told the Board that the liabilities of the undertaking exceeded 2,000*l*., that the assets were between 500*l*. and 600*l*., and that their borrowing powers were exhausted. Mr. Elliott, the contractor, was commissioned to do the work; his charges were taken exception to; the matter was referred to arbitration, and the Council now find themselves in the unenviable position of having to pay 1,267*l*. of the 1,569*l*. charged by Mr. Elliott, together with the costs of the arbitration, which are considerable in amount. The whole matter is now in confusion. The late chairman of the Gas Committee has declined to serve on the committee, and the manager has resigned.

Sewage of Leyton, Essex.—The Local Board of Leyton, Essex, have entered into a contract with the Rivers Purification Association, of Gresham House, for the purification and disposal of the sewage of their district. In these works the method of pressing the sludge into a portable condition, recently introduced successfully at the Coventry Sewage Works, will be employed.

The Will (dated July 23, 1880) of Mr. William Lee, J.P., the senior partner in the firm of Lee, Son, & Co., cement manufacturers, late of Holborough-court, Snodland, Kent, who died on September 29th last, was proved on the 3rd inst. by Mr. William Henry Roberts, the grandson, the acting executor, the personal estate amounting in value to upwards of 124,000*l*.

The Smoke Nuisance.—Last week Mr. Ernest Hart delivered at South Kensington a lecture, in connexion with the exhibition, on "The Bases and Method of Smoke Abatement," to a large audience. Dr. Siemens presided. Mr. Hart commenced his lecture by referring to the influence of smoke upon health, in proof of which he stated that during the week of fog ended on the 7th of February, 1880, the mortality in London was higher than it had been at any time during the last forty years. The lecturer gave some statistics as to the rate of mortality in the metropolis and various large towns in England. He referred, also, to the enormous quantity of coal consumed in London, and as illustrating its injurious effects on public buildings, stated that the external surface of the Houses of Parliament was so injured by fog and smoke as to cost 2,500*l*. a year to maintain it. Every house in the metropolis was also a sufferer from the smoke nuisance. The use of anthracite coal was urged, and directions were given for the best means of burning it. Mr. Hart also suggested the organisation of an enlightened public opinion, which would assist first of all in the more general introduction of improved patterns for household grates and kitcheners by individuals, and the acceptance by speculative builders of the principle of adopting such improved grates as a means of heating their houses more readily. He urged also that great London houseowners should recommend to their tenants the use of smoke-abating grates and kitcheners. The Duke of Westminster, who had taken a great interest in the exhibition, had promised to bring the matter before his tenants, and the committee had decided to approach all the landowners in London in order to obtain their co-operation.

Blythburgh Church.—The Rev. H. Sykes, in a letter to the *Morning Post*, says, in replying to a previous letter on the state of the church, that it is quite true that this "venerable and magnificent pile is assuredly mouldering into sad decay, desolation, and ruin." The spectacle is painful in the extreme to any person who has a spark of love for what is grand and beautiful in architecture, but the question arises, what can be done to prevent the further decay and ultimate ruin of this noble building? Some steps have been taken already. A meeting of parishioners, convened by circular, was held in the school on October 7th, when a committee was appointed to consider the matter. The late Mr. G. E. Street was engaged by the committee to inspect and report. Mr. Street and his son made a thorough inspection of the building in the early part of November, and promised to draw out estimates for the various portions of the work to be undertaken. The architect's reports and estimates have been delayed by the illness and lamented death of Mr. Street, but as soon as these have been received they will be printed for circulation and extensively advertised in the public papers.

The Brighton Sanitary Exhibition.—Mr. Councillor Hamilton, the general hon. sec. of this successful exhibition, has been presented by the exhibitors with a mantel clock and silver salver. The presentation was made, on behalf of the subscribers, by Mr. James Doulton. Mr. Hamilton, in the course of the proceedings, stated that 1,150*l*. had been taken at the doors, and that as many as 3,000 people had paid their sixpence at the door after six o'clock in the evening. The awards made do not appear to have given satisfaction to all the exhibitors,—an old complaint.

The Purification of Air in Tunnels.—For underground railways Dr. Neale has suggested to place beneath the railway carriages trays filled with slaked lime or caustic soda solutions, which, combining chemically with the injurious gases, such as carbonic oxide, carbonic acid, and sulphurous acid, form harmless salts. For hospitals, Dr. Neale recommends a chemical punkah, whose fan being made of vegetable fibre, is saturated with caustic soda solution fed from a small tank above.

Electric Lighting.—Arrangements have been made for lighting up the town of Godalming by electricity. It was brought into operation on the 15th inst.. The utilisation of water-power is not the only novelty. The arc lights are set up in the main street, and Swan incandescent lamps, introduced for the first time for public lighting, in the ordinary gas-lamps in the smaller turnings. Only bare copper wire, upon insulators, is used for the latter; and further, there is no direct return-wire used.

The Proposed Interference with Timber Stacks in the Metropolis.—At the meeting of the Metropolitan Board of Works on the 23rd inst., a large deputation of timber merchants attended to present a memorial against the 18th clause of the Metropolis Management Building and Thames Floods Prevention Acts Amendment Bill. The clause would give the Board power to control the stacking of timber in London, and even to forbid the stacking, except in the suburbs. Mr. Penty, for the deputation, said they were already heavily handicapped by foreign competition, and any interference with their trade would prove ruinous. To remove timber-yards out of London would mean loss of work to many artisans; and, owing to the rapidity with which work had frequently to be done, it would prove impracticable. In answer to questions, he said the deputation did not represent the firewood trade, and would rather not offer any opinion as to the danger of stacking firewood in the neighbourhood of private houses. The memorial was referred to the Works Committee.

The Damage to Maryport New Dock.—Last week a meeting of the Maryport Wet Dock Committee was held at the Harbour Office, to receive the report of the engineers upon the damage done to the new dock works by the late violent storms. The report of the engineers (Sir John Hawkshaw, Son, & Hayter) was read, recommending that the sea works should be strengthened and heightened, and the structure of the higher portion of the works erected in accordance with a new plan which accompanied the report. The report also specified the price per yard to be paid for the extra work, which amounted to an estimated additional expenditure of 25,000*l*., and that the work be carried out by Mr. Doherty, the contractor. On the motion of the chairman, seconded by Mr. Briggs, the report was adopted. The original contract amounted to about 90,000*l*.

Changes at the Parliament House, Edinburgh.—The *Scotsman* says that a scheme has now been completed for the accommodation of Lord Rosebery, Under Secretary of State for Home Affairs, in the Parliament House buildings, and plans to give effect to the scheme have been prepared by Mr. Robertson, of H.M. Office of Works, exhibiting the nature and extent of the arrangements contemplated. The matter is now under consideration of the Treasury. In the first place, it is proposed to utilise the corner premises, formerly occupied by the Union Bank, for the formation of an additional court-room for jury trials and proofs. The remaining space occupied by the acquisition of the bank premises will admit of considerable re-arrangement of certain of the public departments, and the providing of better accommodation for them. It is expected that the work of adaptation will be proceeded with early in the New Year.

Memorial of the Late Lord Beaconsfield. The Rev. Henry Blagden, vicar of Hughenden, states that a large portion of the proposed memorial to Lord Beaconsfield at Hughenden has been completed. A west window, by Messrs. Clayton & Bell, has been erected, and the chancel wall has also been decorated by Messrs. Heaton, Butler, & Bayne, with paintings of evangelists, prophets, and angels, so as to harmonise with the east window, which is the gift of the late earl's executors. The remainder of the work proposed is in hand, to be completed by Easter, but the sum of 200*l*. is still needed to carry out the plan of the memorial.

Industrial Trades Exhibition in Nuremberg.—From May 15th to October 15th, 1882, a Bavarian Home Industrial Trades and Art Exhibition will be held in Nuremberg, under the immediate patronage of King Ludwig II. of Bavaria. The Bavarian State Ministers will support the exhibition to the fullest extent, and the Bavarian Industrial Museum, which is carrying out the arrangements for the exhibition, is doing everything to make it a success, a guarantee fund of 600,000 marks (30,000*l*.) having already been raised for it, mainly in Nuremberg.

Modelling at the Royal Academy.—We are glad to hear that Mr. Hugh Stannus has been appointed teacher of modelling in the Architectural School at the Royal Academy. We anticipate much advantage from the appointment.

Sir Antonio Brady.—It is proposed to build a chancel and to reseat the Church of St. John, Stratford, in memory of the late Sir Antonio Brady, who was anxious that the work should be undertaken.

The Dome of St. Sophia.—The dome of St. Sophia, at Constantinople, is again reported to be in a dangerous condition, and threatens soon to fall in. The cause is attributed to the restoration which was carried out forty years ago by an Italian architect, Signor Fossati, who removed a number of the wooden supports that were previously found under the cupola. The interest of all civilised peoples in this edifice is such that it is to be hoped the best available advice will be obtained.

TENDERS

For sewering, &c., Chapel-grove, Lorne-grove, Gloucester-road, and Roe-street, Urmston, for the Barton-upon-Irwell Rural Sanitary Authority. Quantities by the engineer, Mr. John Price, Assoc. M. Inst. C.E.:—

Henry Prescott & Co., Peudleton	£1,966	14	0
Solomon Holt, Miles Platting	1,762	2	8
Matthew Naylor, Hulme	1,573	10	0
John Mackay, Hereford	1,466	0	0
Edmund Bird, Chorlton	1,304	8	6
Wm. Thos. Moss, Stafford	1,288	14	3
Wm. Snape & Son, Eccles	1,193	10	8
W. H. Worthington, Manchester	1,090	4	8
J. Rendall, Weaste	1,046	0	0
S. Cowburn, Hindley (accepted)	1,000	10	6

For pulling down and rebuilding the Bull's Head public house, Tottenham-court-road, for Mr. Hyams. Mr. E. Brown, architect:—

C. Marr	£7,227	0	0
Perry & Co.	7,000	0	0
S. Salt	6,850	0	0
C. Dickenson	6,450	0	0
J. Morter	6,450	0	0
F. & F. J. Wood	6,194	0	0
W. Shurmur	6,093	0	0
Jackson & Todd, Hackney - road (accepted)	5,920	0	0

For the erection of a detached residence at Barnwood, near Gloucester, for Mr. Chas. Jeynes. Mr. Capel N. Tripp, architect:—

James Clutterbuck, Gloucester	£935	0	0
Alfred King, Gloucester	977	0	0
Edward Godwin, Gloucester (accepted)	878	0	0
F. C. Allen, Gloucester	870	0	0
John Webb, Birmingham	819	0	0

For erecting a farm-house at Ufford, for the Right Hon. Lord Kesteven. Messrs. Richardson, architects:—

Thompson, Derby	£774	0	0
Sharp Bros., Little Bytham	732	0	0
Roberts & Johnson, Ashton	704	0	0
Dean, Uppingham	686	0	0
Roberts Bros., Stamford	663	0	0
Wallis, Spalding	649	0	0
Story & Son, Bourn	648	16	0
John Woolston, Stamford	619	0	0
Allister, Wisbech	616	0	0
Perkins, Easton	615	0	0
Scholes, Stamford	599	0	0
Hinson, Stamford	569	11	9
Thos. Woolston, Stamford (accepted)	540	0	0
Dobson, Stamford	482	12	0

For sewers, Cronch-hill, for Mr. M. L. Cassell. Messrs. Hills & Fletcher, surveyors:—

Hubbard	£317	0	0
Taylor	276	0	0
Joseph Jackson, Upton	266	10	0
Rowley	264	10	0

For building three new cottages in Northey-street, Limehouse, for Dr. Vickers. Mr. Chas. Dunch, architect:—

Higgs	£826	14	0
Shurmur	765	0	0
Taylor & Co.	629	0	0
Palmer	537	10	0
Walker	510	0	0

For alterations at Railway Tavern, Victoria Park Station, for Messrs. Truman, Hanbury, & Co. Mr. B. J. Capell, architect:—

Hearle & Son	£472	0	0
Keetch	432	0	0
Shurmur	432	0	0
Marr	409	0	0

For the erection of school buildings, &c., in the Alma-road, St. Alban's, for the St. Alban's School Board. Messrs. J. & S. F. Clarkson, architects. Quantities by Messrs. Hodgson & Mundy:—

Monk, Two Waters	£3,447	2	6
White, Dunstable	2,960	0	0
Carlin, St. Alban's	2,907	18	6
Capper, St. Alban's	2,886	16	11
Edey, Son, & Co., St. Neots	2,788	0	0
Potter, Leicester	2,769	0	6
Savage, St. Alban's	2,694	6	0
Jones & Co., Gloucester	2,637	0	0
Matthews, Dover	2,625	5	6
Rayment & Son, Hertford	2,588	4	0
George, Stoney Stratford	2,586	3	7
C. Miskin, St. Alban's (accepted)	2,483	0	0
Ireson, Northampton	2,465	0	0

For Masonic Hall, Devonport. Mr. J. F. Burns, architect:—

J. Dart, Devonport	£675	0	0
J. Healy, Devonport	622	10	0
H. Gill, Devonport	550	0	0
R. D. Rowe, Devonport	535	0	0
T. Jenkin, Devonport	530	0	0
A. R. Lethbridge, Plymouth	475	0	0
G. H. Smith, Devonport	469	0	0
J. Harley, Plymouth (accepted)	447	0	0

For erecting offices, stables, cooperage, cask-shed, &c., at the new Swan Brewery, Walham-green, for Messrs. Stansfeld & Co. Mr. W. Bradford, architect. Quantities by Messrs. J. & A. E. Bull:—

G. H. & A. Bywaters (accepted)	£10,427	10	0

For alterations to premises, 224, Goswell-road, for the Metropolitan Provident Medical Association. Mr. Wm. Bradford, architect:—

John Emery	£274	0	0
J. Newton	257	0	0
W. H. Snow	225	0	0
Joseph Edgar (accepted)	207	0	0

For shop-front and internal fittings, 34, Bank-buildings, Hackney. Messrs. W. Waymouth & Sons, architects:—
Shurmur (accepted).

For additions to works, St. Alban's, for the "Turner" Gas Engine Company (Limited):—
C. Miskin (accepted) £254 0 0

We are compelled to decline pointing out books and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under ..... 4s. 6d.
Each additional line (about ten words) ..... 0s. 6d.
Terms for series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under ..... 2s. 6d.
Each additional line (about ten words) ..... 0s. 6d.

REPLIES TO ADVERTISEMENTS,
Addressed Box —, Office of "The Builder,"
Cannot be forwarded, but must in all cases be *called for*, and the Office Receipt produced.

THE CHARGE FOR A BOX IS AS UNDER:—
For "Situations Wanted" Advertisements ..... 3d. per Week.
For all other Advertisements ..... 6d. per Week

PREPAYMENT IS ABSOLUTELY NECESSARY.

*** Stamps *must not* be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, King-street, Covent-garden, W.C. to

DOUGLAS FOURDRINIER, Publisher,
Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the office before THREE o'clock p.m. on THURSDAY.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied *direct* from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum, *prepaid*. Remittances payable to DOUGLAS FOURDRINIER, Publisher, 46, Catherine-street, W.C.

Best Bath Stone.
WESTWOOD GROUND,
Box Ground, Combe Down,
Corsham Down,
And Farleigh Down.
RANDELL, SAUNDERS, & CO., Limited,
Corsham, Wilts. [ADVT.

Box Ground Stone
Is the best for use in all exposed positions, being a well-known and tried weather stone.
50,000 feet cube in stock.
PICTOR & SONS,
Box, Wilts. [ADVT.

Doulting Freestone and Ham Hill Stone of best quality, in blocks, or prepared ready for fixing. An inspection of the Doulting Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK, Norton-sub-Hamdon, Ilminster, Somerset.—Agent, Mr. E. WILLIAMS, 73, Charlotte-street, Portland-place, W. [ADVT.

Doulting Stone and Ham Hill Stone, of best quality. Prices and Estimates, including delivery to any Station, on application to STAPLE & HANN, Quarrymen, Stoke-sub-Hamden, Ilminster. Agent, Mr. E. CRICKMAY, Langbourn-chambers, 17, Fenchurch-street, E.C. [ADVT.

Asphalte.
Seyssel, Patent Metallic Lava, and
White Asphaltes.
